Overall, then, the concept of development is driven by the expanding content of human life interests, using new technology and science advances (Coccia 2019, Coccia and Wang, 2016). Human society should focus on patterns of sustainable development, rather than economic growth, for improving long-run environmental and social factors, and health of people. However, development is also affected by economic, social, psychological, anthropological, and perhaps biological factors that can generate uncertain and unknown long-term effects in environment and society.

# Theories of Ethics

Mary McThomas
California State University, Channel Islands, Camarillo, CA, USA

## Synonyms

Ethical decision-making; Ethical frameworks; Moral principles; Normative analysis; Principled standards; Rights and duties; Rules of conduct

## Introduction

Theories of ethics provide frameworks from which to assess the probity of actions in a disinterested, consistent manner free from personal bias and self-interest. Public administration and public policy are often seen as practical disciplines, yet evaluations of ethical decision-making and good (not merely practical or efficient) policies rely heavily on normative theories of ethics. The different theories and ethical frameworks provide guidelines for determining the most ethical course of action. However, the different theories often lead to conflicting conclusions; thus, understanding the underlying philosophies is important when deciding which framework to utilize.

James H. Svara (2007) describes three distinct approaches to ethical decision-making: those which place emphasis on the proper moral character of the actor (virtue ethics), approaches that focus on the actions themselves with an eye to obligations and the application of rules (duty ethics), and approaches that judge the ethics of an action based on the results (consequentialism). This "ethical triangle" relies on three philosophies – virtue ethics, deontological or duty-based ethics, and consequentialism. However, there are additional and related theories of ethics that are important to explore as they influence our public philosophy and are integral to determining right actions and ethical policies. Thus, utilitarianism, rights-based theories, and the ethics of care will be discussed in addition to virtue ethics, deontological ethical theory, and consequentialism.

## Virtue Ethics

Virtue ethics focuses on the character of the moral agent with the idea that a virtuous person will not only have good intentions but, when trained properly, will reflexively act in an ethical manner. Virtue ethics is largely based on Aristotelian philosophy. Aristotle's ethical theory includes a process of habituation in which, through practice and repeated action, one is trained to be virtuous in the same way, for example, a musician is trained to be a virtuoso. Even those born with natural talent need training and practice. Similarly, even if human nature is generally good, individuals need the process of habituation to shape their character and to be truly virtuous. An individual of firm and unshakeable character will be able to

make virtuous choices even when the laws are silent.

In a similar vein, Terry Cooper (2004) describes virtue as "character understood as the predisposition to behave consistently with one's espoused values and principles" and states that it "is built slowly and consistently over time" (398). Cooper goes on to conclude that "virtue, or character, is clearly one of the elements of the normative foundations of public administration ethics" (398). In this understanding, an individual habituated slowly and steadily over time will be able to consistently perform in a virtuous manner, making ethical decisions and acting appropriately.

One of the criticisms of virtue ethics is that it requires a trainer. That is, in the same way the musician needs a teacher (initially at least), an individual needs some sort of guide or program in order to form a virtuous character. But who provides this guidance? For Aristotle, the state plays a key role in passing laws that will help its citizens to be good and aid in their character formation. In more particularized settings – such as professional ethics – parameters of expected and desired behavior can be provided through codes of ethics. However, both laws and ethical codes presume a universalized notion of right action that is correctly identified by the state or other governing body. A similar reliance on a universal notion of the good is found in deontological ethical theories.

## Deontological Ethical Theories

Deontological ethics holds that individuals are obligated to carry out certain ethical duties and moral actions. As such, this framework provides an array of moral duties and obligations we owe to ourselves and others. Deontological ethics is based on the philosophy of Immanuel Kant. In Kant's view, individuals should act in ways that are determined by universal rules of obligation. He termed this principle the "categorical imperative" – categorical because it is universally binding and imperative because it instructs individuals how to act (Kant 1994 [1785]). Using the categorical imperative, an individual can determine the morality of an act by her willingness to make it a universal law; that is, anyone else in a similar situation should act in the same way. Thus, if it is "right" for you to lie during business negotiations, it is equally ethical for others to lie to you in the same situation.

Duty-based ethicists believe that an ethical person is someone that binds herself by duties based on moral laws and considerations. Kant defines virtue as "the moral strength of a human being's will in fulfilling his duty" (Ibid, 54). He disagrees with virtue ethics reliance on habituation, stating instead "if the skill is a habit. . . then it is not a skill proceeding from freedom and accordingly not a moral skill" (Ibid, 66). A virtuous action must be freely chosen as the actor willingly takes on certain moral obligations and duties.

What constitutes moral duties can vary. Kant provides a rather extensive list, while other theorists are more selective. For example, Stephen Darwall (2003) supplies seven duties which include, for example, the duty of honesty (a Kantian favorite), the duty of reciprocity and fair play (similar to rights-based theories), and the duty of special care (seen in care ethics). In this framework, ethical behavior is not judged by the consequences of actions but rather on the intention of the actor and the actions themselves. Regardless of the results that emerge, it is the action taken – and observance of the rules – that is considered important. In contrast, consequentialism judges the merit of an action by the outcome.

## Consequentialism

Consequentialist ethics places the importance of achieving a desired consequence above duty and moral obligation. In this perspective, the ethics of an action is evaluated solely by the outcome, not by the action itself or the intention of the actor. In common parlance, the end justifies the means. If a decision leads to a positive outcome, it was the right decision even if made for unethical reasons. Conversely, an action that leads to a negative outcome, even if the actor's intentions were good, is considered problematic.

Consequentialist ethics can be divided into act consequentialism and rule consequentialism. Act consequentialism focuses on a singular decision in which one act at one time is chosen over other actions. Thus, ethical assessments made through the lens of act utilitarianism are limited to the act itself. If the consequences of an action are positive/negative, then the action was good/bad, regardless of the actor's intentions. An example often given provides a rather extreme scenario in which an individual believes that a train is going to go off the track. As a result of this belief, that person throws the switch that sends the train to an alternate rail. However, she inadvertently sends the train to a rail that is broken. As a result, the train goes off the track. Even though her intention was good, the result was bad – therefore making the action bad. Conversely, a different individual switches the train's route to purposely kill a family sitting on the tracks. This action inadvertently kept the train from proceeding on a broken track, saving 300 passengers. The intention may have been to kill the family of four, but the action saved 300 lives. It is, therefore, a good action.

In contrast, rule consequentialism takes into account the pattern of actions encompassed in a rule; thus, there is a greater focus on the impact over time if an act was consistently done and less on each individual action. Rule utilitarianism creates rules that are judged by the consequences of those rules when people follow them. Lying might be the best choice in one specific situation; but if lying is the rule, then contracts are undermined, and business and economic exchange as we know it is destroyed. Returning to the train example, the rule would be that it is, in fact, bad to switch train tracks in order to kill families even though the consequences in this particular case turned out to be good. The good consequences were an anomaly, and one the individual could not have foreseen. Therefore a pattern of making this decision would lead to bad consequences. The better rule is to not switch the track.

In either act or rule consequentialism, the focus is still on the action – not on the intention of the person. A "bad" person can do good things. If the result is good, the action is good. While an eye to consequences is important, if not crucial, for public administrators and policymakers, a purely consequential approach is not without its dangers. There are certain means that can never be morally justified. As a result, there is an appeal to avoid a purely consequentialist approach, calling instead for a combined perspective that includes deontological or virtue-based ethics (Pops 1994; Thompson 1992).

## Utilitarianism

Utilitarianism is often seen as a form of consequentialism as utilitarians similarly judge the rightness of actions and goodness of social arrangements by their consequences. John Stuart Mill (2001 [1863]), in *Utilitarianism*, explains that "the end of human action, is . . .the standard of morality" (10). Thus, the morality of an action is judged by the consequences of that action. Part of this has to do with an attempt to avoid moral disagreements based on intangible notions that cannot be proven either way. Who gets to decide what is moral, just, or true? If we disagree about first principles – which we often do – how then do we come to an agreement about the rightness of actions? Utilitarianism attempts to bring math to philosophy in order to provide a metric that does not rely on intangible, metaphysical notions. They use the utilitarian calculus to weigh costs against benefits in order to determine which policy would provide the greatest good for the greatest number of people.

The calculus attempts to remove personal sentiment, bias, and irrational passion and provide an objective, dispassionate, and provable way of determining the best action. We see this formulaic approach in cost-benefit analysis approaches to public policy. Some calculations are very straightforward: Policy A would help 100 people, and Policy B – for the same amount of money – would help 1,000 people. Policy B clearly provides the greatest good. However, the utilitarian calculus also accounts for levels of pain and pleasure. For example, what if Policy A helps the smaller group of 100 people by saving their lives, while Policy B gives 1,000 people one free meal a week? At that point, it is no longer about

bringing pleasure or avoiding pain to the greatest number of people. When the level of pain is death and the level of pleasure a free lunch, the people impacted by Policy A are given greater weight, possibly enough to swing the calculus in their favor.

Even with such calculations taken into account, a policy that kills one person in order to save two or more would be seen as ethical from a utilitarian point of view. But can the taking of a human life ever be justified? On one side, policymakers and administrators remind us that tough decisions have to be made, and if people are going to die, let us find the policy where the least amount of people will suffer. It is the best one can do in certain real-world situations and is, in fact, the most ethical solution. On the other side, rights-based theories of ethics argue that an individual's rights – especially the right to life – should never be traded away. Such rights are inalienable and cannot be sacrificed for the good of others.

## Rights-Based Theories

Classic liberal rights-based theories come out of the social contract tradition. Their premise is that each individual is born with inalienable rights. The role of government is to protect these fundamental rights. In this understanding, humans have rights by the mere fact of being born human. States do not create rights; they merely recognize they exist. States, therefore, cannot take fundamental human rights away. Classic social contract theorists, such as Hobbes, Locke, and Rousseau, describe a state of nature in which humans are rights bearers prior to the formation of society. At some point – and for a variety of reasons, depending on the theorist – people come together to create a political body. At that time, they agree to give up certain powers to the state – such as the power to judge and punish. However, the power of the state still comes from the people, and this popular sovereignty can be bestowed in another form of government if the current form violates or fails to protect the citizen's individual rights. In order to be legitimate and retain popular sovereignty, state power must be derived of the consent of the ruled, and the ruled must be the authors of the laws to which they submit. While the actual writing of the laws may be done by representatives, those representatives are democratically accountable to the people, and the resulting laws should be publicly acknowledged and indiscriminately applied.

In the US context, rights-based theory is clearly seen in the recognition of constitutional rights and the checks of a constitutional democracy in which fundamental rights may not be voted away by the majority. In public administration, this has been talked about in terms of the New Public Service model which reminds proponents of New Public Management (NPM) that those they serve are citizens and that any business model must privilege constitutional rights over efficiency (Denhardt and Denhardt 2002). In general, public administrators should adhere not to business values but to democratic values which recognize constitutional protections of individual rights. Rights-based theories are still the dominant paradigm in the United States. However, this framework has been challenged on a host of fronts including the call to recognize cultural rights and to appreciate communities as sources of identity and belonging. There has also been the criticism that the individualistic focus of rights-based theories discounts other more relational ethical frameworks, such as care ethics.

## The Ethics of Care

The ethics of care was first introduced by Carol Gilligan, and her findings that moral evaluations based on justice and rights are only one type of ethical consideration and that connections of care and networks of obligations also motivate moral reasoning (Gilligan 1982, 1995). The exemplar model of an ethics of care is the parent/child relationship in which parents have special obligations to their children that are privileged over normal ethical obligations we owe all humans. While rights are envisioned as individually held and universally applied, networks of obligation presume relationships among groups of

individuals that vary by situation. Instead of being universally applied, the ethics of care gives special dispensation to those in need, the vulnerable, and those within one's particular network of care. While premised on the parent/child model, these moral obligations based on care extend to other humans, relationships, and networks.

Within this ethical framework, the focus is more on responding to needs and avoiding harm than on recognizing rights. It changes the moral language from asserting separate, individualistic claims to a focus on the interconnected activities and obligations born of relationships. Instead of asking "what is just?" proponents of care ethics ask "who is in need and how should we respond?" In this latter understanding, one may be morally obligated to help the vulnerable merely because they are in need, regardless of whether their condition rises to the level of injustice under a rights-based framework. Using an ethics of care, an action is judged by its ability to meet the needs of those for which one is responsible. When applied to public policy, that group for which one is obligated to consider is quite large, and when policies are based on who is in need, the beneficiaries and outcomes may be quite a bit different than when they are based on who has a right.

## Conclusion

The above overview only scratches the surface of the varied theories of ethics and their intricacies, interpretations, and criticisms. Even in this thumbnail sketch, however, it is clear that different ethical frameworks lead to very different assessments of actions, decisions, and policies. Some focus on intention, others on results, still others on the character of the actor. They differ in their approach to duties, rights, and relationships and result in a different set of obligations. What they do all share, however, is a desire to operate within ethical guidelines. In order to establish these guidelines, theories of ethics urge us to assess our actions and decisions and continually ask "what is the right thing to do?"

Team and participative leadership theories; Traits and skill-based leadership theories

## Introduction

The intent of this chapter is to talk about each of the major theories of leadership and discuss how they are related. Over the years, the field has since evolved into an array of leadership theories – with both striking differences as well as interrelationships between the theories.

**What is a theory?** According to Abraham Kaplan, "A theory is a way of making sense of a disturbing situation so as to allow us most effectively to bring to bear our repertoire of habits, and even more important, to modify habits or discard them altogether, replacing them by new ones as the situation demands" (Kaplan 1964, p. 295). Not all writing about "leadership" rises to the level of theory, so we shall attempt to eliminate a variety of material that does not meet these demanding criteria.

## Weberian Theory

**Weberian theory**: Max Weber talked about three types of leadership. The first type was *traditional* leadership, where the model of leadership was found in an organization that might be fairly static, possibly with leaders being chosen in hereditary fashion, and in a society that was not likely to be easily changed. Followers would be guided by the direction of the family, religious, or royal leader. The second type was the *rational-legal* leadership model. In this organization, the leader would be more likely to have been chosen by merit or political connection, and the organization would be hierarchical, with individuals occupying specific full-time roles for which they are paid. The *charismatic* leadership model is different, in that the leader would have power based upon their excellent powers of communication and influence, drawing people along by force of personality. **Charismatic leadership theory**, as further developed by Robert House, indicates followers who provide power to leaders based upon what they see as significant exceptional leadership capabilities (Robbins and Judge 2015, p. 375) and that these powers may be inherent in that person or may be learned. **Transactional and transformational leadership**: Drawing from the examples of differing types of leaders, James MacGregor Burns suggested that one can see several kinds of leaders. *Transactional* leaders are those who keep an organization stable by giving incentives, rewards, and punishments to employees to perform their tasks. They accomplish many or all of the functions of an existing organization, but do not necessarily push the organization forward to a higher level. By contrast, *transformational* leaders do pose challenges to their followers that move the followers and the organizations upward to a different level. An example would be Martin Luther King, Jr., who led the movement to ensure improved civil rights for African-American people. Building upon the earlier work of James MacGregor Burns, Bernard Bass developed this theoretical structure to include transactional, transformational, and laissez-faire leadership. **Laissez-faire leadership**: If one uses a continuum that begins with laissez-faire leadership on the lower left, and then with transactional leadership toward the middle, then one can visualize transformational leadership on the upper right-hand side of the continuum (Robbins and Judge 2015, p. 379). In laissez-faire leadership, the employees are trusted to do the work and give suggestions, and the leader simply does the cognitive work that is expected of them (Leadership Styles u.d.). If the employees are not self-directed, intellectual, and motivated, this style is not likely to work well. Northouse looks at this approach negatively, suggesting that the leader is not directive, does not interact effectively with employees, and does not challenge them to expand their horizons (Northouse 2013, p. 196).

## Great Person Theories

**Great Person theories**: The "Great Man" (or perhaps more aptly renamed as "Great Person," since many great leaders have been women) theory is based upon the examples of

major leaders in history. Examples range from Catherine the Great of Russia; Queen Elizabeth I; Peter the Great of Russia; Otto von Bismarck; George Washington; Abraham Lincoln; Indira Gandhi; Franklin Roosevelt; Ronald Reagan; Nelson Mandela; Martin Luther King, Jr.; and Alexander Hamilton, among many others. From examples such as these, and many others, one is able to draw out some characteristics of the leaders and develop theory about what characterizes their leadership capabilities. For example, Peter the Great went to Western Europe and came back to Russia with ideas about leadership and a determination to create an opening to the West that would modernize the country. Sometimes these characteristics might be *traits*, sometimes *skills*, and sometimes simply *style* or a mixture of the preceding ideas.

## Trait and Skills-Based Theories

**Trait leadership**: Drawing upon the idea that leaders have certain characteristics that make them leaders, and that leadership is a personal quality, trait theory seeks to identify the kinds of "traits" that are found in leaders. From Alexander Hamilton, one would draw the trait of financial acumen, from Otto von Bismarck one would draw the trait of organizational design, and from Franklin Roosevelt one would draw the trait of creativity in the face of financial collapse and wartime attacks. The early efforts involving testing for organizational roles sought out a list of these traits inherent in the applicants, who could then be evaluated, and candidates for positions could then be ranked on which traits they possessed or did not possess. Clearly *traits* and *skills* are closely related.

**Skills leadership**: The idea of skills leadership is just a bit different. Here the idea is that there are certain skills that are essential for a leader to have. The clear difference from the Great People theory, or the trait theory, is that the characteristics are not necessarily something the leader is born with. Instead, with a set of skills *that can be learned*, it is possible for a person to become a leader. Those skills would be human, conceptual, and technical, as Katz has noted (Northouse 2013, p. 44). At the level of a supervisor, technical skills are essential, as are human skills, with conceptual skills being less important. At the middle level of an organization, technical, conceptual, and human skills are more important. At the highest level of an organization, human and conceptual skills are vital, while technical skills are less important.

## Behavioral Theories

**Behavioral leadership theory**: Instead of looking at traits or skills, one looks at the behavior of the leader. Rensis Likert looked at two types of leaders: the *job-centered leader* (who focused upon the tasks to be accomplished) and the *employee-centered leader* (who focused upon the employees, their needs, and how to accomplish a desirable work environment). Ohio State research focused upon *initiating structure* which involved defining organizational structure to accomplish the job and *consideration* which created understanding between the leader and the employees (Gibson et al. 2006). The concept of *consideration* was basically derived from the same approach as *employee-centered leadership*.
**Style leadership**: This approach suggests that there are certain characteristics of a leader that might be described as their "style" of leadership. Everyone who has worked for a supervisor recognizes that there is a "style" of managing which a supervisor embodies. Northouse suggests that one can compact style into two variables: *task behaviors* which involve the functions or tasks that need to be done and *relationship behaviors* which are the relationships that people have in their workplace (Northouse 2013, p. 75). Visualize a continuum with task on one side and relationship on the other side. One could see this approach reflected in Blake and Mouton's managerial grid, in University of Michigan Survey Research Center studies of how the behavior of the leader had an effect upon groups, and Ohio State studies about how people behaved when performing leadership functions (including *initiating structure* and *consideration*). Some supervisors are good at task management, while others are good at relationship

management. The ideal boss is able to handle both effectively (Norhouse, pp. 76–82).

**Integrated global leadership**: As we move from a cultural base for leadership based solely upon the values of one country, into a more globalized context, it is important that we determine the characteristics of leadership that will better respond to that milieu. Geert Hofstede completed a study of one company (IBM) with employees in 53 countries and found four characteristics in common: "power distance, individualism-collectivism, masculinity-femininity, and uncertainty avoidance." Project GLOBE then expanded upon these characteristics using dimensions ("power distance, uncertainty avoidance, institutional collectivism, in-group collectivism, gender egalitarianism, assertiveness, future orientation, performance orientation, humane orientation") and ranked countries as highest and lowest for each of these dimensions (Kinicki and Fugate 2012, pp. 66–68). In this way, it was possible to see how these country's cultures varied and what needed to be emphasized by managers as a way to be responsive to, and thrive in, these cultures. One might also look at the GLOBE (Global Leadership and Organizational Behavior Effectiveness) study, which looks at the ways in which the styles of leadership differ in each of the countries around the world (Robbins and Judge 2015, pp. 175–176).

**Multicultural diversity leadership theory**: Women as well as racial, ethnic, sexual orientation, and gender orientation/identity groups experience discrimination in the workplace (resulting in less than equal pay and unequal treatment). According to research by Bartunek, Walsh, and Lacey, women who are more directive are less effective than those who are less inclined in that direction, but Camilla Stivers and others suggest that the more nurturing styles of women may actually cover up the underlying hierarchical characteristics of systems (Denhardt and Catlaw 2015, p. 196). Subcultures in the society provide us with a number of challenging issues that need to be addressed – including the level of representation, what strategies can be used to include people from diverse cultures, and how to eliminate barriers to promotion and leadership. And increasingly the impact of the recognition of diversity of employees from a variety of world cultures has made dramatic changes in leadership theory.

## Relational-Based Leadership

**Relational-based leadership**: This theory emphasizes the capability of the leader to develop organizational relationships. The emphasis in this theory is not upon authority or hierarchy but instead upon interpersonal relationships (Drath 2001 cited in Uhl-Bien 2006, p. 672) and their capability to create new approaches and attitudes toward organizational issues (Uhl-Bien 2006, p. 654).

Deriving from the *relational-based leadership model* are **distributed approaches to leadership**: Emphasis upon the informal group came out of the human relations movement, which suggested that an organization was comprised of both the *formal* organization (as shown on an organization chart) as well as the *informal* organization which is comprised of the networks of relationships between employees. Increasingly today, emphasis is placed upon *informal leaders* who may help to move the organization in directions that management wants to achieve, as well as the role of *followers*. If top leaders in an organization work on transferring power to the followers as well as informal leaders, then these employees will develop an approach of thinking in ways that will accomplish the goals of the organization – without the leaders having to prescribe their goals and objectives (Van Wart 2012, pp. 93–103). The leaders and managers may also engage in **shared leadership**, which links together organizational units as opposed to the traditional hierarchical model (with silos of hierarchically distributed power that do not achieve organizational goals).

## Contingency and Situational Theory

**Contingency leadership**: In contingency theory, which may be viewed as one type of situational theory, the key issue is that what works in one context may not work in another. Writers such as

Fred Fiedler suggest that there must be linkage between the leader's style and how much they are able to control (or not control) the context in which they work (Robbins and Judge, p. 369). If they are not able to accomplish this match, they may need to move to a different role, where their capabilities are more effective in meeting organizational goals.

**Situational leadership**: This theory suggests that the leader needs to link their capabilities to the particular situation in which they find themselves. If there is not a linkage, there is not a good "fit." This theory indicates that the leader needs to select the correct leadership mode for the followers, which is in turn dependent upon the willingness of the followers to emulate the leader and perform the required task (Robbins and Judge 2015, p. 371). Another way of thinking about this is suggested by Kendra Cherry, who notes that in some circumstances, an authoritarian approach might be appropriate while in others a democratic model might be more useful (Cherry n.d.).

The **path-goal model** is based upon earlier work in expectancy theory which says that an employee will perform well if they see that a high level of effort will lead to a more positive outcome (Hodgetts 1979, p. 275). Victor Vroom originally developed a decision-making model based upon the use of decision trees. The path-goal model discusses four types of leadership (*directive leader*, *supportive leader*, *participative leader*, *achievement-oriented leader*) and discusses the ways in which one can determine the effectiveness of a leader in a variety of situations (Gibson et al. 2006, p. 326). By providing certain types of leadership and incentives, different goals can be achieved by the various types of leaders.

The **leadership participation model** proposed by Victor Vroom and Phillip Yetton developed a model, also based upon the use of decision trees, using a step-by-step process by which the leader could determine how much involvement by participants would be appropriate for a particular situation (Robbins and Judge 2015, p. 373).

One major form of relational-based theory (but also categorized as falling within contingency theory) is the **leader-member exchange** (LMX) theory which suggests that the leader must analyze each individual relationship and develop a unique working relationship dependent upon that situation (Northouse 2013, p. 161). The focus in previous leadership theories had been upon the leader and the characteristics of the person who functions in that role. In LMX theory, the key issue is in the "dyadic relationship" between the follower and the leader – with each such relationship being unique. Some types of dyadic relationships are more positive (the "in-group" works better with the leader) and other such relationships are more negative (the "out-group" that just comes to work and goes home). Later theory suggests that "leadership making" involves trying to develop effective dyads with all employees, rather than just those within the "in-group."

## Attribution Leadership

**Attribution leadership**: This is a reciprocal process. The employee looks at a leader to see what the leader's capabilities are, while the leader tries to interpret what the employee is doing (Wengrzyn n.d.). Van Wart and Suino note that in that way, expectations help to define both leadership as well as followership (Van Wart and Suino 2012, p. 134). This theory also suggests that people impute certain skills to leaders (Robbins and Judge 2015, pp. 388–389). For example, the belief that Barack Obama was going to bring "change" to Washington D.C. was later a source of great dissatisfaction among many people, because the meaning of "change" was different for each of the individual people who supported his efforts. **Substitutes**: If a leader is not able to create the needed level of support or structure, they may use their practical knowledge or learning to act as a substitute (Robbins and Judge 2015, p. 389). **Online leadership** is occasionally a difficult effort to accomplish because of the need to develop "identification-based trust" which is built upon a reciprocal interpersonal relationship between a supervisor and supervisee (Robbins and Judge 2015, p. 390).

**Psychodynamic leadership**: In its early stages, there were studies designed to look at the

psychological makeup of leaders, in order to determine how one might effectively understand the characteristics of a psychologically healthy (or unhealthy) leader; for example, one might look at Theodor Adorno's book on the *Authoritarian Personality*. More current thinking suggests that the personality is comprised of a variety of drives, feelings, and thought patterns. Amanda Taub's article "The Rise of American Authoritarianism" neatly summarizes the most recent work in this area (Taub 2016)

## Team and Participative Leadership Theories

**Team leadership**: Norhouse indicates that "team leadership" is one of the fastest-growing areas of leadership theory (Northouse 2013, p. 287). With the elimination of a large number of middle management positions, and the decision by top management to convene groups to solve ever-changing problems facing organizations, this is not surprising. The issue, however, is how to coordinate the activities of multiple teams and what type of leadership is most effective for this purpose. Stanley McChrystal, in his discussion of this subject, discusses three approaches that have been, or are being, used: (1) the hierarchical "command" model, where information flows up silos and back down again after being reviewed at the top level; (2) the "command of teams" where multiple teams are on a horizontal relationship, with one leader coordinating their activities; and (3) the "team of teams" model, where teams have a relationship among themselves that is like the person-to-person relationship within an individual team. In the latter approach, people on each team know members of the other teams so that the relationship between them is friendly and not competitive (McChrystal et al. 2015, pp. 128–129). This team of teams forms a network, in which the role of the leader is different. Rather than being a person who is tasked with knowing all of the answers, the leader of the network takes on the role of a "gardener" who is clearing out the weeds and underbrush (McChrystal et al. 2015, p. 226). In his particular example in Iraq, a daily operations and intelligence video teleconference was the mechanism by which this was accomplished. Patrick Lencioni suggests that there are "five dysfunctions" that must be addressed in teams: (1) absence of trust, (2) fear of conflict, (3) lack of commitment, (4) avoidance of accountability, and (5) inattention to results (Lencioni 2002). The use of an open and transparent videoconference is one means to eliminate these types of dysfunctions.

**Participative leadership**: Most of us are familiar with the kind of leadership that calls for a somewhat more democratic involvement of the people who are working in an organization. Instead of a top-down approach, wherein the leader sets out the goals, objective, and implementation strategies, the idea of participative leadership is that the leader builds in opportunities for employees to suggest directions for the organization as well as ways to accomplish the goals. The leader then provides a framework of overall direction as well as resources to accomplish the aims of the organization. This theory derives from the human relations theorists such as Elton Mayo and Mary Parker Follett, among others.

## Authentic Leadership

**Authentic leadership**: Robert Terry developed an "Authentic Action Leadership Wheel" that incorporated a variety of features leading to workplace fulfillment (Minard u.d.). The idea emerged more fully after the economic/social crises of the 1990s that a leader must be authentic in their relationships with co-workers and employees. The assumption is that this leader acts in a way which is honest and motivated by their own values, rather than by a desire for benefit to themselves (Minard u.d.). More recently, it has been suggested that authentic leaders know themselves, are transparent, and act upon what they believe (Robbins and Judge 2015, p. 381).

**Ethics-based leadership**: We have all seen the effects of a form of management that does not take into account any type of ethical standard. The British Petroleum (BP) incident in the Gulf of Mexico, the Enron experience with deceptive

accounting, as well as the Challenger explosion and the Hurricane Katrina experience all point to problems with lack of adherence to basic ethical constraints. Ethics-based management looks not only at the goals to be achieved by organizations but also the means by which they are to be accomplished. A variety of ethical models are proposed by Van Wart and Suino (2012, pp. 111–112). In their Model of Ethical and Exemplary Leadership, Van Wart and Suino define the characteristics of a "person of good character" and a "person of high character" (Van Wart and Suino 2012, pp. 125). One related approach of interest is that of M.E. Brown who attempts to relate charismatic and ethical leadership using **socialized charismatic leadership** which emphasizes a leader's relationship with others, as opposed to solely valuing themselves (Robbins and Judge, p. 383).

**Servant leadership**: The idea behind servant leadership is that the leader provides resources for, and is supportive of, the people that they manage. This is a radically different idea in that it does not presuppose that the leader supplies all of the energy and inspiration for the organization. Instead the group supplies many of the ideas, and the leader helps to enable the group to accomplish its goals. This approach assumes a level of humility on the part of the leader that is unusual in most organizations. Servant leaders listen to their followers and make sure that they develop the capabilities of their employees (Northouse 2013, p. 219).

**Trustworthy leadership**: This type of leader is compassionate and capable, ensures clarity of structure, and during a crisis situation does not hide the realities (Kramer 2014, p. 1). The *trustworthy leader* has the characteristics of integrity, benevolence, and ability (Robbins and Judge 2015, p. 385).

## Performance-Based Leadership

**Level 5 leadership**: Jim Collins (who created the concept of a "high-performance organization") is the developer of the Level 5 leadership theory which suggests the way that a company achieves greatness is by having a leader who exudes humility but who also has strong willpower (Collins 2005). The levels which lead up to Level 5 are as follows: "Level 1 Highly Capable Individual. . .Level 2 Contributing Team Member. . .Level 3 Competent Manager. . .Level 4 – Effective Leader. . ." (Level 5 Leadership Project Accelerator News, www.projectaccelerator.co.uk).

## Complexity and Integrative Leadership

**Complexity leadership theory**: As noted by Van Wart and Suino, this theory is premised upon the existence of chaos theory which recognizes the need for adaptation to change as well as awareness that even the smallest change may lead to the need for major organizational adjustment (Van Wart and Suino 2012, p. 145). In the complexity leadership model, there is considerable similarity to relationship theory since it suggests that including people from diverse backgrounds may allow for improved adaptation (Crowell 2011, pp. 3–4).

**Integrative leadership**: Most recently, the emphasis in public administration has been upon networks and collaboration. Networks are the web of connections between organizations, and collaboration is the process of working together on administrative problems that often cannot be dealt with by a single agency, especially in times when there are limited resources. Hence the idea of integrative leadership is to have different organizations and groups work together on an as-needed basis across traditional organizational lines (Crosby and Bryson 2010, p. 1).

## Conclusion

We have seen a wide variety of organizational theories in this chapter. Their value is to allow leaders (and potential leaders) a variety of frameworks to use when one is managing a small group, a division, a department, or a very large organization. The more recent models, especially integrative leadership, emphasize not only management of a single organizational unit but also efforts to

take advantage of the possibilities inherent in multiple organizations working together for the common good.

# Theories of Revolution

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

## Synonyms

Coup d'état; Insurrection; Internal war; Political change; Rebellion; Social change; Structural change

## Definition

*Revolution* (originates from Latin *revolutiononis* = upheaval), in political science, is a phase of the historical evolution of nations that generates a rapid and radical (social, economic, and political) change in society.

## Introduction

Revolution is one of the most important phases of the historical evolution of nations, occurring in the

presence of socioeconomic and political issues. Revolution is: "change, effected by the use of violence, in government, and/or regime, and/or society. By *society* is meant the consciousness and the mechanics of communal solidarity, which may be tribal, peasant, kinship, national, and so on; by *regime* is meant the constitutional structure-democracy, oligarchy, monarchy; and by *government* is meant specific political and administrative institutions" (Stone, 1966, p. 159, original Italics). This definition allows to distinguish between the seizure of power that leads to a major restructuring of government or society with the replacement of the former elite by a new one, and the coup d'état involving no more than a change of ruling personnel by violence or threat of violence. In the 1960s, social scientists at Princeton University have changed the word "revolution" with the concept of "internal war" that is defined as any attempt to alter state policy, rulers, and/or institutions by the use of violence in society, where violent competition is not the norm and where well-defined institutional patterns exist (Rosenau 1964).

## Theories, Characteristics, and Causes of Revolution

Philosophy, history, and other social sciences have different approaches to explain revolution (see Fig. 1). In philosophy, Georg Wilhelm Friedrich Hegel suggests that revolution is equated with irresistible change represented by a manifestation of the world spirit in an unceasing quest for its own fulfillment. In this context, Karl Marx argues that revolution is a product of irresistible historical forces, which culminate in a struggle between bourgeoisie and proletariat. Arendt (1963) interprets the revolutionary experience as a restoration, whereby insurgents attempt to restore liberties and privileges, which

**Theories of Revolution, Fig. 1** Different approaches for explaining revolution in society

T

| | | Temporal duration | | | |
|---|---|---|---|---|---|
| | | *Long* | *Moderate* | *Short* | *Very Short* |
| **Mass participation / Domestic violence** | *High* | Mass Revolution e.g., France 1789 | | | |
| | *Moderate* | | Revolutionary coup e.g., 2017 Zimbabwean coup d'état | | |
| | *Low* | | | Reform coup e.g., 1955 in Argentina | |
| | *None* | | | | Palace revolution e.g., Venezuela 1948 |

**Theories of Revolution, Fig. 2** Types of revolution and some examples categorized with the level of participation of people, of violence and of temporal duration. Adapted from Tanter and Midlarsky (1967)

were lost because of government's temporary lapse into despotism. Instead, de Tocqueville (1955, p. 8) has defined revolution as an overthrow of the legally constituted elite, which initiated a period of intense social, political, and economic change.

Deutsch (1964, pp. 102–104) proposes four characteristics to differentiate the types of revolution (cf., Fig. 2):

(a) Degree of mass participation
(b) Duration
(c) Number of persons killed both during and after revolution (a measure of intensity)
(d) Intentions of insurgents and their eventual outcome

In this theoretical framework, a revolution may be due to a group of insurgents that illegally and/or forcefully challenges the governmental elite for the occupancy of roles in the structure of political authority. A successful revolution occurs when insurgents are able to occupy principal roles within the structure of political authority. Moreover, if successful insurgents are ideologically committed to certain goals, then they may initiate changes in societal structure to effect the realization of these goals. In general, the changes in the personnel of governmental elite are often the precondition for meaningful changes in the political and social structure of nations.

Determinants of revolution can be:

- Preconditions (long-run causes), which create a potentially explosive situation
- Precipitants (immediate, incidental factors), which trigger the outbreak and may be nonrecurrent, personal, and/or accidental

Brinton (1938) proposes a series of *universals* to explain the great Western revolutions (English, French, American, and Russian), such as economically advancing society, growing classes and status antagonisms, psychologically insecure and politically inept ruling class, and governmental financial crisis (cf., Gottschalk 1944).

Eckstein (1964) analyzes some conditions of revolution, moving from intellectual to economic (increasing poverty, rapid growth, income inequality, etc.), to social (resentment, conflicts due to the rise of new social classes, etc.), and to political factors (bad government, oppressive government, etc.). Moreover, other situational factors can affect the sources of revolution, such as a lack of harmony between state structure and society. Chalmers (1964) defines this situation *dysfunction*. In particular, if the process of change is slow and moderate, the dysfunction may not rise to dangerous levels. However, if the change is both rapid and profound, it may cause deprivation, alienation, and anomie in society, causing what Chalmers (1964) calls *multiple dysfunctions*. Hence, revolutions are due to a condition of multiple dysfunctions associated with intransigent elite.

Eckstein (1964) also suggests that each type of internal war and each step of each type can be explained with eight variables: four *positive* variables (elite inefficiency, disorienting social process, subversion, and available rebel facilities)

and four *negative* variables (diversionary mechanisms, available incumbent facilities, adjusted mechanisms, and effective repression).

According to behaviorist approach, a prime factor of revolution is the emergence of an obsessive revolutionary mentality. Talcott Parsons treats disaffection or "alienation" as a generalized phenomenon that may manifest itself in crime, alcoholism, drug addiction, religious enthusiasm, or serious political agitation. In general, causes of the alienation of revolutionaries and of the weakness of incumbent elite can be economic factors. In this context, Karl Marx states that popular revolution is due to increasing misery, whereas de Tocqueville (1955) claims that revolution is due to increasing prosperity. Olson (1963) argues that revolutions are the product of rapid economic growth, which creates both *nouveaux riches* and *nouveaux pauvres.* Davies (1962) argues that the fundamental impetus toward a revolutionary situation is generated by a rapid and long-run economic growth associated with a rising of the standard of living, followed by a short-term phase of economic stagnation (cf., Coccia 2010a, 2018a). In short, revolution creates new expectations by economic improvement, social and political reforms, and new patterns of technological innovation (Coccia 2010b, 2014, 2014a, 2015, 2015a, 2016a, b, 2017a, 2019), but subsequent economic recessions can increase the gap between expectations and real condition of population.

The reference group theory by Merton (1957) suggests that human satisfaction is related to the condition of a social group of reference against which the individual measures his current situation. Mass diffusion of information and communication technologies even among poor people of the world and the knowledge of high consumption standards elsewhere can induce alienation, distress, and psychopathology in poor society, generating instability and social issues; in fact, the reference group of nations may be other near countries, such as poor countries of North Africa versus rich European ones.

In general, Hopper (1950, pp. 270–279) explains revolution with four social stages:

1. The first is characterized by indiscriminate, uncoordinated mass unrest and dissatisfaction.
2. The next stage sees this unease beginning to coalesce into organized opposition with defined goals; an important characteristic is a shift of allegiance by intellectuals from incumbents to dissidents. Two types of leaders emerge in this stage: a) the prophet sketches the shape of new utopia upon which men's hopes can focus, and b) the reformer works methodically toward specific goals.
3. The third stage is the beginning of the revolution proper. Motives and objectives are clarified, organization is built up, and a statesman leader emerges. Subsequently, conflicts between the left and the right of revolutionary movement become acute, and the radicals take over from moderates.
4. The fourth and last stage is the legalization of revolution. The administrators take over, strong central government is established, and society is reconstructed on a structure that embodies elements of the old system.

## Classification of Different Typologies of Revolution

Brinton (1938, pp. 3–4) suggests a differentiation of revolution in which *a*) coup d'état generates the replacement of one elite by another one, whereas *b*) major revolution generates social, political, and economic change (cf., Fig. 2). Blanksten (1962, p. 72) also distinguishes between coup d'état and revolution, which both have profound consequences for the social structure of nations. Lasswell and Kaplan (1950, p. 252) present a further refinement in the classification of revolution using three categories: palace revolutions, political revolutions, and social revolutions. In this context, a type of revolution similar to palace revolution is the *caudillismo* (a common form of coup d'état in Latin America). These forms of revolution appear to generate an increasing degree of change initiated by successful insurgents and followed by increasing political and social change.

Instead, Rosenau (1964, pp. 63–64) suggests three categories of internal wars:

- Personnel wars: goal is the occupancy of existing roles in the structure of political authority. This concept is similar to palace revolution.
- Authority wars: insurgents compete for the occupancy of roles in the political structure and for their arrangement. Authority wars are struggles to replace dictatorships with democracies.
- Structural wars: goal of insurgents is the introduction of social and economic changes in society (structural wars contain elements of both personnel and authority wars).

In Rosenau's ranking, personnel wars are at the lowest rank position with regard to the degree of social change; instead, authority wars are at an intermediate rank, and finally structural wars are at the highest rank in the scale of social change.

Huntington (1962, pp. 23–24) has suggested a classification of revolution in four categories (cf., Fig. 2): mass revolution, revolutionary coup, reform coup, and palace revolution. The concepts of mass revolution and palace revolution are similar to Rosenau's structural and personnel wars, while revolutionary and reform coups can be included under the category of authority wars.

Finally, Chalmers (1964) categorizes revolution in six typologies:

1. The jacquerie is a spontaneous mass peasant rising, usually carried out in the name of traditional authorities (church and king) and with the limited aims of purging the local or national elites.
2. The millenarian rebellion is similar to the first type but with the added feature of a utopian dream, inspired by a living messiah, such as the revolution of Florence in Italy led by Savonarola, a religious and political reformer, in 1494.
3. The anarchistic rebellion is the nostalgic reaction to progressive change, involving an idealization of the old order, such as the Vendée Rebellion (1793–1796), counterrevolutionary insurrections in the west of France during the French Revolution.
4. The Jacobin communist revolution is: "a sweeping fundamental change in political organization, social structure, economic property control and the predominant myth of a social order, thus indicating a major break in the continuity of development" (Sigmund Neumann as quoted in Chalmers 1964). The goal here is the creation of a more efficient order on the ruins of the old structure of privilege, nepotism, and corruption.
5. The conspiratorial coup d'état is the planned work of a tiny elite fired by an oligarchic ideology. This is a revolutionary type only if it anticipates mass movement and generates social change, such as the Castro revolution in Cuba from 1953 to 1959; it is distinguished from palace revolt, assassination, dynastic succession-conflict, and other forms of political violence, which are all under the category of "internal war (cf., Coccia 2017)."
6. The militarized mass insurrection is a planned mass revolutionary war guided by dedicated elite. This guerrilla warfare is determined by political attitudes and rebels are dependent on popular support. This type of struggle is the insurrection in Vietnam, 1965–1973; Algerian War, 1954–1962; Afghan resistance, 1979–1989; etc.

A classification of manifold types of revolution is in Fig. 3.

## Conclusion

Revolution is a phase in the historical evolution of some nations that can generate a structural change in society. A distinct form of revolution, not included in previous studies, can be *terrorism* that has similar characteristics to revolution, such as violence, a desire for power, and the need to attract attention and send a message (Fig. 3). Terrorism, like revolution, emerges in the presence of social and political issues and of a group organized of people having a purpose related to these issues. Coccia (2018) argues that

- Coup d'état, Caudillismo in Latin America: replacement of one elite by another one
- Major or Mass Revolution: it generates social, political and economic change

- Palace Revolution
- Political Revolution (increasing degree of change)
- Social Revolution

- Personnel War: the occupancy of existing roles in the structure of political authority
- Authority War: the struggle to replace dictatorships with democracies
- Structural War: it contains elements of both personnel and authority wars

- Jacquerie: it is a spontaneous mass peasant rising
- Millenarian Rebellion: it is guided by a utopian dream, inspired by a living messiah
- Anarchistic Rebellion: it is a reaction to progressive change, involving an idealization of the old order
- Jacobin Communist Revolution: the creation of a more efficient order without nepotism and corruption
- Conspiratorial Coup d'état: it is the planned work of a tiny elite fired by an oligarchic ideology
- Militarized Mass Insurrection: it is planned mass revolutionary war guided by dedicated elite

- Terrorism: it has similar characteristics to revolution, such as violence, a desire for power, the need to attract attention and send a message.

**Theories of Revolution, Fig. 3** Different types of revolution in social and political sciences

terrorism (i.e., a distinct form of political violence with some characteristics similar to revolution) thrives in specific regions with high growth rates of population that generate income inequality and relative deprivation of people. In short, terrorism has many analogies with revolution (e.g., economic, social, political, and demographic determinants), and it can generate structural change in problematic societies, such that terrorism might be considered an additional and specific form of revolution (cf., Coccia 2018).

Overall, then, revolutions are due to instability of manifold economic, social, demographic, ethnic, anthropological, and perhaps religious factors in society. To conclude, revolutions are mainly linked to the question of what human beings truly need and how they seek to satisfy needs, solve social issues, and adapt to changing contexts and environmental threats in society.

# Theories of Self-Determination

Coccia Mario
CNR – National Research Council of Italy, Torino, Italy
Yale School of Medicine & Yale New Haven Hospital, New Haven, CT, USA

## Synonyms

Autonomy; Behavioral Self-regulation; Competence; Intrinsic Motivation; Relatedness

## Definition

Self-determination Theory explains the factors of intrinsic motivation (autonomy, competence, and relatedness) and of extrinsic motivation (internalization and integration) that support personality development and behavioral self-regulation to improve personal wellbeing and performance of people in organizations and society.

## Introduction

In order to explain self-determination theory, it is important to clarify the concept of motivation that originates from Latin word *movere* = "to move."

The study of motivation focuses on factors that incite resources of a person to achieve goals and support rational choices in organizations and society. Scholars have developed different approaches to analyze and foster motivation in organizations (Mullins 1999). The early theories of motivation are based on hedonism by Locke, Bentham, etc.: individuals behave in a manner to maximize pleasure and minimize displeasure. The theories of motivation in management from 1910s to 1960s are affected by Frederick Taylor with the approach of *scientific management* and by Douglas McGregor with the *human relations movement*. Taylor's approach is directed to maximize labor efficiency of employees, which are motivated by more than money. Recent studies suggest that employees have a variety of needs, such as security, social fulfillment, and challenging job. In this research field, Douglas McGregor advanced two beliefs about human behavior: Theory X and Theory Y. *Theory X* has the following assumptions: (1) average human being has dislike of work; (2) people have to be coerced, controlled, and threatened with punishment to achieve goals; (3) average human being has little ambition. Theory X was a widely accepted managerial approach prior to the human relations movement (Ivancevich et al. 1977). *Theory Y*, by contrast, considers: (1) commitment to objectives is a function of rewards associated with their achievement; (2) average human being learns; (3) people can exercise self-direction and self-control to achieve goals; finally, (4) intellectual potential of the average human being is only partially utilized (cf., Ivancevich et al. 1977).

Contemporary theories of motivation have two directions: content and process theories.

*Content theories* of individual motivation identify people's needs, their relative strengths, the goals they pursue to satisfy these needs, etc. Main content theories are: Maslow's hierarchy of needs model; Alderfer's modified need hierarchy model; Herzbers's two-factor theory; and McClelland's achievement motivation theory (Mullins 1999).

*Process theories* of motivation focus on work-related factors that arouse employees to motivated behavior. Main process theories are: expectancy-based models by Vroom, Porter and Lawler; equity theory by Adams; goal theory by Locke and also the attribution theory by Heidler and Kelley (Mullins 1999).

Managers can apply these different theories to support specific situations and/or organizations. In this context, *Self-Determination Theory* (SDT) is a broad theoretical framework for the study of human motivation and personality in organizations and society (Deci and Ryan 2004; Ryan and Deci 2000). In fact, humanity has curious, vital, and self-motivated people that are inspired, striving to learn, wish to extend themselves, master new skill, and apply their talents responsibly (Ryan and Deci 2000; Deci and Ryan 2004). Next sections explain the characteristics of this general theoretical framework of SDT.

## Self-determination Theory (SDT)

SDT analyzes the factors of human motivation and personality with a metatheory that highlights the importance of humans' evolved inner resources for personality development and behavioral self-regulation of people in organizations (Deci 1980; Deci and Ryan 2004; Ryan et al. 1997). In general, human nature has the natural tendency to seek out novelty and challenges, to extend and exercise one's capacities, to explore, and to learn. In this context, the domain of SDT is the investigation of people's inherent growth tendencies and innate psychological needs that are the basis for self-motivation and personality integration. In particular, SDT focuses on positive developmental tendencies, and social environments that are antagonistic towards these tendencies, to explain factors that support or undermine self-motivation, social functioning, and personal well-being. SDT begins with an analysis of the determinants of intrinsic motivation and human tendency towards learning and creativity that support motivation, performance, and well-being of people in organizations, competition and society (Baard et al. 2004; Coccia 2014; Coccia and Cadario 2014; Coccia and Rolfo 2013). As a matter of fact, *intrinsic motivation* exists in the job itself and gives personal satisfaction to individuals, such as autonomy, recognition, expense preference (e.g., leeway to invest monetary resources), trust, and empowerment

(Benati and Coccia 2018; Coccia 2019, 2001). Especially, intrinsic motivation describes the natural inclination towards assimilation, mastery, spontaneous interest, and exploration that are essential factors to cognitive and social development for enjoyment and vitality throughout life of people (Ryan et al. 1997; Coccia 2019). O'Reilly et al. (1991) have suggested that intrinsic motivation may be more important for affective commitment and job involvement within organizations.

SDT is based on a subtheory called by Deci and Ryan (1985) *cognitive evaluation theory* (CET) that has the aim of specifying factors that explain intrinsic motivation. In particular, CET is framed in terms of social and environmental factors that facilitate intrinsic motivation *versus* factors that undermine it. CET also specifies that feelings of *competence* will not enhance intrinsic motivation unless accompanied by a sense of *autonomy*. Within SDT, autonomy is not to being independent, detached, or selfish but rather it is associated with the feeling of volition that can accompany any act, whether dependent or independent, collectivist or individualist. Studies show that autonomy supportive parents, rather than controlling parents, have children who are more intrinsically motivated (Grolnick et al. 1997). Autonomy and competence support intrinsic motivation in association with a third vital factor that is *relatedness*. According to CET, social environment can facilitate intrinsic motivation and people will be intrinsically motivated only for activities that hold intrinsic interest for them and that have the appeal of novelty and challenge. SDT also suggests that the basic needs for competence, autonomy, and relatedness must be satisfied across the life span for an individual to experience an ongoing sense of integrity and well-being (Ryan and Frederick 1997). Moreover, SDT suggests that the failure of supporting competence, autonomy, relatedness (not only of children but also of students, employees, patients, athletes, socializing agents, etc.), it can generate the possible effect of alienation and ill-being of individuals in society.

Within SDT, Deci and Ryan (1985) introduced a second subtheory, called *organismic integration theory* (OIT), to detail the different forms of extrinsic motivation and contextual factors that either promote or hinder internalization and integration of the regulation of behaviors. Fig. 1 illustrates the OIT taxonomy of motivational types, arranged from left to right in terms of the degree to which the motivations emanate from the self (i.e., they are self-determined). Internalization refers to people's *taking in* a value or regulation, whereas integration refers to the transformation of regulation into their own that, as a consequence, it will emanate from their *sense of self*.

SDT recognizes that extrinsically motivated actions can also become self-determined. In fact, individuals, with internalization and integration, can be extrinsically motivated and committed. These types of motivation are: external motivation triggered by outside rewards and punishments; introjected motivation based on internal rewards and punishments, such as guilt and self-esteem; identified motivation based on consistency with one's system of values; and integrated motivation based on assimilation into one's system of values (Ryan and Deci 2000).

## Public Management Implications of the Self-Determination Theory

SDT claims that conditions supportive of autonomy and competence can facilitate human growth tendency, whereas conditions of controlled behavior can undermine its expression. Baard et al. (2004) show that on the one hand, employees' experiences of the satisfaction of needs for autonomy, competence, and relatedness in the workplace support performance and well-being at work; on the other hand, excessive control and lack of connectedness can disrupt organizational learning, reducing initiative and responsibility, and also generating distress and psychopathology of individuals (cf., Coccia 2001; Coccia and Cadario 2014; see Fig. 2).

Experimental research inspired by self-determination theory suggests that monetary incentives generate two opposite effects: (a) they enhance extrinsic motivation (the *price effect*); (b) they threaten the need for autonomy,

**Theories of Self-Determination, Fig. 1** Self-determination Theory. (Adapted from Ryan and Deci 2000)

competence, and relatedness, lowering intrinsic motivation – the *crowding-out effect*. Self-determination theory suggests that extrinsic rewards can be demotivating and dissatisfying to individuals (Deci and Ryan 1985). In particular, extrinsic rewards and motivations can undermine perceived autonomy because they have a negative effect on intrinsic interest in a task or job (Deci 1975). Moreover, goals for financial success can undermine well-being, because these goals represent a controlled orientation that interferes with the fulfillment of more enduring needs, such as self-acceptance or affiliation.

Self-determination theory also suggests that performing a task in anticipation of a reward, under surveillance, or within a time limit, it can decrease intrinsic motivation (Deci et al. 1999). In addition, self-determination theory argues that positive feedback, salary, unexpected bonus, competence, and personal growth do not undermine intrinsic motivation, but performance contingent rewards do (Deci et al. 1999). In fact, intrinsic motivation, under certain conditions, can be undermined by pay for performance: giving someone a performance-contingent monetary incentive to do something they already enjoy, it can decrease motivation to do it because the person can view its action as externally driven rather than as internally appealing. In short, extrinsic motivation satisfies personal needs indirectly, because it leads to separable outcomes, such as monetary compensation (Ryan and Deci 2000). In particular, money cannot produce direct utility, but it enables an individual to acquire desired products. Intrinsic motivation, by contrast, satisfies personal needs directly by creating an intrinsic reward for those who perform tasks. Hence, pay for performance can lead, under certain conditions, to a crowding-out effect on intrinsic motivation. For this reason, the performance of interesting tasks is likely to suffer in the presence of performance-related pay (Ryan and Deci 2000).

**Theories of Self-Determination, Fig. 2** Management implications of Self-Determination Theory. Note: + (plus) indicates *positive* effects; – (minus) indicates *negative* effects

## Conclusion

The self-determination theory (SDT) assumes that individuals may derive utility from the activity itself (Deci 1975). SDT suggests that employees are intrinsically motivated if they perform tasks based on loyalty, an internalized sense of duty, and/or enjoyment. Autonomy and competence support intrinsic motivation in association with a third vital factor that is *relatedness*.

These three elements support personality development and behavioral self-regulation, improving personal wellbeing and performance of people in organizations and society.

These predictions of SDT are supported by numerous experiments and field studies in management and psychological economics. Overall, then, STD seems to be an appropriate theoretical framework for explaining and supporting motivation and satisfaction of people and for designing best practices directed to improve their behavior and performance in organizations and society.

## Synonyms

Household; Local communities; Self-development; Social good; Welfare

## Definitions

**A theory** is a detail of reality presented through description and explanation of the complexity and dynamics of a phenomenon across contexts and over time.

**A household** is a group of persons who normally live and eat together.

**Wellbeing** is synonymous with good quality of life. It includes such dimensions as material wellbeing, often expressed as having enough bodily wellbeing which includes being strong, being in the right frame of mind, and looking good; social wellbeing which includes caring for and settling children, having self-respect, peace and good relations in family and community; having security, which includes civil peace, safe and

T

secure environment, personal and physical security and confidence in the future; having freedom of choice and action which includes being able to help others in the community.

## Introduction

Traditionally wellbeing has been linked to a single dimension; income. This approach enjoys the advantage of simplicity under the assumption that money is a "universally convertible asset that can be translated into satisfying all other needs." However, wellbeing goes beyond monetary indicators to include nonmonetary essentials. It is more than health, wealth, and happiness, and more than the absence of poverty measured as an individual's consumption capacity in dollars per day. Wellbeing is a holistic multidimensional condition encompassing personal, environmental, social, and economic features that are the foundation for an individual to live a dignified, meaningful, and satisfactory life. Many elements contribute to wellbeing including material living standards, employment and personal accomplishments, a sense of security and freedom, social relationships and opportunities to engage with others, heritage and culture, social welfare, and having a political voice (Douglas et al. 2018). The multidimensional nature of wellbeing has been found more relevant than the unidimensional methods that characterize traditional welfare economics. The plurality of human life advocates that wellbeing is addressed as much as possible in its multidimensional form in order to develop sustainable policy issues. There is thus a need to move from mainly income approach to the analysis of wellbeing to other dimensions of health, education, security, nutrition, and other quality of life dimensions.

Wellbeing remains one of the main goals of development efforts as evidenced by the adoption of the Millennium Development Goals by most developing countries and international agencies. Thus, there has been an ongoing debate about the elements that should be at the center of any wellness-enhancing strategy as no consensus is arrived at yet on the policy contents of such strategy. Experience of countries which succeeded in promoting wellbeing significantly, however, indicates the importance of sustained high growth in achieving wellness. Despondently, studies on wellness are replete with an equally important finding that high growth alone is not adequate. Beyond growth, the pattern and sources of growth as well as the manner in which its benefits are distributed are extremely important if growth is to mitigate lacking wellbeing. In this wise, many global initiatives have been implemented to advance wellbeing in a sustainable way by addressing persistent social, economic, and environmental challenges. Blundell and Preston (1998) argue that the use of current income in studies of inequality is problematic since income may not reflect the longer run level of resources available to a household or an individual. The study further notes that transitory high or low incomes – a situation all too common among families – may falsely characterize the true economic position of the household when borrowing or saving is allowed to smooth the stream of consumption across time.

A more reliable and a much-preferred indicator of economic welfare based on theoretical grounds, one which proxies for a household's unobserved permanent income level, is total household expenditures (El-Osta 2010). Consistent with this theoretical viewpoint, approximately 734 million people live on less than $2.50 a day worldwide meaning that over three billion people are deprived of basics. This is dominant particularly in the developing societies as compared to the developed world. For example, Africa has more than 800 million people living in 54 different countries and is by far the world's poorest inhabited continent. Around 27–28% of all children in developing countries are estimated to be underweight or stunted due to insufficient wellbeing in Sub Saharan Africa. About 72 million children of primary school age in developing countries were not in school in 2005 due to lacking funds particularly school fees and scholastic materials.

Socially, the better off household is respected and heard; whereas the poor is marginalized and considered as disabled, although communities

have ways of sharing wealth with the poor. The gap between the rich and the poor is at its highest level in decades. Most of the developing countries as well as development organizations have devoted much of their attention and budgets towards improving household wellbeing but to no avail. Again, despite the existence of Poverty Reduction Strategy Papers (PRSPs), Millennium Development Goals and the Sustainable Development Goals that succeeded the MDGs in 2015 and the New Partnership for Africa's Development, about 316 million in Africa still live below the US $1 dollar a day poverty line as do 1.2 billion people worldwide. The international poverty line has just been raised to US $ 1.90 a day but global poverty is unchanged. It is very difficult to point to a single group of African economies that have experienced wellbeing at household level. For instance, in South Sudan, 80% of the population is in extreme poverty, In Central Africa Republic, poverty remains pervasive and about 75% of the population live below the poverty line. This is similar to other countries like Burundi, Malawi, Niger, and a number of countries in sub-Saharan Africa. Most third world countries have increased income inequality by channeling development opportunities to the already privileged thereby marginalizing the underprivileged and eliciting feelings of relative poverty (Munene et al. 2011). The poor are illiterate, unemployed or unemployable, have a high fertility rate, and are ignorant of modern contraceptive methods. Other characteristics of the poor include; polygamy, geographical and social isolation and large number of orphans. In addition, these individuals are unable to voluntarily or involuntarily access formal financial services so as to attain economic development. Nevertheless, depending on the triggering factors, rural people are working harder to attain wellbeing as seen in the case of Mr. R.

The case of Mr. R. can be used to appreciate the construct of wellbeing or redefine it. The single case study is an opportunity to learn about the phenomenon and to reach theoretical generalization. Single case studies can help change our views about occurrence and tell good stories that have a theoretical sense. Additionally, case-based research can also help sharpen existing theory by pointing out gaps and beginning to fill them. This study searched for peculiar aspects of Mr. R. that needed to generate comprehensive theory (Stake 1998).

## The Case of Mr. R

Mr. R dropped out of UPE School in Primary four in 2008 as his humble parents could not afford his uniform, school lunch, the two brooms needed at the beginning of each term, and other scholastic materials. Back at home the parents could not afford the two meals taken a day. They had one meal in the evening and could sleep around 7 pm because of not having paraffin to use in the night. When he dropped out of school, he took the initiative of working in people's plantations on a daily basis at 1500 shilling per day. He did this for close to 2 years as he developed links with different people in his local community. Through these interpersonal networks created, he engaged with one Hakim who introduced him to selling yellow bananas to Muntuyera High School at break time. He later started employing himself by selling 3–5 bunches of bananas daily that he was buying from the local communities. He bought bunches of yellow bananas at around 500 shillings and sold them around 2000 shillings each making a profit of around 1500 shillings per bunch. The students and teachers of Muntuyera High School were his customers. He employed himself until 2013 when started selling pan cakes that fetched him profits and in 2014 he bought 4 pigs from his savings which he fed easily from Muntuyera school's kitchen. In December 2016, he had 21 pigs that he sold 16 of them and bought 4 calves (He sold each pig at 200,000 shillings and bought each calf at 600,000 shillings). He used part of the money from selling pigs to join a Savings Scheme where he paid membership, bought shares totaling to two hundred and sixty thousand shillings and was sensitized on how to save, acquire, and use a loan. After 1 month, he got a business loan and started a retail shop which also greatly changed and improved his livelihood. To date, his shop has grown and is the biggest shop in Rwashamaire town council. After 1 year,

he got an agricultural loan and went into crop farming by growing beans and millet on a large scale on a rented land. He persisted, paid, and completed the loan. He later acquired another boda boda in form of a loan which contributes a lot to paying school fees and increasing household incomes. He changed the livelihood of his parents by building them a simple house and improving their health, nutrition, and increasing their agricultural output as he employed two boys to cultivate for them regularly. Today, he is always networking and identifying opportunities to venture into so as to enhance his household welfare. Mr. R. is always mobilizing his village mates to employ themselves so as to move out of poverty. He continues to say that the network he made with Hakim & Muntuyera staff has propelled him and his family out of poverty (Personal communication with Mr. R, August 20, 2018).

## Theoretical Underpinning

The lessons derived from the action of Mr. R. in the context of public administration calls for theoretical review. According to Reay and Whetten (2011), a good theory is one that explains practice or behaviors. There are a number of theories that could explain this action of attaining wellbeing which include personal initiative, social capital theory, and the theory of minority. A multi theoretical approach is adopted to explain public interest in Uganda due to the inherent limitations in each theory.

The theory of personal initiative assumes that people engage in self-starting and proactive behaviors that overcome barriers on the way towards a goal (Frese et al. 1996). Relatedly, Mr. R. started selling yellow bananas and grew millet plus beans that fetched him profits after some time. He was also proactive by getting a loan from Muntuyera Scheme which he used to increase his agricultural output and also paid tuition for his children at the university. In line with Mr. R., the theory does not show how all the members of his household invested and profited from the money borrowed from Muntuyera Saving Scheme. The social capital theory comes in to address the short falls in the personal initiative.

Social capital theory (Putnam 1993) describes successful individuals as networking and trusting individuals who volunteer to help their neighbors and community with the expectation of long-term reciprocal benefit. This theory facilitates networking that is seen by Mr. R. connecting with Mr. Hakim and the teachers of Muntuyera High School thus benefiting from these networks. Mr. Hakim introduced him to selling yellow bananas as he sold them to teachers of Muntuyera School which made him enhance his household wellbeing. This theory attempts to alleviate or solve societal problems especially lacking household wellbeing that is not addressed in the personal initiative theory. Mr. R. networked with the teachers of Muntuyera, got a loan, and started saving with Muntuyera Saving Scheme. The pursuit of society's welfare often leads to reduction in resources. The access to extra resources possessed by other people is reduced and this theory is silent on the negative consequences of social networks.

The theory of minority influence argues that social change takes place when a member of a minority group influences the majority to accept the minority's beliefs or behavior (Moscovici and Personnaz 1980; Nemeth 1986). It is founded on the notion that a small group or an individual acts as an agent of social change by questioning established societal perceptions and proposing alternative, original ideas which oppose the existing social norms. Related to the case of Mr. R., as a poor person, he influenced social change with his innovative and proactiveness actions. Minorities propose new and original ideas that bring in innovation that creates household wellbeing. However, poor people are marginalized and the levels of minority differ from society to society which this theory is silent about.

## Conclusion

A number of people from poor backgrounds have struggled to create household wellbeing with not

so much success; however, Mr. R provides us with the opportunity of how he moved out of poverty. He came from a humble back ground, took the initiative of starting his small business and networked; he was able to persistently work harder then got into wellness. Three theories can explain Mr. R's act of moving into household wellbeing: personal initiative theory, social capital theory, and Minority influence theory. This is because no single theory can be independently used to explain Mr. R's act of moving into household wellbeing. Therefore, a multi theoretical approach is adopted to explain household wellbeing in Uganda.

## Synonyms

Commons; Local collective goods; Multi-stakeholder governance; Polycentricity; Public goods; Self-organized collective action; Shared management; Strategic public management

## Definition

Cooperation and networking between public and private socioeconomic actors has gained increasing importance. Collective action and cooperative governance take the new public management paradigm of governance into account. In a context of crisis and lack of resources for the public sector, proactive strategies, robust alliances among public and governmental institutions, local communities, associations, and firms (as autonomous "rational resource users" with fixed identities and a common purpose) are moving away from the classical public-private, partnership model. Cooperation and networking improve public services access, provision, and efficiency and give direction on how to create value and economic potential for the local communities, particularly for those with a high degree of social cohesion.

## Introduction

Commons refer to shared natural or artificial resources, to physical infrastructures, immaterial resources (like public knowledge, public domain,

open science) or territories which are generally managed according to the "open access", and to the nonexcludability principles of any potential user. It is impossible to prevent consumers who have not paid for them from having access to them; this is hard yet not impossible (Ostrom 1990, p. 30).

According to Nobel prize winner Elinor Ostrom, neither the state nor the market are able to sustain long-term productive use of resources systems and to solve commons' problems (i.e., free-riding and commitment problems, mutual monitoring, supply, congestion, overuse, and potential destruction of the resources: Hess and Ostrom 2001, p. 54). In certain circumstances, specific local contexts or particular geographical areas, collective action (through forms of self-organization by the users themselves) and durable multistakeholder cooperative institutions (which organize, govern, and manage local public services, common-pool resources, and open access infrastructures) provide organizational solutions that are more efficient than direct private control (with its prerogative of admitting or excluding the members from the user group) or than the bureaucratic management by governmental institutions or state agencies (which are able to prevent the destruction of resource's value through over-exploitation) in providing responsiveness to local needs and better conditions for the development of local economies.

There is no longer one best way (if there ever was) to produce, allocate and manage the different types of commons, goods and services but a variety, not necessarily dichotomic, of possible solutions. Nevertheless, the outcome of the "in common solution" depends on the awareness of the relative community, on its degree of social cohesion, on its willingness to participate, and on its capacity to respect common rules (March and Olsen 1995).

New Public Management and Governance of the commons can make a significant contribution to shaping and optimizing of the interdependencies among public and private socioeconomic actors, particularly in a society which cooperatively attempt to produce public value (Kooiman 1999; Benz and Frey 2007). In particular, the *strategic public management* approach is coherent with the institutional approach of the *polycentric governance* and *self-governed collective action* theorized by Ostrom, since all governance processes take place within a broader network of interaction (involving a diverse array of public and private organizations, corporations, professional associations, nonprofit and community-based organizations) that sets the body of norms and rules by which different kinds of organizations are constituted and their processes of interaction defined and legitimated within the relevant communities. This holistic administrative policy approach, seeking to combine the strengths of the hierarchical bureaucracies into a hybrid (yet coherent) pattern of governance grounded on the networking governance, seems the most appropriate mode of governance for dealing effectively with complex issues (Kooiman 1993; Rhodes 1996, 2000; Peters 2000; Christensen 2012), because it improves policy integration, strengthening the strategic capacity of the public sector in terms of effectiveness, efficiency, and accountability (Steurer 2004).

## Commons, Self-Organized Collective Actions, and Shared Strategic Orientations

Commons refer to shared natural resources (such as watersheds, woodlands, irrigation systems, marine and coastal ecosystems, and the like) or the land tenure and use, it's to the historical-cultural and environmental heritage (in some cases, public goods can coincide with commons, for example, in the case of all historical and artistic goods, but also in the case of natural resources) to artificial resources, either physical infrastructures (like aqueducts, communication routes, urban commons such as apartment buildings, parking spaces, playgrounds, etc.) or computerized (internet or other network) or to immaterial resources (like public knowledge, public domain, open science, and the free exchange of ideas) within a given domain conventionally defined

(Frishmann 2012; Sacconi 2016). They are often governed by common property protocols (arrangements different from private property or state administration) based on the self-management by a local community whereby a particular relation arises between, on the one hand, those who supervise the resources and contribute to their maintenance, reproduction or development and on the other and their users. This relation is characterized by the resource's shared use or common appropriation, and by open and equal access to it, conditional only on the geographical (spatial) extension within which that resource is available, i.e. at local, national or international level, as the case may be.

According to this definition, the necessary characteristic for a resource or good to be considered common is the model of governance and management (that is, a set of rights and decision powers, with the consequent decision-making processes that regulate the resource's appropriation, use, maintenance and (re)production) does not permit the exclusion of any potential user from the resource within the territory in which it is available, that makes the good excludable. Many examples, from the remunicipalization of water (representing the material implementation of the horizontal subsidiarity), the self-management of cultural spaces to the free software and makers' movement illustrates collective practices that establish new spaces, institutions or norms of participative and democratic sharing. These examples represent practices of reappropriation and management of the common, new practices of labor, creation and production based on collaboration and sharing.

In other cases, new generation commons, as for example internet platforms, industrial districts (Pastore and Storlazzi 2017) or tourist areas (Storlazzi et al. 2017) provide grounds for new forms of collective self-organization and decision-making. Particularly, these examples clarify "*how a group of principals who are in an interdependent situation organize and govern themselves to obtain continuing collective benefits in situations where the temptations to free-ride, shirk and to break commitments or otherwise act opportunistically are substantial*" (Ostrom 1990: 29). Inside these contexts, the self-regulatory power is recognized by public authorities in order to ensure the use and the collective enjoyment of resources, infrastructures, and goods, addressing them to the fulfilment of those rights as well as the free development of the person and the safeguarding of future generations. Therefore, commons are the product of a social and institutional structure that demonstrates forms of governing and social cooperation that guarantee its production, reproduction, and spread (Rhodes 1997).. "*Self-governance requires collective action combined with knowledge and will on the one hand, and supporting and consistent institutional arrangements on the other hand*" (Hesse and Ostrom 2007: 5).

The self-organization of cooperation is therefore possible. The socially optimal level of cooperation can be achieved through self-governance, which does not mean tacitly and spontaneously, but through explicit agreements and pacts on the levels of investment and on the fines voluntarily imposed by the participants on the transgressors (Sacconi 2016: 20). In this respect, in these contexts, the self-regulatory power is recognized by public authorities in order to ensure the use and the collective enjoyment of resources, infrastructures, and goods, addressing them to the fulfilment of those rights as well as the free development of the person and the safeguarding of future generations. Therefore, commons are the product of a social and institutional structure that demonstrates forms of governing and social cooperation that guarantee its production, reproduction, and spread (Rhodes 1997).

Stable institutions of self-governance involving a diverse and cohesive set of public and private socioeconomic actors/agents are able to rationally interact (by identifying strategic objectives, implementing integrated actions, and solving collective problems) and to establish rules and institutions regulating access to commons, that is, the resource's appropriation, use, maintenance, and (re-)production and to have them applied on a voluntary basis (Ostrom 1990, 1998). This governance pattern provides access to important resources by involving those with a stake in a

particular issue; it promotes an interorganizational focus on the faced specific types of problems to be addressed and helps to finding widely accepted solutions by sharing of information.

These institutional systems grounded on the self-organization of common goods management via agreement on the rules and their self-imposition allow not only to achieve coordination between different public institutions, which is impossible to obtain only hierarchically, but also to associate organizations representing economic, social, and cultural interests. In this respect, New Public Management and Governance of the commons have shaped the public sector strategic management in the last 30 years in the attempt to improve efficiency and effectiveness in producing and providing public service, on the one hand, and to create value in terms of communities' access and use of commons (more than to ownership), emphasizing cooperation, democracy, and citizen participation, on the other hand.

## Communitarianism and Governance of Public Communities

The governance system of the commons is presented as a system that experiments successful organizational models, reinforces the operational arrangements of the reciprocity in the government of common goods and common services, and appears converging with the paradigm of the new public governance. The consideration about public governance is linked to the debate on communitarianism and on the value of the community.

The public governance requires the possibility of a government of the systems without necessarily having to resort to a form of authority over the parts and to a state of formal control (Manfredi 2013). Moreover, these theories provide interesting prospects for a renewed strategic governance of the public sector. On the one hand, the New Public Governance enhance negotiation at multiple levels, and foster interaction (Torfing and Triantafillou 2013), on the other hand, the "Network Governance" tradition draws attention to a "more plural and pluralist" state (Osborne 2010). As for Ostrom's institutional perspective, public goods, common pool of resources and commons call for an adequate organizational dimension, for an "institutional creation" or for a hybrid institution. Latter are institutional arrangements governing the interdependencies among public and private actors, actions, resources, and property rights in resource governance, either defined by structure (linkage among entities with jurisdiction over different property regimes) or by mode of governance (balance between self-organization and formal regulation as complementary instruments of governance).

The theory of commons and the self-organized collective action principles point out (Olson 1965; Ostrom 1990), by emphasizing the logic of membership and participation in interest groups, many similarities and are consistent with the new public governance logic. They contribute to define the institutional framework, which sets out the incentives and the effective organizational principles in the governance of commons.

The conceptual framework adopted to empirically analyze collective resource systems is called the Institutional Analysis and Development framework (IAD framework). The IAD framework (Ostrom 1990) is a conceptual map focused on the behaviors in diverse situations at multiple levels of analysis and concerns analyses of how rules, physical and material conditions and attributes of community affect the structure of action arenas, the incentives that individuals face, and the resulting outcomes.

According to self-governed action theory, only organizations with a few members do not need additional incentives to motivate the action of their members (Olson 1965). Everyone knows that the result of his action more than that of the others will result in an economic improvement divided by a small number of subjects, so the cost of individual action is generally not superior to economic return. Instead, in large organizations, the increase in well-being has to be subdivided into a large number of beneficiaries; so generally, the gain is significantly lower than the cost of the action (Olson 1965). The principle is that "only a separate and selective incentive" will stimulate a rational individual to act in an oriented way, so only a benefit strictly reserved to the

members of the group will motivate someone to participate and contribute to the group. For this reason, large organizations have to introduce incentives to stimulate individual participation in collective action. The problem of identifying incentives to motivate the community of citizens to take on behaviors of respect and safeguard is therefore central to the public sector process of strategic government.

The analysis of different systems through the IAD framework allowed the commons theory to compare the results obtained and to come up with the definition of a set of design principles based on very different collective resource systems. The so-called design principles are an essential element or condition that helps explain the success of these institutions in preserving collective resources and in getting the community that uses goods to comply with the rules adopted, generation after generation (Ostrom 1990). These principles, not defining precise rules, which may vary by case depending on the specific factors characterizing the system, outline the project conditions that must be considered for the design of sustainable governance systems of commons and of public commons. The design principles are: (Ostrom 1990)

1. *Clearly defined boundaries*: Individuals and families, who have the right to withdraw resource units from the common resource, must be clearly identified. This is to ensure that those who contribute to the management of the good are certain that their efforts will not be frustrated by the action of outsiders nor will they be allowed free-ride behaviors.
2. *Congruence between the appropriation and provision rules and local conditions*: Appropriation rules restricting time, place, technology, and/or quantity of resource units must be related to local environment they govern and to provision rules requiring labor, material, and/or money. For this reason, it is necessary to establish different regulations for different systems.
3. *Presence of agreements on collective rules, defining the ways in which the common good management policies are put in place*. Because self-government works, it is necessary that most individuals affected by the operational rules can participate in modifying the operational rules, in order to adapt them to contextual specificities and systemic changes that intervene in it. The fact that the rules are right does not, however, ensure that these will always be respected. It is therefore necessary to implement the agreement through an enforcement work and invest in monitoring and sanctioning.
4. *Monitoring*: Audit systems must be implemented. Moreover, members of the community must be accountable both to controllers and the whole community. Monitors, who actively audit commons conditions and appropriator behavior, are accountable to the appropriators or are the appropriators themselves. To this regard, robust institutions often have a system of monitoring and sanction that is not outsourced by society yet remains in the hands of the participants themselves.
5. *Presence of a gradual sanction system*: Punishment must be highly probable, even if graduated, for appropriators who violate operational rules (depending on the seriousness and context of the offense) by other appropriators, by officials accountable to these appropriators, or by both. It is necessary to trigger almost-voluntary compliance in the sense that compliance with the rule must be almost without coercion but through the so-called contingent behavior.
6. *Definition of a clear and inexpensive conflict-resolution mechanism: even a monitoring by-product is reached*: The latter being understood as an automatic monitoring system, in the sense derived from the same ways of using the good. Furthermore, usually the community member conducting monitoring activities receives social approval and sometimes also obtains private benefits. While the ones who broke the rule loses its status and prestige. In conclusion, once the community members have committed themselves to a contingent self-commitment, then these will be motivated to monitor themselves the behavior of other members (peer review).

7. *Recognition of rights to self-organize by external government authorities*: The rights of appropriators to set up their own institutions are not challenged by external governmental authorities.
8. *Presence of nested enterprises (where the common resource are part of a larger system)*: The processes of appropriation, provision, monitoring, enforcement, conflict resolution, and governance are organized in multiple layers of nested enterprises (Ostrom 1990: 101) or multilevel organizations. This is also the main message of Ostrom's central concept of polycentrism.

The IAD framework and the design principles of the governance of commons underline how important it is the presence of (spontaneous) organizations or institutions that arise to manage commons. In the government of public communities, asymmetric information and opportunism inevitably related to the traditional process of strategic formulation can be limited in the ability to engage citizens' communities. Initiatives of the type "adopt a monument," or "take care of a flowerbed," or even the establishments of neighborhood committees prefigure in part the presence of the design principles of the government of commons. Awareness of the limits of a rigid strategic approach and of the success of common property governance cases where the presence of a self-governing and mutually controlled community prevails can lead to an attitude that facilitates the introduction of similar logic even in the governance of public communities.

## Governance and Strategic Management of Commons in the Public Administration

Commons call for a new kind of "partner" state, people can work with to regulate for guaranteed access to essential resources, as well as for standards, sustainability, and fair distribution. It follows that new stronger forms of participatory democracy are essential to transform public institutions and to hold them to account. The logic of the self-organized collective action and the theory of commons seem to be able to point out an innovative context in the perspective of a strategic orientation to the government of public administrations. The logic of self-organized collective action and the theory of commons include the third pole made up of community of citizens who are not only the recipients of public policies but are also more actively involved in the definition of choices and in the participation in the process of delivering output and outcome.

In the IAD framework with the action arena is the social space where individuals interact, exchange goods and services, solve problems, dominate one another, or fight (among the many things that individuals do in action arenas).

In the public sector, the IAD framework seems to be characterized in a specific way. The logic of co-creation of value is at the center of action arena that corresponds to the process of delivering many public goods and services that are like a common. In this regard, specific conditions emerge in the public sector, such as:

- The diffusion of information and communication technologies
- Paths of democratization
- The co-participation of population in the definition of public policies and also in the provision of public services
- New organizational models that affect both the recognition of a good as a common and the purpose pursued

Local communities, for example, can organize themselves for the valorization of a tourist area and can attribute common value to the tourist destination and services (Storlazzi et al. 2017). With regard to the goals initially pursued, with the introduction of a logic involving citizens in the delivery of a public service, the value co-creation, maximizing the goals of efficiency and effectiveness are pursued.

The strategic orientation in the public sector brings closer to the pursuit of those goals known to be relevant even if it faces resistance both in the

implementation of strategic choices by the internal organizational structure and in the involvement of the community of citizens. The latter are only partially the recipients of public policies as they are increasingly involved in a process of co-creation of value.

The theory of self-organized action and the theory of commons governance emphasize the logic of membership and participation in interest groups and display many similarities with the new approach of public management.

In this regard, the *strategic public management* approach (Steurer 2004, 2007; Lega and Cristofoli 2009) provides an innovative perspective (compared to hierarchical and market-oriented ones which have dominated public sector practices) and encourages the growth of collaborative public management (Agranoff and McGuire 2003; Agranoff 2006) by governing shared public resources and regulating their use, access, preservation, and maintenance as a viable solution to collective action problems in the commons. Key features of this new governance approach are, for example, various forms of public-private partnerships (i.e., the disaggregation of public administration in particular agencies), or policy networks formed around policy issues or clusters of resources (i.e., sets of relatively stable relationships) which are of nonhierarchical and interdependent nature linking mutually a broad variety of societal actors (Jervis and Richards 1997; Börzel 1998; Christensen 2012).

## Conclusion

The commons both theoretically and empirically focuses on the deepening and analysis of the problems that communities need to solve and on the factors that facilitate or hinder them in the governance processes. These ideas emphasize the importance of participatory democracy, organized and self-organized civil society. Perhaps, in the governmental administration, formalism and determinism should be accompanied by the consideration and inclusion of informal collaboration mechanisms that should be foreseen and encouraged by coming to the definition of shared rules for the sustainable management of public resources. The same measure of outputs and outcomes could be shared with citizens' communities. Informal organizations are not antipublic to the public administration system but need each other to work efficiently and indeed can be particularly useful to limit phenomena related to asymmetric information and opportunism. What that here is underlined is not the application of self-government logic to the public administration system as a whole because in many cases the system would certainly not be governable. However, the success of some initiatives spontaneously born in the government of public goods leads to the reflection on the opportunity to introduce incentives to let communities of self-government emerge.

All this in the strategic government of public administrations translates into favoring a strategic orientation agreed between political sovereignty, governmental organs, and stakeholder concerned with public sector governance. It seems possible to achieve effective mutual sharing and harmony about the pursuit of institutional goals.

In terms of implications, it is possible to ascertain to what extent the model of governance, called to describe the dynamics of interrelations existing in the public system, is reflected in a participative reality of all involved and decision-making and management mechanisms.

In particular, it is necessary to ascertain whether, in the context of public strategic systems, interpreted in the light of an evolved business concept, it is possible to achieve a high degree of overall resonance of all possible stakeholders through the introduction of self-government logic that pursues both the effectiveness of the processes and the effectiveness of the operating structure. This approach is consistent with the pluralistic conceptions of enterprise that underline the shift from a concept of closed-type enterprise governed by input-output relationships to an evolutionary conception that takes into account the plurality of developers.

In the management of the public administration system, the subjects that determine the

development are numerous and varied. They create multiple exchanges, and at the same time, qualify those who contribute to the creation of public value and who are the users of the created value. Strategic management of the public administration system can only be carried out in the light of corporate pluralism, and the interpretation of developmental conditions cannot ignore a careful reflection on the contributing subjects and about those who benefit of the value creation process.

These institutional systems grounded on the self-organization of common goods management via agreement on the rules and their self-imposition allow not only to achieve coordination between different public institutions, which is impossible to obtain only hierarchically, but also to associate organizations representing economic, social, and cultural interests. This governance pattern provides access to important resources by involving those with a stake in a particular issue; it promotes an interorganizational focus on the faced specific types of problems to be addressed and helps to finding widely accepted solutions by sharing of information (Manfredi 2013).

# Theory of Policy Learning, China

Yanzhe Zhang
Northeastern Asian Studies College, Jilin University, Changchun, Jilin, China

## Synonyms

Globalization; Lesson-drawing; Policy-oriented learning; Policy transfer

## Definition

Policy learning is a common learning process whereby knowledge, policies, or administrative arrangements shift from one nation or policy domain to another.

## Introduction

The earliest formal identification by the Western world of policy learning is that of Aristotle in his *Nicomachean Ethics* in which he recommended that the Polis should engage in drawing positive and negative lessons from the development of great city states (see Evans and Marsh 2012). By the end of the twentieth century, scholars such as Common (2004), Carroll and Common (2013), Rose (2005), Evans and Marsh (2012), and Dolowitz and Marsh (1996) have used the concept of policy transfer as an umbrella term for defining a range of processes of learning which integrates different policy elements from different types of organization. Indeed, policy learning theory has increasingly been used as a practical tool for affecting "quick fix" and "short cut" solutions to policy problems.

## Debating Policy Transfer

There is nothing new about the concept and application of policy-oriented learning, policy transfer, and lesson-drawing. By the end of the twentieth century, scholars such as Rose (2005), Dolowitz and Marsh (1996), Evans and Marsh (2012), and Carroll and Common (2013) have used the concept of policy learning (or derivatives such as policy transfer and lesson-drawing) as umbrella terms for understanding a process in which knowledge about institutions, policies, or delivery systems at one sector or level of governance is used in the development of institutions, policies, or delivery systems at another sector or level of governance (Evans and Marsh 2012). Different forms of policy transfer such as bandwagoning (Evans and Marsh 2012) have been identified in a wide ranging and evolving literature which has attracted significant academic attention from domestic (Dolowitz and Marsh 1996), comparative (Wolman 1992), and international political scientists (Stone 2000), as well as public management experts (Common 2004; Carroll and Common 2013).

Policy learning and its derivatives are used as a container concept for quite different claims about why public organizations engage in this form of policy development. Why has there been an upsurge of interest in policy learning? There are at least six main reasons for this. First, processes of globalization both external to the nation state (e.g., through changes in the nature of geopolitics, political integration, the internationalization of financial markets and global communications) and the "hollowing-out" of the nation state itself have created new opportunity structures for policy transfer. There are four interrelated trends which illustrate the reach of this process: privatization and limiting the scope and forms of public intervention; the loss of functions by central government departments to alternative service delivery systems (such as special agencies) and through market testing; the loss of functions from the British government to European Union (EU) institutions; and the emergence of limits to the discretion of public servants through the new public management, with its emphasis on managerial accountability, and clearer political control created by a sharp distinction between politics and administration. One further dimension can be added to these

four – the global trend towards regionalization and devolution.

Second, policy learning is more likely to occur in an era of governance with the increasing pervasiveness of "self-organizing, inter-organizational networks," which compliment markets and hierarchies as governing structures for authoritatively allocating resources and exercising control and coordination. In times of uncertainty, policy-makers at the heart of networks will look to the "quick fix" solution to public policy problems that policy transfer can provide either through other governments or from other sectors (e.g., the Community Sector and social inclusion policy). In a sense, we can understand policy learning as evidence based policy-making on the hoof.

Third, ideological symmetry between governments provides a strong foundation for policy-oriented learning. For example, processes of learning across time and space characterized the flow of ideas between the Clinton, Blair, Rudd, and Gillard governments in the UK, the USA, and Australia particularly in the area of social policy reform. Prominent examples include: education (reduction of class sizes), crime (zero-tolerance, antitruancy drives), and welfare reform (welfare to work and creation of work incentives).

Fourth, for policy scientists it provides a rich source for investigating structures and processes of collaborative governance as policy transfer is often the outcome of collaborative activities between governmental and nongovernmental actors which have become increasingly salient in an era of governance.

Fifth, it is evident that structures of collaborative governance such as those that emerge to steer processes of policy learning can both extend and limit participation; empower and disempower affected societal groups. We shall see a little later that policy learning tends to be reserved for elite groups and actors. Only the select few can join in!

The sixth main reason why there has been an upsurge of interest in policy learning is that the securing of loans by developing countries from the International Monetary Fund and elsewhere has become conditional on the introduction of adjustment programs including initiatives such as privatization. Such programs are predicated on a western interpretation of "Good Governance" and give rise to negotiated processes of policy transfer.

## Conceptual Origins

The modern study of policy learning originates from a subset of the comparative politics literature; policy diffusion studies. Research in this area focused on identifying trends in timing, geography, and resource similarities in the diffusion of innovations between countries (and, in the USA, between states). However, the research revealed next to nothing about the content of new policies. In contrast, the contemporary literature on policy learning primarily focuses on voluntary learning between jurisdictions, identifying a process in which policies implemented elsewhere are examined by rational political actors for their potential utilization within another political system. More recently the literature has begun to address questions concerning coercive learning. As Rose (2005) puts it, "Every country has problems, and each thinks that its problems are unique. . .However, problems that are unique to one country. . .are abnormal. . .confronted with a common problem, policy makers in cities, regional governments and nations can learn from their counterparts elsewhere responded."

In sum then, the literature on policy learning analysis may be organized into two discernible schools: one which uses the label "policy transfer" but deals with different aspects of a process of policy-oriented learning or lesson-drawing using different nomenclature; and one which uses the concept directly. The former includes the literatures on: bandwagoning (Ikenberry 1990); convergence (Bennett 1991); diffusion (Majone 1991); evidence-based practice; learning (Greener 2001); and lesson-drawing (Rose 2005). The latter includes the work of domestic policy scientists (Dolowitz and Marsh 2000; Evans and Marsh 2012; Page 2000), comparativists' (Common 2004; Wolman 1992); and international policy scientists (Carroll 2013; Haas 1992; Stone 2000).

## Approaches

There are four main approaches utilized in policy learning analysis: policy transfer analysis, personal interaction approaches, policy diffusion studies, and inclusive approaches.

### Policy Transfer Analysis

Policy transfer analysis is used by policy scientists who focus on the process of policy transfer directly in order to explain the voluntary, or negotiated importation of ideas, policies or institutions. It has tended to be a predominantly interstate approach which emphasizes the role of state actors as active agents seeking solutions to policy problems rather than the passive agents depicted in pluralist or corporatist decision literatures. The role of the agent of transfer (e.g., policy entrepreneurs such as think tanks, knowledge institutions, or pressure groups) is also considered to be critical within this approach.

Two key applications of the concept can be identified within this approach. Bennett (1991) utilizes policy transfer as his key independent variable. In this sense, the process of transfer is used to explain why a particular policy was adopted. For example, Bennett's work on policy convergence focuses on the transfer of policy goals, content, and instruments (e.g., privatization programs). He has conducted empirical research on, among other areas, how and why evidence about the United States' Freedom of Information Act (FOIA) was utilized in Canada and Britain. He reveals that FOIA was used as an exemplar in Canada and the reverse in Britain.

Policy convergence reveals a process in which international solutions are implemented to solve domestic state problems. Bennett (1991) claims that the word "convergence" refers to the phenomenon of Policy A existing in many countries. He identifies three main phases of policy transfer: (1) the awareness of the program, (2) the utilization of knowledge, and (3) the adoption of the same program (Bennett 1991). In short, Bennett's policy convergence (1991) approach suggests that evidence of success in policy, administrative arrangements, and institutions in Country A leads to the adoption of policy, administrative arrangement, and institutions in Country B. By implication studies of policy convergence focus on structural factors such as policy outcomes as the products of institutions.

A second usage of the term can be found in the work of Richard Rose (2005). Rose uses policy transfer as a dependent variable. He attempts to explain why a policy transfer occurs and how lessons are incorporated into a political system through various processes of copying, emulation, hybridization, or inspiration. Rose (2005) emphasizes the role of the bureaucrat and the program itself.

### Ideational Approaches

If formal approaches focus on the structural aspects of policy learning rooted in institutional analysis, ideational approaches focus on agency. This approach argues that policy learning is almost solely based on the personal interaction between agents of transfer, bureaucrats and politicians within interorganizational settings. As Evans (2012) notes, "the study of policy transfer analysis should be restricted to action-oriented intentional learning: that which takes place consciously and results in policy action."

In these settings, there exists a pattern of common kinship expressed through culture, rules, and values. Hence, an emphasis is placed on analyzing the structure of decision through which policy transfer takes place and relationships between agents of transfer and their dependencies. Here ideas matter. For example, Carroll and Common's (2013, p. 4) impressive *Policy Transfer and Learning in Public Policy and Management* focuses on "the need to consider the processes within which policy ideas, techniques and practice are exchanged." Stone's work (2000), identifies think tanks as key agents of policy transfer within what are termed "epistemic communities." Epistemic communities are comprised of natural and social scientists or individuals from any discipline or profession with authoritative claims to policy relevant knowledge that reside in both national, transnational and international organizations. The function of these communities is to facilitate the emergence of policy learning that may lead to policy

convergence. The epistemic communities' literature has been used to explain how international policy has converged in areas such as GATT, food aid, financial regulation, and environmental issues through regime politics.

The social learning approach is also associated with the personal interaction approach. It focuses on the factors which influence how politicians and policy-makers learn how to learn and addresses problems such as when and how politicians, policy-makers, and societies learn how to learn. An emphasis is placed on seeking to understand the psychology of individual and group behavior as a trade-off between organizational and societal influences.

### Policy Diffusion Studies

A distinct categorization for policy diffusion studies may be identified because such studies, while not using the concept of policy transfer directly, seek to identify and quantify patterns of diffusion that are germane to the process of policy transfer itself. Such studies are common in the USA in relation to the diffusion of innovations across state jurisdictions (Weyland 2007) and local governments (e.g., Shipan and Volden 2008) in European Union studies (see Füglister 2012) and in international studies.

Peters (1997), for example, examines the diffusion of administrative reform policy transfers through the member countries of the OECD. He argues that policy transfer, or policy learning, is a common activity in governments around the world, but that there are differences in the rates at which countries are able to learn and adapt. These differences are explained by structural factors such as economic, ideological, cultural, and institutional commonalties. Those countries similar in these ways are more likely to transfer policy. He concludes that cultural variables play an extremely important role in the transfer of policy innovations among countries particularly in relation to geographical proximity and political similarity. However, another set of policy ideas, those associated with political parties and ideologies, appear to have much less of a relationship with the spread of managerialist reforms.

### Inclusive Approaches

Dolowitz and Marsh (1996, 2000) lead efforts within British political science to develop an inclusive model of policy transfer which draws on the work of Rose (2005), Bennett (1991), and Wolman (1992). In essence, they draw together a general framework of heterogeneous concepts including policy diffusion, policy convergence, policy learning, and lesson-drawing under the umbrella heading of policy transfer. Hence, policy transfer is used as a generic concept which encompasses quite different claims about the nature of policy development. Dolowitz and Marsh (1996, p. 357) provide an extremely useful framework which invites others to criticize and develop it, "[w]e have suggested a series of questions which can be used both to organise our current knowledge of the process and to guide future work." The framework developed by Dolowitz and Marsh is clearly designed to incorporate a vast domain of policy-making activity by classifying all possible occurrences of transfer, voluntary and coercive, temporal and spatial. Policy transfer is common in this scheme and processes such as the "rapid growth in communications of all types since the Second World War" have accelerated the process (1996, p. 343). This is not, however, a claim that policy transfer is all-pervasive and Dolowitz and Marsh make no comment on the difference between policy transfer and normal forms of policy innovation, nor whether policy transfer falls entirely within the parameters of policy succession.

## Understanding the Process of Learning and Globalization

Firstly, in all of the cases processes of globalization (e.g., WTO membership, global communications, adoption of international financial, property, strategic, or public management system) provided opportunity structures for learning to take place. There is no doubt that international organizations have had a growing influence in shaping domestic reform agendas. It is therefore no coincidence that the same discourses in terms of social, economic, and administrative reform can be found in completely dissimilar societies. This is due to a large extent to what Evans (2012) identifies as

"... a political process of global institution building..." that underpins the economic dynamic of globalization. But not only financial international organizations have a say in the definition of the reform agenda; international knowledge organizations such as the WTO also have a determinant role in the agenda setting process. However, it would be wrong to conclude that the increased internationalization of reform practices has limited the development of indigenous content in reform policies. As we have seen the reform processes in this study have not slavishly followed the international benchmark. In most of the cases, initially copying took place but then in the implementation process the objects of transfer were combined with indigenous lessons.

Secondly, it is equally clear that the political orientation of a country does not determine the adoption of certain reform ideas. Governments emanating from either left or right of the political spectrum are equally likely to be involved in introducing neoliberal market reforms.

Thirdly, in all of the cases, processes of social (demographic and cultural) change arising from economic reform (marketization – financial services, securities, real estate, social security) also provided opportunity structures for learning to take place. However, they also exposed fundamental sources of social antagonism between Party elites seeking to protect their privileges and reforming liberal elites striving for better policy. This observation was particular acute in the areas of banking, property management, and growth enterprises reform.

Fourthly, in all of the cases modernization processes also occurred due to citizen dissatisfaction with the existing quality of provision and increased expectation for better services. However, in all sectors of reform the Chinese government lacked expertise to embed new working norms and values and were therefore reliant on technical support from international organizations or overseas governments.

Fifthly, all of the cases represented a significant ideological challenge to the status quo and by implication provide a site of struggle between different conceptions of the public good – party accountability versus public accountability, communal property versus private property, state responsibility versus individual responsibility, and state monopoly capitalism versus neoliberalism. Hence, in most cases we see the reemergence of old elites in new class positions – former party bosses become property magnates.

### Agents of Policy Transfer

There are five observations about the work of these agents of learning that need to be highlighted here. Firstly, the utilization of the expertise of leading international knowledge and financial organizations has helped to legitimate the reform processes themselves. Policy-makers do not only turn to advanced countries experiences but to the guidelines and recommendations formulated by international bodies such as the WTO, IMF, the WB, OECD, and the UN among others (see also Ladi 2004 and Stone 2000). These organizations are increasingly important in shaping the character of transition states as they establish what is considered to be "best practice" in reforming the economy and the public sector. Certain international organizations have the necessary coercive means to force developing countries to adopt certain policies (e.g., the IMF and the WB) and others use moral coercion to pressurize countries to embrace certain reforms (e.g., OECD). In the case of China, the government clearly has greater autonomy in determining its own path to development although it needs to make certain concessions to international benchmarks along the way. Moreover, as international organizations are considered to be authorities in their particular area of expertise, policies, and programs based on their guidelines and principles have implicit international recognition of being in line with best practice.

Secondly, the main internal agents of learning are members of the Chinese bureaucratic elite who share a commitment towards the same policy objectives and have common norms and values. It is evident that this elite is committed to modernization and is relatively cohesive.

Thirdly, it is notable that in all our cases formal and informal institutional structures for policy learning including internal and external agents of

transfer were created to facilitate policy change whether it be a sophisticated policy hub.

Fourthly, the policy learning is characterized by the development of long-term relationships with external agents of transfer.

Fifthly, in all of our cases cohesive policy networks were created leading to fast track processes of learning. However, social conflict emerged in the implementation processes exposing a war of ideas between conservative party elites and neoliberal reformers.

## Barriers to Transfer

There are three broad sets of variables can be identified in the case study literature on policy transfer: "cognitive" barriers, "institutional" barriers, and "environmental" barriers (Evans 2012). These variables interact in complex and often unexpected ways and inform the process of policy transfer.

*"Cognitive" barriers* refer to the process by which public policy problems are recognized and defined in the predecision phase, the rationality of the search conducted for ideas, the receptivity of existing policy actors and systems to policy alternatives, and the complexity of choosing an alternative. The most significant cognitive barriers for agents of policy change to overcome at this stage of policy development are the prevailing organizational culture and the need for effective cultural assimilation. In my understanding, cognitive obstacles in the policy formulation phase of the process of policy transfer constrained policy development due to the absence of a genuinely evidence-based approach to evaluating the compatibility of the objects of transfer. Moreover, cognitive obstacles in the implementation phase of the process of policy transfer led to resistance from party elites until a strategy of elite renewal was crafted. In terms of institutional barriers, the absence of technical capacity to deliver the programs meant that an incremental approach to implementation took place underpinned by capability development programs. Moreover, certain reforms were characterized by organizational resistance to change at the middle management level due to the need for new skills, norms, and values to affect organizational change.

*"Institutional" barriers* refer to the normal technical implementation constraints that constrain or facilitate the process of lesson-drawing. This includes coherent and consistent objectives; the incorporation of an adequate causal theory of policy development; the sensible allocation of financial resources; hierarchical integration within and among implementing organizations; clear decision rules underpinning the operation of implementing agencies; the recruitment of program officers with adequate skills/training; sufficient technical support; and the use of effective monitoring and evaluation systems including formal access by outsiders.

*"Environmental"* obstacles refer to the absence of effective cognitive and elite mobilization strategies deployed by agents of policy change, the need for the development of cohesive policy transfer networks to ensure successful policy-oriented learning, the broader structural constraints (institutional, political, economic, and social) that impact and shape the process of lesson-drawing.

Environmental obstacles during the process of policy transfer constrained policy development particularly resistance from the Party until a strategy of elite renewal was crafted which led to the use of the nomenklatura system to affect control over the process of policy development. This suggests that it is crucial to build a societal consensus across elites on program imperatives in order to ensure the effective implementation of new programs.

## Measuring Success

How can we judge the success of these interventions? David Marsh and Allan McConnell (2010) provide us with the basis of a framework for evaluation. They develop a heuristic device for assessing success, focusing on three dimensions: process success; programmatic success; and political success. Process success is defined as "the stages of policy-making in which issues emerge and are framed, options are explored, interests are consulted and decisions made" (Marsh and McConnell 2010, p. 572). Central to Marsh and McConnell's conception of process success is the notion of legitimacy; understood here in terms of

due process and democratic values. Innovation and influence can also be measures of process success, irrespective of the particular policy outputs and outcomes. Innovation can also be based on policy transfer from another political jurisdiction (see: Dolowitz and Marsh 2000).

Programmatic success refers to the assumption that "programmatic" success is more likely if the policy process involves, and reflects the interests of, a sufficiently powerful coalition of interests (Marsh and McConnell 2010, p. 573). "Programmatic" success is often seen as synonymous with policy success and the contemporary focus among most Western democracies on evidence-based policy-making. And, finally Marsh and McConnell understand political success from two perspectives – from the perspective of government and civil society. For government, a policy may be successful if it assists their electoral prospects, reputation, or overall governance project. However, perceptions of the success of a policy will differ depending on your social location. This requires some reflection on the question: success for whom? As Bovens et al. (2006, p. 322) argue: uncontroversial instances, policy evaluations are entwined with processes of accountability and lesson-drawing that may have winners and losers. However, technocratic and seemingly innocuous, every policy program has multiple stakeholders who have an interest in the outcome of an evaluation: decision makers, executive agencies, clients, and pressure groups.

## Policy Learning in China

Theoretically, the previous analysis of policy learning termed as policy transfer and lesson-drawing, such as Rose (2005), Bennett (1991), Dolowitz and Marsh (1996) and others, has tended to concentrate on the approach of transferring policy, the method of the transfer, and the lessons derived from it (see: Evans and Marsh 2012). However, there is also an increasing interest in exploring what elements influence the success of policy learning (see Marsh and Sharman). This puzzle has become particularly salient with regard to the role of the Chinese state in steering a highly effective economic reform project in which policy learning appears to have played a fundamental role promoting the question – is China particularly adept at policy transfer and policy-oriented learning and if so why?

Chinese policy-makers are keen to learn about what works from overseas countries that they admire. It is noteworthy that Chinese interest in policy transfer is said to have predated the West. As early as 422 BC, the first historian Qiu Zuo, conjured with the idea of lesson-drawing as an idiom as "yin yiweijian" in his book named Guo Yu. The idiom of "Yin Yi Wei Jian" translated as "The overturning of the cart in front is a warning to the carts behind," which means a person or organization should be rational enough to learn positive and negative lessons from others. Fifty years later in 372 BC, the Chinese sage Mencius advocated "yīnjiànbùyuǎn" (Hulsewé 1979), which means you can learn lessons regardless of the space and time period. And the most famous Chinese philosopher Confucius also said: "line three, there must be someone better than me, learn the good from the one to replace my weakness, and avoid the negative lessons." These extracts from Chinese literature demonstrate a long history of lesson-drawing as a theory of praxis in Chinese policy-making.

In the course of the last three decades, processes of globalization (economic integration, geopolitics, communications, political integration) have created a great trading-pit in policy ideas with "ready-made", "off the shelf" solutions to policy problems. This supermarket approach to policy learning has inhibited rational policy learning in which policy-makers use credible instruments of policy analysis such as evidence-based evaluation methods to assess the costs and benefits of pursuing a policy drawn from a non-indigenous setting. The Chinese government has been particularly vulnerable to this approach as the "Reform and Open Door Policy" has provided a perfect environment for the application of "foreign" models to ease transition problems. Methods of adaptation, emulation, hybridization, synthesis and inspiration have played an integral role in economic and social reform. Although the results have often been impressive, there has been

a rising concern among academics and practitioners about why China has been so quick to learn lessons from Western exemplars rather than steer its own course or learn from states at a similar state of development.

## Policy Learning and the Rise of the New China

Since the implementation of "Reform and Open Door Policy" at the early 1980s, China has experienced a great and historical social change due to a progressive incremental reform that has delivered a result of shifting the country from a command to a market socialist economy and latterly to what may be termed a new authoritarian development state. Indeed, in order to meet the perceived imperatives of state transformation, Chinese government has launched a series of profound reform in its government sector and public institution, programmed to promote economic and social development, this has been termed the "reform and Open Door" policy has largely been facilitated through processes of policy learning.

The growth of policy learning has become an inevitable trend in Chinese administrative and policy development due to the increase of global economic pressures, the rapid internal growth communications technology and the increasing influence of international organizations in setting international policy agendas (Larmer 2005). Processes of economic globalization have galvanized the Chinese government into becoming more and more active in incorporating the policy experiences of developed countries into its domestic reform program. This is in keeping with two overlapping claims about the centrality of institution-building in development which have gained apostles in Chinese government in the past decade and which have had an important influence on institutional reform in particular. The first claim is that institutions matter in development because they provide stable governing parameters (Leftwich 2006); the second claim is that the achievement of good governance in "Chinese-style" public administration ensures that institutional rules remain both stable and effective. Hence, the deepening and consolidation of the reform of the administrative system is perceived by party elites to be of vital importance to ensure the continuation of the success of the economic reform project in China (Evans and Marsh 2012). Furthermore, there has been a sharp focus on New Public Management (NPM) type reforms, that is, the application of private sector methods and public choice precepts in the management and delivery of public goods. It is also observed that international cooperative programs have become the key instrument of policy learning in this area.

## Processes of Policy Learning in China

The cumulative effect of the interaction of pressures and ideas emanating from dynamic international and national structures and their interpretation by different agents create the necessary conditions for policy transfer to take place. In China, processes of opening-up, elite renewal and international pressures to conform are some of the myriad explanatory variables that prompted policy-makers to search overseas for solutions to the problems they are facing. However, it would be wrong to conclude that the increased internationalization of reform practices has limited the development of indigenous content in reform policies. As China have seen the reform processes in this study have not slavishly followed the international benchmark. In most of the cases, initially copying took place but then in the implementation process the objects of transfer were combined with indigenous lessons. In short, learning through doing occurred in the process of implementation. This demonstrates the pragmatic nature of Chinese policy learning in keeping with the Chinese political tradition. As Sitwell's observation so acutely observes, the genius of the Chinese national culture lies in its ability to assimilate overseas ideas and adapt them to their own needs and desires. It also highlights the interactive nature of structure and agency. Here the essential components of the national culture are preserved within the policy learning design and inappropriate foreign content is filtered out.

Besides, promoting an "Economy, Efficiency, and Effectiveness" administrative system must be prime objective in the economic transition. As Turner and Hulme (1997, p. 1) observe, "It seems that all are agreed on the proposition that the nature and performance of public sector

organizations are critical elements in determining developmental success." An successful administrative reform requires to build a strong, efficient and effective central administrative system which aims at improving efficiency, effectiveness and responsiveness. Indeed, countries such as South Korea, Singapore, Thailand, and Malaysia all have been witnessed by the most rapid and sustained development regarding to the highly effective public sector organizations, strong centers, entrepreneurial elites, relatively autonomous states, effective economic planning ministries, certain aspects of good governance, and have engaged in civil service reform (see Leftwich 2006).

Furthermore, the successful economic transition and administrative reform require engaging in progressive lesson-drawing and policy-oriented learning from international experience but that ultimately indigenous solutions must be found to indigenous problems. Public administrators must engage in international comparison and rational policy learning and draw on the most proper overseas expertise that fit their own circumstances.

In all of our cases long implementation processes were necessary to achieve effective outcomes. It is also noteworthy that public organizations are normally unlikely to engage in policy transfer if the policy is too complex and difficult to implement (Evans and Marsh 2012). However, in these cases, which all involved complex transfers, the Chinese government moved quickly to copy from overseas exemplars in the policy formulation process and then to hybridization in the implementation process. This is wholly in keeping with Chinese learning traditions and its emphasis on pragmatism and was also reflected in the dominant view that "state of development" issues were not central to evidence-based thinking in policy transfer. Selecting the most appropriate exemplar at a similar state of development is considered fatalism. Hence "to be the best you have to learn from the best."

## Measuring Success in China

The heuristic requires slight modification to each of the three dimensions to operationalize it effectively in the Chinese context. Firstly, in terms of process success, the concept of legitimacy as applied to liberal democracies is underpinned with reference to due processes of constitutional and quasi-constitutional procedures and values of democracy, deliberation, and accountability. This would not be the case in China where the notion of legitimacy in the formation of choices would be reproduced through due processes or procedures underpinned by Party norms and values. Moreover, reference to the passage of law rather than legislation would be more culturally apposite. In addition, given that the heuristic is being applied to a process of cross cultural learning; it makes sense to evaluate success in terms of how cohesive the policy transfer network was in facilitating the learning process (see: Marsh and Evans 2012). Moreover, it also makes sense to evaluate the effectiveness of the formal and/or informal institutions which were created to facilitate change.

Secondly, with reference to programmatic success, the importance of issues of rationality and policy compatibility suggest the need to also evaluate programmatic success in terms of whether the policy proposal was informed by the best evidence, whether it was relevant to China's state of development and, for whom the policy was successful or not.

Finally, in terms of policy success, the issue of government popularity remains an important proxy measure of success in terms of solidifying support for the "One China project" and in maintaining support for dominant party factions rather than in formal liberal democratic elections. In addition, the issue of international opinion is also important. If the policy is aligned with international benchmarks of best practice, it is more likely to be perceived a success regardless of its social impact.

## Avoiding the "Learning Paradox"

The empirical findings identified above provide practitioners with the constituent elements of a better practice framework for guiding processes of policy learning and by implication helping them to avoid what Mark Evans (2012) has termed "the learning paradox." In other words, lesson-drawing can be a rational and progressive learning activity but only if the program that is

transferred is compatible with the value system of the recipient organization, based on the best possible evidence, culturally assimilated through comprehensive evaluation, and, builds on existing organizational strengths. It suggests, following Marsh and McConnell (2010), three dimensions of success – process, programmatic, and political – but with additional indicators that provide a more comprehensive understanding of the learning process. In particular, our understanding of process success is enriched through recognition of the importance of agents (policy transfer networks) in creating ideational structures and diffusing innovative practices and that issues of institutional design are crucial to the generation of successful policy outcomes. Moreover, our understanding of programmatic success is advanced through developing evaluative tools for understanding what can and cannot be transferred (policy compatibility), what the key obstacles to effective policy transfer may be to ensure implementation and in whose interest the program has been developed. And, finally our understanding of political success is progressed through recognition of the importance of elite and cognitive mobilization strategies in winning the war of ideas. In short, evidence is not a sufficient criterion for affecting policy change; politics matters and communicative strategies are central to the achievement of policy success.

## Parting Shot of Policy Learning

Each of these applications has its merits. They are sound in their descriptive understanding of policy development and can be used to explain certain aspects of the process of learning. The existing research tells us who has relationships with whom and it can describe how these relations impinge on the making of policy (e.g., why some actors are central and others are not). However, most accounts lack the methodological tools necessary to provide a rigorous understanding of the movement of ideas from one setting to another. Moreover, their understanding of the process of policy learning are at best patchy and are vulnerable to the criticism that it is questionable that transfer has actually occurred at all. As Evans (2012) notes "it may be argued that policy transfer and by implication lesson-drawing does not advance an explanatory theory of policy development," or, as Ed Page (2000, p. 12) puts it, the researcher should not expect from the literature "firm guidance about how to frame the research questions or how to pursue them empirically" (see also: Dolowitz and Marsh 2000; Evans and Davies 1999). For example, the lesson-drawing and ideational approaches cannot provide a general theorization of policy change that accounts for all processes of lesson-drawing. It can only provide a partial account of policy change emanating from the relationship between the structure of the decision network and the agents operating within them and the network and the policy outcome. If applied in isolation from macro-analysis, this overlooks the potential for the existence of a causal relationship between the network and the environment in which it operates. Moreover, at the same time, the network is interpreted, reinterpreted, and constrained by participating actors. Hence, the complex, interactive relationship between network (structure) and agency needs to be analyzed in any study of policy learning. Moreover, finding the evidence that a lesson has been drawn demands excellent access to key informants in informal decision-making processes. Such access is not often possible either in developed or developing countries.

Two further shortcomings are evident. The first is that the study of policy learning would benefit from a reflection of how traditional organizations can become learning organizations. Rose (2005, pp. 104–5) himself argues that the strategic direction of public organizations are path dependent and characterized by "inheritance rather than choice" in the sense that "past commitments limit current choices." Hence a set of recommendations on how to break from the "wicked context" problem would be extremely useful (see: Common 2004). Secondly, a more detailed identification of potential obstacles to successful policy learning would provide important insights for practitioners into how to develop: (a) the type of learning organization conducive to the facilitation of successful lesson-drawing and (b) how to develop a model of prospective evaluation to guide effective lesson-drawing.

## The Way Forward

In summary then, what would be the properties of a rigorous approach to the study of policy learning? It is proposed here that an approach which: (1) is sensitized to the structure and agency problem; (2) recognizes that issues of institutional design (i.e., how policy networks are designed) are crucial to the achievement of effective policy outcomes; and (3) develops evaluative tools for understanding: (a) what can and cannot be learnt (policy compatibility) and (b) the key obstacles to effective policy learning as a method of prospective policy evaluation provides the way forward.

### The Structure/Agency Problem

Simply put, formal transfer analysis and the ideational approach tend to privilege either structure or agency factors in processes of policy transfer. Following Marsh and Smith's (2000) critique of policy network analysis, I seek to confront this problem by combining the strengths of formal transfer analysis and the ideational approach and integrating them into a coherent analytical approach. The new element which we can take from this approach is that policy transfer processes are driven by policy transfer networks that generate policy outcomes emerging from three interactive or dialectical relationships between: the structure of the network and the agents operating within them; the network and the context within which it operates; and the network and the policy outcome. It is also argued that macrolevel variables are interpreted by both actors and through network relationships and should not be seen as distinct from the object of enquiry – the process of policy learning.

As noted by Evans (2012) policy transfer should be understood as action oriented intentional learning – that which takes place consciously and results in policy action; hence the focus should be on the study of agency. This definition locates policy transfer as a potential causal phenomenon – a factor leading to policy convergence. Nonetheless, policy transfer should be distinguished from policy convergence in that the latter may occur unintentionally – for example, due to harmonizing macroeconomic forces or common processes. The element of intentionality in this definition of policy transfer makes both an agent and ideas essential to both voluntary and coercive processes. Intentionality may be ascribed to the originating state/institution/actor, to the transferee state/institution/actor, to both, or to a third party state/institution/actor.

### Designing Instruments of Policy-Oriented Learning

Recent studies of processes of policy learning have emphasized the role of policy networks as key instruments of policy-oriented learning (Evans 2012; Ladi 2002). These are collaborative decision structures comprised of state and nonstate actors that are set up with the deliberate intention of engineering policy change. It is argued that policy networks matter because they shape the nature of policy outcomes emerging from the process of learning. Moreover, the creation of a policy network provides an opportunity structure for the creation of further policy networks.

### Evaluative Methods: Determining the Success or Otherwise of Processes of Policy Learning

International organizations, knowledge institutions, and think tanks play a key role in facilitating policy-oriented learning through imparting technical advice, for the content of policy transfers normally reflect areas where indigenous state actors lack expertise. This observation has particular resonance in transition countries such as China as the content of policy transfers often takes the form of conditions imposed by, for example, the WTO in return for membership. Hence, transition countries can become dependent on the technical expertise and other resources of nonstate actors. Agents of policy transfer that can bridge the indigenous knowledge gap can become important players in policy transfer networks. However, the degree of autonomy that state actors can demonstrate from the expertise of nonstate actors tends to be broadly representative of their state of development. For example, in most instances, voluntary forms of policy transfer demonstrate the relative autonomy of state actors in decision processes, while coercive forms of policy transfer demonstrate the incapacity of a state to

maintain its national sovereignty over decision-making. Although in the Chinese context, the government has made concerted efforts to guard its autonomy. Nonetheless, the privileging of unaccountable agents of policy transfer within policy transfer networks can lead to cultural imperialism through the back door via the transplantation of international policy agendas that are at odds with indigenous policy systems. A necessary criterion for the development of effective policy transfer networks must therefore be to ensure that such reforms are compatible with indigenous policy systems and settings.

The issue of policy compatibility is, of course, not the only potential obstacle to successful policy learning. This thesis stresses the importance of developing a rigorous implementation perspective in policy transfer analysis to ensure that policy transfer has taken place. This will allow for the identification of the type of learning organization conducive to the facilitation of successful lesson-drawing and the development of a model of prospective evaluation to guide effective lesson-drawing. Here this thesis will draw on the work of Evans (2012) who has identified three broad sets of variables or obstacles to transfer which he derives from the case study literature: "cognitive" obstacles in the predecision phase, "environmental" obstacles in the implementation phase and domestic and, increasingly, international public opinion. These variables interact in complex and often unexpected ways and inform the process of policy transfer. "Cognitive" obstacles refer to the process by which public policy problems are recognized and defined in the predecision phase, the rationality of the search conducted for ideas, the receptivity of existing policy actors, and systems to policy alternatives and the complexity of choosing an alternative. The most significant cognitive barriers for agents of policy change to overcome at this stage of policy development are the prevailing organizational culture and the need for effective cultural assimilation of policy alternatives.

"Environmental" obstacles refer to the absence of effective, cognitive, and elite mobilization strategies deployed by agents of policy change, the need for the development of cohesive policy networks to ensure successful policy-oriented learning, the broader structural constraints (institutional, political, economic and social) that impact and shape the process of lesson-drawing and the normal technical implementation constraints that constrain or facilitate the process of lesson-drawing.

The latter would include: coherent and consistent objectives; the incorporation of an adequate causal theory of policy development; the sensible allocation of financial resources; hierarchical integration within and among implementing organizations; clear decision rules underpinning the operation of implementing agencies; the recruitment of program officers with adequate skills/training; sufficient technical support; and the use of effective monitoring and evaluation systems including formal access by outsiders.

## In Conclusion: Understanding Learning and Avoiding the "Learning Paradox"

In sum then, policy learning analysis describes, almost uniformly, a lateral ring of information "exchange" (Bennett 1991) that leads to policy change in a nonindigenous setting. The study of policy learning can only be distinctive from the analysis of normal forms of policy-making if its focuses on the movement of ideas between systems of governance in different countries. Policy learning is therefore best concerned with the study of features of contemporary policy change that are not otherwise explained. However, most accounts lack the methodological tools necessary to provide a rigorous understanding of the movement of ideas from one setting to another. Moreover, the understanding advanced on the process of policy learning are at best patchy and are vulnerable to the criticism that it is questionable that learning has actually occurred at all.

On the other hand, policy learning can be a rational and progressive learning activity but only if the program that is transferred is compatible with the value system of the recipient organization, based on the best possible evidence, culturally assimilated through comprehensive evaluation, and, builds on existing organizational

strengths. It suggests, following Marsh and McConnell (2010), three dimensions of success – process, programmatic, and political – but with additional indicators that provide a more comprehensive understanding of the learning process. In particular, our understanding of process success is enriched through recognition of the importance of agents (policy transfer networks) in creating ideational structures and diffusing innovative practices and that issues of institutional design are crucial to the generation of successful policy outcomes. Moreover, our understanding of programmatic success is advanced through developing evaluative tools for understanding what can and cannot be transferred (policy compatibility), what the key obstacles to effective policy transfer may be to ensure implementation and in whose interest the program has been developed. And, finally our understanding of political success is progressed through recognition of the importance of elite and cognitive mobilization strategies in winning the war of ideas. In short, evidence is not a sufficient criterion for affecting policy change; politics matters and communicative strategies are central to the achievement of policy success.

## Synonyms

Performance appraisal; Performance assessment; Public governance evaluation

## Definition

Evaluation: A research, assessment, and appraisal of a program in order to identify the degree and efficiency of the implementation and outcome of the program. The research finding can usually help people to draw lessons from the program and to make better decision and judgment about future programming.

## Introduction

Program evaluation research has been developed rapidly after World War II since numerous large expenditure programs were launched and "consequently were accompanied by demands for knowledge of results" (Rossi and Freeman 1999: 11). As a result, two categories of evaluations were developed to meet different needs. One is implementation or process evaluation that is usually conducted to monitor "whether the program is delivered as intended to the targeted recipients" (Rossi and Freeman 1999: 190). The other one is the outcome or impact of evaluation which is used to assess whether the intended goals have been achieved and what effects have been produced (Sharp and Frechtling 1997: 1–2). Evaluation was defined by Weiss as:

> A type of policy research, designed to help people make wise choices about future programming. Evaluation does not aim to replace decision makers' experience and judgment, but rather offers systematic evidence that informs experience and judgment. Evaluation strives for impartiality and fairness. At its best, it strives to represent the range of perspectives of those who have a stake in the program. (Cited in Clarke 1999: 2–3)

An effective evaluation will be identified as the product of four main dimensions of activity: methodology, evaluation design, evaluation in the field, and evaluation report. As methodology is considered as the most influential factor in evaluation, an overview of the three approaches (scientific approach, narration, and participatory approach) will be provided in the first part of this chapter. However, none of these approaches can be used to conduct an effective evaluation independently. It will be argued that mixed method evaluations are the best way to conduct an effective evaluation.

This will be organized into four parts: the first part will begin with comparisons of the three main methods of evaluation and move to explain why mixed method design is the best approach of evaluation; the second part will focus on the other key integrates of effective evaluation, the evaluation design, implementation, and report; the third part will concentrate on the application of evaluation in China, especially on the public governance and public management evaluation; and finally, it will draw a conclusion on the key ingredients of effective evaluation.

## Evaluation Methodology

### An Overview of Competing Methods

#### The Scientific Approach

This approach can yield representative and broadly generalizable information using standardized methods from the data collected. Thus, by applying those systematic statistical analyses, it will invest the interpretation and the findings of evaluations with a higher level of credibility and confidence (Denscombe 1998: 204–205). Furthermore, it is replicable and can be analyzed using sophisticated statistical techniques especially with the aid of computer software. Therefore, the findings are more reliable and relevant to the decision

maker or stakeholders due to objective evidence which is based on numbers, percentages, and graphs (Denscombe 1998: 205).

However, quantitative analysis is not always as scientifically objective as it might seem to be theoretically (Denscombe 1998: 205). It seeks to control the context by using random assignment and multivariable analyses which tend to ignore small deviance. The techniques applied such as postal questionnaire surveys and laboratory experiments do not even require any contact with the people (Bryman 1996: 101). Quantitative researchers believe that some of the data collected may not be accurate or valid but choose to ignore the impact on the evaluation. Besides, the credibility of findings for the preferential evaluation designed for specific stakeholders is questionable. Hence, quantitative researchers only emphasize the quantity of data rather than quality of an evaluation (Bryman 1996: 94).

### The Narration Approach

As a contrast to the scientific approach, this approach will provide meaningful and in-depth information to evaluators, which is used it to interpret the finding from the clues obtained (Evans 2005: 10). Another merit of this approach is that it will reflect the social reality by classifying and analyzing the descriptive data (Denscombe 1998: 220). Besides, qualitative researchers emphasize the importance of understanding the context, and by studying the deviant cases, it will provide an important insight into the subject (Bryman 1996: 94–96). Furthermore, they often reject the idea of applying theory as a precursor to an investigation which may not reflect subjects' views and argue that there is no objective social reality. As a consequence, they are more concerned with the discovery of theory rather than the verification of theory (Bryman 1996: 97).

Nevertheless, qualitative analysis is often critiqued as unrepresentative and atypical due to it subjective findings which are constructed in line with the beliefs of the researcher (Marsh and Stoker 2002: 202). Thus, the insider standpoint will result in a situation in which "the researcher loses the awareness of being a researcher and is seduced by the participants perspective" (Bryman 1996: 96). Qualitative research will provide results which are neither replicable nor comparable (Marsh and Stoker 2002: 204). Furthermore, the meaning of the data may be lost or transformed by coding and categorizing during the analysis process (Denscombe 1998: 222). It also requires good staff skills and considerable supervision to yield trustworthy data whichever qualitative methods are applied. Hence, it may be even more time consuming on qualitative evaluation and any possible further exploration of evaluation and not even to mention the acknowledgement of social complexity (Denscombe 1998: 222).

### Participatory Approach

An evaluation need express not only the opinions of the decision-makers or funding body but also the other parties involved in the program. The emergence of the participatory approach has met the needs of finding out the views of stakeholder or expert knowledge to help decision-making (Gregory 2000: 180). The most commonly used models are stakeholder evaluation and participatory evaluation (Robson 2000: 18–22).

In the stakeholder evaluation model, the evaluators are the principal investigators, while the practitioners only act as consultants. Large numbers of stakeholders have an active role in "shaping and focusing the evaluation so that it links in with their interests and concerns" (Robson 2000: 18). However, the criticism points out that this model is ideal because it is impossible for everyone with a stake to take part in every stage of the evaluation process. If only key stakeholders can participate some stages, it undermines the participants' ability in planning and execution of the evaluation (Gregory 2000: 183).

In the participatory evaluation, while the evaluator still plays the major evaluative role, a small number of practitioners engage in the evaluation process as assistants to the evaluators. The connection between evaluators and practitioners is a joint responsibility that can help to maintain the rigorousness of evaluation after the program management or staffs take part in it. However, the first difficulty of this model is how to avoid the impact of power relations in the participation of the evaluation process. The second is that the practitioners

may feel greater "inhibitions" to their colleagues if the data and findings are negative (Robson 2000: 19–20).

## Mixed Method Evaluation

### Why Mixed Method Evaluation Is the Best Methodology?

It can be seen from the above comparison that any single method has its advantages and disadvantages in this and other respects. However, mixed method evaluations, "where two or more different data-collection methods are used when seeking answers to an evaluation question," exactly combine different strengths and weaknesses from different methods (Robson 2000: 81). As L. Sharp and J. Frechtling observe (Sharp and Frechtling 1997: 1–8):

> By using different sources and methods at various points in the evaluation process, the evaluation team can build on the strength of each type of data collection and minimize the weaknesses of any single approach. A multi-method approach to evaluation can increase both the validity and reliability of evaluation data.

In short, a mixed method design can not only address "all aspects of the research question" but also increase the validity of research by covering the drawbacks of each other (Marsh and Stoker 2002: 237).

### How to Combine Methods

First of all, methodological triangulation is considered as an advantage approach of the mixed method evaluation. It "combines two or more different research method in the study of the same empirical issue" (Marsh and Stoker 2002: 237). The aim of this approach is seeking to acquire reliable and accurate information by using multiple sources of information (Pierce 2004: 69).

Creswell also identified three basic models to integrate different methods. The first model is a two-phase design approach. This approach separates the research into a qualitative phase and quantitative phase in which the evaluators can "operate within the appropriate epistemological paradigm" (Marsh and Stoker 2002: 239). If the quantitative phase comes first, the findings of the survey can inform the context of the qualitative study. On the contrary, if the study starts from a qualitative analysis, the following quantitative phases will enhance the "the validity of the concepts, hypotheses and questions" (Marsh and Stoker 2002: 239–240).

The second is a dominant/less dominant model in which one method will dominate the overall study, while the other one just provides a supplement to the study. "The advantage of this method is that it retains a single consistent paradigm, but allows other data to be collected from a smaller or larger population, depending on which methodology is dominant" (Marsh and Stoker 2002: 240).

The third one is the mixed-methodology model that can be used at any stage of the evaluation process. This is the most popular approach because it "allows the researcher to take advantage of each research methodology" (Marsh and Stoker 2002: 240). Moreover, it uses both inductive and deductive approaches to offer a better reflection of research practice because there are no constraints of the sequence of the methods (Marsh and Stoker 2002: 240).

### Problems of the Mixed Method Approach

Although there is an increasing use of the mixed method approach in evaluation, there are some problems that need to be considered in practice. Firstly, the mixed-methodology design cannot avoid the problem that the evaluators' ontological and epistemological positions have an impact on methodology. Secondly, this approach has been questioned because different evaluators are likely to analyze the data in their own ways and to "make different claims about their results" (Marsh and Stoker 2002: 241). Thirdly, it requires considering that the evaluators need varied skills to deal with those approaches and how to allocate limited resources to cover different methods (Marsh and Stoker 2002: 242).

## Evaluation Design

There are three key components in evaluation design: evaluability assessment, evaluation

questions, methods, and sampling strategy. At the designing stage, the goals and program theory will determine the design of the evaluation questions. After that, the evaluators will select data-collection approaches and develop a sampling strategy according to the questions (Robson 2000: 79–80).

### Assessing Evaluability

Evaluability assessment is "a pre-evaluation appraisal of whether a program's performance can be evaluated" (Rossi and Freeman 1999: 187). The purpose of this assessment is to find out whether the program theory is well defined, or if not, what changes can be made to ensure the evaluation will attain its goals. It involves reassessing the goals and objectives of program, performance criteria, "stakeholders," and side effects (Rossi and Freeman 1999: 187; Shaw 1999: 124).

### Clarifying the Goals and Objectives and Program Theory

As Sabstier observes, ambiguous and inconsistent objectives will lead to the failure of policies or programs (Marsh and Rhodes 1992: 9). It is important to clarify the objectives of the program at the outset to provide guidance to the implementation and evaluation. Moreover, the assessment of the program theory is also important because it is difficult for a program to attain its goals if the program theory is weak or faulty (Rossi and Freeman 1999: 187).

### Identifying Stakeholder Interest in Evaluation Findings

Stakeholders can be individuals or groups of people that are "typically involved in, affected by, or interested in the evaluation" (*Rossi and Freeman* 1999: 55). Nine categories of stakeholders are identified by P. Rossi and H. Freeman: the policy-maker and decision-makers, program sponsors, evaluation sponsors, target participants, program managers, program staff, program competitors, contextual stakeholders, and evaluation and research community (Rossi and Freeman 1999: 55). Each group of people has their own interests in the program. The purpose of identifying stakeholders is to design different questions and select various evaluation research methods for a particular target (Hanberger 2001: 52).

### Formulating Evaluation Questions

The criteria for good evaluation questions are, can they "identify clear, observable dimensions of program performance that are relevant to the program's goals and represent domains in which the program can realistically be expected to have accomplishments" (Rossi and Freeman 1999: 116). The evaluation questions usually cover the following dimensions: the program design, implementation, management and enhancement, staff training and support, impact of policy output, etc. (Evans 2005: 9). In practice, the evaluators will set priorities among a set of candidate evaluation questions according to the concern of various stakeholders (Rossi and Freeman 1999: 117).

### Selecting Data-Collecting Methods

As mentioned above, mixed method evaluations combine the advantages of both quantitative and qualitative methods and can "yield richer, more valid and more reliable findings" (Sharp and Frechtling 1997: 3–7). There is no fixed formula for the mixed method design; however, some consideration should be taken in selecting methods. Firstly, it is important to develop sampling strategies which can ensure the sample is representative and the data collected are relevant to the evaluation questions. It can increase the accuracy by enlarging the sample size; however, this takes time and increases the costs. Secondly, costs are "the various inputs required to set up and run a program which determines the selection of methods, scale of evaluation and the quality of data" (Robson 2000: 136). Thirdly, the general rule of timing is to collect data before "an innovation is first introduced and after it has been in operation for a sizable period of time" (Sharp and Frechtling 1997: 3–8).

## Evaluation in the Field

Evaluation in the field is a process of collecting data and information. In order to get trustworthy answers to the evaluation questions, more attention should be paid to the quality of data. As the policies or programs may evolve in the implementation stage, many new aspects of the evaluation design will emerge during the fieldwork. So a flexible design will allow more room for modification of the questions during the evaluation (Robson 2000: 102–103).

Scriven has identified two categories of evaluation: formative evaluation and summative evaluation (Robson 2000: 50). The formative evaluations are usually conducted during the implementation of a program, whereas the summative evaluations are held after the program has been achieved. In the evaluation framework designed by A. Hanberger (2001: 49), different guidelines have been developed for these two types of evaluations.

### Process/Implementation Evaluation

- What line of action is followed in practice?
- How does the implementing organization work in practice?
- Is enough competence integrated?
- Are resources used effectively and in the right way?
- Do unexpected problems occur?

(Hanberger 2001: 49)

It can be seen from the above questions that a process evaluation generally provides the stakeholders with the information about whether the program is "delivered as intended to the targeted recipients" (Rossi and Freeman 1999: 231). This information involves the program operations, service delivery, resources' allocation, and unintended problems (Rossi and Freeman 1999: 231). Furthermore, process evaluation is precondition of conducting an impact evaluation. It provides information about the ways programs are implemented which can be integrated with findings of an impact evaluation (Rossi and Freeman 1999: 199).

### Impact/Outcome Evaluation

- To what extent are the intended goals reached?
- Are there any unexpected results?
- What are the effects?
- Who benefits from the policy?

(Hanberger 2001: 49)

The focuses of an outcome evaluation are on whether the program achieves the intended goals and the implications of the policy (Hanberger 2001: 50). The implications of the policy could address either the positive or negative side of the outcome: the positive side can be the benefits and effects, whereas the negative side involves the unexpected results.

Finally, two issues are considered as essential at this stage. One is that good communication skills are required for every evaluator to obtain good answers for the evaluation questions. The other one is that the evaluators should be rational in analyzing data and generating the findings.

## Reporting the Results of Evaluation

The final stage of evaluations is to report and communicate the findings. An evaluation report will draw the conclusions of what the evaluators have done during the whole processes, what experience or lessons they have learned, and "how others might benefit from this projects experience" (Sharp and Frechtling 1997: 7–1).

In order to write a comprehensive report, the following issues need to be considered. Before writing the report, it is important to identify the interests and needs of different audiences. The audiences can be the sponsors, stakeholders, program management and staff, etc. The evaluators can prepare various forms of report (executive summary, detailed report, or briefings tailored to special stakeholders) to satisfy different interests and needs (Sharp and Frechtling 1997: 7–2).

Additionally, the organization of an evaluation report usually consists of five parts. It will provide the background stating the goals and objectives of the program from the outset. This is followed by a description of the evaluation design with the evaluation questions and the methodology used to

collect and analyze data. The findings section is the most important part which "should provide a concise context for understanding the conditions in which results were obtained and identifying specific factors that affected the results" (Sharp and Frechtling 1997: 7–3). The final part will draw a conclusion of the findings, strengths, and weaknesses of the program and give recommendations for improvements (Sharp and Frechtling 1997: 7–4).

## The Application of the Theory of Evaluation in China

The policy learning of public governance evaluation by the Chinese Government and pubic organizations from the experience of the developed countries or international organization, such as United Nation, Word Bank, WTO, and etc., has started from the end of the twentieth century (Bao and Zhou 2009: P12). After nearly 20 years of development, government performance evaluation has been widely adopted by all levels of governments, central or local, as one of the most important tools to assess public management performance and efficiency (Wang and Lan 2012: P43).

The systematically study of the public governance evaluation theory and **criterion** can be concluded into four main streams. ***Firstly***, an evaluation system of public governance has developed by K. YU with 15 criterion, such as legislation, citizen participation in politics, political transparency, civil rights, party and government supervision, intra-party democracy and multiparty cooperation, etc. ***Secondly***, ten evaluation criteria were suggested by Z. HE from the perspective of good governance, which included equity, legitimacy, legislation, responsiveness, etc. (Bao and Zhou 2009: P12). ***Thirdly***, Chu (2008: P37) identifies that public governance assessments are examined by three core indicators: deployment of power, citizen participation, and degree of civil satisfaction. It is argued that "the deployment of power involves arrangement and balance of powers, citizen participation covers citizens' engagement in social affairs and public policies, while the degree of civil satisfaction includes the public's attitude to both the behaviors and the results of government" (Chu 2008: P37). ***Finally***, Bao and Zhou (2009: P12) provide an evaluation system to guide the practice of public governance evaluation with seven criteria, and each criterion has detailed guideline of assessment. The seven criteria are equity, legislation, sustainability, participation, transparency, accountability, and efficiency (Bao and Zhou 2009: P12).

As mentioned above, the **evaluators** are required to be rational and have good communication skills in the fieldwork. In China, the database of CNKI (China National Knowledge Infrastructure) 2005–2011 shows that 96.8% of the governance evaluation were conducted by the evaluators from the higher educational institutions, such as the scholars in the universities and colleges, whereas the research departments within all levels governments only accounted for 0.45% of government performance assessments studies (Wang and Lan 2012: P41). The third-party evaluation institutions, non-profit organization such as University of Lanzhou and commercial research institute such as Horizon Research Consultancy Group, are also introduced to be the leading participants in the public governance evaluations (Bao and Zhou 2009: P13).

The study of CNKI database 2005–2011 also identified the **sponsors** and **research funding** of public governance evaluation. The statistics shows that almost 85% of evaluation studies within the public sectors are volunteer research, and only 10% of the research funding are from the national level, for example, the National Social Science Fund, NSFC (Natural Science Foundation of China), and the China Postdoctoral Science Foundation (Wang and Lan 2012: P41).

To sum up, the awareness of the importance of public governance evaluation leads to gradually increasing researches getting involved in these areas. It is argued that the theoretical study, local research, and research fund of governance evaluation in China are comparatively inadequate (Wang and Lan 2012: P43). It is also suggested that intensive attention would be paid to the implementation of public governance evaluation,

which are the cultural differences between China and the West, the differences in foundation of governance, and regional development differences, in the further studies (Bao and Zhou 2009: P11).

## Conclusion

This chapter has examined four phases of the evaluation process – methodology, the evaluation design, fieldwork, and communicating the report – to identify the key ingredients consisting of an effective evaluation at each stage.

As the methodology is considered as the essential component of a successful evaluation, the first section of this chapter focuses on the selection of the evaluation approaches. By comparing the strengths and weaknesses of scientific, narration, and participatory approaches, it draws a conclusion that a mixed method evaluation which combines the strength of each single approach is the best approach in evaluation. There are three forms of the mixed method approach: two-phase design, dominant/less dominant model, and the mixed-methodology model. However, this evaluation requires that the evaluators have various skills and avoid the impact of personal ontological and epistemological positions on the evaluation results.

Apart from the methodology, three other main issues have also been identified at evaluation design stage. The evaluability assessment includes clarifying the goals and objectives of the program, reassessing program theory and performance criteria, and identifying stakeholders' interest and side effects. The evaluation questions need to be clear and relevant to the program goals, cover as many aspects as possible, and be flexible to allow the policy room to evolve. Mixed data-collection methods will be selected according to the types of question and the considerations of sampling strategies, costs, and timing.

The implementation evaluation and outcome evaluation have different goals and emphases in the fieldwork. The former focuses on the program operations, service delivery, resource allocation, and unintended problems, whereas the latter concentrate on whether the program achieves the intended goals and whether there are any unintended results. The evaluators are required to be rational and have good communication skills. After that, the final task of evaluation is reporting the results of evaluation. The report will summarize the findings, implications, and lessons of the program. Apart from considering the preferences of various audiences, an evaluation report is better to presented in the standard format.

Finally, the application of the theory of evaluation in Chinese public governance has been explored though the four categories of evaluation **criterion**, the evaluators from higher educational institution and the third-party evaluation organization, and the recourses of research funding.

In conclusion, an effective evaluation was determined by three dimensions of these activities: evaluation design, fieldwork, and reporting the findings. The selection of evaluation methodologies is the core of the evaluation process, which has significant impact on the validity and reliability of the data collected and the findings.

# Third Gaps of SERVQUAL in Indonesia

Ilham Rifai Hasan
Public Administration, State University of Makassar, Makassar, South Sulawesi, Indonesia

## Synonyms

Service delivery; Service quality gaps model; Service quality

## Definition

"Third Gaps of SERVQUAL" is a theoretical terminology referring to the conception of gaps analysis-based service quality. The gaps profile in the conception consists of five categories; one of them is third gaps identified as "service delivery." In this context, service delivery gaps are interpreted as any gaps occurring in the phase of service delivery. Any aspects which potentially influence service delivery quality in this phase are identified as third gaps of SERVQUAL or service delivery gaps.

## Introduction

In public service provision, "service delivery" is a phase in which service performance and customers' perceptions meet. In this phase, the personnel in charge apply the SOP (standard operational procedure) which has been constructed based on the management perception of customers' expectation. The significance of service delivery gaps in influencing service quality theoretically occurs through three factors: structural, human, and facility-infrastructure factor (Parasuraman et al. 1985).

Anything leading to an obstacle in the service delivery process is supposed to be one aspect of any of the three factors. It may be one aspect of structural factor such as role conflict or role ambiguity; it can be that of human factor such as a teamwork weakness, supervisory weakness, or employee job fit; and it can also be that of facility-infrastructure factor such as technology job fit.

If the three theoretical factors are outlined into service delivery practice performed by one of the government networks managing the citizenship administration and civil registration in Indonesia, then the six imperative aspects in the service delivery concept should be examined. This may happen because of theoretical category of the service delivery concept, which is accurate enough to read realities (isomorphis), and the realities of service delivery in Indonesia, particularly in provision of citizenship administration service and civil registration, which still seems to be a general or even universal phenomenon through researchers' investigations. Yet, employing the same theoretical "glasses," this entry reveals the typical phenomena of service delivery gaps in Indonesia.

## Factual Realities of Service Delivery

### Office Supplies Job Fit Phenomenon

The factual condition of service delivery in the government networks managing the citizenship administration and civil registration throughout Indonesia has revealed some typical phenomena that can bar and even stop the service process. The reality that there are no more citizenship administration documents available, such as Citizen Identity Card and birth certificate, because the central office has not sent the stocks is a phenomenon

which can be verified through the six imperative aspects of the service delivery concept.

The phenomenon is due to implementation of *Peraturan Menteri Dalam Negeri Republik Indonesia* (Regulation of Home Affairs Minister of Republic of Indonesia) Number 9/2016. The minister regulation itself is implementation of the Constitution Number 23/2006 regarding citizenship administration in Indonesia. The regulation (Article 18, Verse 1) rules the special machine used to print the documents, the types of paper used for the documents, and the security design used on the paper. Accordingly, all the government organizational networks that organize the services of citizenship administration and civil registration experience this as an implication of the regulation implementation.

Empirically, the central government has the authority to produce the forms of Citizen Identity Card, birth certificate, and other documents of citizenship and civil registration. Consequently, it is so possible that the documents availability is not in line with the needs. When this is what really happens, the service delivery process gets stagnant without certainty when the central government will send the needed documents.

### Authorized Official Legalization Phenomenon

The above argument is also relevant to the second phenomenon, which is the reality that the citizenship and civil registration documents, such as Citizen Identity Card and birth certificate, cannot be given to the customers in the service delivery process since the authorized official, who has to sign the documents, is on an official trip. Here, "official trip" is such a common term referring to any official activities conducted by an official outside the office or even in another city or district; when on the trip, usually the officer cannot come back to the office at the same day. Practically, this situation can delay distribution of the documents to the customers since the documents have not had the official's "wet John Hancock" on them.

In Indonesia, the right and obligation to have an official trip essentially refer to authorization stuck on a civil servant's position in Indonesia as stated in *UU No. 5 Tahun 2014 tentang Aparatur Sipil Negara dan Permendagri* (Constitution No.5/2014 regarding the State Civil Servants) No. 29/2016 regarding official trips regulation. Implementation of the constitution is then ruled through the minister regulation for civil servants in the ministry sphere and the district regulation for those in districts.

The number one person in a government office can independently determine this task; he or she does not need special permission from the regent, mayor or governor as long as the official trip is still in the province area. Thus, this phenomenon is reconnected to the regulation, although it is not a regulation that specially rules the implementation of tasks and functions of public services.

## Policy Incoherence in Service Delivery Gaps In Indonesia

Regulation as the root of public service problems has considerably been identified in various scientific studies. Ashworth, Boyne, and Walker (2002) and Hood et al. (1998) mentioned that political authority determines scopes of policies which restrict bureaucracy acts despite the ability to overcome the problem through audit and inspection. This political control can increase accountability, integrity, and loyalty; yet, it can also harm bureaucracy creativity and impede innovative performance. According to the scholars, there have been some overlaps and "gray areas" roused by the regulation conception in this case. Implications of the overlaps and "gray areas" are what the researcher views as the phenomena which precede empirical facts of the regulations barring the delivery service process.

In the context of public administration provision in Indonesia, the situation remains an unavoidable determinant. A number of regulations obviously state the main tasks, functions and structural duties in Indonesia, therefore, such a task is an obligation. It is undoubtedly a description of contradiction between the regulation of citizenship and civil registration documents legalization through the official's signature as stated in

*UU No. 23 Tahun 2006* (Constitution No.23/2006) regarding citizenship administration and that of structural officials' tasks which has determined that the in-charge officials have the authority to leave the offices, where the services are provided. Accordingly, again, the analytical argument using the terminology "policy incoherence" (Wild et al. 2012) becomes relevant.

Although Lewis, Mcculloch and Sacks (2016) mentioned that Indonesia has switched to the use of various incentives to boost performance of district governments in service delivery, there are still some regulations that can directly trouble the delivery service process.

It has, however, been proved through many opinions that the feature of public management is the level of regulation by external bodies (Boyne 2002). Public service providers are not free to determine their own process and strategy; they have to work based on the policies issued by the highest political authority (Hood et al. 1998). On the other hand, it is so common that political interests defeat public interests. Actually, regulations can elucidate how to create quality public service prosess since the regulator apprehends how to increase services better than do local bodies as argued by Boyne (2002), yet, this seems "too good to be true" in Indonesia since the home affairs minister regulation, on the contrary, has the potential to create service barriers or even stop the services in a period of time that cannot be determined by the district office.

As mentioned by Boyne (2002), such a relationship can be mediated by regulator's proficiency. If the regulator understands how to improve the service better than do local bodies, then the regulation impact tends to be positive. Nonetheless, the regulation substance indicates that the regulator just lets the technical gaps open wide, hence, the services cannot be provided when there are no more citizenship administration and civil registration documents available. At the same time, this kind of service is organized by government agencies throughout the country. Thus, it can be inferred that the regulator's knowledge of quality public services is not better than the local bodies', or it is merely a political matter.

In the phenomenon of office supplies job fit, the factual problem due to this situation is the halt of service process lasting until the central government distributes the needed documents to the citizenship administration and civil registration offices. In Indonesia, this is such a common phenomenon. Firstly, this can be due to the geographical condition of the archipelago country; many districts in its administrative territory are situated far from the central government, and this can lead to the problem of distribution. Secondly, this may be due to the central government bureaucracy's late response towards districts' needs; this can be caused by the big volume of districts' logistic needs that must be distributed. The condition of supporting transportation infrastructure, either for sea or air transportation, also has given some influence. Up to now, the two kinds of transportation system still have the potential to contribute towards the delay. Unfortunately, instead of restructuring the regulation substances, which technically can lead to the service gaps, the current government is trying to overcome this problem only by planning the sea toll infrastructure development, which is projected to cover big logistic services.

The phenomenon of authorized official's legalization leads to the same factual problem, which is the civil and citizenship documents delivery delay. The delay continues until the official comes back from the official trip and puts his or her "wet John Hancock" on the documents. Absolutely, this situation impacts on customers' daily needs. The factual problem abstraction can be categorized as an aspect which emphasizes "service product legalization by authorized official".

Overall, the two situations become very crucial since they impact on citizens' daily needs. Such a delay or halt of service delivery process leads to customers' loss. In administrative framework, such a phenomenon is essentially a conflict of obligations in public service (Zeithaml et al. 1996; Bitner et al. 1997). In concrete, this finding is a matter of administration, yet, it occurs through level of policy incoherence (Wild et al. 2012), which is an aspect that emphasizes office supplies job fit due to the limitations created by policies.

## Theoretical Implication

If the finding is outlined into the conceptual formula of *service delivery gaps* (Parasuraman et al. 1985), then it can relevantly get into *facilities and infrastructure factors* as an additional aspect. Originally, this factor contains one aspect only, which is *technology job fit*, with an argument that technology incompatibility with job can bar service process; this is in line with the fact that quality service needs to be supported by the right technology. Conclusively, the finding is to reinforce the factor through its aspect enrichment.

If the second finding is outlined into *service delivery gaps* (Parasuraman et al. 1985), then it can relevantly get into *structural factors* as an additional aspect. Originally, this factor consists of two aspects: (1) *role conflict*, with an argument that role conflict can occur when employees think that they are unable to satisfy their boss or customers and (2) *role ambiguity*, which deals with employees' doubts in playing their roles. Conclusively, the finding is to reinforce the structural factor through its factors enrichment.

Contributions and positions of the two findings in the concept of *service delivery gaps* are elucidated in Fig. 1.

In the context of public administration provision in Indonesia, the two findings are still considered as ideal conditions. This is reinforced by a number of facts, such as the fact that the Home Affairs Minister Regulation No.9/2016 Article 18 Verse 1, which has determined the use of special machine to print the needed documents, is still considered necessary to be in the central government authority. So far, there have been no signs or situations, either political or technical, projecting delegation of the authority to the districts for effectiveness and efficiency.

In common, the two regulations, which determine the main tasks, functions and duties of structural officials in Indonesia, emphasize the "tour of duty" as a must-do task for structural officials despite the fact that administrative process design referred in Indonesia highly requires the presence of authorized officials in the service spots. Obviously, this is such a description of factual realities of public administration services in a developing country.

## Conclusion

The empirical evidence reveal that there are two specific phenomena which potentially lead to *service delivery gaps* in a "unique" way; the office supplies job fit and authorized official's legalization. Technically, the phenomenon of office supplies job fit occurs as an impact of the implementation of the Home Affairs Minister Regulation No.9/2016 Article 18 Verse 1 regarding the use of special machine to print the

documents of citizenship certificates and civil registration. This regulation potentially leaves a time gap between the documents availability and the documents supply from the central government. The phenomenon of authorized official's legalization occurs as an impact of the implementation of a number of regulations based on the Constitution No.5/2014 regarding the state civil servants and the Home Affairs Minister Regulation No. 29/2016 regarding official trip regulations. The regulation implementation creates service delivery gap, which is an implication of policy incoherence. Accordingly, it can be claimed that the two phenomena are service delivery gaps which are due to policy incoherence.

## Synonyms

Third-Generation University; University Governance; University Governance dimensions

## Definition

The Third-Generation University Governance refers to a set of structures and processes through which a university would be governed by the assembly of the stakeholders' representatives (senate), the board of directors, academic staff, and administrators. The Third-Generation University would be effective when the bilateral and multilateral cooperation of stakeholders is strengthened by the governance procedures and contributes in a society.

## Introduction

The new millennium is an era of change and transformation. No organization, business or industry is exempt from transformation, and each one is required to adapt to the different needs of its stakeholders. Universities, like any other organization, must expose themselves to far-reaching structural changes especially those that can empower them in the areas of innovation, entrepreneurship, wealth creation, and succeed in a competitive world of higher education (O'Meara 2007). Parker (2002) points to the

results of the changes that have occurred in this field. Since the early 1990s, new topics such as entrepreneurial university, world-class university, university as an enterprise and, of course, the third-generation university have been introduced. A third-generation university is a multifaceted set of up-to-date education, research, and initiatives that responds competitively to the needs of the external environment and offers a kind of scientific and technological innovations in line with customer needs. Such a university serves as a link between the scientific and economic worlds through the establishment of science and technology parks, technology transfer centers, and incubators for young entrepreneurs (Maximova et al. 2016). In addition, these kinds of universities are wealth-creating and customer-oriented and hold an applied view of research; therefore, they have significant differences from previous generations in terms of governance models (Jarernsiripornkul and Pandey 2018).

In the field of higher education, university governance (UG), according to Trakman (2008), refers to a set of decision-making processes within a university. In a UG context, the university governing body is required to determine the policies, goals, and strategies and constantly monitor the extent of the university's success in achieving the goals. Despite the importance of the concept of UG and the necessity of changing the prevalent governance models in developing countries, especially Iran, previous studies were not able to provide a comprehensive and accurate picture of UG dimensions and illustrate the relationships among them. These issues are dealt with in the following sections.

## Theoretical Background

UG involves the adoption of policies and procedures for decision-making and controlling over leadership as well as management processes with a focus on effectiveness (Carnegie 2009). Similarly, Shattock (2006) views UG as a set of structures and processes through which the university is governed. According to him, governance is exercised through the assembly of the stakeholders' university representatives (senate), the board of directors, academic staff, and administrative, and it is strengthened by their bilateral and multilateral cooperation. In Iran, UG has a background of more than 80 years. The UG system in this country was something like an academic governance model before the Islamic revolution, but, after that, till the end of the 1980s, it changed to government-based governance. Since the 1990s, it has been practiced through boards of trustees and a low level of privatization and independence (Zaker Salehi 2013).

Numerous studies have been conducted on UG dimensions. Figure 1 shows these dimensions, and in Tables 1, 2, 3, 4, 5, and 6 their indicators are explained.

(A) **Independence**: it refers to the degree of discretion and freedom of action of the university in planning and decision-making in accordance with the capacities and environmental conditions. It depends on the extent of the authority of the university to determine its educational, research, technological, financial and administrative, and structural plans.

(B) **Stakeholder Participation**: it means any influence of various university stakeholders in the field of university governance, in such governance matters as decision-making and macro-policy of the university, developing university resources and capacities, and communication and investment in university plans.

(C) **Accountability**: University accountability refers to the degree of commitment of the university to the interests of the stakeholders and giving assurance to perform the duties and responsibilities of the university based on the methods and criteria agreed by the stakeholders. Furthermore, being accountable means being bound to answer questions about decisions or actions within the authority of university administrators.

(D) **Monitoring, Evaluation, and Quality Assurance**: Monitoring refers to the systematic review of the implementation of the approvals of the board of directors,

**Third-Generation University Governance Model Using Total Interpretive Structural Modeling, Fig. 1** UG Dimensions

instructions and executive regulations, and the existence of inspection and complaint management mechanisms in the university system. Evaluation involves judging the desirability of the final output and the outcomes with regard to the university goals, and quality assurance refers to the regular management of evaluation procedures to ensure the achievement of quality whether determined or improved, to provide a basis for the trust of stakeholders in the way the university is governed.

(E) **Transparency**: It means the level of stakeholders' access to university data, analyses, and reports. Transparency refers to the process of disclosing information about decisions, actions taken, and the quality of decision implementation. In other words, transparency is about being apparent. So, in a democratic framework, a university stakeholder is able to identify and understand what decisions, how, and based on what standards they are made and implemented in the university environment.

(F) **Risk Management**: Risk management refers to the process of identifying, evaluating, and prioritizing risks, followed by the coordinated and economical use of university resources to minimize, monitor, and control the likelihood or impact of accidents and maximize the opportunities arising from each risk.

In addition to the discussion of the dimensions of university governance, it is worth to understand how these dimensions affect a system of governance. Using Total Interpretive Structural Modeling (TISM), the direct and indirect relationships among the dimensions are shown in Fig. 1. It should be noted that educational, research, and technological independence can lead to the creation of new and more diverse revenues, given the positive impact they have on the development of

| Other beneficiary groups | Donating, gifting, crowd financing of university projects, media participation to develop the scope of university organizational communication, pressing news and information in cultural, sport, and social projects, cooperation of nongovernmental organizations in the development of organizational communication, participation in cultural, sport, social, and environmental projects of the university, participation of citizens in cultural, sport, social, and environmental projects of the university | |

university services and products and regarding their roles to strengthen the university's communication with the business and market environment. Thus, they play a significant role in providing the financial resources needed by the university and increasing its financial independence. Moreover, educational, research and technological independence can increase the need for academic independence in administrative fields, which is due to the requirements imposed on the university to provide decent and consistent human resources. In the next step, administrative and financial independence can create more commitment to the management of risks in various functional aspects. This is owing to the greater authority and decision-making power of the university and its greater connection with the external environment. Risk management is naturally associated with new requirements in the field of evaluation, monitoring, and quality assurance of university performance; as a result, the level of the university accountability is expected to increase. In the next step, as a result of the increase in the university accountability, more tools are

| Monitoring | The establishment of a working group and specialized units of supervision in the university, supervising the strategic and operational plans of the university continuously, systematic monitoring of the progress of programs, supervising the quality of implementing council approvals, implementing the laws and instructions in all the areas of university activity, system inspection, designing a complaints management system, continuous monitoring to identify and deal with violations (embezzlement, unnecessary expenses, abuse of power, educational fraud, etc.), monitoring the level of cooperation among schools, monitoring the level of cooperation among departments | Kim (2008), Dobbins and Knill (2017), Loukkola and Zhang (2010), Van Dao and Hayden (2019), Yakubu et al. (2019) |
| Evaluation | Establishment of working groups of evaluation in the university, goal setting and planning to evaluate the educational, research, technology, infrastructure, cultural, social, student, sport, administrative, and financial performances of the university (by goals, criteria, indicators, standards, and length of evaluation periods), conducting purposeful evaluations, being process-oriented, evaluation independence, reporting the evaluations and doing the corresponding follow-ups, post-evaluation improvement plans | |
| Quality assurance | The establishment of quality assurance working groups or units in the university, determination of quality indicators and standards in the functional areas of the university, formulation of policies, instructions, and quality improvement processes in the functional areas of the university, implementation of quality audit services, setting up connections between the results of quality evaluation and the allocated budgets, receiving reports on the analysis of quality indicators from the educational, research, and technological units of the university, providing a suitable platform for external evaluation by specialized governmental and nongovernmental institutions, existence of executive instructions in order to guarantee the quality of the performance of the departments | |

expected to be used to make the university affairs transparent for the stakeholders, and these tools will have a positive effect on mutual accountability. In the final step, the general expectation is that, with the development of transparency tools, the scope and the quality of the transparency of the university increase. These factors, in turn, will affect the participation of the university stakeholders (Fig. 2).

## Conclusion

UG is of high importance in the competitive higher education market. Its dimensions need to be brought into the focus of decision makers and key governance bodies in third-generation universities. With regard to what is discussed in this entry, the issues brought up herein about a comprehensive and multidimensional model seem to

**Third-Generation University Governance Model Using Total Interpretive Structural Modeling, Table 5** UG dimensions (transparency)

| Indicators | Codes | Sources |
|---|---|---|
| Transparent information | Timely, comprehensive, accurate, comprehensible, measurable, comparable to the past performance, valid, up-to-date, relevant information Dissemination by the university among stakeholders | Sabandar et al. (2018), Sari et al. (2018), Quyên (2014), Ramírez and Tejada (2018) |
| Transparency tools | Establishment and development of university public relations unit, websites, newsletters, social networks, newspapers, quarterly reports, mobile-centered university software, seminars, annual lectures, the existence of job descriptions, bylaws and executive instructions related to the work affairs of the schools and departments of the university | |
| Scope of transparency | Education and research (ratio of academic staff to students, ratio of PHD students to bachelor students, ratio of PHD students to academic staff, ratio of university income to academic staff, the ratio of students' knowledge and skills to industry needs from the perspective of industry managers, educational and research equipment and facilities in the form of classrooms, workshops, laboratories, libraries, information technology centers, number of fields and faculties, curricula, ranks and academic positions of professors, university entry requirements, methods of evaluating student performance and length of courses, national and international rankings, approved university research projects, the status of project implementation, per capita articles published in scientific journals indexed in reputable scientific databases, rate of scientific citations), technology (number of knowledge-based companies established, number of registered intellectual property rights, rate of employment of knowledge-based companies, income of knowledge-based companies), infrastructures (civil engineering, technology management, Intranet and Internet), culture and sports (cultural halls and centers, participation in cultural programs, rituals, celebrations, customs, cooperation with people-oriented cultural institutions, sports facilities, sports equipment), society (scholarship, employment rate, poverty alleviation), environment (green space management, natural resources and energy consumption management), students (dormitory management, food supply, system), Approved university budget, revenue management, financial investments, loans and bonds in the form of independent auditor reports, annual internal audit reports in terms of the number, timing and content of reports) | |

be of novelty, compared to the previous studies just conducted on risk management and monitoring, evaluation and quality control. According to the findings of this study, UG dimensions can be considered at six hierarchical levels. Among these dimensions, the fundamental one is independence. As it has emerged, the most important component of university independence is educational, research, and technological independence. Furthermore, the stakeholder participation

**Third-Generation University Governance Model Using Total Interpretive Structural Modeling, Table 6** UG dimensions (risk management)

| Indicators | Codes | Sources |
|---|---|---|
| Financial | Reduction of financial resources, reduction of diversity of financing methods, reduction of government budget, failure to allocate government budget on time, investment resulting in devaluation of university funds | Huber (2011), Brewer and Walker (2011), Soin et al. (2014), Yudianti (2015) |
| Reputational | Possible abuse of the university brand, staff and student strikes, anti-university movements in the cyberspace by students, political and social consequences of staff behavior | |
| Operational | Entry of new educational or research competitors, legal ban on offering new training courses, decline in the quality of education (in terms of teacher mastery, appropriate curriculum and use of educational technologies) in accordance with the needs of the industry, educational fraud, bribery, reduced industrial relations and industry distrust of the university, incomplete research contracts and legal problems, reduced student demand for educational services, endangering the lives of animals and humans as a result of laboratory research, scientific fraud in academic research, lack of protection for university intellectual property, lack of cooperation and interaction among colleges and departments | |
| Administrative/ organizational | Selecting an unqualified human resource (including academic staff, administrative staff, researchers, managers), natural outflow of qualified human resources (including key managers, prominent academic staff, academic research specialists, and administrative staff), quitting jobs by qualified human resources (including key managers, top academic staff, academic research professionals, and the departure of academic staff), insufficient supervision and guidance of the departments in implementing the instructions of the risk management system, risks in construction projects, maintenance of buildings and equipment, information networks and web security risks, equipment theft, interruption or failure in the provision of electronic services and the Internet, risks within the university environment (transportation system, fire, contaminated food, use of alcohol and drugs, raping, murder, suicide) | |
| Environmental | Natural environment (all natural disasters), health (infectious diseases), legal issues (changing laws and regulations of the government and the ministry), political issues (political changes including revolution, coup and insurgency, sanctions and lack of access to information resources, no macro-organizational relations and joint academic educational and research projects, improper use of the available human resources and the human resources resignations due to political differences as a result of partisan changes), social issues (lack of freedom of speech in the university environment, change in the society's attitude toward buying university educational and research services), technology (lack of access to the latest educational and research facilities in the world), economic issues (recession, inflation, exchange rate fluctuations) | |

**Third-Generation University Governance Model Using Total Interpretive Structural Modeling, Fig. 2** Total Interpretive Structural Modeling of UG in third-generation universities

dimension and the scope of transparency and transparent information are found to be under the strong influence of the other components in the governance model. This implies that, in order to measure the effectiveness of the governance model of a third-generation university, the main indicators to consider are the level of the stakeholder participation in the governing body of that university, the scope of transparency and the amount of transparent information provided to the stakeholders. The study also suggests that educational, research and technological independence

can affect the process of monitoring, evaluation, and quality assurance of the university performance by helping the process of risk management. It is further found that monitoring, evaluation, and quality assurance indicators can enhance the level of accountability and, consequently, the scope of transparency as well as the quality of information available to the stakeholders.

# Threats to Free Expression in the Digital Age

Md Nurul Momen
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Comparative digitalization; Digital governance

## Definition

Free expression is a principle that supports freedom of an individual or a community to share their opinions without any fear, or legal censorship.

Freedom of expression includes freedom to hold opinions and ideas and to receive and impart information without restrictions by state authorities [Article 10: Freedom of expression].

Freedom of speech tolerates those with minority views and opinions that often speak to its performance on human rights more generally [Human Rights Watch].

## Introduction

Domestic constitution or national human rights law, generally, provides protection for free speech. Despite the protection of free speech through the regulatory framework, the increased use of the Internet in the recent times raises the question whether the traditional approach of protecting free expression is adequate (Joyce 2015). However, authoritarian regime has realized the potential of the Internet for citizens' empowerment; therefore from time to time, despotic government has worked to create a culture of fear in the Internet domain. It is worthy to note that the development of the Internet and the changing nature of media landscape has become an important place for global communication. However, the entry is to highlight the importance of free expression and its threats in the contemporary digital age.

## Freedom of Expression in the Digital Age

Global governance institutions and governments in the world have accepted the principle of freedom of expression and opinion as a fundamental human right (Dutton et al. 2011), which is also enshrined in Article 19 of the Universal Declaration of Human Rights (UDHR). However, freedom of speech is now under threat around the world. Autocratic governments, to various degrees, put restrictions or censorship on what is acceptable to say and what is not. On the other hand, ordinary citizens and activists demand that their voices should be heard in the digital age (Bollinger 2012).

Freedom House has identified three possible ways through which freedom of expression on the Internet can be censored (Dutton et al. 2011). First, obstacles or restriction to access to the Internet might be imposed by governmental regulation or economic conditions, such as absence of supportive Internet infrastructure; second, limits to digital content through the censorship of the government, or self-censorship imposed by the Internet industry itself; third, sanction on the rights of Internet users through (un)lawful disruption of Internet services (Dutton et al. 2011).

## Digital Age and the Conditions for Freedom of Expression

Revolution in the digital technologies has changed the global communication channel and impacts on freedom of speech. Under the authoritarian regime, the state often makes controversial principle with respect to free speech. Revolution in the digital technologies includes the development of communication networks and widespread availability of technologies that connect every part of the world for the purpose of distributing digital content (Balkin 2004). However, different laws for free speech in the digital age have created debates within academics, policy makers, and practitioners about the challenges and its implications (Mutu 2018). Advocates for the free speech on the Internet have raised questions over how regulatory framework obstructs freedom of expression

(Dutton et al. 2011). The autocratic government always does not see the benefits of the Internet for their political regime (Joyce 2015), thus limits free speech in the name of national security. It is stressed that the state needs to make a balance between freedom of expression and national security and it is further highlighted that freedom of expression will establish a more secure and stable community.

Internet surveillance is now observed in many authoritarian regimes, such as China, Iran, Bangladesh, etc., but also many countries across the world that have been the so-called promoter to the right of freedom of opinion and expression on the Internet. It is now revealed in the context of global communication platforms that show the widespread surveillance about citizen's affairs. The violations of human rights practices have, in fact, damage the credibility of free speech on the Internet (Joyce 2015). Due to surveillance of citizen affairs under authoritarian regimes in different parts of the world, it is stressed that the state actor must promote the international agenda on Internet freedom in society. In order to make borderless world, the state actors need to limit the expenses of the Internet uses as an affordable and must ensure citizens access to the Internet as global public good. As it is noted earlier, Internet freedom assists citizens to improve their global communication around the world (Joyce 2015). Looking at the cyberattacks by Russia on independent regional states and the surveillance of the NSA on citizens' affairs in the USA, in 2014 it has been highlighted the Internet freedom in society by the former UN Secretary-General, Ban Ki-moon, opined in a forum on Internet security in Estonia that:

> I am disturbed by how States abuse laws on Internet access. I am concerned that surveillance programs are becoming too aggressive. I understand that national security and criminal activity may justify some exceptional and narrowly-tailored use of surveillance. But that is all the more reason to safeguard human rights and fundamental freedoms. Some argue that they need to curtail freedoms to preserve order. I say they need to protect freedom or they will undermine order. (Video message to the fourth Annual Freedom Online Coalition Conference: Free and Secure Internet for All, 28–29 April 2014. www.un.org/sg/statements/index.asp?nid=7634)

The Arab Spring using social media network through the use of the Internet have illustrated the capacities for a successful political movement and social change (Hintz 2012). However, it is found new sets of policy and legal framework introduced around the world that confronts with the Internet freedom in society. More specifically, online social communication across the world now challenges to authoritarian regime; therefore, the illiberal democratic countries make surveillance through the content restrictions. Furthermore, defenders to free speech are always under pressure by the authoritarian state, they are being challenged for their free speech through physical violence, brutality, and other forms of political repression.

However, citizen-based journalism is not a new phenomenon in the world today. Community and groups have created online platform, blogging sites, community radio and TV, and the other forms of communicative network, such as posters, music, video, theater, etc. Furthermore, there are many cases found in the world that have played a significant role in political and social movement for positive changes at local level. For instance, incidence of the cassette tapes in the earlier stage of digital revolutions in the Middle East, and the Samizdat movement in the former Soviet bloc, can be provided as example (Hintz 2012). Over the past decade, different social media network advances democratization process, thus political and social changes have been observed around the world. For instance, at the early stage of digital revolution, the use of SMS for democratic movement in Spain and in the Philippines in the early 2000s and social networking platform, such as Twitter and Facebook in Iran, Moldova, and others (Hintz 2012), have shown that social network creates a frustration to the authoritarian regime. Furthermore, during the Arab Spring, in Tunisia, Egypt, and elsewhere, social media claims for citizen's movement (Hintz 2012). It is pointed out that social media and other forms of the uses of online platform supports "citizens to report news, expose wrongdoing, express opinions, mobilize protest, monitor elections, scrutinize government, deepen participation, and

expand the horizons of freedom" (Diamond 2010, p. 70).

In the current democratic protests in Hong Kong started in June 2019, young adults use the Internet, social network platform, and mobile communication that have been an important tool for citizens' movement. The Internet allowed citizens for the establishment of different civic forums for shared criticism over the social and political environment (Khamis and Vaughn 2011). The Internet supports in mobilizing citizens' movement, organizes their activities, and generates an avenue for developing criticisms against any undemocratic decisions or practices. Thus, the Internet and social media have become an effective tool for any social and political changes. It is stressed that the Internet trigger for a free society. Given the conditions, an Egyptian activist, Wael Ghonim: "If you want to free a society, just give them Internet access" (Khamis and Vaughn 2011), although some political analysts and commentators are quite cautious and skeptical about the Internet freedom, pointing to a "functional differentiation" (Wagner 2011).

It is always highlighted the freedom of opinion and expression in society for democratic changes in authoritarian countries. As it is commented by Gunilla Carlsson, Swedish Minister for International Development Cooperation that "net activists are the new democracy fighters" (Christensen 2011: 234), therefore, many development partners or organizations to the third world countries have shown their strong commitment for promoting freedom of expression for global democratic changes (Christensen 2011). It is important to note that staying in a long distant place, international observers are sometime quite aware about local events than local people; therefore, many conservative regime around the world is used to tight their grip on power using online surveillance to detect and arrest anti-government activists (Hofheinz 2011).

*Polarization, Intimidation, and Harassment of the Internet Users.* Many governments in the world have introduced regulatory measures for bloggers and journalists in order to legitimize their crackdowns in online free speech. Shahbaz (2018) ranked Egypt as the third in the world for the number of journalists who have been imprisoned. As a part of restriction in online expression, new law passed in 2017 requires all social media users with more than 5,000 followers to manage permission from the Higher Council for Media Regulation. In the same tune, in Cambodia, as a part of the requirement of the directive passed in July 2018, all web addresses must be registered with the Ministry of Information, if any violation of the directive, users might be imprisoned up to 2 years for citing fake news online. In case of social media, in June 2017, China introduced new legislative framework that block some accounts of social media from further posting anti-government news, while in the same year, Telegram groups in Iran with over 5,000 followers are now required to register with the concerned regulatory agency (Shahbaz 2018).

Over the 12 months (January–December, 2018), many repressive regimes used to cut off Internet access on the ground that user are spreading fake news and hate speech. Especially, there are many instances in the South Asia of temporal shutdown of Internet access or blocked social media sites (especially Facebook) during the protests of the opposition, justifying that the measures were necessary to stop the online incited outbreaks of violence. It is of worth to note that India has been the highest number of Internet shutdown country in the world, with more than 100 reported incidents of the Internet shutdown in 2018 alone (Shahbaz 2018).

On the other hand, social media can also motivate citizens into polarized environment; as a consequence, it fuels the hostile environment. False and partisan information online may produce a significant impact on polarized environment. For instance, social media accounts were polarized with false news during the presidential election campaign held in 2016 in the USA, when Russian-controlled social media accounts was involved in providing false information for predominantly supporting to Donald Trump over Hillary Clinton. However, in January 2017, the US intelligence agencies found that Russia intervened the presidential election campaign which undermines integrity of 2016 election. The US intelligence agencies also concluded that Russian intelligence unit had illegally targeted

and hacked into some of the US web domain of important organizations which maintain voter rolls; however, later on, Russian intelligence unit leaked the hacked information to third parties (Freedom House 2017).

Many countries in the world have moved toward digital authoritarianism by adopting the Chinese model of the Internet censorship. Based on the consecutive 3 years report (2016, 2017, and 2018) from Freedom House that many authoritarian governments have introduced criminal penalties for the expression online of what they perceive fake news. For example, in the Middle East, South Asia, and North Africa, online activists often faced intimidation, in extreme cases; they even faced political repression, brutality, torture, and enforced disappearance (Momen 2019). In 2018, 13 countries in the world prosecuted dissident individuals for citing information which went against the regime (Shahbaz 2018). Added to that, in 2016 alone, at least 38 journalists were imprisoned in China, 34 of whom contributed and shared ideas and information online (Committee to Protect Journalists 2016). However, Article 35 of the Chinese constitution guarantees freedoms of expression, but this right is said to be vested with the Chinese Communist Party's (CCP) power; furthermore, the constitutional right to freedom of expression cannot generally be challenged in the judiciary (Momen 2019).

## Conclusion

Freedom of expression in the digital age is now getting less free globally; as a consequence, democratic consolidation process is under threat. Many individuals under the authoritarian regime have been imprisoned for their dissent views on the Internet, including members of opposition parties, human rights defenders, and religious and ethnic minorities. Many governments around the world restrict freedom of opinion and expression on the Internet. Especially authoritarian regime creates *obstacles to access* Internet by introducing legal and ownership control and establishing regulatory bodies. Authoritarians also limit on the Internet content by blocking or technical filtering of web addresses, which violate freedom of expression online.

# Three Hundred Sixty-Degree Assessment

Chaitra M. Hardison
Pardee RAND Graduate School, RAND Corporation, Santa Monica, CA, USA

## Synonyms

360-degree assessment; Multi-rater assessment; Multi-rater feedback; Multisource assessment; Multisource feedback

## Introduction

Put simply, 360-degree feedback is employee performance feedback information collected from multiple sources, such as superiors, subordinates, peers, and customers. It serves as one way for employers to provide employees with a better understanding of how they are performing on the job. The basic premise behind 360-degree feedback is that by soliciting feedback from multiple sources an employee receives a more complete picture of their performance. This assumes that direct supervisors are not able to view all aspects of an employee's performance and that others who regularly interact with the employee can offer unique and valuable insights. For supervisory, management, or leadership positions, where interpersonal interactions with peers and subordinates are a central component, the views from below, for example, can be particularly relevant.

Three hundred sixty-degree assessments, having grown in popularity over the last few decades, are now in use in many organizations in some form or another. Matching that rise in popularity, there is now no shortage of 360-degree assessment tools being marketed to organizations, but not all are worth the investment. Although there is no single appropriate form for a 360-degree assessment to take, researchers have identified a series of important design considerations when developing 360-degree assessments. Careful attention to those design features is vital for ensuring the feedback is sound and effective. The following sections describe several of those design features. They also provide greater detail on typical features of 360-degree assessments, discuss some of the controversy surrounding the use of 360-degree assessments, and explore why 360-degree assessments are not always a worthwhile investment.

## Defining 360-Degree Feedback

A defining feature of 360-degree feedback is that the feedback has been solicited from multiple points of view, not just the employee's direct supervisor, as is typical of more traditional employee performance assessments. Although the term 360-degree feedback is often used interchangeably with multisource (or multi-rater) feedback, some (e.g., Foster and Law 2006) have argued that 360-degree feedback should be viewed as merely one type of multisource feedback. Under this stricter definition, multisource feedback that includes fewer sources (such as just peers and supervisors) or alternative sources (such as customers or clients) would not technically constitute 360-degree feedback. That is, 360-degree feedback would be limited to only feedback that is solicited from self, peers, superiors, and subordinates, as illustrated in Fig. 1. Nevertheless, many organizations and researchers continue to use the term 360-degree feedback to refer to all multisource feedback tools even when it strays from this strict definition.

## Design Considerations

There is no ideal 360-degree feedback design. Nevertheless, there are features of the design process that clearly distinguish well-designed 360-degree assessments from poorly designed

**Three Hundred Sixty-Degree Assessment, Fig. 1** Traditional sources of 360-degree feedback

ones. For example, well-designed 360-degree assessments are built with careful attention to the following:

- *Linking assessment content to a job analysis*. Which dimensions are most appropriate to include in the 360-degree assessment should be determined, at least in part, based on what dimensions are required on the job. This is especially relevant when the feedback will be used for personnel actions.
- *Aligning it with the organization's goals and values*. For example, if the organization aims to use the tool to develop their leaders, the design features selected should support that use (e.g., keeping ratings anonymous, keeping feedback confidential, offering one-on-one coaching). Additionally, if the organization has a clearly specified set of values it expects leaders to follow, including items, evaluating a leader's adherence to those values would make sense.
- *Establishing buy-in from leadership, raters, and ratees*. If the culture and climate in an organization is not supportive of a 360-degree assessment, it will likely not prove useful.
- *Designing valid and reliable survey items*. Psychometric measurement properties of the assessment should be considered and explored during the development process.
- *Pilot testing the instrument*. A pilot test can help improve the tool and identify potential problems before it is officially launched. For example, it can be used to explore how much time raters spend completing it, user reactions to the tool, poorly worded or confusing items, gaps in content, or dimensions that are not applicable to the job in question.
- *Measuring effectiveness*. As discussed further below, not all 360-degree assessments are successful at improving behavior. Including measures of the impact of 360-degree feedback on performance can be critical to determining whether the tool is a success.

There are also numerous design decisions that need to be made along the way. In many cases, some approaches or design features are more strongly supported by experts than others, but the best choice will also often depend on the organization's goals for the 360-degree assessment. The following are just a few examples of the types of design decisions that need to be made:

- *Purpose (developmental vs. evaluative)*. An organization should decide in advance whether the assessment is going to be used for development, personnel actions, or both. Experts are generally more likely to recommend using 360-degree assessments for development than for evaluation. However, it is possible to use 360-degree assessments for evaluative purposes. See below for more discussion on this.
- *Performance dimensions to be assessed*. The dimensions of performance to be assessed in the 360-degree assessment should be clearly defined and items should be designed to tap those dimensions. The dimensions identified should be job relevant (i.e., they should apply to the job in question), observable by others, and (as noted above) tied to the organization's goals for the assessment.
- *Number of items*. The number of items should depend on the number of performance dimensions to be evaluated as well as the total time to complete the rating tool. There should be

enough items such that each dimension is measured adequately, but the tool should not be so long that raters are unwilling to complete it thoughtfully.

- *Rater selection*. Raters are commonly selected randomly, nominated by an employee's supervisor or nominated by the ratee. When used in personnel actions, random selection or selection by a supervisor can help ensure fairness of the ratings. For developmental 360-degree assessments, however, allowing the supervisor or ratee to nominate others can be useful especially if they choose people who they believe will have constructive or informative responses. Nonrandom selection does, however, make comparison of average ratings across ratees less informative, as each ratee or supervisor may use different criteria to select the raters. Regardless, raters who have had sufficient opportunity to observe the individual's performance in the domains of interest should be targeted.
- *Minimum number of raters*. Three hundred sixty-degree assessments often require a minimum number of subordinate or peer raters before results will be disclosed to the ratee. This serves two purposes. First, if anonymity is being promised to raters, then establishing a minimum number of raters can help protect that anonymity. Second, raters – even within the same rater type (e.g., multiple subordinates or multiple peers) – often disagree about a ratee's performance. This can occur for any number of reasons (not having had an adequate chance to observe their performance, observing different aspects of their performance, interpreting the rating scales differently, etc.). As a result, ratings from multiple raters are typically collected and averaged to achieve a more reliable and ultimately valid impression of someone's performance. Although establishing a minimum is recommended, there is no clear consensus on what that minimum number of raters should be.
- *Coaching*. The goal of coaching in a 360-degree assessment is to help the employee use the feedback to create lasting improvements in their performance. Experts agree that one of the keys to ensuring that 360-degree assessments are effective at improving performance is to include the use of trained coaches, regardless of who provides the coaching. Some 360-degree feedback efforts offer one-on-one coaching with someone external to the organization, some provide in-house trained coaches, and some rely on supervisors to serve as the coaches.

## Using 360-Degree Feedback for Development Versus Evaluation

Three hundred sixty-degree feedback was originally designed for the use as a development tool; however, increasingly organizations are using it for personnel actions (such as pay raises, promotion decisions, annual performance reviews, etc.) as well. This runs counter to recommendations by experts who typically strongly advise against using 360-degree feedback for personnel actions and instead recommend that it continue to be used solely for developmental purposes.

The primary reason that experts advise against using 360-degree assessments for personnel actions is that it can undermine people's willingness to provide honest feedback. If raters do not feel comfortable providing honest feedback about an employee, then the feedback may end up being useless. When performance ratings are provided from the top down, as in traditional performance appraisal systems, there is far less concern that honesty will be impacted. However, when peers and subordinates are asked to provide ratings they know will lead to high-stakes personnel actions (such as changes to the person's pay or potential for promotion), they may be motivated to alter their ratings to varying degrees.

In some cases, the resulting ratings may be too lenient, and in other cases, they may be too harsh. For example, peers might inflate ratings of those they consider friends; on the other hand, they might rate employees that they view as

competition more negatively. Ratings by subordinates face similar issues. For example, they may provide higher ratings out of fear of retaliation or to earn a supervisor's favor. Alternatively, they may provide excessively harsh ratings to retaliate for a supervisor's actions against them. Given these ulterior motives, when ratings from these sources are intended for use in high-stakes decisions, they are questionable at best.

In spite of the expert cautions, however, many organizations do use 360-degree feedback for more than just development. For example, a 2013 survey of organizations that use 360-degree assessments (see 3D Group 2013) suggests that while very few use them exclusively for personnel actions, about a third use them for both development *and* personnel actions. And such mixed use (i.e., use for both development and personnel actions) can be even more problematic than using it for personnel actions alone.

For example, it can be especially problematic when an organization starts out offering 360-degree assessments solely for development but changes the purpose later. Employees often grow to like 360-degree assessments for development, when they trust that the results will be used solely for that purpose. If, however, employees believe that a 360-degree feedback tool is being used for developmental purposes, only to discover later that the company intends to use it for more than that, they can feel that their trust has been violated. Once that trust in the process is lost, raters may be less likely to provide honest ratings or to provide ratings at all. Such loss of trust in the process is one way that 360-degree assessments lose their value over time. Once that trust has been lost, it can be very difficult to regain it, even if the organization decides to return to a development only model.

## Arguments Against Using 360-Degree Feedback

Although their use is widespread, there are several legitimate reasons that an organization may opt not to pursue a 360-degree assessment. First, as noted previously, there are strong criticisms of the use of 360-degree feedback for personnel actions, some of which center on the fact that rater honesty can be compromised. As discussed above, when results of 360-degree assessments are high stakes (e.g., when they factor into annual performance reviews or are used for raises, bonuses, or promotions), raters may manipulate their ratings of others out of fear of retaliation or for personal gain. Supervisors can also attempt to even the score with subordinates who provide negative ratings in a variety of ways – demoting them, transferring them, giving them less desirable assignments, or even firing them.

Keeping ratings anonymous can help mitigate these issues; however, it cannot eliminate them. For example, some may still fear that their ratings will be identifiable by inference, even if rater identities are not disclosed, and toxic leaders may still take punitive action against suspected subordinates, regardless of whether or not they did, in fact, provide negative ratings. In addition, when ratings are anonymous, it can be difficult for an employer to successfully defend a personnel action, in the event that it is challenged.

But, even for development, their value is not always guaranteed. As a result, experts caution that 360-degree assessments need to be designed and used thoughtfully. The biggest issue experts point to when cautioning against overuse of 360-degree assessments or use of poorly designed ones is cost.

Using off-the-shelf tools can help defray some of those costs; however, they may not be aligned with an organization's unique culture or goals, which could reduce the relevance and usefulness of the tool and undermine buy-in from participants. As a result, many organizations choose to build their own. But creating the tool – building the survey interface, deciding how to display the results, etc. – can be expensive.

There are also administration costs. Requests for rater inputs, assistance with an online interface, monitoring the rating process timeline, establishing policies to protect anonymity, training raters, fielding questions, etc. – these are all examples of factors that have to be managed as part of a 360-degree feedback effort.

Another cost consideration is coaching. One-on-one coaching for a few employees could be a reasonable expense; however, as the number of employees receiving 360-degree feedback increases, the cost of coaching increases as well. For that reason, many organizations forgo one-on-one coaching. Unfortunately without such coaching, 360-degree feedback may be ineffective at encouraging behavior change, which would make justifying the other, potentially very large costs associated with the tool difficult.

But by far, the largest cost incurred during the administration of 360-degree assessments is the time spent by the raters. The process of completing a 360-degree feedback form can be time intensive, particularly when it solicits written comments in addition to numerical ratings and when the raters take the time to be thoughtful in the ratings and review comments. Add to that the fact that multiple peers, supervisors, and subordinates are asked to contribute to each person's 360-degree assessment, and the number of man-hours spent on reviews can add up quickly.

## Effectiveness

Although many organizations have adopted 360-degree assessments, research suggests they may not always be effective at changing employee behavior (Bracken and Rose 2011). While experts recommend that organizations measure effectiveness of their 360-degree feedback efforts, most organizations do not follow through on that recommendation. That is, 360-degree assessments are often designed and implemented without a plan for evaluating their success. As a result, data are not typically available to explore this issue. Instead, most organizations focus their evaluation efforts exclusively on whether users (raters and/or ratees) are satisfied with the process. Research does show that employees typically respond positively to 360-degree assessments that are well designed, aligned with the organizations goals, and administered for developmental purposes. They tend to respond more negatively to them when they are used for personnel actions or are excessively time-consuming and burdensome for raters to complete.

## Conclusion

Three hundred sixty-degree assessment can be a useful form of employee developmental feedback; however, its effectiveness can hinge on how carefully the tool is designed and how well it is tested. The sections above included examples of several key design features to attend to and decisions to be made about them. Given that such design features can ultimately make or break the success of a 360-degree feedback effort, involvement of experts – especially those knowledgeable about psychological measurement principles (i.e., validity and reliability) – in the design process is important for ensuring a successful 360-degree feedback effort. Implementation of 360-degree assessments for personnel actions is generally not recommended, at least not until an organization has thoroughly considered the consequences and challenges that come with such an implementation.

Given the expense associated with a well-designed instrument, when organizations do decide to implement them, they should use them sparingly, especially if effectiveness of the tool has not yet been demonstrated. This issue of cost is particularly relevant for consideration in public administration contexts as taxpayer dollars are at stake and good stewardship of resources is expected. On the other hand, well-designed 360-degree feedback tools could, in fact, provide unique and valuable insights for developing our public servants. As such, the potential benefits of 360-degree feedback in public administration contexts should not be dismissed simply because it can be expensive. Instead, the cost of a 360-degree assessment should be one of many factors weighed in the decision to proceed.

# Total Quality Management

Patria de Lancer Julnes
Penn State Harrisburg, Middletown, PA, USA

## Synonyms

Quality management; Total quality control

## Definition

TQM is an organization-wide, integrative effort to continuously improve the quality of an organization's products or services and fully satisfy the needs and wants of their customers/clients.

## Introduction

Total quality management (TQM) has a long but spotty history, filled with false starts and great achievements that can be traced back to the American factories of the early 1900s. The emergence of mass production and concomitant need for standardization and cutting waste drove factories to emulate laboratories testing the scientific approach to improve productivity and efficiency. This era saw the emergence of both Frederick Taylor's brand of scientific management and quality control (QC), the forerunner of TQM. However, unlike scientific management, the QC approach concepts and techniques received only sporadic attention in the United States (USA). QC figured prominently in the USA at the height of military production during World War II but then declined. It was in post-World War II Japan that QC was first widely implemented.

QC remained underdeveloped in the USA not evolving into TQM due in part to lack of involvement of management. The perception was that ensuring quality products was the exclusive responsibility of quality control departments with heavy emphasis on statistical controls (Deming 1982; Feigenbaum 1951). It wasn't until the 1980s, with more than 20 years of accumulated success in the Japanese industry and fear that the Japanese would overtake American industry, that a more management-based version of quality control, TQM, gained a broader audience in the USA. The most prominent figures in the history of QC, and subsequently TQM, are in the USA, Walter A. Shewhart, W. Edwards Deming, Joseph Juran, and Armand Feigenbaum and in Japan, Kaoru Ishikawa.

In the public sector, the implementation of TQM coincides with the rise of the New Public Management (NPM) movement in the 1980s. This movement emphasized private sector approaches to increase government performance.

### What Is TQM?

The term TQM is believed to have been first introduced by Armand Feigenbaum in 1983. This modern-day version of quality control efforts is now understood as a process and a philosophy for ensuring the quality of an organization's products and services and can be characterized as follows:

- Total: implies that everyone, every department, and every function in the organization are involved and focused on improving the quality of all the organization's activities.

- Quality: implies conforming to and exceeding all requirements. These requirements are set by the customers, who are the ultimate judges of quality.
- Management: implies that achieving total quality does not happen by accident. Instead, it requires deliberate and continuous efforts at all stages of the production process and is led by management.

What follows describes the evolution of TQM from its QC foundation to modern times. This evolution is presented in chronological order and shows the major actors, events, concepts, and ideas that led to this management philosophy.

## From Quality Control to Total Quality Management

### Foundation: Quality Control 1900–1940

TQM was born out of the application of statistical quality control systems (QC), including control charts and the quality circle, developed by Dr. Walter A. Shewhart. He was a statistician, physicist, and engineer who started his work in 1918 at the Western Electric Company's Hawthorne plant in Cicero, Illinois, and remained there until 1927 when he went to Bell Laboratories.

Shewhart recognized that the quality of a product is inherently attached to the value that the consumer gives to the product and so is based on the characteristics of the product that consumers perceive as important. Accordingly, these perceptions should guide organizations to standardize their products and maintain the standards of quality toward which they would strive. For Shewhart and those who followed, statistical control methods, including measurement and sampling as well and the isolation of causes of variability, can help industry ensure quality, improve productivity, and reduce cost. This initial application of statistical methods to address these issues in industry is marked by Shewhart's introduction of the quality control chart in 1924, which allows for the plotting of data to study how a process changes over time in relation to preestablished tolerance limits of variation. The use of the quality control chart also sealed the importance of data in quality management – for analysis, prediction, presentation of results, and decision-making.

In his book *Economic Control of Quality of Manufactured Product*, first published in 1931, Shewhart laid the foundation for defining quality, the scientific basis for controlling quality, the economic advantage of controlling quality, and the application of statistical methods for achieving quality control and, ultimately, achieving customer satisfaction. Shewhart believed that through the application of statistical methods to routine systems of production, industry could fulfill its purpose of meeting human wants in an economical way. Key to this was the need to minimize variability of the products by setting up quality control thresholds at every stage of the production process, from start to finish. This would then reduce the cost of product fluctuation, inspection, and rejection.

In 1939 Shewhart introduced the three steps of control – specification, production, and inspection or "judgement of quality," which he believed represented "a dynamic scientific process of acquiring knowledge" (Shewhart 1939, p. 45). These steps came to be known as the Shewhart cycle and later popularized as the Deming cycle in Japan (Deming 1986).

Further, Shewhart was an important influence on both W. Edwards Deming and Joseph Juran and often collaborated with Deming. Both Deming and Juran worked at the Hawthorne plant. Remarkably, this was the same plant where the scientific management studies that led to the Human Relation School were conducted.

The use of statistical methods for quality control continued to develop and disseminate through the 1930s as manufacturing became more complex, increasing the need for skilled individuals to perform quality inspections and to learn to minimize variation throughout the production system. Looking back, history shows Deming playing an important role in the dissemination of statistical methods training. While he was in charge of math and statistics courses at the graduate school of the US Department of Agriculture, he invited some of the luminaries of statistics to give lectures. One of

these was Shewhart, who was interested in making statistical control techniques accessible to workers and focused his training on the practical use of statistics in the production process.

### Quality Control During World War II (the 1940s)

The ideas about quality improvement were elaborated and received a tremendous boost during World War II when American manufacturing personnel received training on the use of statistical methods to improve the quality of military products and processes. Both the training in these methods and the war figure prominently in the evolution toward TQM. Key actors during the 1940s included the War Production Board whose work focused on promoting and supporting training to American industries and Deming, who was among those who provided the training.

Also during this time, after leaving Western Electric Company, Joseph Juran, another proponent of the use of statistical controls, joined the government's Land Lease Administration. In this capacity he improved the efficiency of processes so that oversea allies could receive supplies in a timely manner. Others also focused on promulgating statistical controls including Ellis Ott, Harold Dodge, Harry Romig, and Eugene Grant (Watson 2005).

Moreover, during World War II a 23-year-old Armand Feigenbaum supported the war effort and continued to build the foundation for what would become TQM. Feigenbaum was made manager of quality control at the General Electric's (GE) Schenectady plant in New York. This plant built the bulk of the propulsion equipment required during the war for cruisers, aircraft fighters, vessels, and submarines (Watson 2005; Schenectady Public Library 2015). Through his work here, Feigenbaum expanded and further refined the QC concepts to develop what he came to call total quality control (TQC), described below.

### Post World War II: Total Quality Control and Reconstruction in Japan

A 1950s version of QC methods with a more holistic approach, closely mirroring some of the characteristics of modern TQM, was total quality control, TQC, a system-engineering approach introduced by Armand Feigenbaum in his 1951 book *Quality Control*: *Principles, Practice and Administration*. The TQC approach was later refined and elaborated in the Feigenbaum (1961, 1983) republication of this book with the title *Total Quality Control*. Feigenbaum (1951) introduced a set of 37 principles for establishing quality control programs based on "experiences with total quality control" (p. 1). The first principle was a definition of TQC as "an effective system for integrating the quality-development, quality-maintenance, and quality improvement efforts of the various groups in an organization so as to enable production and service at the most economical levels which allow for full customer satisfaction" (1951, p. 1). Watson (2005) summarizes the basic tenets of Feigenbaum's approach to quality as follows:

- Quality is an organization-wide process.
- Quality is what the customer says it is.
- Quality and cost are a sum, not a difference.
- Quality requires both individual and teamwork zealotry.
- Quality is a way of managing.
- Quality and innovation are mutually dependent.
- Quality is an ethic.
- Quality requires continuous improvement.
- Quality is the most cost-effective, least capital-intensive route to productivity.
- Quality is implemented as a total system connected to both customers and suppliers.

Feigenbaum continued to develop and implement TQC as a senior executive at GE, both in the USA and in Europe and Japan. Concurrently, Edwards Deming and Joseph Juran conducted training on the application of statistics to quality improvement for Japanese industry workers, managers, researchers, and engineers (1950 and 1954, respectively). The Japanese Union of Scientists and Engineers (JUSE), which focused its efforts on the reconstruction of Japan's economy after the war, invited them to deliver lectures and provide training on QC.

By the time Deming and Juran arrived, the Japanese had already begun to study quality and the application of statistical methods for quality control of customer goods. They had been exposed to "the men from the Bell Laboratories [who] explained to members of JUSE that statistical methods had improved accuracy of American weapons" (Deming 1982, p. 100).

When Deming visited Japan in 1950, he delivered numerous lectures across Japan. It was during one of his lectures with top management that Deming also introduced a chart showing production as a system and argued that quality improvement involves the entire production line (Deming 1982). It was also during this time that he popularized the use of the Shewhart cycle referenced earlier.

In his 1982 book *Quality Productivity and Competitive Position* (later refined and republished as *Out of the Crisis* in 1986), Deming lamented that while the application of statistical methods gained great importance in Japan's reconstruction efforts and eventually led to the unparalleled success of the Japanese economy, in America by 1950 the "Brilliant applications burned, fizzled, and died out" (p. 101). Discussion of quality control and improvement in mainstream America had to wait until the 1980s. Nevertheless, the American Society for Quality Control (ASQC), now the American Society for Quality (ASQ), was born in 1946 out of the quality efforts implemented during World War II and has continued in existence since then with a mission to uphold standards of quality and promote innovation in quality.

For his part, Juran spread the philosophy that achieving quality required both technical and managerial involvement but that the main responsibility for quality lies on upper management and their application of the management process based on "the quality trilogy": planning, control, and improvement (Juran 1988, p. 35G.8). This philosophy was a radical departure from previous quality improvement practices, which assigned the responsibility for quality control to specific quality control departments and was confined to manufacturing and quality inspection.

After the visits of Juran and Deming, and between the periods of 1955 and 1960, Kaoru Ishikawa introduced the term company-wide quality control (CWQC), a version of total quality control (Ishikawa 1985). This version decentralized quality control and spread the responsibility on the entire organization. With CWQC, Japanese companies started to deemphasize the application of statistical methods and techniques as the main approach for quality improvement in favor of a broader approach that combined these methods with organizational-wide strategies and managerial methods (Strang and Kim 2009). The lectures by Juran led to the expansion of the concept of quality control to all the areas and branches of the company (Juran 1988). Thus, a main difference from Feigenbaum's version of TQC, as explained by Ishikawa (1985), was that while Feigenbaum advocated TQC be conducted by QC specialists, in Japan all units and employees became involved (p. 90).

Moreover, building on the teachings of Deming and Juran, in the early 1960s, Ishikawa also introduced quality circles, which became a component of the quality improvement practices in Japan and later in the USA. These were small groups of employees (5–10) that performed similar jobs, coming together periodically to study and discuss production-related problems, identify causes of the problems using simple statistical techniques, including the Ishikawa diagram (fish and bone diagram), and suggest and carry out solutions to increase productivity and quality. By combining the application of statistical methods/tools with employee participation in the company's decision-making process, this made quality control "everybody's business in an organization" (Sengupta 1987, p. 54).

Quality control circles, as initially dubbed by Ishikawa, were characterized by voluntary participation (*jishusei*, Lillrank and Kanö 1989) in that workers were not coerced or mandated to participate but by themselves "initiated and sustained the effort" (Ishikawa 1985). The groups were often led by a foreman or supervisor. Through its magazine *Quality Control for the Foremen*, JUSE promoted the approach among Japanese workers,

adopting the slogan "QC circle members – Let's study!" (Ishikawa, preface to the original edition, 1986), providing instructional material for studying and training on quality control methods, and organizing lectures and conventions where workers could learn from each other. The number of registered QC with JUSE went from three in 1962 to a staggering 148,106 by 1982 and 1,205,780 registered members in the late 1980s, spreading rapidly throughout Japan's industry at a registration rate of about 1000 circles a month (Cole 1980; Juran 1988).

### 1980s Onward: Rebirth of the Quality Movement in the USA and Emergence of Total Quality Management

The ideas and methods for improving quality, first developed in the USA and then elaborated and applied in Japan with spectacular results, circled back to the USA at a time when American manufacturing was in decline. The rebirth of the quality movement evolved into the concept we now know as TQM. Although TQM is often associated with Deming, the first person to use the term TQM to describe an inclusive organizational-wide approach to quality control was Feigenbaum (Watson 1995). In the 1983 version of his *Total Quality Control* book, Feigenbaum described the organization-wide impact of a total quality control approach as one that "deepens the work and the very concept of quality control. . .. [P]ermits what might be called *total quality management* [emphasis in original] to cover the full scope of the product and service 'life cycle' from product conception through production and customer service" (p. 14).

Through the years a number of American companies and government organizations had experimented, with varying degrees of success, with the different strategies of the quality movement widely popularized in Japan. However, by all accounts, the reemergence of the interest in quality improvement in the USA was an attempt to respond to the success of the Japanese quality revolution (Juran 1988).

By the 1980s this "revolution" in Japan threatened American manufacturers and the national economy. By then it was widely believed that American products were no longer competitive (Deming 1982). Investing in producing quality products, reducing the cost of "unquality things," and implementing zero defects began to be promulgated as a way to improve profits (Crosby 1979, p. 1). Similar to the 1900s, the 1980s were characterized by a need to reduce waste. By turning waste into better product and services, the company would unleash a chain reaction that would result in "lower cost, better competitive position, happier people on the job, jobs, and more jobs" (Deming 1986, p. 2). Also, though not a new idea, the notion that everyone in the organization, all the way from top management to frontline employees, has a role in quality improvement finally started to take hold in business strategy.

Sounding the clarion call for the need for transformation of management in American industry to stay competitive, Deming (1982, 1986) proposed a set of 14 points. These have now become equivalent to TQM, though not originally presented as such (Deming 1982, pp. 16–17, p. 30):

1. Create constancy of purpose toward improvement of product and service.
2. Adopt the new philosophy.
3. Cease dependence on mass inspection.
4. End the practice of awarding business on the basis of price tag.
5. Constantly and forever improve the system of production and service.
6. Institute modern methods of training on the job.
7. Institute modern methods of supervision (leadership).
8. Drive out fear.
9. Break down barriers between staff areas.
10. Eliminate numerical goals for the work force.
11. Eliminate work standards and numerical quotas.
12. Remove barriers that hinder the hourly worker.
13. Institute a vigorous program of education and training.
14. Create a structure in top management that will push every day on the above 13 principles.

These 14 points share similar ideas as the 37 principles promulgated by Feigenbaum. According to Deming (1982), these points formed the basis of the system of management implemented in Japan post World War II.

The imperative for American firms to implement such quality management systems was elevated when in 1987 the US Congress established the Malcolm Baldrige National Quality Award. This award, equivalent to the Deming Prize established in Japan by JUSE in 1950, recognizes excellence in seven quality management domains: leadership; strategic planning; customer focus; measurement, analysis, and knowledge management; human resource development and management; process management; and results.

The management literature suggests that the adoption of TQM in the USA was rapid and widespread from the mid-1980s through its peak in the mid-1990s and then experienced a rapid decline in popularity (Strang and Kim 2009). TQM was enthusiastically endorsed in industry and government by President Bush who touted the approach as "'Reasserting our leadership'" (Carr and Littman 1990, p. 2, quoted in Swiss,1990, p. 356). But the efforts to promote TQM in government did not go unopposed.

One of the most oft-cited critiques of TQM was delivered by Swiss (1992), who argued that Deming's version of TQM, which he called "orthodox TQM," was not suitable for application to the public sector. Swiss believed that the manufacturing foundation of TQM made it difficult to adapt to organizations that produce services. Furthermore, unlike private companies, government cannot readily identify its customers. As such, the basic tenet of customer satisfaction could not be fulfilled. Swiss also worried that Deming's orthodoxy, with its emphasis on inputs and processes, would lead to goal displacement. Finally, Swiss argued that the turnover of high-level government executives made it difficult to create a culture of continuous quality improvement, a requirement for successful implementation of TQM. However, Swiss recognized some value in TQM. He encouraged public sector organizations to implement a modified version of TQM that retained customers' feedback, the tracking of performance, continuous improvement, and employee participation as guiding principles. Swiss may as well have been foretelling the fate of TQM in the public sector. TQM per se was enveloped in the New Public Management movement.

Although the principles and values identified by Swiss continue to be promoted, the language of TQM in government has been replaced by practices promulgated by the National Performance Review, with its emphasis on a citizen/customer orientation in government and cutting waste; the Government Performance and Results Act (GPRA) of 1993, reauthorized in 2010 as Government Performance and Results Modernization Act, with its emphasis on performance measurement, strategic management, and stakeholder involvement; as well as the Sarbanes-Oxley Act of 2002 (SOX), with its emphasis on accountability and accuracy in financial practices.

The private sector TQM appears to have been replaced by the Six Sigma method. This method, first developed by the Motorola company engineer Bill Smith in the mid-1980s, seeks to improve performance through the reduction of defects. The approach harkens back to the practices of the QC movement, with its emphasis on statistical analysis, Shewhart cycle, quality circles, and the qualitative methodology introduced by Ishikawa (Folaron 2003). It also encompasses some of the values of TQM and the ISO 900 and QS 1200, such as the focus on satisfying customers' desires. General Electric, once again, played a crucial role in the dissemination of the Six Sigma method when in 1995 CEO Jack Welch discovered it and successfully adopted it to improve performance and financial performance (Watson 2001).

## Conclusion

The history of TQM is firmly grounded in a foundation that consists of the application of statistical methods to quality control (QC). Though not always discussed, early QC efforts were also based on an underlying logic of a system perspective where all aspects of the production process

needed intervention to ensure products that satisfy customers' needs and reduce waste. That QC was practically abandoned in the USA after playing center stage during World War II may have been due to the fact that for the most part, quality control was viewed as the responsibility of quality departments, engineers in particular, and not managers.

Although the teachings of Juran and Feigenbaum emphasized the important role managers play in the improvement of quality, the realization in Japan that quality was everybody's job helped post-World War II Japan become a major industrial economy. Only then, in the 1980s, were the principles of TQM, often associated with Deming, adopted in the USA not only in manufacturing but also in service organizations, including healthcare. In the public sector, where TQM was received with skepticism by some, it became part of the larger New Public Management discourse. While some of the values espoused by TQM have been maintained, TQM as such has largely faded from both the public and the private sectors.

# Tourism Policy

María Velasco
Universidad Complutense de Madrid, Madrid, Spain

## Synonyms

Public tourism objectives; Tourism government decisions or nondecisions; Tourism public action; Tourism public planning

## Definition

Tourism policy is a set of discourses, decisions, and practices driven by governments, sometimes in collaboration with private or social actors, with the intention to achieve diverse objectives related to tourism.

## Introduction

Tourism is a relatively young phenomenon which involves the development of a singular and important economic sector. From the very beginning, that economic dimension of tourism has been the main priority for governments, and this has also been reflected in the tourism policy research. In fact it is very common considering tourism policy as a part of the economic policy, but tourism is much more than an economic sector. Tourism is probably one of the most determinant influences on our societies, and it will remain AS a key issue in the future.

The aim of the present text is to contribute to the debate on the nature, content, and instruments of tourism policy by expanding the scientific approaches to this issue and furthering the understanding of public decisions related to tourism.

The analytical perspective of policy analysis is used to propose an operative definition of tourism policy, enumerate the constitutive elements of this type of public action, and describe the instruments available to public decision-makers in order to reach the intended objectives.

### A Public Policy for a Multifaceted Phenomenon

Tourism is a key economic sector. It has positive impacts on economy due to the fact that it could be an interesting surplus on the balance of payments and that it is a very labor-intensive sector (WTO 2012a, b). The employment development related to the activity has also benefited from the continued growth of domestic and international demand during the last 50 years. However, tourism also has some negative economic impacts, like the increase of prices in tourist destinations, the unequal distribution of the benefits, strong international inflows, economic inequality between population of tourist destinations (Wall and Mathieson 2006), and the quality of employment has different problems (ILO 2010). In this case the rationality of public policies had to be explained through the market's failures with regard to public assets. Effectiveness efficiency become the reference values.

Tourism is also a key cultural factor. It has become a fertile mechanism to make different cultures come together, to fostering communication, and to allowing people to understand the richness of our diversity. Tourism had increased the awareness about heritage, and investment in conservation had been made due to the interest of more people. On the other hand, problems of authenticity had been highlighted by different researches (MacCannell 2013); tourism can cause an intense acculturation process, especially towards fragile cultures. Much of the investment in culture attractions is not intended to be oriented to citizens, but to foreign tourist (McKercher and Du Cros 2002).

Something similar occurs if to the environment dimension is considered. Tourism had been a crucial element to unfold more effective environmental protection policies, but there is a deep controversy about the negative impact of the activity related with the uncontrolled tourism development, the urbanization of natural areas, and the overconsumption of natural resources (Gössling 2002).

If we look at the research dimension, we also find complexity. The different fields of knowledge emphasize specific dimensions of the issue and overshadow others. To advance in the study of the tourism policy, it is better to assume that:

1. Tourism has a multifaceted nature. It is no possible to build a universally accepted definition of tourism, but rather definitions which make sense to each one of the related scientific fields which may engage in the analysis of the issue. Only if we have significant definitions to our scientific field it will be possible to improve our understanding.

2. Tourism can be studied from a range of different disciplines, and the sum of all these contributions will enrich the resulting analysis.
3. Tourism is an issue that has only recently come to the fore and thus has to compete for the attention of a scientific community which is focused on dealing with far more established study objectives. Notwithstanding this tension, tourism is an important issue in all disciplines now.

### A Broader Definition of Tourism Policy

Tourism policy has been the subject of extensive research over the past decades (Hall 1994, 2011; Hall and Jenkins 1995; Branwell 2006; Burns and Novelli 2007; Branwell and Meyer 2007; Dredge and Jenkins 2011), and there have been relevant efforts to incorporate the main discussions in the field of public policy to the subject of tourism policy (Hall 2005; Scott 2011); nevertheless, "the field is not as well served as it could be" (Hall 2014:537), and many issues regarding tourism policy still need to be addressed.

A broader definition of tourism should be adopted to be able to extend the analytical boundaries of the tourism policy arena. This definition should considerer the issue from a dynamic and reticular viewpoint, admitting tourism policy is about dispute between interests which have different power, ideologies, and values. Is that a complex reality, which perfectly fits into the image of "wicked problem," which requires the design and implementation of public actions?

Tourism creates a wide variety of interactions and relationships deriving from the processes whereby citizens are attracted to, stay, and take up occasional residence in a particular territory. Considering that, tourism policy could be defined as a set of discourses, decisions, and practices taken by governments, sometimes in collaboration with private or social actors, with the intention to achieve diverse objectives related to tourism.

Tourism policy is an intentional course of action which goes beyond the level of theoretical reflection and political intention materialized into real actions, involving the use of public resources. It is also integrated by consistent actions or, at least, actions which were designed to be consistent.

Governments should be a central actor; nevertheless, tourism policy does not necessarily have to be promoted and implemented exclusively by public actors. Precisely the opposite, it is essential to involve private and social actors in the process. This is an issue connected with the rich and interesting raise of the studies focused on governance, which rightly question the role of the government nowadays (Hall 2011; Bramwell and Lane 2013).

### Tourism Policy Objectives

Tourism policies combine in a diverse manner five major objectives related to the nature of the phenomenon and their different dimensions (Velasco González 2004). There are differences in intensity and degree on the government aims depending on the political system, the level of overall economic development, and the level of tourism development of the destination.

The first objective is to pursue tourism growth or remain competitive, in the case of mature destinations. Whereas in new or emerging tourist destinations, the governments usually consider the following objectives:

1. To promote the destination trying to improve internal and external tourism demand.
2. To achieve international tourism growth and increase foreign currency income to support the balance of payments.
3. To establish public institutions, national tourism administrations in terms of WTO (1997), to stimulate tourism growth and to do so in a sustainable manner.
4. To increase awareness of the importance of the activity among entrepreneurships and private sector in order to make tourism more attractive for private investment. It has also been a common practice to attract public companies in order to have a demonstration effect.
5. To support the right to travel and move freely as laid out in the Universal Declaration of Human Rights. Tourism can be an instrument stated of peace since it encourages people to become closer and means a better understanding of other cultures.

In the case of mature destinations, the major objective should be to maintain the level of international competitiveness through marketing and international promotion and to modernize and reassess programs.

The second objective is related to spatial dimensions of tourism and its impacts on land use dynamics. Here the central concept is the idea of planning, a precess to achieve a better spatial distribution of tourism activities, promoting the use of untapped resources, or improving local participation in decision-making process related to sustainable strategies. Some common aims are:

1. To formulate development strategies and programs.
2. To invest in better mobility systems in the tourism areas to help manage tourism flows and build of tourism-related infrastructure (like marinas or theme parks).
3. To invest public budget in tourism-related resources, for instance, in order to make accessible new coastal areas or investing in cultural and natural heritage restoration.
4. Recently, as the tourism has own objectives related to the reinforcement of the coexistence between tourists and locals have started to appear. In some destinations, the problems that local communities are suffering – disrespectful behavior or noise – lie at the heart of the public debate.

Thirdly, as tourism is also an experience or service consumed by people, there are objectives related to provide a safe, satisfying, and fulfilling experience for visitors. Common aims could be:

1. To protect tourism-consumer
2. To improve the regulation framework across different tourism subsectors through the adoption of regulations concerning safety levels in accommodation, travel intermediation, as well as new products such as active tourism
3. To promote actions to improve quality standards of tourism products and customer attention, usually through training programs.

In the fourth place, coordination appears to be a central need due to the transversal nature of the issue. In tourism, policies often appear, as objectives:

1. To stablish coordination bodies to coordinate actors from different backgrounds and different subsectors (culture, environment, infrastructure, etc.).
2. To create Destination Management Organizations (DMO, in WTO terms) involving public and private sector and other different stakeholders.
3. To stimulate business platforms, as clusters or product clubs to pursue better competitiveness.
4. Finally, tourism is considered a young phenomenon which is in a process of constant change.

In order to intervene on the tourist market with a strategic vision, it is necessary to have updated information and have expertise that can be applied by various actors.

The tourism sector is comprised mostly by small and medium enterprises. Typically, these business structures cannot bear the cost of research and produce knowledge, although they are the ones who have daily contact with the reality of the activity. The dynamics of the phenomenon makes public decision-making difficult.

Therefore, one of the classic goals in tourism policy is to invest in research and production of knowledge and ideas and to create tools that enable innovation and improvement spread. This objective is carried out through:

1. Establishing institutes or research entities and analysis to have a more precise knowledge of the tourism phenomenon and its changes
2. Generating knowledge that will help manage business decisions, like new management tools
3. Disseminating information to help business decision-making, like data conjuncture of sending countries or new market niches
4. Supporting innovation process sector

### Policy Instruments for Tourism Policy

Any of the above objectives can be achieved by using some of the instruments that governments have. Instruments can be defined as the techniques or means through which governments attempt to attain their goals (Howllet 2001).

One of the most cited typology of instruments was initially proposed by Hood (1986; Hood and Margetts 2007) and completed by Howlett (2011). This typology contains the following categories:

- Organization: By using both human and material resources, different organizations allow the government to act on a particular matter. These organizations can be traditional bureaucratic organizations, public enterprises, or other hybrid entities.
- Authority: Regulations control or prevent some types of behavior and are usually used to confer rights or impose obligations.
- Treasure: Different measures attempt to align the goals of nonpublic actors with objectives that are fixed by the policy. These measures may fundamentally relate to economic incentives but can also be honorific.
- Knowledge and information: Provision and diffusion of knowledge and information.

By adapting these categories to the tourism arena, we propose to consider that there are five differentiated categories of instruments which can be used by public decision-makers: organizational instruments, regulatory instruments, incentive and promotion instruments, improving knowledge instruments, and communication instruments (Velasco González 2004).

1. Organizational instruments. Institutions who design, implement, or merely act on tourism policy. For the development of any policy, program, or action, it is always necessary to have some institution who manages programs and actions using both human and material resources. The institutional framework is a key element in any policy and thus in tourism policy. There are three basic types: the traditional administrative political structures, the executive structures dependent of the formers and usually related to marketing and destination promotion, and structures of cooperation between public and private actors.
2. Norms or regulations of a compulsory character. They confer rights or impose obligations related to tourism and they stablish direct or indirect government regulation.
3. Incentive and promotion instruments. Instruments that seek to stimulate private actors to be aligned with the goals of tourism policy, usually through economic stimuli that are articulated through grants, soft loans, subsidies, and tax credits. It could also honorific.
4. Improving knowledge instruments. Related to the need to generate relevant data on tourism, the importance for investigations in this field, and the willingness to help tourism knowledge. An example would be plans or programs that seek to promote R + D + i in tourism or generate information systems to support decision-making.
5. Communication tools. The use of mass media could be both for raising awareness of specific values, as hospitality, and for supporting promotional campaigns of tourism destinations.

There are subsets of policy tools that are more feasible and appropriate at a given time. Not all of these instruments need to be used, or used at the same time, although the conclusions of other analyses indicate that the combination of several is usually more fruitful than the use of a single instrument. This is because each instrument has its own distinctive character and is geared to a specific objective being pursued by a government through its tourism policy (Table 1).

## Conclusion

There is no doubt that the analysis of tourism policy could be conducted from an economic perspective. However this is not the only perspective that should be taken into account when governments are facing designing tourism policy; they must also consider culture, environment, and social dynamics. In this sense, it is necessary to

**Tourism Policy, Table 1** Instruments for tourism policies

| Instruments | Nature | Purpose |
|---|---|---|
| Institutional arrangements | Binding for the government | Self-organization |
| Regulatory instruments | Compulsory | Regulation and control |
| Incentive and promotion instruments | Voluntary for those involved | Promotion and encouraging |
| Instruments for improving knowledge | Voluntary | Dissemination of knowledge, training, and information |
| Communication instruments | Symbolic | Dissemination of values |
| | | Promotional campaigns |

Source: Velasco González (2011)

use a broader definition of tourism and tourism policy. It may be helpful and necessary to consider the issue from the perspective of the dispute between interests which have different power, ideologies, and values. Growing importance of conflicts emerge, and the tourism policy cannot stand aside.

There remains a need to advance in terms of research by addressing some of the central questions facing the tourism policy today: how to combine a steadily growth with sustainable principles; how to achieve cohabitation between tourist necessities and local, or which is the role of the tourism policies in a better balance between costs and profits to local societies.

# Toxic Policy-Making in Iran

Tayebe Amirkhani[1] and Fateme Hematiyan[2]
[1]Department of Public Administration, Faculty of Management and Accounting, Shahid Beheshti University, Tehran, Iran
[2]Allame Tabataba'i University, Tehran, Iran

## Synonyms

Poisonous policy-making; Self-interested-based policy-making; Unethical policy-making

## Definition

Toxic policy-making is the system of policy-making that sets the stage for the spread of discrimination, corruption, and injustice in the society and does not meet the public interest. Instead, in this policy-making system, the main concern of policy-makers is to protect individual and group interests. Corruption, injustice, discrimination, and misapplication of laws are the main consequences of toxic policy-making system.

## Introduction

As the oldest country on earth, Iran has an ancient glory of governance, culture, and administrative achievements. But modern Iran has dropped back in the process of progress to higher levels of governing and public administration despite the brilliant background of governance (Farazmand 2002). So that today this country does not have a good position in terms of many indicators of development and progress. Renani and Moa'yedifar (2013) discussed the following statistics in Iran:

The highest mortality rate of traffic accidents, the average increase in the number of prisoners over the last 30 years from 138 per million prisoners to 2100 per million, the low average life of roads as it is 25 years in other countries while it is only 5 years in Iran, reduction in the production rate and employment, and high rates of corruption, immigration, addiction, and suicide. Renani and Moa'yedifar (2013) stated that the answers to all these statistics lie in the concept of social capital, and they claimed that social capital in Iran has a declining trend. Since the policies in the public sector are designed, developed, and implemented to solve social problems (Knoepfel et al. 2007), one of the reasons why this country and other similar countries are dealt with such situations can be found in the quality of policies and policy-making system. For example, Moaddab (2013)

stated that the quality of policy-making system in Iran is far from what it should be. Danaee Fard et al. (2015) discussed that what has happened as a result of the policy-making process in Iran has led to the waste of material and spiritual resources, a decrease in public trust, national opportunity loss, and ruining the reputation of the policy-maker.

Explaining this issue, it should be noted that in the modern and complex world, policy-making is applied to all areas and forms a significant part of our environment. Nonetheless, many of these policies are not formulated and implemented in a rational model but in a political or garbage can model; thus, it can have negative consequences for the societies (Dye 2013). Moreover, in the absence of regulatory and restrictive institutions, the policy-makers may act within the framework of public choice theory and distance themselves from ethical and community-based behavior to maximize self-interest. Therefore, the policy-making can have dark faces, which can be detected by signs such as political behaviors, injustice, political conflict, narcissism and authoritarianism, and relation-based behaviors rather than rule-based behaviors (Thissen and Walker 2013). Therefore, the question arises whether it can be said that the policy can be considered toxic to its target community.

Toxication is one of the concepts that has been recently considered in some areas of management such as leadership and decision-making. Maitlis and Ozcelik (2004) defined the concept of toxic decision-making and stated that it is a process with results that cause negative emotions in the organization. Since decision-making is the focus of policy-making, the present study hypothesized that policy-making can also have toxic features. This concept has been studied in Iran. The findings of the present study are the results of interviews with policy-making experts in Iran. Therefore, the basic theoretical foundations have been discussed first, and then toxic policy-making, its background and causal conditions, and finally the consequences have been investigated in detail.

## Theoretical Roots of Toxic Policy-Making

### The Concept of Toxication

Toxication is one of the concepts that have been studied in different areas such as organizations (Appelbaum and Roy-Girard 2007), leadership (Mehta and Maheshwari 2013; Pelletier 2010), and decision-making (Maitlis and Ozcelik 2004). This phenomenon includes the human systems and is considered as an inevitable reality in social life (Goldman 2008). The features of toxic organizations are as follows: inability to fulfill operational goals and commitments, fear-based problem solving processes that rarely result in effective decisions, poor internal communications, frequent repetitions, and interpersonal relationships based on deception and selfishness (Appelbaum and Roy-Girard 2007). Besides the toxic organizations, the concept of toxic leaders has been examined as well (Mehta and Maheshwari 2013; Pelletier 2010). Milosevic et al. (2019) explained that toxic leaders may lack the required leadership competencies; in this regard, their main goal is to hide their incompetencies in order to keep their control position. Milosevic et al. (2019) showed that the toxic leaders create ambiguity in this regard through up and down influence tactics and ruin the opportunities of performance appraisal because this may reveal their incompetencies. This can lead to feelings of powerlessness, fear, frustration, and inability to do things in followers.

Maitlis and Ozcelik (2004) defined the concept of toxic decision-making as a process of decision-making that causes extensive negative emotions in the organization. The words of negative emotions are used to explain intense unpleasant feelings such as fear, embarrassment, apprehension, and rage. In this context, it should be noted that the concept of toxic decision process connects high-intensity negative affect and decision-making in organizations.

Toxic decision-making contradicts the concept of ethical decision-making, which means determining the facts, identifying ethical issues, setting practical ethical standards, seeking required input/expertise, maintaining objectivity and

transparency in decision-making, and reflecting on outcomes (Singh 2018).

### Public Choice Theory

The theory of public choice in line with standard economic analysis assumes that political and administrative staff rationally maximize their interests. The basis of individual interest negates direct attention to others' well-being. According to this theory, individuals pay attention to others' well-being or concern for justice to the extent that it does not have any negative effect on their own interest.

In the political domain, this assumption entails organized interest groups including self-interested government officials to pursue policies that advance the former's interests in return for benefits.

According to this theory, the logic of collective action indicates that relatively small and homogenous groups are more effective than the public at large in advancing their limited interests. Based on the assumption of this theory that the staff in the public sector, whether elected or appointed, have the purpose to maximize their competencies rather than the public interest, it is assumed that the staff in the public sector form coalitions to support stakeholders and adopt policies that benefit these groups in return. However, in situations where individual interest is of paramount priority for policy-makers, the disproportionate power of interest groups to influence the present and future well-being of staff in the public sector may lead to the adoption of policies that are limited to narrow interests and take advantages to the public interest. The resulting wealth shifts are neither effective nor fair (Zamir and Sulitzeanu-Kenan 2018).

## Theorizing Toxic Policy-Making

In describing the features of toxic policy-making system, as the first feature, a policy-making system can be called toxic when policies lead to the spread of discrimination and injustice in the society and do not meet the public interest. In such a system, corruption, injustice, discrimination, and misapplication of laws prevail. Then, evil administrative actions appear and lead to suffering for people in administrative affairs (Balfour and Alibašić 2018). In this situation, the policy-makers ignore the national interest, and, therefore, an illegal bubble is formed. The policy-makers do not have a clear attitude and understanding of the situation, making them unable to solve problems. In this policy-making system, there is no specific mechanism to analyze the available options, and this results in disorder in affairs, and everyone provides a point of view to select the options based on his/her personal judgment. In addition, there is no specific mechanism for supervision, which can, in turn, lead to chaos and unlawfulness. Due to unfamiliarity with policy theories and failure to apply planning logic, the policy-makers adopt policies that contradict each other and double the chaos. In such circumstances, the policy discourse is not formed, which in turn causes a misunderstanding before forming a policy. The issue of policy learning is not considered, and organizational knowledge will not be updated. The discriminatory policies will increase the nation's distrust and deepen the gap between the government and the nation, which in turn will lead to a misunderstanding of the situation and an incorrect and poor analysis of the situation in the country because the public demands will not be of priority for the government.

### The Context of Toxic Policy-Making

Regarding the features of toxic policy-making, the following categories have been recognized as the context of toxic policy-making in Iran: "poor democracy and weak civic institutions in Iran," "high power distance," and "the rentier government."

Iran is one of the countries with a long history of fighting with tyranny (Katouzian 2007), and there has been no democratic governance in Iran, in the sense of what is seen in developed countries.

In this regard, the regime of Iran can be probably authoritarian because according to Prysmakova (2018), it is a type of state administration whose main objective is supporting its rule and protection against any possible damage caused by the power-threatening elements.

Prysmakova (2018) refers to the government control over policy-making and implementation, the limited autonomy of an organization in representing its members and constituents, and creating obstacles for citizens to define and articulate their priorities as prominent characteristics of the authoritarian regime. Therefore, an authoritarian state is supposed to restrict the freedom of associations. This is true about Iran as the Iranian regime imposes severe restrictions on the activities of civil society organizations. The lack of freedom of civil society and the media has prevented the proper reflection of the problems truth as well as the process of solving them to the public. The lack of relationship between people and the government alienates the two, and the absence of parties makes the situation worse.

In this regard, the high power distance in Iran exacerbates the situation. This has institutionalized a kind of behavior in the form of tyranny and selfishness between the policy-makers and decision-makers and the executive agents, which leads to disregard for national interests and disbelief in expert work. Advancement of affairs with negligence expands the process to the level of the people and finds root as a great sociocultural problem. When the people of a country become accustomed to this process of negligence, there will be no more protests, and the foundations of this lawlessness will be firmer.

The rentier government and the government's dependence on oil revenues have in turn worsen the situation because the government's dependence on oil revenues and the relative independence of taxes have led to increased independence of the government from the nation, which in turn reduces transparency and accountability and fosters the authoritarian spirit in the government. Therefore, the rentier government in Iran sets the stage for the weakening of democracy and civil society, which in turn can reduce the role of citizens in policy-making and intensify the process of toxic policy-making process in Iran.

## The Causal Conditions of Toxic Policy-Making

The causal conditions of toxic policy-making system have been recognized as follows: "dominance of individual interests over public interests," "lack of attention to science and rationality in managing affairs," "lawlessness and defects in the existing laws," "politicization of the decision-making and policy-making system," "poor supervision and regulatory mechanisms," "disregard for meritocracy in governing the society," "multiplicity of decision-making institutions in the country," "lack of formation of the concept of citizen," "viewing the citizens as subjects by the government," and "inappropriate electoral system." Each is briefly explained in the following.

One of the main reasons for the formation of toxic policies is the dominance of individual interest over a public one. As stated in the public choice theory, the policy-makers can seek to maximize their self-interest, and once an authority defined his/her main goal based on his/her individual and personal interests, the public interest has no position; this is the case for the policy-makers in Iran. Explaining this issue, Sari-ul-ghalam (2015a) stated that Iranians have so far had no experience different from authoritarian diversity and have moved from one authoritarian system to another. According to Sari-ul-ghalam (2015a), one of the consequences of the authoritarian system is the shortening of people's thoughts, ideas, plans, and lives. "People cannot think for long-run plans and everything relies on judgment, demands, priorities, and the desires of the central system of governing" (p. 45). This shortened period, in turn, leads politicians and decision-makers like the public to prioritize individual interests over national interest; this is the main foundation of toxic policy-making.

It can be explained, in this regard, that the experience of living under authoritarian regimes for centuries has led to the dominance of the spirit of in-group collectivism in Iranians and reflects "the extent to which individuals are attached to their families and circles of friends" (Javidan and Dastmalchian 2003, p. 130) – rather than institutionalized collectivism which measures the extent to which members of societies respect broader societal interests versus individual interests (Javidan and Dastmalchian 2003, p. 130), which in turn exacerbates the adoption and implementation of policies maximizing individual and group interest rather than the public interest.

Another factor causing toxic policies is "disbelief in science and lack of commitment to rationality." That is, managers and politicians in Iran regard themselves as experts, and it is frequently revealed that although they have a high degree in a particular field, they reject the relevant scientific findings and prefer their previous knowledge that is in many cases rooted in tradition. This is reflected in the form of poor specialization, disregard for knowledge of policy evaluation and analysis, disregard for global experience and scientific theories, and lack of any connection between the university and the system of governing.

Another causal factor underlying the toxic policy-making is "lawlessness and defects in the existing laws." Lawlessness has been emphasized as one of the Iranians' cultural features (Sari-ul-ghalam 2015b), and the nascent institution of law exacerbates it; the first constitution of Iran was adopted 114 years ago, and before that, the king's orders and decisions were considered to be laws. Moreover, even after the enactment of the laws, authoritarianism rooted in the Iranian political system has led to the superiority of the individual to the law. The law is always influenced by those in power, and this in turn undermines the rule of law and the equality of citizens to it. Further, it provides the policy-makers with the courage to break the law and makes the ground for the emergence of toxic policies. This feature in turn has led to "poor regulatory mechanisms in Iran"; that is, there is no supervision, control, and indication for supervision in Iran.

Apparently, in such circumstances, meritocracy is not formed, and this in turn decreases the quality of government. Quality in government reflects what taxpayers obtain in return for their taxes. Accordingly, the quality of government indicates its good performance. The performance of the government also reflects the ability of its administrative system to deliver products and services to citizens efficiently, effectively, and economically, which is possible through the presence of professionals in governmental organizations. Taking this into account, low-quality governments are supposed to have a very negative impact on the health and well-being of citizens (Reichborn-Kjennerud 2018). Therefore these conditions in turn exacerbate the toxication of the policy.

"Politicization of the decision-making and policy-making system" is another category identified as a causal factor in creating the toxic policy-making system. This is reflected in the following forms: marginalization of specialized commissions and replacement of fractions (political organizations of representatives), politicization in the field of policy-making, ineffective legal issues due to the ambiguity of the political space, the prevalence of political behavior in the organization, the change of government and policy-making system into a trophy-dividing system, and politicized culture of choosing a policy-maker. The political immaturity of the people intensifies this politicized atmosphere.

"Multiplicity of decision-making institutions in the country" is another category identified as a causal condition. Governance in Iran consists of two parts: appointed and elected. Due to dual governance in Iran, the elected institutions do not accept the responsibility of policy outcomes, and there is no accountability mechanism for the appointed institutions; thus, irresponsibility is evident in the country.

Perhaps, one of the most effective causes of the formation of toxic policies is inappropriate electoral system in Iran, which in turn is originated in the weakness of democracy. In the absence of organized parties and party-based elections and the existence of a very weak civil society, only the people who meet the criteria set by the Guardian Council that is an appointed body are eligible to be candidates in elections. However, these criteria that are determined by a small number of people (12 people) have never been put to a vote by the people and only examine the extent to which the individual conforms to the official goals and ideology of the government. Therefore, there is no attention to the people's professional and specialized competencies; furthermore, people lose the power of a real election and can only choose among the people who have been approved by the 12-member appointed council.

The form of relationship between the government and citizens is another cause of the formation of toxic policy-making system in Iran.

As Vigoda-Gadot (2018) points out, the meaning of citizenship and citizenship behavior has changed according to the mindset of modern societies. From this perspective, the government has no longer the monopoly of reforms and policy-making, but it rather depends on the motivation of volunteer groups, citizens, and the third sector, in general, to carry out tasks, which was previously the responsibility of public officials and politicians.

Iran is known as a country that government has had a higher position in the society over its long history, which can be considered to be rooted in the lack of popularity of liberal philosophy in Iran. Iran's geographical location has also strengthened the government's superior position. Thus, in the absence of a valid legal system, governments have always acted in the form of authoritarian regimes (Prysmakova 2018), and the citizens have been always subjects of the government which has been considered to be the ruler. Although in the last 120 years, two revolutions have occurred in the direction of democracy and the realization of civil rights in Iran, and there has been no considerable change in the position of citizens and the government and their relationship. This may be due to the lack of change in the basic assumptions of the Iranians since the majority of people are unfamiliar with the new political ideas, so that they are more seduced by appearance and structures in the developed world and are unfamiliar with the intellectual foundations of these structures.

In this context, it can be said that most Iranian citizens do not have the characteristics of a citizen who participates in the administration of affairs, including a long-term attitude to the public administrative issues, prospection, and preference of public interests over individual interests, concern for the development of the society (Denhardt and Denhardt 2015), and the government does not attempt to provide the required ground to empower the citizens. As Vigoda (2002) stated, though nowadays citizens and the government are considered as partners with a relationship in the form of collaboration and, in Iran, citizens are in the position of voters and government is regarded as trustees, citizens are considered as subjects in reality, who have no rights. In fact, the government does not consider itself accountable to the citizens, and as described, the people do not consider themselves citizens and do not know the rights and duties of a citizen; such a mutual relationship has strengthened the toxic policy-making system in Iran.

### Strategies of Toxic Policy-Makers

This part deals with what activities toxic policy-makers do in the toxic policy-making process in order to achieve their goals or what strategies they choose to use to pursue their goals.

One of the strategies used by toxic policy-makers is populism and adopting a short-term view. They seek people's short-term satisfaction and do not seek long-term achievements; according to the public choice theory, the decision-making situation in these circumstances will be subject to a shortsightedness effect. Therefore, decisions will be made in a way that entails short-term political benefits and long-term economic costs.

Adopting an island and unscientific view is another strategy used by toxic policy-makers; so, such policy-makers don't have a systematic view and view the policies in an island and linear way. They ignore organizational knowledge and try to resolve the side complications and signs rather than find the roots of problems. Inoperative and inexperienced decisions, sudden and unplanned changes, and lack of systematic views are other categories identified in the description of this category.

Ignoring public interests is another strategy identified in this regard. The pursuit of individual goals, factional and group views, irresponsibility, and lack of attention to national values and social norms are the most important micro categories that explain the strategy of ignoring national interests.

In addition to the mentioned cases, rent-seeking and monopoly are other strategies used by toxic policy-makers in this regard. They take measures such as eliminating competitors, party-based employment and discrimination, extravagance in using public funds, corruption, and rent-seeking to easily achieve their goals. Since these policy-makers try to maximize their self-

interests, they seek for various rents, and the atmosphere of monopoly certainly facilitates it.

## The Consequences of Toxic Policy-Making System

Reduced economic growth, increased Gini coefficient, and the waste of resources or lack of optimal use of resources, increased the country's costs, and the rapid and intense increase of corruption are the most important economic consequences of such a policy-making system. The loss of social capital and public trust and the deep gap between the people and the government have been identified as the most important social consequences of such a policy-making system, which in turn will lead to the lack of collaboration of people with the government and will make the running process of the country very difficult.

Discrimination due to the toxic policy-making system makes a group of people feel that they are deprived from certain advantages; this is reflected in the form of explosive behaviors, which in turn will cause negative cultural and moral consequences for the country.

The decrease in the legitimacy of the government and the political system is one of the most important political consequences of this policy-making system. At the management level, the coordination between units and the mobilization of resources will be lost. Accountability, transparency, and participation decrease, and the feelings of inefficiency and despair will prevail, and not only the public problems will remain unsolved, but also new problems will be created.

This will cause poor international relations at the international level, resulting in knowledge and political isolation. The inability to adapt to the external environment is another consequence of toxic policy-making system at the international level.

The negative consequences of toxic policies can also have negative effects on an individual

**Toxic Policy-Making in Iran, Fig. 1** Toxic policy-making system

level, so that frustration with reform and improvement and distrust in the government direct the citizens to utilitarian behavior with a short-term sight; this can cause numerous harms to the country in various areas.

Moreover, learned helplessness in citizens leads to frustration, social isolation, and brain drain, indicating why Iran is in the first rank of brain drain in the world.

## Conclusion

The present study investigated the toxic policy-making, its context and conditions, and consequences as well as the strategies of toxic policy-makers. In this regard, the following figure shows the relationship between the underlying factors and consequences (Fig. 1).

As shown in this figure, the underlying factors of toxic policies interact with each other, and one-way and linear relationship cannot be considered between them. Once these conditions are created, the various factors reinforce each other, and loops are formed between them, which are difficult to get out of. For example, in a context where democracy and civic institutions are weak and the rentier government is dominant, meritocracy becomes weak, which in turn leads to the dominance of individual interest over public interests. The dominance of individual interests over the collective interests reinforces the politicization of the policy-making system, and politicization in turn can exacerbate the weakness of meritocracy. Further, weakness in meritocracy can in turn strengthen the politicization of policy-making system. The formation of such loops exacerbates the toxication of policies and causes more negative consequences for the countries entrapped in these conditions. Providing the required ground for downsizing the government, reducing the government's dependence on oil revenues, and taking the first step to strengthen the democratic aspect of the system, such as granting the right for free activities to the parties, media, and NGOs, are considered as the first steps to break these intertwined loops.

# Trademark Governance in Bangladesh

Shaleh Akram Somrat
Supreme Court of Bangladesh,
Dhaka, Bangladesh

## Synonyms

Bangladesh; Intellectual property; Intellectual property rights; Trademark; Trademark enforcement

## Definition

Trademark includes a device, brand, heading, label, ticket, name, signature, word, letter, symbol, numeral, figurative elements, combination of colors, or any combination thereof. A trademark also includes service marks and certification marks.

## Introduction

Bangladesh, being one of the world's most densely populated countries, has the biggest concentrated business market but is yet to be a place for smooth business operations when it comes to intellectual property rights (IPR). It is commonly assumed here that the intellectual property rights (trademarks, patents, industrial designs, copyrights, etc.) protection mechanism is introduced by the Western world to satisfy the manifestation of developed countries to establish the way of modern colonization over the developing or least developed countries. Hence, it is strongly advocated by the developed countries that the intellectual property rights (IPR) mechanism is necessary to ensure secure foreign investment by implementing sound technology transfer and knowledge sharing. Nevertheless, at the time of becoming a member of the World Trade Organization (WTO), Bangladesh endorsed the terms of "Uruguay Round" accepting the memorandum in respect of the "Agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS)" where a minimum global standard of IP protection was fixed for the first time of history. Article 19 of the TRIPS agreement demonstrates details in relation to the signs, symbols, logos, etc. which may be protected as trademark as well as what should be the minimum standard of trademark protection.

## Theoretical Framework

This paper emphasizes toward articulating an impression regarding the governance of trademark affairs in Bangladesh. This article aims to frame a clear picture of how the domestic authority is approaching toward realizing international obligations and standards, how the concerned ministries are designing their governance mechanism, and in response, what is the

practical scenario from the perspectives of an intellectual property rights practitioner. This article may not provide solution to any trademark conflict; rather it will draw an idea as to how trademarks and its related affairs function in Bangladesh.

## Historical Context of Trademark Governance

It is commonly misconceived that TRIPS has made it compulsory for Bangladesh to provide trademark protection in a larger scale. Indeed, TRIPS can be marked as a new era of trademark governance mechanism in Bangladesh despite the fact that the legal draftsmen seem insightful of protecting intellectual property rights, especially the trademark rights, since a long time. Among the existing laws of Bangladesh, reference can be made from 150 years back, i.e., the Penal Code 1860 which contains provisions for protecting trademark rights. Sections 478–489 under Chap. XVIII containing the heading of "Trade, Property, and Other Marks" clearly define trademarks, property marks, and false use of these marks along with punishment for using a false trademark or property mark, punishment for counterfeiting a trademark or property mark used by another, punishment for counterfeiting mark used by public servant, and some other relevant offenses thereof.

However, the scientific and technological development conferred the intuition that the provisions of the Penal Code 1860 might not be sufficient to protect the right of a trademark owner in the sociocultural situation of Bangladesh for some reasons. Firstly, the Penal Code is not illustrative in respect of the types of trademark rights; secondly, there is no guideline for procedural protection mechanism; and thirdly, the draftsmen might have failed to foresee the future of multidimensional aspects of trademark rights.

Nevertheless, sooner it was found that the popular marks using for merchandise purposes are fraudulently used by others escaping the obligations under the Penal Code 1860, and therefore, the draftsmen came to the understanding that new law for protecting merchandise marks should be enacted to amend the law relating to fraudulent marks on merchandise. In such a perspective the Merchandise Marks Act 1889 was enacted, but it failed to demonstrate adequate legal protection for merchandise marks holders. However, the state of business affairs made it clear that along with the Merchandise Marks Act 1889, a separate law for governing the trademark affairs is necessary, and in response, the Trade Marks Act 1940 [Act No. V of 1940] was passed with the objective of providing the registration and more effective protection of trademarks in Pakistan (Bangladesh was under the British regime in that period). This Act contained 85 (eighty five) sections prescribing the types of trademarks, conditions for trademark registration, registration procedure, duration of registration, effect of registration, assignment and transmission of trademark, rectification and correction of trademark register, and other practical issues for smooth functioning of trademark affairs. The Revised Trade Marks Rules 1963, Trade Marks (Invalidation and Summary Registration) Act 1950, and Trade Marks (Invalidation and Summary Registration) Rules 1950 are some other laws governing the trademark affairs at that time.

After liberation (1971) from Pakistan, the said three major laws, i.e., Penal Code 1860, Merchandise Marks Act 1889, and Trade Marks Act 1940, continued to be in operation to govern the affairs relating to trademarks until the enactment of the Trademarks Act 2009 [Act No. XIX of 2009] repealing the Merchandise Marks Act 1889 and Trade Marks Act 1940 but with some reservations. However, on February 14 of 2008 Trademark Ordinance was promulgated, complying with the requirements of the TRIPS agreement during the period of the Caretaker Government of Bangladesh. At present, the entire trademark governance mechanism is dominantly governed by the Trademarks Act 2009 (as amended in 2015) along with the Trademarks Rules 2015. However, the provisions of Penal Code 1860 still exist to give an extra hand to the Trademarks Act 2009 (as amended in 2015) in applicable cases.

## Domestic Implications of International Treaties and Agreements

The influence of international treaties and agreements on trademark governance in Bangladesh is mention worthy. All the new laws in respect of trademarks have been drafted focusing its compatibility with international treaties and their guidelines. The Paris Convention for the Protection of Industrial Property 1883 (which includes trademarks, patents, industrial designs, etc.) can be traced as the fundamental treaty for setting out an international trademark protection mechanism. The only international institute that, however, introduced the most effective mechanism to implement international IPR governance in Bangladesh is the World Trade Organization (WTO) which has dominant command over the international business relationship as well as management of globalized trade market on its member states. It sets out some duties and obligations for Bangladesh to be complied with while dealing with industrial and commercial matters. After the accession to the WTO, the government felt the necessity of amending some existing laws governing trademark-related affairs in Bangladesh as to adjust with the rules governing the areas of international trade and negotiation as directed by WTO compliance. To be more specific, some provisions of the TRIPS agreement possess dominant influence over the provisions of Trademarks Act 2009 and its supplementary Rules 2015. Influence of international treaties and agreements has also been allowed by some judicial decisions. In the case of Sunil Kumar Das v Canon Kabushiki Kaisha and another [57 DLR (2005), P 93–100], the Division Bench of the High Court Division of the Supreme Court of Bangladesh comprising their Lordships Mr. Justice Syed Amirul Islam and Mr. Justice AKM Shafiuddin directly considered the influence of Article 6 of Paris Convention in respect of trademark conflicts.

## Operational Dimensions of Trademark Governance in Bangladesh

The Ministry of Industries is the body governing the registration mechanism of a trademark. The ministry controls the trademark application, examination, journal publication, registration, certification, objection, rectification, cancellation, and other similar natured registration mechanism through its Department of Patents, Designs and Trademarks **(DPDT)**. This department is a specialized department for maintaining records of intellectual properties. DPDT has several units, i.e., the trademarks unit, the patents unit, the design unit, the geographical indication unit, etc. To be honest, among these units, the trademarks unit is the most active and busy one. Nevertheless, there is a registrar for the department who governs and supervises all the units, but there are separate deputy registrar, assistant registrars, and examiners for each unit.

The DPDT mainly keeps records of trademarks. It receives new trademark applications, examines, as well as gives and ceases registration (in applicable cases). It also works as a tribunal in limited cases, i.e., at the time of hearing objections and oppositions. Nevertheless, the Act 2009 has given power to the courts to interfere and pass necessary orders in certain situations. A brief discussion of the enforcement procedure will be made in subsequent portion of this article.

In order to draw a clear picture in respect of trademark governance in Bangladesh, it is pertinent to scrutinize the Act 2009. This Act was enacted to add new altitude in the registration, governance, and protection mechanism of trademarks in Bangladesh. The Act contains 128 - sections categorized into 11 chapters that include and prescribe the purpose of enactment of the Act, introduction and description of the trademark office, registration mechanism, result of registration, assignment and transmission of trademarks, correction of register, different types of trademarks, offenses under the Act and punishment thereof, forum to stop breach of trademark rights, appeal procedures, conventional priorities, and other necessary provisions to govern and protect trademark rights.

Before we move on, the readers must be satisfied regarding the concept of trademark. Section 2 subsection 8 of the Act 2009 defines trademark in relation to offenses, penalties, and procedures as "(i) a registered trademark or a mark used in

relation to goods for the purpose of indicating a connection in the course of trade between the goods and the person having the right as proprietor to use the mark (ii) a mark used in relation to a service so that it may be indicated that the person has the right as proprietor to use the mark in the course of trade" and in relation to other affairs as "a mark used or proposed to be used in relation to any service or goods indicating a connection in the course of trade between the goods and the person having the right, either as proprietor or as registered user, to use the mark; and also certification mark." Basically, a trademark is a sign devised distinctively to identify particular goods or services as manufactured, marketed, produced, or provided by a specific person, institution, company, or enterprise. A trademark helps the consumers to identify or purchase a product or service of a unique trademark as its kind, nature, and quality meet their needs.

## Trademark Registration: Why Important?

In Bangladesh a trademark can be registered as trademark for goods, trademark for services, certification mark, associated mark, collective mark, protective mark, etc. To get the protection under the existing law, registration is mandatory requirement as section 24 of the Act 2009 states that "No person shall be entitled to institute any proceeding to prevent, or to recover damages for, the infringement of an unregistered trademark." However, right of passing off is also recognized by the law but within a very narrow scope.

## Trademark Governance: From Filing to Registration

An application for registration of a trademark is to be made before the registrar of the trademarks. The applicant must be the proprietor of the trademark. The Bangladesh trademark office follows the international classification for filing trademark application, i.e., the international classification according to the NICE Agreement concerning the International Classification of Goods and Services for the purpose of registration of marks. Nevertheless, multiclass application is not permitted in Bangladesh. Separate applications shall be made in respect of every class of goods or services, and the applications are considered by the trademark office according to the serial of receipt. However, the registrar has given exclusive jurisdiction to accept or reject any trademark application. In accepting or rejecting a trademark application, the registrar considers the guideline provided by the Act 2009. Nevertheless, no mark shall be registered as a trademark if it comprises or consists of any obscene or scandalous matter, if the use of mark conflicts any provision of any existing law of the time being, if the use may deceive or cause confusion to the consumers, if the mark contains any matter which is likely to hurt the religious belief of any citizen of Bangladesh, or if the mark, without proper authorization, contains name, official sign, hallmark, map, flag, sign, or anything that resembles to these creates confusion in relation to any country, international association, or any association or office established through any international convention or treaty which is identical with or an imitation of or contains element of armorial. In addition, using names of chemical materials or using identical or deceptively similar trademarks is prohibited for registration. On the other hand, it is encouraged to insert the name of the company or individual of firm with the mark, one or more invented words having no direct reference to the character or quality of the goods or services, and to devise the mark distinctive. Nevertheless, it is wise to apply for registration without any claim of color as the law prescribes that so far a trademark is registered without defining any color and it shall be deemed to be registered for all colors.

As per section 119 of the Act 2009, Bangladesh accepts the rules of priority application. Priority application is such an application which provides retrospective registration effect to a trademark application, subject to some conditions. States which are listed under the Paris Convention and World Trade Organization (WTO) may enjoy the privileges of priority

application. Where a person has made an application for the registration of a trademark in a convention country which is a member of Paris Convention or a member of WTO, that person or his legal representative or assignee may make an application for the registration of a trademark in Bangladesh within 6 (six) months after the date in which the application was made in convention country together with the full particulars and certified copy of the priority application, and the trademark shall, if registered under the Act 2009, be treated to have its registration as of the date on which the application was made in the convention country and that date shall be deemed to be the date of registration in Bangladesh.

Schedule I and II of the Trademarks Rules 2015 provides specific trademark forms for all types of applications to be made to the registrar and to be used for official purposes. Applications in any other form shall not be accepted by the trademark office.

Before providing registration, the trademark office follows a law-stipulated mechanism that examines an applied mark in several stages. After filing of a trademark application, upon receipt of the application, the trademark office issues official filing receipt to the applicant. The receipt copy contains all relevant filing details of the trademark, e.g., application number, date of application, the amount of remittance, the trademark, name of receiving staff, and other necessary information. New trademark applications are examined by the trademark examiner within 2–4 months of filing. If trademark application satisfies all requirements, then the respective examiner, on behalf of registrar, shall issue a letter of acceptance for the mark to be advertised in the Trademarks Journal. If Trademark application does not satisfy all requirements, then the examiner will issue objection notice. Any objection given by the examiner may be dissolved in two ways, i.e., reply of objection and objection hearing. After the representation or hearing, if the office is satisfied, then the next step will be publication to the Trademarks Journal. Otherwise, the original TM application will be treated as rejected, and the trademark is denied to be registered by the authority. However, subject to the deposition of publication fees, the accepted mark is to be published in Trademarks Journal. Nevertheless, when a trademark is advertised in the Trademarks Journal, any person may oppose registration of the mark within 2 months from the date of such publication. In such a case, the matter will be referred to the trademark tribunal whose decision will be final, subject to the filing of appeal before the High Court Division of the Supreme Court of Bangladesh. If no opposition is filed against the published trademark, then the applicant will be asked for depositing registration fees. Upon receiving the registration fee, the registrar will issue the registration certificate within 2–6 months from the date of depositing of registration fees. Furthermore, any person who is aggrieved may file rectification case in the prescribed manner against the impugned registered trademark either before the Registrar of Trademarks or before the Hon'ble High Court Division of the Supreme Court of Bangladesh to cancel the registration of the same.

The validity of trademark in Bangladesh is a frequently asked question. Initially, a registered trademark is valid for 7 (seven) years from the date of filing of application and renewable thereafter for periods of 10 (ten) years in each term to an indefinite period, subject to the condition of depositing proper renewal fee.

## Governance in Action: From Violation to Judicial Protection

A registered proprietor of a trademark in respect of any goods or services enjoys the exclusive right to the use of the trademark in relation to those goods or service. Thus, he can bring infringement action against any unauthorized use, and in such a case the Trademarks Act 2009 and the Penal Code 1860 both provide legal recourses. Authorized use can be ensured by licensing, permission, assignment, or transmission. Nevertheless, a registered trademark may lose its approval if the

proprietor fails to use such trademark in any bona fide purpose within 5 (five) years from getting the registration. Nevertheless, on application of any aggrieved person, the High Court Division of the Supreme Court of Bangladesh or the Registrar of DPDT may pass order to cancel, correct, or rectify any registered trademark, which is subject to the satisfaction of certain terms and conditions as prescribed in the Act 2009.

However, despite having practical challenges in respect of enforcement mechanism of trademark rights, the draftsmen of the Act 2009 tried to include all possible ways of infringement. I personally consider the Chapter X of the Act 2009 as the most important part of the Act as it defines offenses and prescribes penalties for such offenses and procedures to stop such infringements. A trademark right may be infringed by applying false trademarks or trade description, by selling goods to which a false trademark or trade description is applied, or by falsely representing an unregistered trademark as registered or by unintentional contravention of the law relating to trademarks or abatement of any infringement committed out of Bangladesh.

The Act 2009 provides both civil and criminal remedies for the breach of trademarks. A case for trademark infringement can only be filed within 3 (three) years of commission of the offense or within 2 (two) years of discovery of such infringement, whichever is earlier. Sections 73 and 74 provide criminal action/remedy for using or applying false trademark and false trade description, for example, selling goods to which a false trademark or trade description is applied, that is imprisonment for a period which may extend to 2 (two) years but not less than 6 (six) months or fine of taka, the amount of which may extend to tk. 200,000/- (two lac) but not less than tk. 50,000/- (fifty thousand), or both. In addition, for repeating the offense, punishment may extend to 3 (three) years but not less than 1 (one) year or fine of taka, the amount of which may extend to tk. 300,000/- (three lac) but not less than tk. 100,000/- (one lac), or both. In addition, the Act also prescribes penalty for falsely representing a trademark as registered which is imprisonment for a period which may extend to 1 (one) year but not less than 6 (six) months or fine of taka, the amount of which may extend to tk. 100,000/- (one lac) but not less than tk. 50,000/- (fifty thousand). For getting recourses under theses sections, an aggrieved trademark owner or his representative has to file criminal case to the concerned police station or, in appropriate cases, to the court of judicial/metropolitan magistrate or first class magistrate with proper jurisdiction. Nevertheless, the court may order forfeiture of goods where a person is convicted or acquitted of an offense under sections 73 or 74 of the Act 2009. In addition to the provisions of the Act 2009, the provisions of Penal Code 1860 as mentioned before are still in operation, and any interested person may take aid of those sections as well. The Code of Criminal Procedure,1898, subject to some limitation, shall be applicable in respect of trial and procedure of criminal cases initiated under the Act 2009.

Nevertheless, a registered trademark owner or an unregistered trademark user (passing off) subject to some limitations may file civil suit before the Court of District Judge claiming order of injunction, damages, accounts of profits, delivery of any infringing labels and marks for destruction, or removal from deceptive products. In such a case, the procedure prescribed in the Code of Civil Procedure 1908 shall be applicable.

However, a person sued under the Act 2009 may take defense that all reasonable precautions to prevent infringement were taken by him, his activity is the ordinary course of his business which he is employed on behalf of any other person, or in applicable cases, he may file application to the High Court Division challenging the validity of the trademark and praying for rectification of trademark register in respect of the goods. In addition, appeal may be filed to the High Court Division challenging any decision of the trademark officer or the registrar.

Furthermore, to give an extra hand to the trademark rights protection mechanism, the Customs Act 1969 provides some prohibitions on goods

imported to Bangladesh by air or land or sea. Section 15 restricts entry of counterfeit coin, forged or counterfeit currency notes, goods having applied thereto a counterfeit trademark within the meaning of the Merchandise Marks Act 1889, goods made or produced outside Bangladesh and having applied thereto any name or trademark being or purporting to be the name or trademark of any manufacturer, dealer or trader in Bangladesh, etc., while section 16 gives the authority power to restrict entry of any specified trademarked goods.

Therefore, it is apparent that theoretically Bangladesh has been trying to design a comprehensive mechanism of good governance of trademark-related issues to give an investor confidence in respect of his intellectual property rights protection.

## Rhetoric Versus Reality: Perspectives from a Practitioner

Theoretically trademark affairs are well governed by the existing laws, but the practice reflects a different picture. In comparison with the sociocultural practice as existed in Bangladesh, the laws are yet to ensure a standard protection mechanism toward trademark infringement. Offences of trademark infringements are disproportionately treated, by both the general people and the administrative or law enforcing agencies, comparing with other punishable offenses. As Bangladesh is still struggling with its economic ossification, brand responsiveness is a rarely prioritized issue. Brand value and quality fade away in terms of availability and price of any product or service, offering scopes to local businessmen to imitate or use popular and well-known trademarks. Though the recent legislations provide specific recourses to stop infringement of trademarks, a trademark infringer can take advantage of its weak enforcement mechanism. Being a regular IP law practitioner, I have found that the administration and also the judiciary are not well prepared to provide instant aid to trademark infringement. TRIPS persuasion successfully compelled Bangladesh to enact new laws, rules, and regulations, but it was not considered whether Bangladesh has the infrastructure to maintain the compliance or whether Bangladesh needs strict IPR protection at this stage. Apart from the most debated conflict of interest between the developing countries and strict IPR administration, it must have taken into consideration that whether the government employees are duly trained and educated on these issues, whether the customs authority is practically advanced to conduct necessary inspection, whether the international dispute resolution mechanism in context of Bangladesh is well adjusted. Nevertheless, the hurried implication of IPR compliance led to a practical disorder in its enforcement process. From filing to registration and from violation to judicial protection, the practical scenario is different. The trademark office is succumbing with its very poor logistic support to tackle the loads of trademark files and ultimately leading toward unreasonable delay in file processing, responding queries, providing official decision to facilitate enforcement mechanism, and hence, creating an impasse at the very beginning of right enforcing practice. In addition, the judiciary seems very weak and elastic in dealing with trademark infringement cases. It takes years in resolving cases, be it civil or criminal in nature, when a week's infringement may have serious consequences in terms of loss of reputation or goodwill. Furthermore, the government fees prescribed from filing to registration is over charged in context of the socioeconomic condition of the country, which is impliedly creating prima facie hurdle for the small-ranged investors.

Apart from irregularities in effective IP governance mechanism, the reason for non-responsive tendency and lack of promptness of the law enforcing agencies in the event of trademark infringements, in my opinion, is that copying well-known trademarks is yet to be considered as morally wrong in Bangladesh. This implies the need for creating awareness from the very root of the society. Guaranteeing a complete and effective trademark protection mechanism requires huge investment and social revolution. The price for implementing strict trademark

protection mechanism in a developing country like Bangladesh will be very high as it involves the need to set out a complete IP protection mechanism, while the threat of hindering development process of the developing countries by obtaining privileged entrance to its market by the developed countries still subsists.

The duration from trademark infringement to enforcement of right needs to be minimized in order to uphold the spirit of the TRIPS agreement by creating an effective trademark governance system. Alternative approach may be adopted by either developing own enforcement facilitating force of the Department of Patents, Designs and Trademarks (DPDT) or by delegating cognizance power to the law enforcing agency in cases of trademark infringement.

## Conclusion

Despite the stack of limitations, Bangladesh always adopts progressive measures and has been embracing challenges coming with the fruits of globalization. Trademark is now a commonly known concept, and the recent business laws are indicating technical improvements in enforcing a sustainable trademark protection mechanism. Moreover, lots of recent judicial works in explaining the trademark rights are going on. For example, registration of a "phonetically identical trademarks" was examined in the case of Mr. Electric Ltd. vs. Mozammel Hoque (Md), Trading as MK Electrical Industries and others [60 DLR (2008), P 53–59]. Similarly, the right of passing off was endorsed in the case of Dominous Pizza and others vs. Domino's Pizza Inc. [61 DLR (2009), P 780–788], and the meaning of "use of a registered trademark" was scrutinized in the Case of Managing Director, Baghdad Vegetable Oil Industries Ltd. vs. Van Den Heghs and others [66 DLR (2014), P 450–457]. Nevertheless, many more judicial instances can be drawn as examples to make a strong argument that the entire legal system is trying to present a sustainable trademark governance mechanism to make our laws compatible with the provisions of international treaties and agreements. Furthermore, the DPDT is now a profit-making wing of the Ministry of Industries. To facilitate fruitful outcome, WIPO is funding training to trademark examiners and government employees. In addition, brand awareness is witnessed by the emergence of many prominent Bangladeshi brands. To sum up, it is to say that the laws for trademark governance system in Bangladesh are broadly comprehensive and actively operational, thus presenting a strong trademark protection mechanism for the trademark right holders in Bangladesh.

# Trait Theory of Leadership

Wallace Swan
Walden University, Minneapolis, MN, USA

## Synonyms

Attributes of leaders; Characteristics of leaders; Five-factor trait dimension/domain model of personality; Great person theories; Inborn traits; Relationship between trait and situation; Traits resulting from training

## Definition

Montgomery Van Wart suggests that the basic idea of "trait theory" is that there are certain kinds of attributes that leaders have which improve the functioning of organizations as well as improving the stature of the leader (Van Wart and Suino 2012, p. 54).

## Introduction

The concept of trait theory draws its origins from the "Great Man" theories, as propounded by Thomas Carlyle in his 1841 book *On Heroes, Hero-Worship, and the Heroic in History*. This book suggests that one can learn how to do leadership if one studies the lives of great men. Some of the first versions of this approach emphasized the idea that if people demonstrated masculine traits and dominant behavior, then they could become leaders (Kinicki and Fugate 2012, p. 365).

## Summary of Theories

Of course, the problem with "Great Man" theories is that they embody both an assumption that a leader is a *man*, which involves overlooking the lists of traits and accomplishments of women like Catherine the Great, Margaret Thatcher, Indira Gandhi, and hundreds of distinguished female, as well as LGBT, leaders.

And it is interesting that these male traits are found to be a positive characteristic, not only by male respondents but also by female respondents as suggested John W. Fleenor in a 2006 article published in the *Encyclopedia of Industrial and Organizational Psychology* (Cherry 2016, p. 1).

If one were to create a less male dominated approach to leadership that involved characteristics of men and woman, as well as LGBT people, it would not be a major leap from "Great Person" theories to a somewhat more advanced trait theory, wherein one would look at the great leaders of all types and figure out what leadership traits they might have had.

In order to differentiate the traits possessed by leaders who are effective, Kinicki and Fugate noted that earlier research indicated one could tell a leader from a nonleader using a specific list of traits (Kinicki and Fugate 2012, p. 365).

An analysis by Richard Hodgetts in *Management: Theory, Process, and Practice* (1979) suggested that trait theory during the 1970s looked at people from the viewpoint of what specific attributes make a person a good leader (Hodgetts 1979, p. 289). Hodgetts cited two studies that identified problems with trait theory: (1) a 1940 study by Byrd looked at twenty traits that presumably characterized leaders, *but* different traits appeared on different lists and (2) Jenkins looked at studies of different kinds of groups and found that there was no particular group of traits that identified a person as a leader when that list was contrasted with a list of traits of people who were not leaders (Hodgetts 1979, p. 289). Northouse pointed out that Stogdill in 1948 did a study which said that there was no list of traits that could distinguish leaders from nonleaders, so as a result "situation" was the determining factor (Northouse 2016, p. 19) but later (1974) indicated that one needed to take a broader view to determine the type of the relationship between leadership, the particular organizational situation, and traits (Northouse, p. 20).

One also needs to think about whether the selected traits of a positive leader are inborn or developed through training and experience. It turns out that these traits may be both: Leaders may be characterized by being intelligent, extraverted, being risk-takers, as well as being able to take advantage of the context they are in and adapting to it (Riggio 2009). The type of intelligence needed appears to be social intelligence, which needs to be teamed up with empathy (along with the other traits listed above) – according to Riggio. However, James Alcock and Stan Sadava suggest a slightly different set of traits of leaders, several of which would appear to be inborn traits (Alcock and Sadava 2014, pp. 383–384).

Barbara Kellerman indicates that there are certain traits which are possessed by bad leaders (Kinicki and Fugate 2012, pp. 366–367). One need only look at a wide variety of recent leaders, including presidents of countries, to find examples of people with these characteristics. Thus a set of key positive traits has emerged, by process of elimination from this body of literature, according to Kinicki (Kinicki and Fugate 2012, pp. 368).

Besides the origins of trait theory in "Great Man" theories and the interrelationship of traits with situational aspects, another problem has been that an assumption was posited that a person is born with certain traits that make them more likely to become leaders. The only problem with this assumption is how one would go about determining which people are "leaders at birth" and which people are not. One would be hard-pressed to find a measurement technique that would allow one to determine which people are leaders at birth, *unless it might be one's social and economic status*. Clearly a person might be more likely to exhibit the traits of a potential leader if they have access to a family that has money sufficient to provide an expensive quality education. The Brookings Institution's "Hamilton Study" indicates that household incomes have decreased for many families with children; the United States is increasingly suffering from income inequality combined with lack of social mobility and that children may have the same ability but be limited by the amount of opportunity that they have (Brookings 2013).

Clearly, if the family of a potential leader has the financial resources to ensure that their child receives a university as well as a graduate level education, during the course of that process of education, the student will have access to training that will enhance any leadership traits that they may already have developed.

More recently, Northouse has noted the renewed importance that trait theory has been given due to the way in which visionary and charismatic leadership has recently been emphasized. In 2006 Jung and Sosick determined that leaders have a number of traits that relate well to their charismatic characteristics (Northouse 2016, p. 20). A synthesis of all of these characteristics was then assembled by Peter Northouse, who suggests that there are five major leadership traits (Northouse 2016, p. 23).

In the 1990s, studies had added to this research on trait leadership by exploring to the concepts of "emotional intelligence" and "social intelligence."

We know that *intelligence* involves our ability to learn about knowledge and utilize it in our experience. By contrast, *emotional intelligence* involves the ability of a person to monitor and control their emotions (Cherry n.d.). A somewhat different concept, *social intelligence*, involves the relationships that develop when we interact with other people. Leaders with both emotional and social intelligence skills would seem to have a decided advantage in their supervisory and managerial activities.

Another new direction is indicated by Montgomery Van Wart who suggests that recently the use of basic trait theory approach has been supplemented by analysis of information about employees and the culture of the organization, among several other factors (Van Wart and Suino 2012, p. 56).

Another new direction is that involving the development of a five-factor trait dimension/domain model of Fleenor (2005, p. 831) which suggests that leadership must involve an interaction between the traits of the leader and the situation. For instance, a person with a certain set of

traits might work well in a government or nonprofit organization that requires those skills, while conversely a manufacturing environment might require a manager with a significantly different set of traits.

Finally, Kinicki suggests that there are two useful features of trait theory, as it is currently studied, including using assessments of traits and personality when picking managers, as well as building programs of management training which presumably would emphasize how one might develop leadership traits (Kinicki and Fugate, p. 367).

## Conclusion

Trait theory has gone through quite a few evolutionary changes. It started with traits of a "great man" (which were more recently critiqued in such a way as to yield "traits of great people"). But a major problem with traits was that it was difficult to see if there were any lists of traits that were different when applied to nonleaders as opposed to leaders. This approach then evolved into a more situational approach: A particular set of traits would be necessary in one specific situation, but a different set of traits might be required in another situation. Then it was necessary to sort out those traits which were given at birth, as opposed to those traits which have been enhanced by a person's wealth and status. The theory of charismatic and visionary leadership then intersected with trait theory, and we found that there were certain traits that were more characteristic of charismatic and visionary leaders, as opposed to other kinds of leaders. More recently, competency approaches and the five-factor dimension/domain model of personality have led to studies of the relationship between traits and organizational performance. As a result of this overall process of development, we have developed an enhanced and more in-depth theory of how traits relate to leaders.

# Transactional Leadership

Wallace Swan
Walden University, Minneapolis, MN, USA

## Synonyms

Leadership by metrics; LMX theory; Management by exception; Managerial grid theory; Path-goal leadership; Situational leadership; Transactional leadership; Virtual leadership

## Definition

The concept of transactional leadership would appear to have been derived from juxtaposition with its opposite, transformational leadership. One could define the term "transactional leadership" by saying it is leadership that involves managing necessary transactions with and between employees, while keeping organizational arrangements the same.

## Introduction

Transactional leadership was really quite popular in the 1960s through the 1980s and reflected an increased interest in the human relations model, closed-systems thinking, as well as including the viewpoints of the workers. It has now become surprisingly relevant due to the evolution of our workplace in the direction of virtual leadership.

## Major Theories

According to Montgomery Van Wart, it took a variety of forms, including:

- Blake and Mouton's managerial grid theory, which relates interest in people with interest in production.
- Hersey and Blanchard's situational leadership, which suggests four different approaches to leadership dependent upon the specific situation.
- Path-goal theory, which sets up an employee path to the attainment of organizational goals.
- Leader-member exchange theory, which looks at several different ways of analyzing the relationship between the leader and the follower (Van Wart 2012, pp. 58–69).

James MacGregor Burns, in his 1978 book on leadership, discussed transformational leadership which is an approach that leads to positive change in an organization and is often accompanied by charismatic leadership. But he also discussed transactional leadership.

Peter Northouse further distinguished transactional from transformational leadership by suggesting that the transaction between the leader and the follower just involves a mere interaction, using either a *contingent reward* (where the management provides a reward for something the employee does) and *management by exception* (which involves management taking action if something out of the ordinary occurs) (Northouse 2016, p. 171).

There is a difference between a transaction where a leader gives the employee something in exchange for their work effort and a situation where the leader provides a transformative direction for the employee. A good example of this would be the difference between a North American Treaty Alliance that is based solely upon which nations pay in order to receive military aid from the United States (transactional relationship); and a vision in which the United States provides regional leadership by ensuring that an attack upon one country constitutes an attack upon all with the United States as a power guaranteeing nuclear superiority (which is a transformational vision).

Bernard Bass did perhaps one of the best descriptions of the theory of transactional leadership using data that he collected: He found 44 behaviors that he characterized as helpful management behaviors; and identified two factors that are characteristic of modern management – accomplishing the work and taking care to appreciate the work that the employees perform (Bass 1990, p. 20). Bass does not paint a positive picture of transactional management, especially if it suggests that the manager only gets involved when standard practices are not being implemented. If and when the leader has control of performance incentives, then they can use these to ensure that the employee is rewarded for following procedures or penalized financially when they do not (Bass 1990, p. 210).

However, as Bass indicates, transformational leadership has always seemed to be the more interesting of the two concepts. It seems to be the province of leaders who are able to dream about the future and provide a picture of an environment one would want in an ideal world.

Clearly one would like to be the Nelson Mandela, the Martin Luther King Jr., or the Mother Theresa of their generation. However, the nature of our changing economy is modifying the relationship between transformational and transactional leadership.

We all should know that *leadership* for this type of society is not the same as *management*. Leadership sets directions, works on cultural change, and provides mentoring and guidance to employees. Management works on the implementation of goals and objectives. It takes the direction that has been set and makes it become real. So that almost leads one to think that "transactional leadership" is more like "transactional management." What type of transactions might a leader engage in, given this distinction? It could be a form of leadership where all of the necessary actions required of a manager to make an organization function are reinforced.

One of the issues identified by Van Wart is that transactional theory counts upon an environment characterized by stability (Van Wart 2012, pp. 58–69). One of the problems, however, is that we are now going through a period of immense social change as identified by the urban theorist Richard Florida. As he has noted, we are going through what he calls "the Great Reset." Our society is changing from a service and corporate society to one based upon mega-cities, which attract skilled and highly productive people. Since the 1908s, we have had 30 million new jobs created (artists, entrepreneurs, scientists, and tech people). According to Richard Florida, these jobs constitute 50% of the wages, with 1/3 of the workforce producing ¾ of the discretionary income; and an economic engine producing three trillion dollars. Twenty cities now produce 50% of the new jobs in the United States. And capital formation is located in only a few cities. San Francisco, for example, produces 45% of all venture capital start-ups (Florida 2016).

This change is reflected in differences among generations in our society. Bruce Tolgan has done considerable research on generational shifts with special emphasis upon how retention may be accomplished among millennials. As part of his research, he finds that the workforce is changing because of the pressure of doing more with less and that leaders from the baby-boomer generation want the work to be done without a lot of explanation. He also notes that millennial employees have many "hard skills" or computer and technical skills, but they are deficient in having "soft skills" or people skills (Tolgan 2016).

Organizations these days have to be quite flexible and adaptive. Leaders of these organizations have purposefully set up the organizations in this way in order to compete in a globalized economy. Regional and international trade agreements have resulted in lower wages and required that jobs become very flexible in order that corporate entities might compete.

Instead of job security, organizations now offer jobs to independent contractors; hence the concept of the "gig economy." Perhaps 30% of the corporate employees in the United States are compensated in this way, and the forecasts are that much higher percentages will be in the offing (Small Business Labs 2014).

Employees work on a particular project, for a set period of time, and they receive payment for that – oftentimes with no benefits. It is not just in the corporate sector that we find this type of "gig" employment. For instance, in academia today, a large percentage of teaching faculties are often hired for a single course, paid a set amount, and have no benefits (AAUP undated).

This approach by management to the hiring of employees is spreading, and it is dramatically changing the way in which employees deal with their management, even in governmental and nonprofit agencies. These employees have short-term objectives, have their work measured using metrics, and see their work as *transactional* (Tolgan 2016).

Tolgan suggests some approaches that highlight the kind of transactional leadership that is needed to manage this new generation of Millennials: (1) teach them the basics of leadership and management, (2) spend time with them, (3) teach them how to follow, (4) since they are used to structure, one can show them how they can set themselves up for successes, (5) spell out expectations, (6) tell them how to puzzle through a problem and figure out where they fit, and (7) lay out the expectations and keep score (Tolgan 2016).

The nature of the new "virtual workplace" makes these transactional leadership skills even more important. (MBA/UNC undated). Because of the way in which activities are increasingly linear, virtual, and very highly detailed, it is important that managers and employees have the kinds of relationships in their organizations that are *transactional* in nature. Certainly at the very highest levels of management "transformational leadership" is important, but for most managers and employees, "transactional leadership" is surprisingly necessary in our new economic and technological environment.

## Conclusion

Transactional leadership began as the opposing theory to the more exciting transformational leadership model. It was seen as the kind of mundane relationship that one experiences in working with their supervisor; e.g., "if one completes this task, one's employer may reward one with another task to complete, and if many of these tasks are completed, one will be paid for them." As our society has changed to an increasingly digital society, and toward a "gig economy," transformational leadership is reserved for the very few upper middle and upper class leaders and professors who are paid handsome salaries and receive benefits for their work in contrast to the employees and adjuncts that do their work. By contrast, transactional leadership has become more and more important – because that is the way that a large and increasing number of lower and middle income people make their living.

# Transference Teachers to Administration/Finance Positions

Mihail Diakomihalis[1] and Eleni Bolovinou[2]
[1]Department of Accounting and Finance, Technological Educational Institute (T.E.I.) of Epirus, Preveza, Greece
[2]Ministry of Education/Primary Education, Preveza, Greece

## Synonyms

Finance or administration officer; Job satisfaction; Professional development; Public sector employees; Teachers; Transference

## Definitions

"Transference is a form of mobility of employees and it means essentially resigning-leaving a job and re-hiring to a new working position."

"Every transfer from one job to another, either within the public sector, or between the public and the private sector, or between the public sector and international organizations, is a form of mobility."

"Professional Development is the improvement of the functioning of the organization along with the growth and increasing capabilities of employees through specific strategy and policy (i.e., education, training, etc.)."

"Job satisfaction expresses the feeling of employees regarding specific aspects of work such as physical and material working environment, administrative structure, organization and support, interpersonal relations between colleagues and management, salary, prospects, and development."

## Introduction

Transference is a form of mobility of employees, and it means essentially resigning-leaving a job and rehiring to a new working position. Mobility may be applied so much in the public as in the private sector.

Transferences do not constitute a new procedure since they have been institutionalized for many years, during which they were a deliberate choice of workers. During the last decade, transferences of different nature have arisen, by which employees transferred either unintentionally and under the threat of being fired from their work, or "intentionally and unintentionally" under conditions of uncertainty about their work in the future. In the context of restructuring and reorganizing the public sector in Greece, redundant teachers moved by changing their professional position in order to fulfil the need for administrative staff for various public services and education administrative offices.

Conceptually, there are two types of transference in the public sector: those taking place in the education sector on the basis of an institutional framework due to a change in educational levels and those made mandatory, or almost mandatory, in the context of administrative restructuring of public administration. The result of both forms of transference is the modification of the professional status of employees, and it occurs as the issue of whether and what kind of professional rehiring there is and what the consequences are. This entry focuses on mobility within the public sector and the findings of the empirical study presented concern the primary and secondary school teachers' transference from the class room to administration and financial positions.

The aim of this entry is to try to give answers on why some teachers either select or are being forced (?) to transference in different work position than teaching, which is the position they have been hired initially. Besides, the difficulties encountered with the decision of teachers to transfer as well as the opportunities for their professional development, irrespective of whether the decision was unintentional or deliberate, and ultimately their job satisfaction in the new administrative or financial positions are issues that need to be answered in this study.

Furthermore, this contribution aims to investigate the reasons which incited teachers to take the decision to transfer to administration/finance positions in primary and secondary education, but also the difficulties and problems arising from this exercise, whether the host organization applies policies for improving and increasing capabilities of transference teachers and what are they (education, training, etc.), to verify how easy or difficult the adaptation of the transference teachers is and if they feel welcomed and satisfied into their new working position. The degree of job satisfaction, irrespective of whether the decision for transference was deliberate or not, is the issue to be investigated in this study.

Taking all these into consideration, it is realized that it would be appropriate and interesting to investigate the issue of the existence of a policy frame for the transference teachers in their new duties, or transference is simply considered as an emergency solution without the providence to promote the professional satisfaction and development of teachers as administration officials neither the development of the organizations (Diakomihalis et al. 2017, 2018).

The issue of job satisfaction of transference teachers is another subject of this entry. Transference teachers, regardless of the reasons which have led them to this decision, after their transference belong to the administrative staff of the Education Administrative offices and pursue a new profession. Thy have expectations from their new

profession and engage in satisfying their needs. The achievement of these will affect, and at the same time will be affected by, the degree of satisfaction from the new working environment. The contribution of this entry refers to the investigation of whether and to what extent transference teachers are satisfied, what are the factors that cause satisfaction (salary, relations with colleagues, administrative support, prospects), taking into account their demographic characteristics, such as gender, age, marital status, years of work experience, academic qualifications, specializations, and level of education. Besides, the possibility of transference teachers to return to their previous professional status is a subject this entry is concerned about (Diakomihalis and Bolovinou 2017, 2018).

From the perspective of the organizations, professional satisfaction is a matter of major interest, and this is justified by the fact that human resources is a very important factor for their operation. This is because professional satisfaction is linked to their performance, leading to economic and organizational development of the organizations themselves.

From the perspective of the employees, professional satisfaction is also very important for themselves, if we consider that an employee devotes a large part of the day and his life in his/her working premises. Besides, labor matters frequently concern the employees beyond the working environment and the working period.

From the data collection and processing the views of the transference teachers about the reasons which led them to decide their transference, creating a wider concern for the conditions behind such a "decision of life," will be recorded.

On the basis of the above mentioned issues and the individual objectives of this entry, the following arisen questions are expected to be answered:

(a) For what reasons (professional, economic, personal) the teachers have chosen the transfer.
(b) What is the treatment of transference teachers by the host institution? (colleagues, supervisors)
(c) What are the adaptation difficulties encountered in their new position?
(d) To what extent their professional development is supported.
(e) With what procedures the organization supports their professional development.
(f) The degree of satisfaction and the problems they face.
    - Is there business satisfaction with specific aspects of work? (physical and material working environment, administrative structure and organization, interpersonal relations developed both between colleagues and between workers and management).
    - Is there an overall professional satisfaction after transference?

## Literature Theories

Each shifting from one job to another, either exclusively in the public sector (internal mobility), or between the public and the private sector (external shifting), or even between the public sector and international organizations is considered as mobility. Mobility can be applied to structures of the same hierarchical level (horizontal) or to shifting from a higher to a lower hierarchical level and vice versa (vertical). It may also be voluntary or obligatory, refer to functional diversification of working position or even be a geographical shift, with the aim of the best possible use of human resources. In certain cases, personal needs of workers might be satisfied through some forms of mobility. By reviewing the pertinent studies, it has been realized that there is no relevant research to study transference of officials and in particular, the issue of teachers' transference to administrative positions has not been investigated. However, many studies regarding the abandonment of a profession and career change in general, as well as for school teachers, have been found. There are also many studies which are mainly aimed at the reception and integration of newly recruited and adjunct teachers into school units, and their professional satisfaction and development, while there is no such study for

teachers which after some years decide or are "forced" to decide to serve the education sector through a different role and position. In the present entry, the reasons that incited school teachers to quit their teaching profession and "decided" to transfer into educational administration will be investigated, with the ultimate aim of contributing to the fulfilment of the research gap in the existing literature.

### Professional Development

Professional development of personnel is considered an essential factor for both the development of the organization and the development and personal fulfilment of the employees. The increase in the qualifications and skills is undoubtedly beneficial for the utilization of the employees within the organization.

Several studies regarding the practical vocational development of human resources, comparing workers from different periods and from different working environments, have demonstrated the significance of personal motivation and coaching of workers. The conclusion in these kind of studies was that the main sources of learning come from the daily work procedure and the experience acquired by the workers through their cooperation with their closest-direct supervisors.

One of the objectives studied in this entry is the evaluation of transference in relation to the environmental and individual factors, and to what extent their needs and expectations are fulfilled.

### Job Satisfaction

The degree of satisfaction or dissatisfaction of school teachers who quit their profession and "decided" to transfer into educational administration, with the ultimate aim of contributing to the fulfilment of the research gap in the existing literature is also a subject to be investigated and presented in the present entry.

In several studies, salary and benefits as well as the confidence of the profession seem to have little relevance to the satisfaction, while autonomy has greater relevance. The working conditions are also related to the satisfaction of teachers is administrative support and leadership. The highest percentage of the most satisfied teachers of public schools indicate the existence of assistive administration. The lack of participation in decision-making seems to increase the degree of lack of satisfaction. Cooperation with colleagues is a positive experience for teachers (Klassen and Chiu 2010; Perrachione et al. 2008; Zembylas and Papanastasiou 2004). Even the possibilities of improving qualifications and skills (Perrachione et al. 2008) are positive experiences related to satisfaction.

However, in order to investigate the existence or not of job satisfaction for transference teachers, it is appropriate to refer to the factors contributing to this and to focus on some of them.

## The Methodology Followed in This Entry

This entry aspires to contribute to Public Administration and Public Policy issues by revealing the findings from primarily quantitative researches, i.e., a form of social researches based on surveys. The researches' tool is the structured questionnaire and has as a target group the transference teachers in administrative positions in Education Administration offices in Greece.

## The Findings

The findings of the researches presented in this entry could contribute to a strategy for improving the functioning of the organizations while ensuring the development, growth, and development of employees. The professional development of workers is extremely beneficial for the organizations themselves. Therefore, the organization should follow strategies to promote achievement of professional satisfaction and professional development, in order to support and use effectively their human resources.

### Reasons for the Decision to Transfer

Transference teachers were asked to indicate whether the transfer was a decision for voluntary or compulsory and then to express the degree of

agreement in a series of proposals relating to the reasons which led to the transfer.

It seems that 70% of the transference teachers took the decision to shift from the education voluntarily and 30% said that they have been forced to this decision. It is interesting to note that 70% of the transference teachers declare that the choice of transfer is considered voluntary despite the fact that some of the recent years transferences are characterized by the state itself as mandatory.

The main reasons which led to transfer from teaching are mainly economic and family. In particular, the main reason that led the teachers to transfer was to reduce the distance from the place of the family residence. For two-thirds of the transferred teachers, the reduction of the distance from the place of residence played a very important role in the decision to transfer. The second key factor for the decision of the teachers to transfer was the reduction of cost of living, such as, for example, the avoidance of rent. The possibility of dismissal from the education was also a reason leading teachers to transfer. In particular, almost 60% of teachers believe that the possibility of dismissal from the education had affected "a little" to "very much" their decision to transfer to administrative positions. Finally, it is interesting that 60% of teachers has chosen to shift from the classroom because of their interest in the administration position. The reasons for transference "prospects for professional growth and development" in the new work, "lack of satisfaction from the teaching profession," "limited prospects of education" and the "workload" in education seems to have influenced teachers "a little" in their decision to transfer. The lack of satisfaction as a factor for shifting depicts a small percentage.

### Difficulties and Problems in the New Work

The transference teachers were invited to express their opinion referred to the difficulties and the problems they encounter in their new position as administrative officers.

The greatest difficulties faced by transference teachers in their new working position have to do with "working hours," "paid holidays," and "workload." As to the subject of the new job, teachers do not seem to have serious problems since the majority of the respondents indicate that the new subject of their new work creates "not at all" to "a little" problems. It is important to mention that the majority of transference teachers declares that there is "not at all" difficulties in relation to colleagues, the supervisors, and the public transactors. The material environment and the natural environment of the new work appears not to create difficulties for transference teachers.

The results show that one-fourth of total transference teachers consider that there is no differentiation in their treatment from officials in their new working position. This diversification is mainly a result of the different culture between "old" and "new" employees (60%) and of the different culture between transference teachers and administrative personnel (47%). In addition, teachers who believe that they receive different treatment from current administrative employees (30%) consider that this behavior is due to the lack of administrative knowledge of transference, while 20% of them believe that the existence of this differentiation is due to the treatment by the head of the department and 20% believe that this is due to other reasons, such as the different educational level between old and new administrative staff.

### Professional Development

The views of the teachers regarding the educational factors of professional development in their new job as well as the method and frequency with which their professional development is promoted by the host institution were investigated in this analysis.

The factor which obtains the highest percentage and the first ranking place is the "cooperation with colleagues." Obviously, transference teachers believe that good cooperative relations in the workplace will help them learn better their duties and achieve their professional development.

The factors "continuing education and training," "cooperation with colleagues," and "introductory education and training" are considered by the teachers very important for their continuous professional development, as their ranking in the first three positions of the hierarchy reveals. The

next important factor is the "guidance by experienced colleague in the particular work," since the highest evaluations of this factor appear in the second, third, and fourth place. The "guidance from the supervisor" is also a significant factor for the teachers professional development, since it is ranked in third, fourth, and fifth position from about 50% of the responders. The factor "personal investigation on the subject of work" ranks in fourth and sixth place, indicating a moderate significance for the teachers. The factors "participation in scientific events," "search for knowledge on the internet," and "attending a master's program" rank in the last three positions of the hierarchy, proving they are not considered important for the professional development of transferred teachers. This finding might be related to the fact that workers do not seek the acquisition of theoretical knowledge but the application of theory in practice. The classification of a "master's program" in the last positions may be associated with both the previous finding and with the current economic situation, since most of the available programs require fee payment. Another reason could be the long time required for a master's program study, since teachers seem to prefer educational programs of short duration.

### Job Satisfaction

The findings of previous conducted researches (Koustelios 2001; Mondal 2015) supported the existence of an overall job satisfaction for school teachers, a result that is confirmed by the present analysis. Some of these indicate that teachers are not satisfied with salary, promotion opportunities, and the possibility of professional development as well as with the excessive demands of the profession (Mahmood et al. 2011).

The areas in which the teachers declare as most satisfied are those referring to communication, cooperation, and recognition from colleagues, the head and the public. The highest average value displays the variable "communication and cooperation with my colleagues," which means that teachers declare that they are "much" to "very much" happy with the relationship with their new colleagues. The areas in which the transference teachers declare as less satisfied, i.e., show lower average prices, are "promotion of professional development," "economic rewards," and "working time." The lowest average value shows the variable "promotion of professional development of workers," which means that teachers are "a little" to "not at all" satisfied with the prospects and development offered in their new work. This finding may mean either that they do not expect to improve their knowledge or are not pursuing an occupation of higher administrative position.

The results of transference school teachers' overall satisfaction from their current job show that about 50% of the respondents are rather satisfied by their current work and only 15% indicated to be fully satisfied. "Rather dissatisfied" to "very dissatisfied" from their new job declare the 37% of the transference teachers.

## Conclusion: Discussion

The results of the research showed that the transference teachers driven this option for personal, family, and economic reasons, among which is the distance from the place of residence and the living cost. The feeling of security against the fear of dismissal, the interest for the new object desk is in addition to the reasons of the venture.

In accordance with the survey results, it is obvious that personal, family, and economic reasons, such as the distance from the place of residence and the living costs, play an important role for the decision to transfer. The transfer-retirement of workers seem to be linked to the general economic situation in Greece, as well as the sense of security of transference, since the fear of dismissal played a role to their shifting from one operation to another. The interest for the new working position is another reason which contributed to the decision to leave education. The lack of satisfaction from the teaching profession and the workload influenced very little their decision to transfer. The prospects for professional growth

and development in the new task and the limited development prospects of teaching are also factors which led to the transfer. Professional development has been underlined by other researches as a factor related to the decision of abandoning the profession.

The teachers of primary education show more interest in the administration while their decision has influenced by the lack of satisfaction from the teaching profession, the limited prospects, the many requirements of teaching, and the workload. At this point, it should be noted that the teachers and preschool teachers have chosen deliberately to leave the profession without being affected by the process of the recent transferences. The reasons for shifting from the classroom are also mentioned by other researchers (Klassen and Chiu 2010), as the lack of satisfaction and opportunities for promotion, the desire to change career, family, personal reasons, the workload and requirements in teaching, as well as governmental and economic policy.

The reduction in the cost of living and the distance from the place of residence of the family were the decisive reasons for transference by the secondary education school teachers.

Regarding the reasons on the voluntary or compulsory choice of transfer, it is found that the voluntary versus compulsory has more to do with the lack of satisfaction, the many requirements of teaching and the workload in the education and the interest for the subject of administration. The reduction of the distance from the place of residence of the family and the reduction in the cost of living, were the greater incentives for teachers who have applied for voluntary transfer compared to teachers who have been forced to shift from the education. The compulsory transfer is relating more to the possibility of dismissal. Once again it seems that teachers who were forced to transfer have taken this decision with the fear of being dismissed.

The factor which obtains the highest evaluation and ranks first in significance for the professional development of teachers is "cooperation with colleagues." Very important factors considered "continuing education and training" and "introductory education and training," with the majority of the participants ranking them in the first three positions of the hierarchy. "Cooperation with colleagues" is a convenient strategy for development of the organization staff, rather effective and certainly inexpensive. The officials on the other hand perceived the "cooperation with colleagues" as more important because the colleagues seem to be almost the only experienced in the new working environment. However, both, "continuous" as well as the "introductory training," are strategies, each organization should apply because these may expand the professional horizons of the employees. "Guidance from experienced colleague" and "guidance from supervisor" are important factors, while "personal investigation on the subject of work" is of medium importance. "Participation in scientific events," "search of knowledge on the internet," and "attending a master's" are ranked in the last positions.

So much in the empirical researches analyzed in this entry, as in the research of Zaleska and de Menezes (2007), "guidance from experienced colleague" and "guidance from the supervisor" are important factors for professional development. "Continuing education and training" holds a leading position in the present study. In the same survey, "cooperation of colleagues" is only a very small percentage, while the factors in the lower evaluations for professional development are the same in both surveys.

It is worth at this point to point out that transference teachers believe that their professional development will be achieved mostly with the "cooperation with colleagues." This may be due to the fact that they have not previous experiences, neither any general information for the functioning of the organization, the working conditions and the new duties of work, making them to rely mainly on the good will and the "diligent" of colleagues. It should be kept in mind that education of new hired colleagues is not an additional cost for the organization, on the contrary, it is

considered a very constructive as in-service training.

The most frequent method applied by the host institution for the professional development of transference teachers, is "guidance from experienced colleague" and "guidance from supervisor." "Introductory education and training" was not applied in almost any case. It is worth repeating that about 95% of transference teachers stated that "education and training programs" and "participation in scientific events" are applied rarely to never. About 80% declared that "introductory education and training" has never been applied.

Organizations must provide incentives to meet the expectations of transference teachers and to keep in their new positions.

The organization is required to apply strategy for professional development of workers and support of employees career with the introduction of specific methods based on the real needs of every employee, in order to earn organizational commitment. Finally, the results of the present analysis show that "interpersonal relations in the working environment" is a significant factor for professional development. The organization should "exploit" talented and experienced staff by strengthening the mentoring and coaching.

Another issue the research is dealing with is the determination of the problems faced by transference teachers. It has been recognized that the "work schedule," the "paid holidays," and "workload" are the main factors considered difficult and keeping skeptical the administrative officials.

The majority of transference teachers does not address any difficulties at all in their relations with colleagues, supervisors, and the transacted public. The "few" difficulties attributed to "material and the natural environment" of the new job are rather related to the overall logistical state of public services in Greece, taking into account the present economic circumstances of the country which have further reduce the associated operational costs. The researches of this entry reinforce the aspect that administrating offices suffer from lack of logistics.

To a large extent, transference teachers declare that there is no differentiation in their treatment by the permanent employed staff in the administration. However, the percentage of teachers which indicate that there is treatment diversification, believe that it is attributed mainly to the existence of a different culture between "old" and "new" officials and between transference teachers and administrative officials. This diversification is likely to be related to the fact that teachers have a more people-centered approach due to their studies and to their relation to children in contrast to the employee attitude of the administrative personnel toward common adults. Another reason to this diversion, even for a lesser extent, is the lack of administrative knowledge of transference and the treatment by the supervisor. The reception of new employed to the organization seems to be positive, and this explains to a large extent the positive view of the transference teachers.

The treatment differentiation regarding to gender is associated with the "problems with colleagues," where women are facing more in relation to men. It is very possible that this is attributable to the different perception and treatment of relations and, more generally, to different characteristics of the personality of the two sexes. Transference teachers who have 3–5 years are facing greater difficulties with their colleagues, compared to those who have more or less years of administrative experience.

A statistically significant difference in the opinions regarding the "workload" has been detected in respect to the age of transference teachers. Those under 50 indicate that the workload creates a greater problem compared to those older than 50 years. Employees with at least 6-year experience in administrative posts judge "workload" as a lower significance problem.

Transference teachers in the secondary education administrative offices face greater difficulties regarding the "natural working environment" compared to those employed in primary education, probably because the logistical conditions are obviously worse in the secondary. The teachers of primary education face more problems with the transacted people compared to other disciplines.

The problems in the administrative position regarding the choice of transfer (optional or

mandatory) appear to be related to the "natural environment" and are experienced to a greater extent by those who were forced to transfer and those who serve mainly to secondary education administrative offices. Perhaps this shows that the conditions in the primary education offices are better as it depicted in the previous finding.

The degree of satisfaction among transference teachers in various sectors of the new job does not differentiate statistically significant regarding the gender. The transference teachers without work experience or experience 1–2 years in managerial positions are more satisfied with the cooperation with their colleagues and the supervisor in relation to the transference teachers having from 3 to 5 years of experience in administrating positions. Also the transference teachers with over 21 years total service are more satisfied by the subject of their new work compared to those who work fewer years. This may be due to the experience they have gained over the years.

Regarding the demographic factors, not statistically significant difference was found. A marginal statistically significant difference appears as to the specializations of the teachers, with those of the Primary education showing greater professional satisfaction in relation to the others.

It has been realized that the teachers who decided voluntarily their transference are more satisfied overall with their new work as well as with the specific factors of their new working position. This perhaps is due to the fact that they were prepared at least psychologically and that they have been informed of their new duties.

The type of transference is also linked to the teachers' intention to return to their prior professional position. The mandatory transference school teachers are more positive to this possibility. Finally, regarding the intention of the transference teachers to return to the classroom, great interest is shown by the particularly high rates of those who declare that "rather" and "certainly" will return, and that is a result perhaps of mandatory and unintended transference which did not satisfy them in all levels.

The dedication in many cases lowers the tendency for resignation even when the disappointment is obvious. In this entry, it is a clear finding that even when the satisfaction is apparent in some cases, the resignation is not unavoidable. In conclusion, the voluntary transference depends on the particular circumstances prevailing and must be examined in any case. The clearly voluntary option of a transference may lead to greater organizational commitment and reduce dissatisfaction from the new job.

Transference as a form of mobility of employees, by resigning-leaving a job and rehiring to a new working position, is a means of reorganizing the public administration. This massive movement of workers through transference could contribute to reduction as well as to the reformation of the public sector, if there is concern for employees redistribution based on the needs of organizations, on the qualifications, skills, and the needs of the employees.

# Transformation Metaphor of Organizations

Paul C. Nutt
Fisher College of Business, The Ohio State University, Columbus, OH, USA

## Synonyms

Changing public organizations; Reforming public organizations

## Definition

Transforming public organizations is when a strategic process and strategic leadership are used to change public organizations.

## Introduction

In recent years, public organizations have been called upon to make radical, transformational changes (Osborn and Gaebler 1992). This call has been made before and is repeated anew, seemingly with each new budget crisis (Wechsler and Backoff 1986; Nutt 2004a). Budget crises are coming more frequently so calls for transforming organizations are coming more frequently. The question is whether such demands are feasible: Can public organizations truly make radical and transformational, changes? What constitutes a transformation? And under what conditions would transformations be possible? This chapter offers some insights into these and related questions.

The primary focus is the general-purpose bureau or agency found in federal, state, county, and city governments (Nutt 2004b). The intent is to identify conditions that make altering current practices and fashioning new ones feasible in such organizations. The ideas should extend to the private/nonprofits such as hospitals, port authorities, and regional planning commissions, as well as many other types of organizations. The many large in number but small in size voluntary organizations are not considered in this entry.

## Distinguishing Types of Change

Two types of change are considered: repositioning and transformation. Repositioning focuses on current clients and their needs, which limits its scope. A transformation deals with the future clients and their predicted needs. To transform, leaders create greater variety, additional skill, and enhanced ability to serve customers/clients in new and different ways (Pauchant and Mitroff 1992). Leaders must go beyond using maintenance and control activities to improve efficiency and effectiveness. A transformation requires new ways of thinking that alter taken-for-granted and often hidden organizational rules, which limit how people think about change (Wilber 1982; Pribam 1983; Fisher and Torbert 1991). Repositioning alters current practices, ruling out radical change sought by a transformation (Wheatley 1992).

Public leaders reposition by asking hard questions about how to improve their *current* strategy (Nutt 2005). This involves altering current services, customers served today, current service provision channels and skills, the basis for today's collaborative advantage, current sources of funding, and image (Hamel and Prahalad 1994; Quinn and Cameron 1988). To carry out a transformation, a leader seeks to answer these same questions put in a *future* context. A leader fashions a vision that suggests what *future* services, customers, channels, skills, bases for collaborative advantage, sources of funding, and persona might look like (Nutt and Backoff 1997; Wheatley 1992). Transformation goes beyond tinkering with today's strategy, projecting today's thinking into the future, to imagining what a desired future would look like. This takes place when radical and coherent changes in the services, clients, etc. that make up the organization's current strategy are integrated with core capabilities (Nutt 2005).

For instance, the Ohio Department of Natural Resources (ODNR) was transformed with a vision to incorporate critics into its programs to build joint interests. Conflicts between sportsmen and environmentalists were managed by opening up new hunting and fishing areas and using fees for hunting and fishing licenses and park use to support wildlife, environmentally threatened areas, and state parks. Cooperation between historically antagonistic groups, representing sportsmen and environmentalists, was created and resulted in broad support for tax-based funding to protect endangered areas and wildlife and to support recreation programs. Recreational areas were expanded. The increased revenue from user fees provided the funds to support other initiatives. The synergy of protection and use programs leads to an ODNR budget that relied on the state funding for less than one-third of its programs, making it take on the characteristics of a private-nonprofit organization. The transformation allowed ODNR to move to a higher order of complexity in which change, such as new services, was not just added on but emerged from the integration of old and new services. As a result, a transformed organization is able to respond in new and different ways to the emergent demands and opportunities found in turbulent environments. Public organizations with a vision that anticipates client needs can use these needs to make changes in their core services and procedures and produce a similar result. Synergy between the organization's new and old services and other aspects of its strategy increase flexibility and adaptability (Levine 1980).

Note how transformations go beyond fostering growth, which adds to existing capability by serving the current stable of clients more efficiently or effectively, incorporating new ideas into the organization's strategy (Weisbord 1988; Bass and Avolio 1990). Novel ways to meet the needs of new clients are integrated with current services, channels, etc. which make up the organization's strategy. A successful integration provides a quantum jump in the capacity of the organization. The transformed public organization brings these new capacities to bear as services for clients that can be internal or external to the organization turning upside down traditional notions of who is a customer or a client.

## Change in a Public Organization

Change calls on public leaders to review how their organization responds to its clientele, noting whether this stance inhibits change. Factors that appear to block change are enumerated. The leader asks if strategic repositioning can be carried out and then if transformation is feasible.

### Organizational Stance and the Prospects of Change

Some public organizations have limited capacity (resources) and/or little responsiveness to perceived missions (Levine 1980; Nutt and Backoff 1993; Ingram 2001). Capacity erodes by years of budget cutting, limitations on prerogatives, rule making by legislatures, and assignment of duties to other agencies. Motivated staff leave, further limiting capacity. As capacity declines, complacency sets in making change difficult (Alter and Hage 1993). Buffeting by events the organization is unable to manage also limits change prospects. Demands can be experienced at a rate that exceeds the organization's ability to understand, let alone cope with expectations, creating learned

helplessness. Elaborate rationales for avoiding action supplant building capacity to meet demands.

The susceptibility to change is governed by the prospects of growing organizational capacity to enhance organizational responsiveness (King 1982; Nutt and Backoff 1997; Bozeman 1987; Rainey 1997). Capacity sums up resources available. Due to the labor-intensive nature of public services, this is given by the numbers and skill levels of key people and the prospects of adding additional capacity (Levine 1978; Lawrence and Dyer 1983; Gailbreth and Schendel 1983; Thompson and Strickland 1996). A perceived lack of capacity prompts organizations to resist change, fearing that the new demands will expose shortcomings (Eichholtz and Rodgers 1964; Zaltman et al. 1973; Nutt 1987). Capacity is measured in a comparative manner, indicating per capita funding of organizational types such as university hospitals corrected for patients served by severity or business schools adjusted by undergraduate, MBA, and PhD enrollments. High-capacity agencies would be well above the median and low-capacity ones would fall below it.

In the private sector, initiative springs from demands emerging in a market (e.g., Miles and Cameron 1982; Lawrence and Dyer 1983; Porter 1985). In the public sector, responsiveness stems from the extent client needs are met. Here, oversight bodies that regulate client fees and supply funds as budgets act as the market. Instead of selling to end users, the public organization must sell an oversight body on the need to increase its responsiveness. Oversight bodies can be very fickle about expected levels of responsiveness (Levine 1980). After a long period of low expectations, the organization may suddenly pop up on a political agenda. Demands are made and responsiveness expected. The prospect of change is given by the extent to which public leaders find themselves committed to being responsive to oversight bodies. Change is held back by certain types of commitments and facilitated by others. Such latent demands can be elusive and several measures are needed to capture them. An index of responsiveness suggests the amount of agency initiative, given by the level of services offered less those *not* being offered. For a given type of organization, service demand is inferred by agency mission changes under discussion and new services proposed, measuring the number of clients to be served.

A public organization changes when it moves toward increased capacity and increased responsiveness. This is shown by a path that moves up the diagonal in Fig. 1, running from the lower left to the upper right, as indicated by the arrows. The path along the diagonal first to the buffeted and then to the proactive zone identifies a sequence of conditions that are created to enlarge the scope of change. A public organization with an imbalance in responsiveness to its constituencies and its capacity will find it difficult to engage in change. Change is feasible when responsiveness and capacity are balanced.

## Organizations That Resist Change

Stable types of public organizations have little motivation to change (Fig. 1). Stability arises, somewhat paradoxically, when capacity and responsiveness are badly out of balance. Because either building capacity or responsiveness dominates, attention is focused on the maintenance of capacity or on responsiveness and not on using capacity to provide responsiveness.

*Professionally Dominated Organizations* – Professionally dominated public organizations have high capacity, real or perceived by outsiders, and little responsiveness. Activity is directed by professional values with little responsiveness beyond the imperatives embraced by such values. Political, legal, and economic forces that ordinarily direct and channel organizational energies and ensure accountability are not in place. Typically, such organizations have considerable prerogative to act in a prescribed arena and use connections to protect its budget and resource base.

The FBI under Hoover and the IRS are examples. Departments of taxation and the attorney general's office provide examples in state government. Public organizations that rely on highly skilled and self-regulated staff members to provide key services can also become professionally dominated organizations. Examples include: state-run mental health hospitals, public acute care hospitals, university medical centers,

**Transformation Metaphor of Organizations, Fig. 1** Change forces for types of public organizations

university facilities, social work agencies, public defender offices, and the state architect office. Such organizations are dominated by professional elite who control the terms of services provided. The periodic release of selective data and testimonials is offered to measure success.

Change, prompted by a leader or an outsider, is very difficult when professionals can maintain this degree of control over what the organization does. A professionally dominated bureau or agency can ignore client preferences and the political agenda of reformers and may even be insulated from budget cutting. In some instances, the professionally dominated organization can turn aside legal mandates and judicial orders.

*Protected Organizations* – A protected organization can be created, or it may evolve a protective posture. An example can be found in state departments of development (DOD). Recently, Republican-controlled state legislatures contend such departments can spur economic growth and create jobs. The leader of a DOD carefully maintains an old-boy network, made of supporters in the legislature, in part to harness forces that would normally call for accountability in growth and job creation. When a critic asks how many new jobs have been created by a DOD and how much tax base has been given away, the network is mobilized to deflect such questions and make them seem politically motivated.

Some public organizations slip into a protected posture to survive. The impetus stems from stress as leaders attempt to respond to increased demands without the means to do so. To cope, such a leader seeks an island of stability that provides safety. Public organizations singled out for reform often find themselves in this position as mandates are added without the funding to carry them out. Cities struggling with unfunded mandates in federal legislation provide an example. To respond, available funds would be spread too thin to accomplish much making any attempt seem futile. The organization copes by resorting to strategic posturing.

For instance, state and federal laws call on state departments of education (DOE) to institute educational reforms. Oversight bodies use these mandates to lean on a DOE to carry out competency-based education, insure financial equity across school districts, implement new funding formulas, adhere to federal regulations for special education, reconcile the demands

made by life skills and back-to-basics curriculums, and still others. A DOE may have neither the competence nor the funds to do all this. To survive, leaders resort to image management, talking about what they have done and not what they will do.

If oversight bodies reject a "K-Mart" solution that would let an agency deliver low quality to all comers, responsiveness is limited, doing only what the oversight body asks. To demonstrate responsiveness, leaders determine the agenda of key people on the oversight body and focus the agency's limited resources on doing what these individuals want. For example, a bureau of workers' compensation (BWC) narrowed its responsiveness to survive. Oversight bodies of a BWC are often polarized, with different views of the key client. Clients, represented by labor unions among others, want assurances that injured workers will be taken care of. However, small business representatives often dominate the oversight body of a BWC. Small business interests want to reduce their fees that fund compensation benefits. A BWC is often forced to choose reducing fees over benefit provision. To survive, such organizations cultivate patronage that will endorse its actions. When successful, this allows the overstressed organization to move from a threatened to a protected position.

To become protected there is a shift in responsiveness from broad to narrow. If successful, this allows the overstressed organization to move from an unstable position to a protected one. To develop the required patronage, leaders ferret out the views of opinion leaders that control funding and the terms of service, such as fees and co-payments. Public leaders can become very clever at identifying the agenda of key people in an oversight role and then giving them what they want.

Such leaders look for an opportunity to carve out a new domain in which their organization has an exclusive right to act, creating a "protected" environment. Legislation can even be written to give exclusive rights or responsibilities. For example, the Iowa Legislature gave the University of Iowa Medical School exclusive rights to provide all tertiary health care, statewide. In a protected organization, old-boy networks are carefully maintained to deflect criticism and routine accountability and to harness the forces that would normally be used to monitor actions. The leader exploits values that have become legitimized and no longer subject to challenge. No one questions the massive shift in funds to county governments for MRDD. Levies pass routinely, even though patients are still warehoused, albeit locally, and the inefficiency of county governments is well known. Organizational leaders carefully manage the old-boy network that supports their periodic levies to insure continuing funding. Control of turf in this way creates little incentive to improve capacity and makes the organization quite political.

*Routinized Organizations* – Public organizations with few demands and low capacity often become highly routinized, developing codified routines that are rigidly followed. Because no one questions its products, the organization continues its low-value processing with little accountability. Examples include bureaus of motor vehicle licensing, contract activities in departments of transportation, claim processing in bureaus of workers' compensation, and service departments such as travel and records in universities. Former students who complain about poor service, such as delays in getting a transcript, are ignored by university leaders and oversight bodies who have more important things to do. Delays in receiving compensation benefits fall on deaf ears, charges of unfair or unethical contracting for highways are ignored, and questions about the time and cost to do things and the inability to deal with the most trivial exception go unanswered by the motor vehicle bureau. Oversight bodies find little reason to think about the agency, let alone question its practices, allowing such an agency to drift toward a change-resistant posture.

## The Forces for Change

The protected, professional, or routinized public organization is pushed toward change by a loss of patrons and/or a loss in capacity. When this occurs, the organization experiences buffeting and feels pressure to reconsider its strategic

commitments. This movement can occur in three ways as shown by the arrows in Fig. 1.

### Change for a Professionally Dominated Organization

Change in a professional organization can be blocked unless capacity is thought to be declining. This blocking may continue even when the call for increased responsiveness is clear and compelling. Only perceptions of diminished capacity push the professionally dominated organization toward change.

The strategy of a professional organization rests on maintaining its perceived capacity. Capacity erosion forces change. The FBI's reputation following Hoover's death, and again after 9/11, went into eclipse forcing the FBI to reexamine its role with new strategic positioning. The first move is to defend past practices, coupled with some small-scale adaptations of the practices. Sustained pressure is required to force the agency to consider larger-scale change. Such pressure can force an organization to rebuild its image of competence as new practices are forged and adopted. For example, the IRS, stung by reports that they unmercifully harass taxpayers, confiscate the bank accounts of the children with parents in arrears, and give inaccurate tax advice, reformed its procedures and then engaged in damage control.

Pressures may not be sufficient to move an organization out of a professional posture. The Army Corps of Engineers, following Katrina, was faced with severe criticism. The levies supposedly constructed to hold back 100-year flood waters were unable to contain storm surge. Locals, who had predicted likely levy failure for years, were given new attention, and questions about agency practices were posed by national media. A clamor for change, however, proved to be short-lived, and the Corps returned to its professional posturing. Budgets and projects were routinely approved, with little questions about the safety factors. Performance accountability, beyond those accepted by Corps Values, continues to be ignored. The Atomic Energy Commission went through a similar sequence of questioning followed by a return to business as usual following the Three Mile Island meltdown.

### Change for Protected Organizations

Protected organizations are found in the upper left corner of Fig. 1. Here, resources are devoted to cultivating patrons in an oversight body in place of building capacity to serve clients. For example, the oversight body for an economic development agency may have an agenda that ignores the public and their needs. Legislators that appoint the oversight members are often drawn to flashy projects, such as arenas and convention centers. These projects do little to create local jobs or enhance local quality of life but take precedence over projects that do. Leaders that jump on board and push arena and convention center ideas can cultivate patrons. This makes the organization highly responsive in a very narrow way. Such leaders never question the oversight body or its values and assume that clients are being served by the demands being made. This may not be so, but is never questioned. The strategy is to maintain the old-boy network and other arrangements that protect turf.

Change is unlikely unless these arrangements erode. Erosion of prerogatives occurs when patrons lose elections or leave office or when an old-boy network ceases to function, pushing a protected organization into the buffeted zone. The political agenda of newcomers or a shift in power among stakeholders can prompt a call for better client services. To increase capacity to meet these new demands, the organization moves toward the diagonal in Fig. 1.

After a new governor took office, Ohio's Department of Public Welfare experienced such a shift moving from a protected position to one of increased expectations. This status quo was no longer acceptable and a posture of change was adopted. The welfare department abandoned practices that required clients to respond as directed and moved toward practices that emphasize helping clients (Fig. 1). The loss of a protected status may also prompt an increase in scrutiny, which illuminates low capacity. When low capacity is exposed, it often prompts rapid action to improve matters, increasing the prospect of change.

A change in leadership often results, which leads to new practices.

### Change for a Routinized Organization

Public organizations with very limited capacity can be ignored for decades. Until there is a shift in expectations, such organizations go about low-value processing routines with little accountability. For instance, decades of complaints about long waits and inept staff reached a breaking point and prompted change in a bureau of motor vehicles. Funds were provided for systems that allowed mail-in license plate renewals that separated taxpayers and staff, reducing both dysfunctional agency contacts with the public and the time involved. Note how complaints from consumers had to become intense before action was taken to increase competence (new systems).

New organizational stakeholders often introduce new expectations. If these expectations gather good currency, they spill over a threshold to become requirements. Usually, this stems from a galvanizing event: a patient escapes from a mental health institution and kills someone, a child is abused in a foster home, or the head of a state teacher retirement plan claims that the money in the system does not belong to the teachers. This makes questions permissible. People in oversight roles question practices such as mental health patient furloughs, the number of children being served by the Family Service Agency, or the wisdom of giving teacher retirees 13th month pay checks, which started during better economic times. This threshold will vary with agency visibility and the current economic situation. The agency is pushed into the buffeted zone when the threshold is breeched.

## Prompting Change

Organizations on the diagonal in Fig. 1 have balanced capacity and responsiveness. Questions are posed about how an organization's capacity can be used to increase responsiveness, altering the organization's strategy to produce hoped-for outcomes. This questioning can arise externally through the expressions of stakeholder preferences, shifts in political agendas, erosion of public support, budget shortfalls or windfalls, and legal rulings. It can also arise internally with a shift in the views of agency insiders about the value of their service practices or by changes in leadership. Internal and external pressures combine to lower the barriers erected by the protected or professional posture. This creates two new types: the buffeted and the proactive organization.

*The Buffeted Organization* – An erosion of competence and/or increased demands to better serve their clients creates buffeting for professional, protected, and routinized organizations. The can stem from fickle public support, changing legal mandates, shifting political agendas, new client expectations, and a loss of key benefactors. As mandates shift, budget support can decline prompting questions about how limited resources are used. As budgets are cut, priorities shift providing moving targets that lead to frustration and turnover. More scarce resources bled away as turnover forces investments in training. Organizations experiencing such a buffeting become susceptible to change, questioning responsiveness and how organizational capacity is being used.

Consider the IRS after the disclosures in the late 1990s. Two steps were taken. Responsiveness was increased in several ways including new forms of agency oversight, shifting burden of proof from the taxpayer to the IRS, and changes in IRS staff prerogatives that prohibited them from taking property without due process. This was followed by attempts to shore up its image, showing how agency resources were being put to better use by upgraded computer systems, monitoring employee behavior, and taking steps to increase the accuracy of advice given to taxpayers.

Strategic change helps the buffeted organization cope. Capacity to act is built by finding ways to increase responsiveness. This new responsiveness can lead to happier and more challenged staff and reduce turnover. As capacity is built new client responsiveness becomes feasible, increasing an interest in strategically repositioning the agency to better serve their clients.

*The Proactive Organization* – High capacity balanced with high responsiveness creates a "proactive" environment. For a transformation to

emerge in a proactive environment, a leader must clearly understand needs and potentials to act. To illustrate, the leader of the Ohio Department of Natural Resources (ODNR) saw an opportunity to become proactive. Key stakeholders who had expressed criticisms were folded into task forces to deal with important issues such as wildlife protection, natural areas, hunting and fishing rights, waterways, and recreation. Programs were identified and funds sought to operate them through licensing the use of wild areas, through park use programs, and through new types of fishing and hunting licenses. The fees collected were turned back to fund program development, which produced more fee-generating activities until two-thirds of the ODNR's funding was outside the state's budget process. By responding to stakeholders in this way, the ODNR became a self-sustaining proactive state department that is highly responsive to stakeholders as well as high in action. Previously, allowable actions have been limited to changing organizational practices to correct faults. Here, the leader can seek out unmet needs and alter the delivery of services so that these needs can be meet.

## Mutualist Leadership and Transformations

A dramatic increase in needs calls for strategic repositioning to alter current strategy. Changes are made in information about needs, services, service provision channels, resources (human and physical), collaborative arrangements, sources of funds, and image. At least one change (e.g., services) is required, tracing ripple effects through the other strategy elements.

If needs are not meet, a transformation will be entertained. This calls for posing the same questions as repositioning with a future focus. For example, future clients are imagined asking how they might be served (e.g., services, channels, etc.). To carry out such an effort, leaders must become "mutualists" (Nutt and Backoff 1995). A "mutualist leader" creates collaborative arrangements to meet needs that are expected to arise. To carry out mandates that exceed the prerogatives of a single agency, capacity is sought beyond the leader's organization. Consortia such as the National Kidney Foundation and the Highway Safety are formed. Attempts by the Ohio Department of Mental Health to fold county mental health boards into a partnership to pursue quality care and better insurance coverage describe a contemporary effort of a CEO to become a mutualist leader.

Mutualist leadership takes shape as a quest, which mounts new initiatives to realize a grand vision. This requires (1) forming a consortium to draw together key stakeholders into an umbrella organization, (2) subordinating personal and organizational interests, (3) guiding stakeholders away from competition toward cooperation, (4) focusing effort on meeting needs, (5) creating a vision to meet key needs, and (6) seeking win-win arrangements (Nutt and Backoff 1995).

The mutualist leader substitutes collaboration for competition. The best outcome from a competitive posture would have each agency serve people thought to fall under their jurisdiction. Such an approach can prompt jurisdictional squabbles that leave important needs unmet or undeserved and prompts duplication. Collaborative approaches call for negotiation with taxing and budgeting authorities and sister agencies to parcel out service areas so that all service responsibilities can be met. This is done with the resources and programs drawn from many sources. The self-interests of these programs and their supporters are subordinated to the greater interest of servicing needs. The mutualist leader forms an umbrella organization to proactively guide the effort.

This requires vision, commitment, and leadership. Vision is required to anticipate emergent needs with a transformational strategy (Vail 1989). Commitment is required to set an example for others (Bennis 1989). To set the tone called for by a mutualist leader, personal aims and parochial interests are sacrificed. Leadership skill is needed to strike a posture that avoids being pretentious but takes a moral position to call for collective action. Many are apt to interpret such a posture as a clever way to promote one's interests. Success depends on putting things into a frame in which

mutualist values are believable so others will adopt and emulate these values. Many may aspire to be a mutualist leader, but few get the endorsements needed to create a proactive organization that can realize this aim.

Before a transformation can be mounted, a mutualist leader must gain the support from several sources. Leaders need authorization to begin an interagency initiative from each agency's oversight bodies. If given, a leader must then get concurrence from other agencies that must cooperate to meet needs. A proactive organization emerges when the need for interagency cooperation is endorsed by all of the cooperating agencies. Securing this magnitude of cooperation can be a daunting task. And creating a proactive organization is essential, but not sufficient. Before settling on a transformational move, key players in the cooperating organizations offer up their pieces to the puzzle, and the mutualist leader must integrate them and fill in missing pieces.

This makes a transformation difficult to mobilize and even harder to sustain. A mutualist leader must be in place when the opportunity for a transformation arises. The organization must be buffeted, making it susceptible to change. Experimenting with repositioning must have been carried out. The need for still more pervasive change must be recognized and supported by oversight bodies from cooperating agencies. Leaders of cooperating agencies must be given the latitude to act by their oversight bodies. The likelihood of all this seems remote, making transformation a rare event. As a result, leaders may have to be satisfied with changes in current strategic arrangements and not future ones.

This may explain why substantive change and transformation are rare. By their actions, if not their public pronouncements, governors supporting only small-scale efficiency improvements, such as TQM, seem to fear strategic repositioning and duck the commitments required for a transformation. As a result, leaders can only rethink a current strategy. For example, the Ohio Department of Mental Health has long been guided by a vision of treating people in the least restrictive setting, close to family and friends, which has been called "deinstitutionalization." A new vision of integrated care that merges acute and mental health care and their insurance coverage frightens state politicians, who have blocked such initiatives. Until such a vision is endorsed, only changes in a current strategy are feasible.

## Conclusion

This chapter explored one of the enduring dilemmas of organizational renewal: the resistance to change and how to cope. External forces that pose limits on initiating change and limit its magnitude were considered. The forces were examined to reveal timing, when action is possible, and how to find essential steps to initiate and sustain change when forces are favorable.

Professionally dominated, protected, and routinized public organizations were noted as organizational types resistant to change. This resistance stems from an imbalance between responsiveness and capacity or little responsiveness and capacity. To lead such organizations toward change, its leaders must be given the latitude by oversight bodies to show how responsiveness can increase, capacity be built, or both. Pushing the ideas forward suggests that a message that arises internally must be brought externally and vice versa. External demands for responsiveness can be brought to insiders who are shown how capacity must be changed or augmented to meet the new demands. Internal demands for more capacity must be brought to oversight bodies to show what must be changed to be truly responsive to the needs of clients, such as more funding or better staff. Transformation was linked to creating a culture of high responsiveness and finding the needed capacity in a consortium of agencies, replacing independent organizations with a proactive consortium.

Transformation seems possible, but only when these conditions are present. The prospects of initiating and sustaining a proactive organization to fashion a transformation improve when participating agencies have mutualist leaders supported by their oversight bodies. The many difficulties in creating such arrangements may explain why the

transformation of public organizations is so rare. If so, elected officials that call for radical change create impossible expectations. This clamor for the impossible is a disservice to those the agency is to serve and to the public that funds them.

Northeastern University, Boston, MA, USA

T

## Synonyms

Charismatic-inspirational leadership

## Definition

Leadership that inspires and motivates followers to achieve outcomes beyond expectations and

helps followers grow and develop by responding to their individual needs.

## Introduction

The introduction of transformational leadership generally is credited to James MacGregor Burns (1978) who used the term to distinguish between those who led through the exchange of performance for rewards (i.e., transactional leaders) and those who led by inspiring followers to aim for and achieve ambitious goals (i.e., transformational leaders). This development in leadership thinking signaled the beginning of a shift to what has become known as new-genre perspectives that focus on more interpersonal, inspirational, and visionary leadership. Burns (1978) argued that transformational leaders develop followers as individuals and as future leaders by empowering them and responding to their needs. As a result, transformational leadership results in high levels of follower commitment and job satisfaction and promotes performance that exceeds expectations by aligning followers' goals with those of the leader, the group, and the larger organization (Bass 1985; Bass and Riggio 2006).

## Overview

Transformational leadership is defined as leadership that inspires and motivates followers to achieve outcomes beyond expectations and helps followers grow and develop by responding to their individual needs. Since its introduction, transformational leadership has become, and has remained, the most-researched leadership theory (Barling 2013). Its argued effects have been tested and supported across medical, military, educational, governmental, professional, and industrial contexts, as well as across international cultures (Bass and Riggio 2006). Although there is some debate about the exact number of dimensions that underlie the concept, scholars generally agree that transformational leadership is a multifaceted construct. The most commonly accepted structure of transformational leadership suggests it is comprised of four subdimensions: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Bass 1985).

## Idealized Influence

Idealized influence captures transformational leaders' tendency to behave in ways that generate admiration, trust, and respect from followers. Because of idealized influence, transformational leaders establish themselves as role models to followers and cause followers to want to identify with and emulate leaders. Further, this facet of transformational leadership often results in followers attributing extraordinary capabilities to leaders.

## Inspirational Motivation

The inspirational motivation facet of transformational leadership refers to leader speech and behaviors that provide meaning and challenge to followers' work. Through inspirational motivation, transformational leaders communicate enthusiasm and optimism for a compelling vision of the future. As a result, followers are motivated to achieve high expectations and realize the desired future state.

## Intellectual Stimulation

Intellectual stimulation refers to transformational leaders' behavior that encourages followers to be creative and innovative by challenging assumptions and attempting to view problems through new and different perspectives. In this way, transformational leaders encourage followers to take risks and establish an environment where it is safe to make mistakes as a result of trying something new. Further, intellectual stimulation captures leaders' encouragement of followers' ideas that might differ from those of the leader. Thus, innovative solutions to problems are more likely because follower creativity is not stifled.

## Individualized Consideration

Developing followers as future leaders is one of the hallmarks of transformational leadership (Bass and Riggio 2006), and individualized consideration captures transformational leaders' attention to followers as individuals with differing needs and desires. More specifically, transformational leaders are cognizant of followers' need for growth and development and act as a mentor or coach, working with followers to develop them further based on their individual differences in needs and desires. Thus, transformational leaders' individualized consideration for followers results in a supportive and developmental climate.

## Similar Leadership Perspectives

Often, transformational leadership is considered synonymous with, or at least heavily related to, other new-genre leadership theories that capture leaders' inspirational and motivational tendencies. In fact, charismatic and transformational leadership often are used interchangeably. In some ways, this is understandable, as there are notable similarities between the two styles of leadership. This largely is due to the idealized influence and inspirational motivation dimensions of transformational leadership, which, in combination, capture admirable behavior that causes followers to identify with the leader, similar to the effects of charisma (Bass and Riggio 2006; Bono and Judge 2004). However, charismatic and transformational leadership are distinct concepts, as charismatic leadership does not account for intellectual stimulation and individualized consideration.

## Outcomes

Decades of research on transformational leadership has established its effects on a number of important individual, group, and organizational outcomes. More specifically, transformational leadership has demonstrated beneficial effects on followers' attitudes, behaviors, and performance (Judge and Piccolo 2004). Because of its focus on followers as individuals, transformational leadership has been positively related to follower self-efficacy, satisfaction, commitment, perceived fairness, trust, and identification with the leader and negatively related to follower turnover. Additionally, transformational leadership has been shown to positively affect group-level constructs such as potency (i.e., the belief that the team can be effective across a range of tasks and domains) and cohesion (i.e., the positive emotional bond between team members).

Further, because of the inspirational vision of the future provided, and encouragement to think differently, transformational leadership has been positively related to a number of follower performance outcomes, including motivation, task performance, extra-role behavior (i.e., performance beyond expectations noted in the job description), creativity/innovation, and group/organization performance (Judge and Piccolo 2004). In addition to effects for followers, transformational leadership also has beneficial consequences for leaders. More specifically, transformational leadership has been positively related to ratings of leader's job performance and ratings of leadership effectiveness.

## Full Range Model of Leadership

As a result of the decades of research supporting transformational leadership's effects on such a wide range of outcomes, it is considered one of the most active and effective forms of leadership. In fact, it has been positioned at the top of a hierarchy of leadership styles in the full-range model of leadership (Bass and Riggio 2006). In this perspective, styles of leadership are positioned from least to most active and effective. The low end of this leadership spectrum is occupied by laissez-faire leadership. Following this are three styles of transactional leadership: passive and active management by exception and contingent reward behavior. Finally, transformational leadership represents active and effective leadership beyond those styles previously listed.

Laissez-faire leadership captures the avoidance of leadership altogether, where those in leadership ignore responsibilities, fail to make decisions, and

put off necessary actions. Management by exception is considered a transactional form of leadership because it involves an action undertaken as a response to an error or mistake. With passive management by exception, leaders wait for an error to occur before stepping in to provide guidance and direction. Conversely, active management by exception involves leaders actively monitoring follower effort to identify potential need for corrective action. Contingent reward captures the most common conceptualization of exchange, where leaders provide rewards or punishment based on follower performance.

Upon its initial introduction to the literature, transactional and transformational leadership were considered to be somewhat conflicting styles. To some degree, scholars argued that the exchange-based form of transactional leadership should be eschewed in favor of the more motivational style of transformational leadership. However, the full range model of leadership recognizes that transactional styles also can be effective approaches for follower motivation. Thus, the full range model suggests that leaders attempt to employ a profile of leadership behaviors that is more heavily weighted to the active and effective styles (i.e., contingent reward and the transformational dimensions) and includes less frequent use of laissez-faire and management by exception (Bass and Riggio 2006).

Further, although research consistently has supported claims that transformational leadership is more effective (Judge and Piccolo 2004), many scholars have found support for an augmentation argument (Bass 1985). In this view, transactional leadership is considered the base of effective leader behavior, upon which transformational leadership builds and extends leader effectiveness. Thus, leadership scholars have argued that the incremental effectiveness of transformational leadership not be interpreted in a manner that ignores the efficacy of other leadership styles.

## Antecedents

Given the effectiveness of transformational leadership, a natural question is whether there are identified predictors of the behaviors associated with this leadership style. Despite expectations that personality factors (i.e., the Big Five taxonomy of openness to experience, conscientiousness, extraversion, agreeableness, and neuroticism) would predict individual dimensions of transformational leadership, as well as the overall construct, aggregate results across 20 studies were relatively weak. More specifically, only extraversion (i.e., the tendency to be outgoing and emotionally expressive) and neuroticism (i.e., the tendency to be anxious and moody) were consistently related to the individual transformational leadership dimensions (i.e., extraversion was positively related and neuroticism negatively related). Further, only extraversion was associated with the overall transformational leadership construct. These results, combined with research demonstrating the effectiveness of transformational leadership training interventions (Barling 2013), indicate that transformational leaders are more "made" than "born."

## Conclusion

In conclusion, transformational leadership is one of the most widely researched and accepted theories of leadership. Its impact is further evident by the increasing research attention it receives each year. Through countless studies across varying cultural and employment contexts, it has been positively related to a number of important follower, leader, group, and organizational outcomes. Although this approach to leadership is not without criticism (e.g., van Knippenberg and Sitkin 2013), it clearly is important to our understanding of leadership. Further, because research has indicated that it is a style of leadership more likely to be developed than genetically driven, it remains an attractive area of both research and practical inquiry.

# Transformational Leadership Fostering Organizational Change in the Public Sector: Perspective from Bangladesh

Shah Md Azimul Ehsan
Department of Public Administration, Faculty of Social Sciences, Jagannath University, Dhaka, Bangladesh

## Synonyms

Organizational change; Organizational change in public sector; Transformational leadership in Bangladesh; Transformational leadership in public sector

## Definition

Transformational leadership refers to such type of leadership that has the capacity to inspire and motivate the followers in order to achieve outcomes that might be beyond expectations. Such a leadership also makes the followers well equipped and developed so that they can respond to their individual needs.

Organizational change refers to the changes that an organization deliberately brings in its structure, process, culture, methods, strategies, technologies, and a range of other things for the sake of enhancing organizational efficiency and effectiveness.

## Introduction

Change is inevitable for every organization, be it public or private. The urgency for organizational change has become even more pervasive in this era of globalization and digitization to cope with the increasingly volatile environment (Warrick 2011; Harb and Sidani 2019). However, it is often observed that employees neither in public nor in private organizations gladly embrace the change initiatives, rather they tend toward path dependency and resist the innovations. In such a scenario, many scholars (Kirkpatrick and Locke 1996; Yousef 2000; Bass and Riggio 2006; Chou 2014) have asserted the role of leadership style as an instrumental factor in navigating the organizational change. This is because the leader through setting the specific goals and creating a favorable work environment for accepting change can influence the introduction, acceptance, and adoption of new ideas (Sarros et al. 2008). More specifically, Bass and Riggio (2006) have advocated for transformational leaders who can help organizations and employees for overcoming the proclivity by establishing a shared vision, goals, and culture that connect and empower workers and promote innovation and commitment (Stazyk and Davis 2020). On the contrary, a few scholars have raised a pessimistic overtone regarding the fact that although transformational leadership can facilitate organizational change in the private sector; the unique organizational context of the public sector which is often characterized by machine bureaucracy creates a constraining situation for the transformational leaders in initiating change or innovative measures.

Against this backdrop, this chapter attempts to understand, explore, and analyze whether transformational leadership can foster organizational change within the specific context of the public sector. Having set the scene in the introductory part, the next section starts with conceptualizing transformational leadership and organizational change. The following section critically analyzes the claim from both groups of scholars regarding the fact that if transformational leadership can bring organizational change in the public sector or not. Drawing on a case study from Paba Upazila (a local government tier) of Bangladesh and explaining it with the existing literature, the study argues that transformational leaders can positively contribute to facilitating organizational change in the public sector.

## Conceptualizing and Theoretical Underpinnings

### Transformational Leadership

For almost four decades, transformational leadership has been central to leadership and organizational behavior literature. The term transformational leadership was first coined by a political scientist Burns (1978). It was later developed and conceptualized by Bass (1985) as the ability of a leader in transforming the energies deployed by his/her collaborators with the intention of motivating them in achieving the desired results and objectives not only individually but also organizationally. In other words, transformational leaders motivate behavior by changing their followers' attitudes and assumptions in contrast to transactional leadership, which is mostly based on individual gain and the exchange of rewards for effort (Wright and Pandey 2010). Warrick (2018) noted that this sort of leadership additionally promotes innovative thinking and creativity.

According to Bass (1985), Avolio et al. (2009), and Wang et al. (2011), there are some key elements of transformational leadership viz. – inspirational motivation, idealized influence, intellectual stimulation, and individualized consideration that facilitate them in inspiring their employees to go beyond their personal interest in working for the common good of the organization. First, by inspirational motivation, transformational leaders develop and articulate an appealing vision along with encouraging and facilitating their followers to work towards that vision (Bass and Bass 2008). Second, through idealized influence, these leaders function as a role model, that is, act coherently with the stated vision that triggers imitation and identification behaviors among their collaborators (Bass and Riggio 2006). Third, through intellectual stimulation, they provoke their followers to challenge old assumptions about organizational problems and practices and thereby assist them to achieve the missions. Thus, by using these crucial factors, transformational leaders essentially direct, inspire, and empower their employees (Wright and Pandey 2010). Despite the common notion about the dichotomy between transformational and transactional leadership, Bass and Riggio (2006) have argued that there are empirical findings that suggest transformational leadership augment the use of transactional behaviors along with transformational ones.

## Organizational Change

The term organizational change is a broad and ambiguous concept. As a result, scholars have defined it from different perspectives. For Lewin (1947), organizational change is a process moving from one fixed state to another which involves a series of predictable and pre-planned steps. While for Dawson (1994), it is a period of transition within the organization that is characterized by confusion, disruption, and unforeseen events that emerge. When it comes to public organizations, organizational change is often viewed from public management reform perspective which focuses on "the deliberate changes to the process and structures of public sector organizations with the aim of running them with more effectiveness" (Pollitt and Bouckaert 2004: 8). Irrespective of the nature of the organization, the rationale behind the organizational change is to ensure that they remain relevant in the ever-changing environment.

Organizational change strategies differ across organizations depending on the nature and the context of the organization where they are being applied (Burke 2010). Broadly, these have been categorized into two types – planned change and emergent change. According to Burnes (1996, 2004 cited in Van der Voet 2014), planned change occurs through a process of rational goal-setting in which objectives for change are framed in advance and the implementation follows a top-down approach. This means that in order to successfully shift to the desired state, the organization must go through a number of stages. On the contrary, the emergent change appears spontaneously. More specifically, either internal factors (distribution of knowledge, games of power, and uncertainty) or external factors (political, economic, and competition) induce such changes (Starbuck 1983; Stacey 1993 cited in Harb and Sidani 2019).

Whatever be the type of change, the instrumental factor that determines the success of organizational change is the support of employees (Bartunek et al. 2006; Herold et al. 2007). The employee support for organizational change is contingent on both the content of the change and the process through which the change is facilitated (Armenakis and Bedeian 1999; Self et al. 2007). This implies that organizational change is something that can be managed (Van der Voet 2014).

## Can Transformational Leadership Promote Organizational Change in Public Sector? A Critical Review

A substantial amount of literature exists, notably (Pawar and Eastman 1997; Shamir and Howell 1999; Herold et al. 2008; Liu 2009), where scholars have opined that transformational leadership can emphatically contribute during the phase of organizational change. Arguing in the same vein, Den Hartog et al. (1997) stated that transformational leadership can ultimately transform the organization by defining the need for change, creating new visions, and mobilizing commitment to these visions. Some scholars have also related the critical elements of transformational leadership which help those leaders to facilitate change in the organizations. For instance, Kanter et al. (1992) and Kotter (1996) expounded that through inspirational motivation, transformational leaders may initiate change by developing an appealing future vision for the organization, which is generally seen as a first and fundamental step in the implementation of a planned change. While Eisenbach et al. (1999) asserted that through intellectual stimulation, transformational leaders can contribute to the implementation of change by formulating challenging objectives and the stimulation of new ways of thinking. Meanwhile, Higgs and Rowland (2011) noted how transformational leaders through idealized influence can foster the implementation of planned change.

Again, for any change to be successful in organizations, employee support is a must. One of the common scenarios during organizational change is that organizations often face employee resistance to change. During such crisis time, the role of transformational leaders becomes even more critical. A number of empirical studies, notably (Bommer et al. 2005; Nemanich and Keller 2007; Herold et al. 2008; Chou 2014; Van der Voet 2014), suggest that transformational leaders, not only can help in reducing such employee resistance to change but also can reinforce the employee support for change by dint of their leadership skills.

Interestingly though, there is a plethora of literature, for instance (Shamir et al. 1993; Rainey and Watson 1996; Howell 1997; Pawar and Eastman 1997; Shamir and Howell 1999; Coram and Burnes 2001; McNulty and Ferlie 2004; Bass and Riggio 2006; Burnes 2009; Stazyk and Goerdel 2011; Isett et al. 2012; Davis and Stazyk 2015), where a pessimistic overtone has been raised regarding the effectiveness of transformational leadership, particularly in the public sector. Such a proposition emanates for a number of reasons. Firstly, the public managers operate mostly with legal-rational authority as proposed by Weber (1948) and are subject to bureaucratic control mechanisms. Secondly, they have to operate under a strict legal framework which further constrains them by political and financial checks and balances. Thirdly, their actions are tied by

public policies of the political governments. Therefore, such a bureaucratic organizational structure and control mechanisms provide less flexibility and discretion to leaders in the public sector that transformational leaders usually require. As a matter of fact, these challenging factors make it difficult for public managers to emerge or behave like transformational leaders and facilitate the change process in the public sector.

Contesting such claims, another stream of literature (Lowe et al. 1996; Wofford et al. 2001; Dumdum et al. 2002; Trottier et al. 2008) exists, which argue in favor of transformational leadership's effectiveness in public organizations. In fact, Wright and Pandey (2010) have challenged such pessimistic claims, stemming from mainstream management literature, regarding bureaucratic stereotyping. Echoing on other public management scholars (Rainey and Steinbauer 1999; Moynihan and Pandey 2005; Pandey et al. 2007; Andrews et al. 2009), Wright and Pandey (2010) stated that public organizations and their leaders can overcome structural constraints and exhibit the behavior of transformational leaders. In a recent literature, Stazyk and Davis (2020) also asserted that many public employees along with other extrinsic motivations, self-select into the public sector because of altruism which is viewed as a core element of transformational leadership. The argument is also consistent with the advocates of New Public Management (NPM), which has been a paradigmatic shift in the management of public sectors since the 1980s. In other words, NPM proponents have also urged for altruism and motivation for public managers.

All these arguments suggest that the desire to be a transformational leader can be particularly prevalent in the public sector (Stazyk and Davis 2020). It also implies that transformational leadership is not only the purview of private or non-governmental organizations rather they can be very effective in the public sectors. The following case study will help to better understand how transformational leadership of a bureaucrat can contribute to the change management process in the public sector.

## Evidence of a Transformational Leader Facilitating Organizational Change in Bangladesh Public Sector

This case study is taken from Paba Upazila, a local government tier in Bangladesh. It is about the story of Shahadat Hossain, who served as an Assistant Commissioner (Land) at Paba Upazila of Rajshahi district from 2013 to 2015. The case will shed light on how Shahadat Hossain, outperformed through transformational leadership to foster remarkable changes in the land management system at Paba Upazila, despite remaining in the public realm and serving within the bureaucratic structure. Before discussing what change initiatives were introduced and implemented by him, it is important to give a brief flashback regarding the service delivery mechanism of the AC (land) office before he took over the charge. This will help to compare the earlier scenario and the current one to better comprehend his role as a transformational leader.

For availing various land-related services like land mutation (*namjari*), record of rights (*Khatiyan*), *Khas* land-related issues, and settlement of land-related disputes, people in Bangladesh usually go to the land office. The AC (land) office is headed by Assistant Commissioner (AC), a junior level bureaucrat of Bangladesh Civil Service (BCS). Earlier, one of the common pictures of these land offices was that they were teemed with agents or middlemen. Those agents literally swarmed around any service recipient arriving at the land office, and they used to introduce themselves as officers and staff of AC (land) offices. The situation did not end there. Rather, those service recipients were often forced to give speed money to those middlemen even before they could enter the AC (land) office. However, the services were not received as promised by those so-called middlemen. Rather, those service recipients had to pay repeated visits to the land office for finding a record or a land deed which resulted in more cost and more time (even years) (Azad 2018). In a nutshell, the situation was in disarray!

When Shahadat Hossain joined as an Assistant Commissioner (land) of Paba Upazila in 2013, he found a similar scenario as discussed above. On

top of that, he had to remain occupied entertaining a section of the elite class of the society who used to visit his office frequently during office hours. He was pondering what could be done to mitigate the deplorable situation because bringing change is always faced with resistance. Being aware of the situation, he opted for a planned change. At first, he identified the dysfunctions in the existing system. He realized that there were many middlemen in front of the AC land office as there is a lack of interface between the service recipients and the real service providers. He also found out that the delay in receiving the land-related service was also because of the poor condition of record rooms (a room where land-related documents are kept). Having identified the loopholes, he started making incremental changes.

First, he decided to organize the record rooms and arrange the relevant land-related documents in such a way so that they could be fast-tracked. This was a very challenging task and it could not be done overnight. So, he progressed slowly and selected the weekends for that rearranging purpose. He led his team from the front and through consolidated efforts for 1 year, they gave the record room a new shape. Arranging them chronologically, he named them "*Prothoma*," "*Ditiya*," and "*Tritiya*." Once he was done with the updating of record rooms, he moved his attention to the middlemen issue. He realized that if the interface between the service recipients had to improve, then there should be such a platform where the service seekers could directly approach him with their queries. So, his second move was even more bold, unique, and innovative. He set up a booth just beside the main office building (i.e., AC land office), exactly where the agents used to gather. He named it "*Matir Maya.*" He himself sat at that place daily from 10 am to 11 am every day. He called people waiting for service one by one by their names, and in many instances, he solved their minor problems immediately. However, in the case of complex issues, he forwarded the file to the concerned officer with specific delivery dates (Azad 2018).

Along with these fundamental changes, he also made the existing citizens' charter functional and effective by increasing its visibility. Shahadat Hossain also introduced a help desk for resolving the queries of service seekers. Moreover, he also used digital platforms quite robustly to expedite land-related services. For instance, mobile messages were used to keep the concerned service recipients informed about the dates of land mutation and land dispute cases. Again, provisions were made to apply for land mutation and file cases related to land disputes via a website of the Upazila office. Furthermore, through the Facebook page of the AC land office, any complaint could be filed to Shahadat Hossain for prompt action (Azad 2015).

The implications of these innovative initiatives have been quite spectacular. Azad (2015) noted that using the new mechanisms, providing service and advice to service recipients increased two times, while the resolution of land-related disputed cases enhanced five times, compared to previous records. A special report about the "*Matir Maya*" program was published on 17 October 2015 by *Prothom Alo*, a reputed national daily in Bangladesh. That turned up to be a wake-up call for the national-level administration. Cabinet Division of Bangladesh Government not only applauded the efforts of Shahadat Hossain but also issued letters along with a copy of the *Prothom Alo* report to all assistant commissioners (land), district commissioners, and divisional commissioners across the country so that they could draw lessons from the case and implement the same through remodeling (Azad 2018).

It is evident from the above discussion that the "*Matir Maya"* program has been successfully launched and implemented only because of the transformational leadership of Shahadat Hossain. Through inspirational motivation, he created a vision on how to improve the land-related service at Paba Upazila. He knew his journey would be daunting but through idealized influence, he led from the front as a role model to turn the vision into reality. Moreover, through intellectual stimulation, he got his supporting staff on board. He opted for planned change and approached incrementally rather than expecting to transform everything within a blink. Another crucial factor behind his success was properly communicating his vision and mission with the top-level management

that aided him to get their cooperation. Helaluddin Ahmed, the then Divisional Commissioner of Rajshahi district in particular, provided inspiration and support for this cause. A question might arise why a senior bureaucrat like him encouraged the innovative measures of Shahadat Hossain. This did not happen overnight. It is the result of the several efforts that the Bangladesh government has put, (for instance Managing at the top, MATT-I and MATT-II, and other change management training courses), with the assistance of development partners for making the senior mid-level bureaucrats pro-change minded.

One might be wondering that what Shahadat Hossain did was perhaps more because of his charisma and it might not be able to be remodeled or replicated elsewhere. His successor Nurul Hai Mohammad Anas, the current AC (land) of Paba Upazila, proved that this sort of pessimistic thinking is rather irrelevant. Following the legacy of his predecessor, he initiated a mobile application to provide eight types of services to the clients. Land development tax can be paid through this application. The new slogan that he added is "AC land in people's pocket" (Azad 2018). This case study gives a message that days have gone by for viewing the public sector from the lens of traditional public administration. Changes are happening in the public arena and most of these are the brainchild of bureaucrats like Shahadat Hossain.

## Conclusion

This chapter aimed to understand and analyze whether transformational leaders can facilitate organizational change within the specific context of the public sector. The study found that most scholars have expressed optimistic views regarding the role of transformational leadership in navigating changes in organizations. Their line of argument is that installing innovative measures usually instigates employee resistance. During such complex situations, transformational leaders can prove to be hyper-effective. By dint of their inspirational motivation, idealized vision, intellectual stimulation, and individualized consideration, they can get everyone on board. Despite such a congruence of opinions, there is divergence among the scholars regarding its feasibility in the public sector. However, this study, echoing with Wright and Pandey (2010) and other mainstream public administration scholars, challenges such bureaucratic stereotyping and concludes that transformational leadership can be effective in the public sector as well. The case study, discussed in the previous section, succinctly revealed how Shahadat Hossain being a bureaucrat brought remarkable changes in land management of Paba Upazila in Bangladesh. The case also solidifies the argument that the bureaucratic structure does not necessarily hold back a bureaucrat to operate like transformational leaders. Nonetheless, this study acknowledges the fact that its limitations because of reliance on a single case study derived from secondary sources. Therefore, this opens the scope for further investigation into this topic with empirical data taking multi-case studies.

## Introduction

The functionality of elected representatives within a democracy is heavily dependent on the competencies of public administrators. They are responsible for managing systems with numerous employees, coordinating across departments, and advising policymakers for an effective and efficient functioning of the administration. Given the dynamic nature of these functions, and ever-increasing expectations of both the government and the public, the functional competency of public administrators hinges on their own competing values and dispositions for a given role. Hence, nurturing public administrators with the right attitude and values is paramount for effective and efficient administration. Public administrators thereby need to integrate their skills for governance along with those of leadership and management. Instead of focusing only on *doing right things in the right way*, public service leaders also need to make sure *right people are doing things right* and so primarily comes to their leadership talent of *doing the right things*. Nevertheless, with globalization and digitalization in the public administration processes, civil servants need to be flexible with both time and resources, be adaptive with situations, and have a creative bent of mind for problem-solving. These demands warrant that administrators should be concerned and prepared for tackling a variety of issues. On the other hand, public administrators, despite knowing the standard processes and procedures, may differ in their capacity to function due to personality-driven dispositional differences. In this context, this entry highlights that individual differences are important and have to be considered. However, they need to be harnessed; civil service training academies should tweak the induction programs to this effect.

## Idea of Transformational Leadership and Public Administration

Leadership literature (Bass and Riggio 2006) stated that unlike transactional leadership, which focuses largely on leading followers to maintain work norms in exchange of reward, praise, and resources (as well as sanctioning errors and deviances when they occur in the system), transformational leadership focuses on adequately meeting follower's and other stakeholder's needs, inspiring in them a vision for future goals, questioning their assumptions about work models, while positively reinforcing them for innovative solutions to problems. In the wake of changing environmental demands and recent administrative reforms, theorists have argued that the role of public leadership has gradually been shifting from transactional to transformational leadership to better connect with the public welfare, as the latter is more effective and efficient (Pandey et al. 2016).

Under the public administrative setup, transformational leaders not only inspire but also stimulate followers to think beyond what is evident in some difficult situations. Besides, they can act as role models through their work standards and can persuade through performance systems, goal clarifications, and crafting and managing organizational culture that enables decision-making. Thus, the image of the transformational leader has a direct infusing influence and a convincing indirect influence on employees, as they make use of public values in organizational decision-making (Pandey et al. 2016; Marathe and Kakani 2020). It is vital for authorities to understand that training programs at leadership academies or learning centers should focus on inculcating transformational leadership values in public administrators, as these competencies are critical for the broader interest of society. This approach suggested is in line with Cummings and Oldham's (1997, p. 23) finding, which stated "employing people with lots of creative potentials will only

have an impact on creative outcomes if the context is set up to nurture and encourage that creative potential."

## Are We Nurturing the Right Personality (Nature)?

Innate personality traits tend to be unique to leadership potential and are not uniformly distributed in the population (Bono and Judge 2004). Thus, in leadership training programs, the assessment and development interventions could be better served if the individual personality of the public administrator is borne in mind (Seidle et al. 2016). Personality-based developmental programs have increasingly gained momentum with executive coaches, practitioner trainers, and leadership assessment centers. However, trainers are often at a loss to understand what mechanism or framework could explain the transfer of transformational leadership training (nurturing) to administrators' potential (nature), so that transformational outcomes are realized in real situations.

To address this interaction of nature versus nurture in public administration training program, the authors adopted a mixed-method study on 169 public administrators in a training academy, which nurtures potential leaders. Further, they chose Myers-Brigg Type Indicator (MBTI) framework, defined in literature of "personality types." They were keen to understand whether public administrative training programs do effectively nurture the right talent, given that there has been a paradigm shift in public leadership requirements from transactional administrators to transformational administrators.

## MBTI Framework and Interaction of Nurture vs. Nature

MBTI (Myers et al. 1998) drawn from Jung's theory of personality types sorts people into four dichotomies – extrovert (E) vs. introvert (I), sensing (S) vs. intuition (N), thinking (T) vs. feeling (F), and judging (J) vs. perceiving (P). These dichotomies indicate how we get energy (extroversion vs. introversion), how we collect or become aware of information (sensing vs. intuition), how we decide or agree to a conclusion about that information (thinking vs. feeling), and how we deal/transact around the world (judging vs. perceiving). To understand how this framework could add knowledge for better outcomes to achieve this goal, the authors hypothesized the likely impact of nurturing transformational leadership across four dichotomies.

Under the dichotomy (introvert vs. extrovert), researchers reasoned that if one is an introvert, one tends to focus on the inner world to draw energy by being quiet, reflective on receiving information, and listening attentively to acquire deepness in knowledge. The extrovert is more expressive and sociable, likes taking initiatives, and is active and enthusiastic, with a focus on the outside world to draw energy (Myers and Myers 2010). Prior meta-analytical research has identified that extraversion is the most consistent and strongest correlate of transformational leadership (Bono and Judge 2004). The new paradigm today advocates nurturing transformational leadership through extroverts. The researchers had hypothesized that public administrators with extraversion disposition are better nurtured and would show greater improvement during training as compared to introverts. However, Marathe and Kakani (2020) study results showed that performance improvement is independent of the personality type – extrovert vs. introvert.

In the second dichotomy, the authors questioned that in public administration training, in order to train on how information has to be gathered, who would get nurtured better "sensing" or "intuiting?" Sensing-type administrators are people who trust facts and details, believe in present realities, and are systematic while maintaining traditionality in perception. In contrast, Intuitive types are imaginative, working for possibilities in future, conceptual, unconventional, and theoretical, and have a sixth sense. In public administration, real-life situations are complex, and one needs to be intuitive, innovative, and theoretical. Thus, training systems should focus on one's intuitive skills. The researchers

hypothesized therefore that administrators whose intuitive skills are far developed would perform better than those with sensing skills. Earlier research too has reported positive correlations of intuitive leaders with transformational leadership (Bass and Riggio 2006). Marathe and Kakani (2020) study shows a different picture; it was revealed that training academies still rewards "sensing" disposition. Hence, academies have to plan better to come to realistic leadership development.

For the third dichotomy (thinking vs. feeling), the thinking type of people focus on logical and objective decision-making by questioning assumptions. Feeling type of people focus on decision-making; they're more characterized by having compassion through person-centered values and prefer an accommodative approach to create harmony (Myers and Myers 2010). Prior research suggests that leaders who have "feeling-type" preferences were better associated with transformational leadership, while "logic-driven" decision-makers were better associated with administration (Myers et al. 1998). However, under the changing paradigm today, leaders have to be articulate and inspirational. They need a "vision" to "lead" integrating followers of multiple activities; "feeling" nature would thereby be a better predictor in job performance. The researchers hypothesized thereby that administrators whose feeling skills are far developed would perform better than those with thinking skills. Extant research concurs with the same by affirming that there are positive correlations of intuitive leaders with transformational leadership (Bass and Riggio 2006). However, Marathe and Kakani (2020) study results indicate that training rewards and performance improvement is better for those with thinking style rather than feeling, both during induction and during mid-career training programs. This set of findings is insightful as training academies are still rewarding people with thinking-type personality in comparison to feeling which would be better in long-run.

Under the fourth dichotomy (i.e., judging vs. perceiving), judging type of people are the ones who focus on being systematic and orderly; they're early starters. Perceiving types are characterized as being flexible, open-ended, spontaneous, and emergent with their options (Myers and Myers 2010). The current administrative situation demands the administrators to be spontaneous and emergent, which is positively associated with the proclivity for transformational leadership (Bono and Judge 2004). Under the circumstances of change, perceiving types are considered better to manage stress and considered more enterprising. Compared to this, old paradigm would nurture administrators to handle situations methodologically with a set process and routine. In the context of training, public administrators need to be familiarized with being open, flexible, and spontaneous with followers, systems, and situations. The researchers thereby hypothesized that administrators whose perceiving skills are far developed would be better performers than those with judging skills. However, the findings of Marathe and Kakani (2020) indicate that training academy preferences for judging skills are rewarded more than perceiving skills. Thus it is insightful to understand that training academies in public administration reward trainees with judging skills, which is in contrast with what skills (perceiving) would be more realistic in real situations.

## Practitioners' Insights

New-generation public service leaders are expected to digitize with highest data governance, have speedy processes yet empower the millennial employees working mostly off-site, and, lastly, provide outcomes beyond potentials by transforming the assumed boundaries of bureaucracy. However, this study suggests that in public administration training institutes, starting from the initial induction training, the administrators are recognized more for linear transactional bearings than enormous nonlinear transformational potential. Administrative competencies get affected by value conflict, precisely in terms of what is discoursed and what is formally valorized and rewarded. Assessments and encouraging and valorizing transactional behavior compared to transformational behavior would negatively impact the

demonstration of budding transformational personalities into being actual transformational leaders. There is an urgent need to build necessary training systems that would nurture the use of the feeling function as a preferred way to make decisions and approaching the world using a perceptive style that is adaptable and spontaneous. That would mean strong corresponding support from relevant shifts and modifications in content, delivery, and evaluation of the respective training pedagogy and systems.

## Conclusion

The millennial generation of public administrators need to be transformational leaders who would bring energy in the entire system by creating awareness about the core purpose of administration. While public administration training schools/academies pledge toward producing transformational administrative leaders, the researcher's extensive public administrative training experience suggests assessment systems are still not aligned with the larger objective.

# Transition in Nonprofit Organizations

Pamela Ransom
Metropolitan College of New York, New York, NY, USA

## Synonyms

Change; Conversion; Passage; Transformation

## Definition

A transition is generally understood to involve the process of passing from one state, stage, place, or subject to another or movement across boundaries. A number of different meanings connected with the term include that of passage, some type of alteration or conversion, the concept of change, and also a connection to what follows.

## Introduction

Nonprofit organizations experience a range of transitions linked to the myriad of changes that are an inevitable part of organizational life. Transitions in organizations are slightly different from the general concept of change because a transition involves not only the change itself but also the psychological process of people adapting or

coming to terms with change (Bridges 1980; Hinden and Tebbe 2003). This is an internal process that involves both mental and behavioral adjustments to change for the individuals involved. Specific phases of a transition include first the ending, or the phase of finishing or bringing closure to the existing situation or status quo; a secondary period, that is, the unsettled phase between what is the existing and the new condition; and then the final period of new beginnings indicative that a change has finally occurred or been completed (Bridges 1980).

During the initial ending phase of a transition, the primary challenge is to get rid of old patterns and identity. This phase often engenders a range of reactions for involved participants that accompany uncertainty. This second phase involves a variety of steps related to the process of readjustment to new forms of operation, while in the final phase, the new identity or condition is formed and/or reaffirmed. To make a new beginning successful, it is suggested that there are four essential components including communication of the purpose, creation of a clear picture or vision, formulation of a plan, and finally determination of the part that individuals who are involved need to play (Bridges 2009). Critical tasks in the process of successful transition are those involved in appropriate management and anticipation of the many small adjustments that change incurs, since those not properly managed increase the level of difficulty involved.

One theory links transitions in organizations to two drivers, or what are called "motors" at the individual and organizational level (Cule and Robey 2004). These are related to either managerial actions, called the teleological motor, or at the organizational level, a dialectic motor, that includes factors both supporting and opposing change. Three phases of transition include creation, destruction, and unification. At each of the phases of transitions, it is clear that strong organizational leadership can play an important role, helping individuals not only face and acknowledge problems but also find the necessary spirit of motivation to face the road ahead.

## Transitions and Nonprofit Organizational Stages

With respect to nonprofit organizations, there are a number of stages in the life of most organizations which involve a range of transitional adjustments and reconfigurations. Many of these are linked to the natural life cycle of organizations and impacts on the individuals involved. All nonprofit organizations move through the stage of formation, through a phase of ongoing operation and functioning, and finally through the stage of eventual closure, transformation, or institutional death. It is useful to think of seven phases of the organization including the initial idea, start-up, growth, and maturity, followed by eventual loss of relevance, movement into new directions, and/or decline (Stevens 2001). Mapping involved organizational stakeholders would find that adjustments and ongoing transitions are part of each phase. These often relate to role transitions as individuals move into new positions or change orientation to roles previously held (Ashforth 2001). Each transition involves rites of passage related to separation, transition, and finally incorporation linked to role exit, movement between roles, and finally entry when a new role or status is defined (Ashforth 2001; Kralik et al. 2006). Most transitions are also accompanied by a range of complex and sometimes contradictory emotions, both negative and positive, including feelings such as anxiety, frustration, sadness, shock, denial, or anger, as well as those of excitement or peace (Adams 2010).

One of the first major transitions for all nonprofit organization involves moving through the early phases involving the process of formation. During this period, individuals, including the organizational founder or head, are taking on new roles as organizational systems are shaped. The phase demands those with a special type of entrepreneurial spirit, some propensity toward risk taking, and ability to address problems with new ideas. Thus, a blend of commitment, tenacity, vision, and skills in articulation of the nonprofit mission is key. Successful transition through this early phase often involves some community outreach and tapping resources of volunteers. Most

nonprofits face a challenging environment with fierce competition often due to high density of organizations. Survival is enhanced by navigational ability, scoping of regional attitudes toward philanthropy, clear identification and focus on relevant policy, and enough viable sources of funding for the organization to survive. During this stage, because most nonprofits are small with minimal operating systems and budgets, some degree of passion of the initial founder and other involved actors is key.

For this phase of transition to run smoothly, it is important to balance the development of administration, programs, and governing strategies (Stevens 2001). There are useful tools for diagnostic assessment of capacity and organizational readiness to move through this developmental stage. These include a range of elements including articulation of the idea, development of a program, market and operational organization, core group expertise, commitment, motivation, and relations with beneficiaries. During this phase, individuals new to the organization are undergoing a process of role socialization and adjustment to unfamiliar work role demands. The person-environment fit theory defines the dual adjustment processes to new work environments that are taking place that involve both reactive adjustments of individuals learning to fit the environment and active mode adjustments as the environment adapts to individuals involved (Niessen et al. 2010).

For nonprofit organizations a variety of other types of transitions also take place during later operational phases as the organization continues to thrive and grow. This is a stage in which sustainability requires adjustments and role reconfigurations to ensure leadership competence, management capability, and appropriate levels of financial management skills. Accountability to boards, community served, and those with resources often requires a range of periodic transformations, both large and small. In some sense, transitional processes continue to reverberate through the organization as a result of ongoing adjustments to major changes in location, leadership, management, and policy. Sometimes these involve shifts in focus or internal versus external orientation, for example, as service is broadened, narrowed, or redefined.

Successful transitions of this nature necessitate systemic thinking, thoughtful planning and preparation for a wide range of ramifications that may result. Careful consideration should be given to strategies to increase communication, cooperation, transparency, and the necessary resources, with implications for leaders, managers, and the board (Kreutzer 2009). Transitions linked to the operational phase may even include introduction of new or major changes to existing equipment and technology. This involves consideration of issues such as differential levels of staff knowledge, training, levels of technology anxiety, as well as impacts on decision-making, security, privacy, or even budgetary considerations where technology plays a role. There are a variety of helpful resources including information technology resource centers, guides or consultants for nonprofits available to provide help.

## Leadership Transitions

Leadership change*s* are one of the most critical and sometimes traumatic, internal transitions that most nonprofits face at some point in time. These are impacting an increasing number of nonprofits for a variety of reasons including the large number of retirements among aging baby boomers (Bell et al. 2006). Transitions in governance are sometimes the result of voluntary retirements and departures or because of involuntary reasons such as firing, sickness, or death. These transitions sometimes take place swiftly with little time for adjustment or at other times quite slowly with a great deal of lead time before the change (Board Source 2010). Although leadership transitions are often traumatic with potential to threaten the very existence of the organization, they can also provide important opportunities for new transformation and increased vitality if the process is handled well (Chapman and Vogelsang 2005).

Impacts from leadership transitions are particularly severe when these individuals are the

original organizational founders or have been with the organization for long periods of time. Some leaders have special qualities of charisma that have shaped and defined the character of the organization and key relationships with stakeholders over many years. They may also have a long memory of the organizational history which is uniquely their own. The period before departure or replacement of the organizational head may lead to a range of subtle disruptions with respect to staff, funders, and key stakeholders, sometimes generating high level of fears and anxiety about change and organizational collapse. These anxieties are better managed if they are anticipated and addressed well in advance. Boards tend to discount the significance of the process of transition to new leadership and the myriad number of tasks where they may need to get involved. Thus, many fail to take advantage of important opportunities to move the organization forward to new levels of strength (Allison 2002). It is suggested that a critical period is the initial five day period after departure of a long-standing leader. A successful transitional process requires a five-step process of engaging in organizing, stabilizing, understanding, planning, and finally executing (Board Source 2010). Others have divided the executive leadership transitional process into three phases including the stages of preparing, pivoting, and thriving (Adams 2010).

While less than half the nonprofits have succession plans in place, these can be important tools which help with the adjustment process of transitional preparation. Succession planning is all too often ignored for a range of reasons including costs, time involved, as well as fears about administrative issues involved in coordination. Planning initiatives can either be those that are departure defined, as a result of an emergency, or part of the process of ongoing leadership development (Adams 2010). These plans involve commitments to basic building blocks of transition including identification of the need for leadership change, appropriate preparatory assessments including formulation of time frames, and roles necessary for the process to run smoothly (Hinden and Tebbe 2003). If time and circumstances permit, steps in the period before the departure may include coaching of the exiting leader or director as well as taking steps to formally recognize and celebrate their past contributions. Various types of succession and transition management assessment tools are available, with several quite easy to use (Adams 2010).

In the phase to begin the transition to new leadership, it is helpful to create a transition committee or team. The board can take this step to help ensure there is appropriate oversight of the subsequent transitional process including providing guidance for the hiring process to replace the former director. A transition consultant may also play a useful role. The field of individuals with this expertise is growing into a new area called ETM or executive transition management (Hinden and Tebbe 2003). Planning the transitional process can be further formalized through the creation of a transition plan. This provides an opportunity for consideration of the range of activities that need to be worked through including preparation for outreach and communication, organizational assessment, developing job descriptions, and interim management strategies to ensure that organizational knowledge transfer about various systems including financial systems takes place. Consultants work with organizations as part of the transitional process to develop a more well-defined sense of strategic direction and organizational work plan.

It is recommended that major leadership changes in roles such as that of an executive director should be a process that is approached gradually. For example, bringing on board an interim director who is not a candidate for the full-time role is useful to help guide the organization through the phase before the actual formal replacement of the executive director. The permanent full-time role should only be filled after a more careful process of planning, consultation, and multi-stakeholder involvement in the assessment of requirements for the job. After completion of a more comprehensive search, a new director should then be brought on board. The first year generally involves a period of combined help from the transition consultant and committee

working together to lay out expectations. It is useful for the transition consultant to facilitate communication through clarification of concerns and expectations between the board and executive director in a meeting that takes place a few months after they are brought on board. Because transitional processes can be complex, consideration should also be given to seeking specialized grants or funding to help with resources during this period to ensure that the organization is fully prepared (Allison 2002).

## Endings and Transitions

The phase of ending major programs or the organization as a whole includes other important transitions for many of those involved. This phase usually involves job layoffs for staff who must also undergo a variety of critical transformations related to ending and starting anew. Organizational resizings also have a range of transitional implications for remaining staff who often struggle with what has been characterized as the layoff survivor syndrome. They often feel increased pressure from additional amounts of work, new levels of uncertainty about roles, as well as a reduced sense of security, confidence, and trust. Similar to the steps involved in preparation for leadership transitions, it is useful before the actual closure or downsizing for the organization to spend time in reflection on previous processes related to termination to consider how to handle layoffs with new levels of dignity and respect (Bridges 2009).

Failure or closure of nonprofits, particularly in the human service field, is often influenced by factors including age, size, or the organizational focus. Nonprofits in the human service sector with missions focused in certain areas such as emergency management may be less likely to fail, while, not surprisingly, those with smaller assets may be more likely to undergo closure. Organizations between 5 and 9 years are also more likely to fail than those in existence for over 20 years. Flexibility in the use of volunteers may be a buffering factor. Problems that lead to failure come from organizational inability to control procedures or finances or a wide range of external issues including reputation, regulations, or changes in the market for the services the organization provides. Some nonprofits, particularly those involved with social service, sometimes overcome challenges of self-sufficiency by introducing various types of commercial ventures. Higher levels of income can sometimes contribute to an organization's ability to survive.

Irrespective of the factors leading to closure, failure, or endings, this phase of organizational life touches many stakeholders, each with a variety of transitional issues playing a role. Closing a nonprofit usually is not a quick process, often taking several months to unfold. Utilization of outside resources to help with the transitional process can help reduce the level of pain and anxiety for involved participants and ensure that the process moves smoothly. However, even when closures are announced well in advance, this begins a period of significant anxiety and uncertainty for all involved, and there may be times when employees have difficulties facing the realities at hand. It is also important to recognize that most of these uncertainties will lessen over time and that increased flexibility in coping is linked to better adaptation.

Four natural phases of role exits include that of grappling first with doubts, then alternatives, reaching a turning point, and then a final phase of adjustment to the ex-role (Ebaugh 1988). Leadership in the ending phase of a transition is always key, and acknowledgment of the situation by marking endings can also help. The process of closure or failure can often be particularly stressful for the organizational leader or head. Formulation of a core group of trusted advisors and time for appropriate self-care are useful as the process unfolds. Dissolution planning is recommended which involves establishing and moving toward specific goals and objectives to ensure the process unfolds in a strategic way. This includes careful consideration and implementation of steps related to the necessity for dealing with assets, the organizational legacy including interest group outreach, and appropriate levels of stakeholder communication.

## Conclusion

Each of the stages of nonprofit organizational life involves a variety of complex transitions with important implications for the various impacted individuals. Transitions involve important stages of ending, being in-between, and new beginnings that touch many stakeholders who are part of organizational life. There are a wide variety of triggers for staff who undergo role entries or exits characterized by a myriad of physical or psychological adjustments and changes that occur (Ashforth 2001). The process of individuals entering new roles involves a wide range of subtle negotiations between the individual and organization as new forms of identity are forged. This involves accompanying phases of self-definition, shaping of new meaning, and establishing control as well as a sense of belonging. Role exits on the other hand that occur because of downsizing, firing, closures, or even managerial changes are characterized by complex processes of disengagement that can be either voluntary or involuntary, depending upon the circumstances. A critical component of most successful transitions involves core components including careful planning, good communication, and implementation of systems to ensure the process moves smoothly.

# Transnational Capitalist Class, The

Leslie Sklair
London School of Economics and Political Science, London, UK

T

## Synonyms

Capitalist class

The transnational capitalist class (TCC) is defined as the group of dominant capitalists comprising those who own and/or control major corporations and their allies in the political, technical, and culture-ideology spheres.

## Introduction

The capitalist class has traditionally been defined as those who own the means of production and act directly or indirectly as a ruling class. While the original theory of the capitalist class as elaborated by Marx and Engels in the middle of the nineteenth century saw this as an international phenomenon, scholarly research has tended to concentrate at the level of the nation-state, particularly in large and economically powerful countries. With the rise of globalization and neoliberalism as new features of the economic, political, and cultural spheres in the second half of the twentieth century, attention started to focus more and more on what were then most commonly labeled multinational corporations, and a stream of studies emerged that began to "internationalize" the capitalist class. Novel theories abounded around ruling classes and elites (Scott 1990), and new concepts multiplied, for example, the international managerial bourgeoisie, international networks of banks and industry, networks of corporate power, intercorporate relations, and triple alliance of multinational, state, and local capital. Around this time, a key source of insight into a global ruling class also began to emerge from the Gramscian turn in International Relations, introducing ideas of global and regional class structures. The concept of the transnational capitalist class (TCC) within the global capitalist system can be seen as an attempt to build on this rich literature – a step toward consolidating the theoretical link between capitalist globalization and the ruling class and providing some evidence that these concepts have genuine empirical referents. This implies, conceptually, that the state (represented by the state fraction of the TCC) is only one, albeit important, level of analysis and empirically, that state actors are losing power in some key areas of economic, political, and culture-ideology decision making to non-state global actors – a transition from the international to the transnational mode of analysis.

## Theory and Research

Since the 1960s capitalist globalization has changed the structure and dynamics of the capitalist class and made it necessary start to explore the question of the extent to which the transnational capitalist class is the ruling class in the global system. The theory of the transnational capitalist class conceptualizes class in capitalist society in terms of ownership and/or control of the means of production, distribution, and exchange; resists the neo-Weberian attempt to separate class, status, and command; and highlights the central role of the capitalist class in the struggle to commodify everything. TCC theorists generally focus around three working hypotheses. First, a transnational capitalist class is emerging that is beginning to act as a global ruling class in many spheres; second, that the key feature of the globalization of the capitalist system in recent decades has been the profit-driven culture-ideology of consumerism organized by this class; and third, that the TCC is working consciously to obfuscate the effects of the central crises of global capitalism, namely, the simultaneous creation of increasing poverty and increasing wealth within and between countries and the ecological unsustainability of the global capitalist system (Sklair 2002).

Despite its relatively short history, there are already several ways of conceptualizing the transnational capitalist class. Prominent among these are the materialist approach of Robinson and Harris (2000) and the network-oriented approach of Carroll (2010). The global system approach introduced by Sklair (1995) is elaborated in a four fractions model of the TCC (Sklair 2001). These are (1) those who own and control the major transnational corporations and their local affiliates (corporate fraction), (2) globalizing politicians and bureaucrats (political fraction), (3) globalizing professionals (technical fraction), and (4) merchants and media (consumerist fraction).

In all versions of transnational capitalist class analysis, the most important members of these groups constitute a global power elite, ruling class or inner circle in the sense that these terms

have been used to characterize the class structures of specific countries, with Robinson and Harris emphasizing the broader elements of Marxist political economy, Carroll emphasizing interlocking directorates and networks of power and influence, and Sklair (expanding the classical Marxist definition of class) emphasizing the leading role of the corporate elite and the central role of the culture-ideology of consumerism.

The transnational capitalist class is generally held to be transnational (or global) in the following respects:

(a) The economic interests of its members are increasingly globally linked rather than exclusively local and national in origin. This follows directly from the shareholder-driven growth imperative that lies behind the globalization of the world economy and the increasing difficulty of enhancing shareholder value in purely domestic firms. While for many practical purposes the world is still organized in terms of discrete national economies, the TCC increasingly conceptualizes its interests in terms of markets, which may or may not coincide with a specific nation-state or group of them, and the global market. There is overwhelming evidence to show that the global corporation of today is not the same as the multinational corporation of the past (Sklair 2001).
(b) The TCC seeks to exert economic control in the workplace, political control in domestic and international politics, and culture-ideology control in everyday life through specific forms of global competitive and consumerist rhetoric and practice. The focus of workplace control is the threat that jobs will be lost and, in the extreme, the economy will collapse unless workers are prepared to work longer and for less in order to meet foreign competition. This is reflected in local electoral politics in most countries, where the major parties have few substantial strategic (even if many tactical) differences, and in the sphere of culture-ideology, where consumerism is rarely challenged.
(c) Members of the TCC have outward-oriented global rather than inward-oriented local perspectives on most economic, political, and culture-ideology issues. The growing corporate and international institutional emphasis on free trade and the shift from import substitution to export promotion strategies in most developing countries since the 1980s have been driven by members of the TCC working through government agencies, elite opinion organizations, and the media. Some of the credit for this apparent transformation in the way in which big business works around the world is attached to the tremendous growth in business/management education since the 1960s, particularly in the USA and Europe, but increasingly all over the world.
(d) Members of the TCC tend to share similar lifestyles, particularly patterns of higher education (increasingly in business schools) and consumption of luxury goods and services. Integral to this process are exclusive clubs and restaurants; ultra-expensive resorts in all continents, private as opposed to mass forms of travel and entertainment; and increasing residential segregation of the very rich secured by armed guards and electronic surveillance, from Los Angeles to Moscow, from Manila to Beijing, and from Lagos to Mumbai.
(e) Finally, members of the TCC seek to project images of themselves as citizens of the world as well as of their places of birth, generating corporate global visions. The concept of the transnational capitalist class implies that there is one central inner circle that makes system-wide decisions and that it connects in a variety of ways with members of the TCC in each locality, country, and region. While the personnel in this inner circle may change (there may even be several overlapping inner circles at any one time), the TCC is a class with identifiable leaders.

What the inner circle of the TCC does is to give a unity to the diverse economic interests, political organizations, and cultural and ideological

formations of those who make up the class as a whole. As in any social class, fundamental long-term unity of interests and purpose does not preclude shorter-term and local conflicts of interests and purpose, both within each of the four fractions and between them. The culture-ideology of consumerism is the fundamental value system that keeps the system intact, but it encourages a wide variety of choices to satisfy the needs of the different actors and their constituencies within the global capitalist system. The four fractions of the TCC in any geographical area – community, city, country, and region – perform complementary functions to integrate the whole. The achievement of these goals is facilitated by the activities of local and national agents and organizations which are connected in a complex network of global interlocks (Carroll 2010).

A crucial component of this integration of the TCC as a global class is that virtually all senior members of the TCC will occupy a variety of interlocking positions, not only the interlocking directorates that have been the subject of detailed studies for some time in a variety of countries but also connections outside the direct ambit of the corporate sector, the civil society as it were servicing the state-like structures of the corporations. Leading corporate executives serve on and chair the boards of think tanks, charities, scientific, sports, arts and culture bodies, universities, medical foundations, and similar institutions. It is in this sense that the claims "the business of society is business" and "the business of our society is global business" become legitimated in the global capitalist system. Business, particularly the transnational corporation sector, then begins to monopolize symbols of modernity and post-modernity like free enterprise, international competitiveness, and the good life and to transform most, if not all, social spheres in its own image.

The concept of the transnational capitalist class is controversial and has been criticized on theoretical and empirical grounds, particularly by those who are skeptical of the claims of globalization researchers in general and those of Marx-inspired global system theorists in particular. Theoretically, those who reject the primacy of class as a mode of analysis of individual countries or the global system as a whole obviously will not find the idea of a transnational capitalist class useful. Many who are more open-minded about the issue, especially those influenced by the Marxist tradition of class analysis, will be unwilling to expand the class concept beyond the direct owners of the means of production, as in the four fractions model. However, the parallel expansion of the concept of money capital to include cultural and other forms of capital, especially in the era of capitalist globalization, has broadened this debate, and research into the role of the TCC in the fields of education, religion, architecture, and global cities, for example, suggests that at the very least the expansion of the class concept throws up some interesting researchable questions. Empirical research into the substantive foundations of the concept, focusing around the issue of the extent to which the TCC is evolving from a class in itself to a class for itself, will always be challenging. While few question the economic power and reach of the corporate elite, globally and locally, the political and sociological consequences of this power and reach are difficult to establish clearly and unambiguously. While network and corporate interlock research documents connections, it is often difficult to specify exactly what the results of these connections are.

## Conclusion

It is no exaggeration to say that there is now a flourishing community of scholars largely but not exclusively connected with the Network for Critical Studies of Global Capitalism (NCSGC), who are building a substantial foundation for research on the transnational capitalist class all over the world, further details of which can be found in the ever-expanding NCSGC bibliography https://drive.google.com/open?id=1SzooNM4_4pQUkPPK-vIwYSGE46ijFlTqRVGsMMgAAH0.

## Transparency

Alex Ingrams
School of Public Affairs and Administration, Rutgers University – Newark, Newark, NJ, USA

### Synonyms

Openness; Open government

### Definition

Transparency is the principles and practices that enable organization insiders and outsiders to obtain accurate information about organizational activities.

### Introduction

Transparency in public administration is a concept that describes the principles and practices that enable organization insiders and outsiders to obtain accurate information about organizational activities. The principles and practices of transparency involve different types of information which lend themselves to different types of transparency. Transparent information can be detailed data such as accounting figures; it can be aggregated metainformation about policy plans or forecasting; alternatively, it can be information about the rules or laws that govern the system of organizing information.

One characterization of transparency by Albert Meijer (2014) moves beyond the information components of transparency to the behavioral facts: Transparency is a behavioral *virtue* of governments or politicians, a style of *relationship* between a political actor and a public forum, and a *system* of formal and informal rules. Lack of transparency may result from deliberate concealment of information or functional, systematic, failure to communicate the relevant information. Transparency can be revealed with different mechanisms. Within a governmental system, transparency can be passive, proactive, or forced. That is, it can be brought about by mechanisms such as freedom of information (FOI) (*passive*), organized through public websites and open data (*proactive*), or initiated anomalously through the system in whistle-blowing or leaking (*forced*).

Transparency is also viewed as a practical matter of efficiency that arises when public policy makers seek to share information for better decision-making and coordination. An approach to transparency that underlies decision-making or metaphors about abstract ideas such as "public value" or "democracy" is a *modernist* or *rational* approach to transparency. The rationalist approach takes information as the building block of conscious goal setting by actors in government. However, transparency underlies other types of metaphors of public organizations. For example, the premodern and postmodern metaphors of Meijer (2009). The premodern metaphor emphasizes the immediate, person-to-person openness of the citizen-government relationship and is exemplified by the affective and cognitive attributes of citizen trust of government. On the other hand, the postmodern transparency metaphor

accepts the mere simulation of truth often resulting from transparency. The postmodern approach focuses on the aesthetic dimensions of computer-mediated systems and platforms of transparency.

Within the broadly *modern* perspective of transparency as rational design, the process of transparency may be divided into three kinds: (1) informational transparency where the new data used to inform policy making is transparent; (2) decision-making transparency when the content and the actors involved in making policy decisions are known and identified; and (3) policy outcome transparency where the actual policy consequences and their causal dependency is transparent to public and other decision makers. Each of these stages in the transparency process may have a different set of professional, legal, and administrative contexts with attendant organizational tasks and challenges.

## History of Transparency

Historically, transparency emerged as a principle of democratic government in the British liberal school of philosophy in the 1800s frequently under the term "publicity." Jeremy Bentham (1748–1832) can probably lay claim to being the first author to use the word "transparency" in its modern sense. However, related ideas abound in political thought from much earlier dates. Christopher Hood (2006) traces the history of transparency to ancient Athens and Sparta (c. 500 BC–c. 400 BC) in the West and Shen Pu-Hai (400 BC–c. 337 BC) in China. In both worlds, the ideal functioning of government was viewed as adherence to clear and fixed rules. Theories about the virtues of open public discussion and the inner workings of political power can be found in the works of John Locke (1632–1704), Jean-Jacques Rousseau (1712–1778), and Immanuel Kant (1724–1804) and were influential in the Republican revolutions in Europe and the American colonies. Rousseau believed that lack of transparency, or "opacity" as he called it, was the root of political evil, while James Madison (1822) famously wrote that "popular government, without popular information, or the means of acquiring it is but a Prologue to a Farce or a Tragedy; or perhaps both."

With these varying influences, theory about transparency has become a contested arena. Transparency can at once be a self-evident good and a multifaceted concept with vague boundaries. Different disciplines view transparency differently. Economists view it as a condition for open markets, political scientists view it as a condition for public participation, and legal scholars view it as a condition for administrative legality (Meijer 2014). In the area of public administration, the most far-reaching transparency reforms were the freedom of information laws created in the 1960s and 1970s in North American and European countries. However, today, transparency policies extend to many different levels of government and program areas as well as procedural or metaphorical aspects. Thus transparency can be seen as a public good in public choice economics or as a regime value in the sense of a formal practice of government in the way that John Rohr put forward (Piotrowski 2014). To the extent that transparency is viewed as a public value, it also suffers from challenges associated with public management of traditional public values such as equality or security. That is, alternative public sector goals such as efficiency may overshadow them. The tension is apparent in the new public management (NPM) reform initiative of which transparency policies have been a part. NPM aimed to achieve greater customer satisfaction, market competition, and decentralized decision-making through more open information systems.

## Antecedents of Transparent Practices

A further barrier to the attempts of researchers to grasp the practical purposes and principles of transparency is the complexity of causal theory linking antecedents to the practice of transparency. Varying antecedents and causal explanations accompany the stages of the transparency process in policy decision-making. These causal influences relate to different areas of external

pressure that emerge during the stages of the transparency process. Thus policy information transparency is engendered through dependency on the main agent of information production in society: the media. The decision-making process transparency often depends on the political environment, and, notably, the influence of left leaning political parties. The transparent outcomes of the policy making and implementation of policies may be given open disclosure by sustained pressure from actors and actor networks that are most interested in such consequences, namely, organized citizens and civil society organizations (CSOs). While there is not much difference in levels of transparency between conservative and progressive countries, one consistent predictor of higher levels of transparency is lower dependence on foreign aid.

External environments are not the only drivers of transparency as internal resources and decisions must also be taken into account. Transparency must be managed and given adequate resources, and it requires a strong internal organizing capacity. In general, strong transparency policies are found in governments that already have strong democratic institutions. If government is plush with resources and has reliable tax income streams, the government is more likely to open itself up to more internal transparency and scrutiny. Further, to the corollary of left leaning political environments, left leaning politicians are also associated with more transparent regimes. Though, it should be noted that transparency is not a uniquely left wing policy approach and is often advocated by rightist or centrist politicians. The political stripe of decision-makers is therefore not as important as the general democratic persuasion of political institutions. The explanation for the association of democracy and transparency is that in democracies public officials have the incentives and institutionalized accountability culture to promote transparency by providing credible information to the public.

As transparency is a process mediating between a government that is transparent and an observer (the citizen, CSO, or other third party), the role of third parties is a dual one. That is, the third party is both a driver of transparency adoption and an ongoing participant in monitoring and scrutiny. For this reason, transparent political regimes while requiring a necessary level of economic, professional, and technological input rise or fall depending on the density and energy of the CSO sector. Transparency is coextensive with the rise of civil society and the growth of democracies as forums of informal and publically engaged citizens. CSOs and informed members of the public demand greater transparency. Given the right incentives, politicians are likely to comply. However, while third parties play an important role in delivering or supporting transparency, the boundaries between the government and the third parties must be clear for transparency policies to be functionally sustainable. A clear demarcation between the private and public sectors is necessary for transparency.

Such third party analysis is often provided by principal-agent theory. In research on transparency, the organizational mechanism of principal-agent dynamics is political competition. In representative democracies, elected politicians choose to adopt transparent administrations to capitalize on political superiority provided that party political competitors are also subject to such transparency. Here, transparency creates both the cost of greater scrutiny and the possible cost of negative publicity. However, the alternative risk of being viewed as an antidemocratic government or party is viewed as a greater cost than accepting (and championing) such transparency. Political antecedents of government transparency therefore also involve the trade-offs of secrecy and monitoring in competitive party politics. However, such a principal-agent analysis does not hold in all country contexts. In authoritarian regimes increased transparency laws do not necessarily lead to improved accountability because local decision-making is strongly centrally controlled and a weakened civil society can make very little difference.

Another important antecedent in internal organizational capacity is technological capacity as transparency is increasingly reliant on digital forms of information disclosure. Today, as a result of technological development and political will, transparency policies are proliferating all over the world.

## International Organizations, CSOs, and Other Third Parties Involved in Transparency

Networks of CSOs that advocate for increased transparency cross over national boundaries and have established a global sphere of influence. Such global influence is leading to a convergence of transparency regimes and practices between countries. Once transparency policies have been adopted, CSOs play a key role in supporting accountability through transparency, especially when there are existing deficiencies of accountability in government administrative systems. CSOs fill this gap by accessing and distributing information as well as demanding accountability and creating an environment to monitor public officials and politicians.

Another third sector pressure at the global scale is effected by multinational regulatory organizations such as the World Bank and the International Monetary Fund (IMF). The pressure on governments to raise transparency levels has been strongest in the area of financial transparency where global regulation is tightest. Financial stabilizing agencies such as the IMF make opening the accounting books of governments to public scrutiny a condition of funding often at the expense of other governmental priorities such as political development, public faith in legitimacy, and data privacy concerns. Indeed, multilateral organizations can themselves be conspicuous in their lack of transparency. International organizations such as the World Trade Organization (WTO) are much more likely to open up on areas that are relevant to economic liberalization but not on other areas of organizational transparency. MDBs, while open to information flows with the public that help to foster support, are internally conflicted because they have different agreements of diplomatic confidentiality with different countries.

Further, there are inherent shortcomings in the extent and quality of the reach that CSOs have over government transparency. While CSOs play an important role in the transfer of transparency policies, they are frequently incentivized to promote the lowest common denominator of transparency policy standards in order to increase the chances of the government actually adopting the policies. The government is reluctant to adopt increased transparency and therefore, as pragmatic advocates, CSOs enter into strategies of complicity and gradual change in the form of "iron triangle" politics. Transparency policy change typically happens incrementally.

## Benefits and Costs

The benefits of transparency cover a wide gamut of important governmental domains. Countries with transparent governments tend to have higher GDP and lower levels of corruption. Transparency alleviates information asymmetry in public-private partnerships and is therefore a strong predictor of government contracting success. Budget transparency in particular has become a prerequisite for fiscal balance, fewer electoral cycles, and long-term economic development. One growing area that recognizes the benefits of transparency is evidence-based policymaking, where policy development is enhanced by taking advantage of the increase in governmental data and information.

The benefits of transparency are such that it is unlikely that any modern democracy would not have the core features of transparent regimes such as FOI and public participation. However, despite the numerous benefits of transparency, scholars widely recognize that transparency can be a double-edged sword. Transparent government regimes have the benefit of increased third party involvement in policymaking, but as a result the policymaking process itself is sometimes slow and ineffectual. Internal processes of deliberation are sluggish, hampered by red tape and political and media interference. Privacy can be endangered which both adds to the potential for costly legal delays and breaches of citizen confidence. Further, citizen confidence can be damaged by the perception that difficult government decisions about confidentiality and publicity are simply evidence of government duplicity and hypocrisy.

While the pressure to bring about transparent policy reform may lead to politicians being accused of selective release of controversial

information, there are logical reasons to hypothesize that transparency may itself bring about certain sorts of undesirable behavior. In particular, the healthy habit of politicians to act properly in order to avoid blame may be turned into a game of tinkering and spinning of information in order to generate favorable public opinion. Similarly, politicians might be less likely to make decisions in the interests of their constituents if their policy choices and information are completely transparent because politicians will inevitably be attracted by the need of spending time and resources convincing of their own (the politician's) credibility.

Another unintended consequence of transparency is that perceptions of political ineptitude or corruption magnified to the collective level of public opinion may trigger unpredictable political reactions. Minor misdemeanors may blow up to catastrophic proportions or false information may become ingrained in the social consciousness. A further danger is that citizens or civil society actors may decide to withdraw, resign, and disengage from politics as a response to political dysfunction rather than producing the behavior of remedial political action that theorists of transparency assume.

Considering these problematic aspects of transparent information and communication costs, researchers are almost unanimous in their conclusion that transparency should not be viewed as an unalloyed administrative good, political panacea, or intrinsic public value. Indeed, as the capacity of governments to gather information on citizens and foreign citizens grows through IT innovation, the principle of government transparency becomes ever more fraught with the challenge of balancing good kinds of transparency such as political accountability and public participation with dangerous kinds of transparency such as surveillance and invasions of personal privacy. Some scholars have identified a critical tipping point in this balance with the arrival of nonstate actors into the delivery of political transparency (e.g., Roberts 2006). Notably, the evolution of one perspective on organizational transparency represented by the organization known as WikiLeaks is about immediate transparency of large amounts of information that circumvents the separation of public and security interests shown in FOI kinds of transparency.

## Citizen Views of Transparency and Effects on Trust

Perhaps the most contentious topic of transparency costs and benefits is the impact of transparency on citizen trust and attitudes towards the legitimacy of government action. The relationship between transparency and government legitimacy in the eyes of citizens is complicated. It is conditional on several different factors and is accompanied by several mediating variables relating to individual and social differences (Grimmelikhuijsen and Meijer 2014). The relationship between transparency and perceived trustworthiness is mediated by a person's existing level of trust of the government and their knowledge of the given policy or information area. More specifically, citizens who believe that they can have a positive influence on decision-making tend to have more favorable views of government transparency, and in public services decision-making that uses citizen engagement, citizens are enabled to draw positive inferences about the responsiveness and legitimacy of government activities.

Another important variable in the relationship between transparency and trust is culture. Different administrative cultures take different policies towards types of information sharing. Culture shapes how people perceive and interpret the results of transparency. Some recent research shows that the level of information that citizens require to make favorable assessments of transparency is low. Citizens seem to value the quality of information rather than quantity. From the general citizen perspective, it is sufficient that policy makers justify their decisions even if the proceedings and protocols involved in the decision-making are themselves not known to the public. Such meta-information is viewed as superfluous in practical terms by citizens, but citizens are reassured by proactive attempts to explain and justify the political, economic, and legal background of decisions (Licht 2014).

## Conclusion

Practices of transparency can be seen in many different principles and practices of government. Transparency fundamentally changes the governmental landscape of accountability and has wide ranging impacts on third party organizations such as CSOs and citizens. Transparency practices are deeply rooted in history and are today growing worldwide. However, while scholars and public administrators alike herald its advantages in democracy systems of government, the empirical research about the benefits and costs of transparency is mixed. It is clear that there are conditions under which transparency is most effective. Moreover, there must be limits placed on the availability of public information.

The lack of a clear consensus on scientific knowledge of transparency is also evident in the evidence of its long-term effects on government and society. Transparency may shift patterns of discourse and enable organizations to be more open to the public in the long term. However, distinguishing the desirable effects of transparency from the undesirable effects is a difficult task especially in a rapidly shifting environment of information and technological innovation. The further to the future that researchers set the scope of their empirical analyses, the more difficult the analysis becomes. Nevertheless, longitudinal studies of transparency regimes have started to raise the importance of addressing questions and testing hypotheses regarding long-term effects. As transparency policies become more widespread around the globe, such effects will become an increasingly important area of public administration and public policy research.

# Transparency and Accountability in the Philippine Local Government

Laila Castro Castillo[1] and Arneil Garcia Gabriel[2]

[1]City Government of Cabanatuan, Cabanatuan City, Philippines

[2]Department of Public Administration, Nueva Ecija University of Science and Technology, Cabanatuan City, Philippines

## Synonyms

Actual observance; Continuum of transparency; Good governance; Open government; Seeing through government operation; Twin governance principles

## Definition

As a practice, transparency is an act of allowing the internal and external forces of governance to

inquire into, have access to, and influence to a certain extent the government operations.

As a concept, transparency embraces accountability. It is linked to and provides the enabling environment for greater accountability and is therefore presumed operating in a continuum. The effectiveness of transparency is measured on the degree of accountability that it would provide to government personnel. Transparency is a matter to open up government and governance to public scrutiny and encourage greater citizens' participation.

## Introduction

The organizational practices of government personnel are central to building public trust and confidence. It cannot be denied that work ethics and organizational culture prevailing in the Local Government Unit (LGU) are reflections of public sector performance which in turn creates an impression on how a particular government office performs. Alongside with the development of desirable work ethics and good governance practices is the institutionalization and observance of transparency practices. The core significance of transparency and its relationship with personal and organizational accountability have been established in many studies. The need for transparency in governance is globally recognized (Lindstedt and Naurin 2010; Olsen 2015; World Bank 2017; Gabriel 2017). For instance, a greater degree of transparency creates a higher level of accountability in government operation. According to Ingrams (2016), transparency is the principle and practice that enables organization insiders and outsiders to obtain accurate information about organizational activities. Within the governance system, transparency can be passive, proactive, or forced. In international context, transparency is the accurate mode of assessing the openness, accessibility and value of government, and monitors the internal workings or performance of an organization having impact on the social, political, and economic realities of the community (Heemsbergen 2016; Gabriel 2017). Transparency is a critical matter to open up of government and governance to inform scrutiny and participation. They need to be embedded in the culture of local governance and it is something which politicians and administrators alike should invest considering the key role local governments perform towards countryside development (Gabriel 2017). For an institution to become accountable it has to be transparent; and if an institution is transparent, it is likely that it is accountable as it has nothing it wants to hide. The more transparent the government is, the more accountable the officialdom. The pressure to become accountable arises from the knowledge of the citizens of the standard of services they deserve and should receive (Gomez and Mudlong 2017; Gabriel and Gutierrez 2017; De Leon 2016; Calina 2015; Republic Act 9485, 2007). Transparency transforms the rights of consumers under the New Public Management (NPM) Model, to political and legal rights of citizens in Public Governance model (Reyes 1994). Lower degree of accountability in the government encourages systemic corruption which would likely cause not only decay of the governmental system resulting in the loss of trust and confidence of the public to public institution abandoning in the process the Constitutional mandate that "public office is a public trust" (Bernas 1996; Brillantes and Fernandez 2011; Cucciniello and Nasi (2014). Transparency is a mechanism to minimize negative bureaucratic behaviors in the government. According to Benito (2016), it is the act of providing the public reliable information needed to make informed decisions on matters affecting the operation of government. It creates trust among citizens, enhances citizens' engagement with the government, improves internal efficiency, and promotes open government on a global scale (Orelli 2016). Transparency is among the most effective deterrents to corruption in public procurement (OECD 2014).

Transparency is often associated and conflated with "good governance" in Malaysia and Singapore (World Bank 2017; Gabriel and Gutierrez 2017), a variable to increase local legislative performance and a means to improve the quality of legislative service commensurate to public money (Gabriel and Ong 2018). However, incongruence

of knowledge on the need for transparency and accountability and actual adherence is recorded; yet, the twin principles remain effective tools for good governance practice (Gabriel 2017; World Bank 2006).

This chapter measures the transparency and accountability practices of 56 department heads and 662 personnel from two cities and five municipalities in the Philippines within the domains of: decision-making; procurement; and access to information are from *"almost always"* to *"always"* and equated to high observance of accountability practices. Applying Mann Whitney U test and Kruskal-Wallis test, there was no significant difference in terms of observance of transparency practices in access to information and decision-making. But significant difference is found in the transparency practices on procurement.

## Hypothesis

The observed transparency practices in city and municipal LGUs do not significantly differ on decision-making, access to information, and procurement.

### Analysis of the Chapter

The framework of analysis is shown in Fig. 1 which suggests that transparency per se is not effective without its observance in the day to day operations of government. The relationship between transparency and accountability is direct. The effectiveness of transparency depends on making the information available, accessible, and actionable. The chapter asserts that effectiveness of information can be measured by the manner and degree they are observed by the leaders and government personnel themselves who have the power and prerogative to publish and make the information known to the public clients.

The interface of transparency and accountability is in a continuum. Transparency creates accountability in practice. Thus, the measure of transparency practices equates that of accountability. The chapter analyzes three domains of transparency: domains of decision-making or administrative transparency; the procurement system or financial transparency, and access to public information (political transparency) in the local setting (Armstrong 2005).

## Transparency Practices of LGU Personnel on the Three Domains

### Domain of Decision-Making

It is observed that not all personnel are consulted in making decisions in the LGUs. The inputs arrived at in the lower level during consultation in the department and area are escalated by the respective department heads to the higher ups. On legislative matters, the *Sanguniang Bayan* (Municipal Council) recommends to the LGU Chief the decision arrived at in their level for final decision. This finding is supported by the assertion of Ingrams (2016) which in effect states that transparency does not always require a clear – all – conditions. Data show that LGUs of two cities and five municipalities observed almost similar practices in making decisions in their

**Transparency and Accountability in the Philippine Local Government, Fig. 1** Three conditions for the effectiveness of information initiatives. (Source: World Bank (2017, p. 248) based on Naurin (2006) adopted in Gabriel (2017))

units. Majority of the personnel in the LGUs said that *"no consultation practice"* was least observed. This implies that, autocratic decision-making is not apparent as any decision made comes from the inputs of the other personnel on the lower echelon. Participatory governance in decision-making is somehow observed. No other practice in decision-making was cited by the respondents.

### Procurement

In the domain of procurement, the governing principles are embodied in RA 9184. One of these principles is transparency in the procurement process and in the implementation of procurement contracts (RA 9184). Fiscal transparency has been the focus of international initiatives and standards, which includes the importance of using public available information for financial decision-making or accountability purposes (Seiwald 2016; Sirotkina and Pavlovskaya 2016). The cities LGU found that 14 procurement practices embodied in RA 9184 are all observed by the personnel. It is their common and foremost practice to establish their Bids and Awards Committee (BAC). Before procurement is made the personnel concerned see to it that procurements to be made are within the approved budget of the local government (LG) and undertaken in accordance with the approved Annual Procurement Plan (APP). Bidding of contracts are made open to qualified bidders.

Invitations to bid are extended through different forms of media like websites newspapers and the Philippine Government Electronic Procurement System (PhilGEPS). BAC meetings are all held within the premises of the LGU. During biddings, a representative of the Commission on Audit (COA) is invited to witness or participate in the proceedings. Minutes of meetings and any decision made by the BAC are recorded, documented, and posted in a prominent place within the vicinity of the LGU. After the bidding, the authorized person in the LGU notifies the winning bidder to proceed not later than 7 days from the date of approval of the contract.

It can be implied from the gathered data that there is observed transparency in the procurement procedure in the city LGUs and the procedural process is in compliance with the mandated procurement law. There is openness and general consensus of BAC on the procurement rules that can be regarded in implementing transparency. Public participation plays an important role in public management. It helps the government to respond proactively to the public's concern, hence, making the public management more dynamic (Greitens 2016). The public includes the nongovernment and civil society organizations. The principal-agent relationship of the people and government officials in-charge of the bidding process must be observed, thus maximum participation of the principal(citizens) in the process should be worked out not only for increase transparency but also for a higher degree of government accountability (Vyas 2017).

Meanwhile, all the five municipality LGUs BAC is duly created and the meetings are held in the municipal hall premises. Procurement was undertaken in accordance with the Approved Procurement Plan and invitations to bid contracts were undertaken under competitive bidding procedures. The respondents claimed that the process in the implementation of procurement contracts was made known to public. In the five municipalities, minutes of meetings are complete and decisions made are kept on record. The BAC in the municipal level is also inviting a representative from COA during their meetings. The provision "All bids is accompanied by Bid security" was the practice least observed. Public monitoring of the procurement process and the implementation of awarded contracts, deliberation of the agenda, and other information are expected to have been deliberated upon by the committee at least 1 week before the holding of such meetings were also practices least observed. These findings tend to imply then of the shortcomings of the municipal LGUs procurement system. In short, respondent LGUs, transparency in the procurement process is "no clear picture," as the implementation process has been undermined by several uncertainties like the public monitoring of the transaction. However, there are more reasons to believe than to doubt that transparency was observed.

The LGUs followed the procedural process of procurement.

### Access to Public Information

The Annual budget and finance is the area where access to information is most likely to attract attention of citizens not only because it is something that interest them but also because it is where the tax payers' money goes.

The Annual Budget Operations (BOM) for LGUs is embodied in Circular No 112 issued in 2016 by the Department of Budget Management (DBM), which took effect in 2017. The BOM is the definitive guide of the LGUs in the entire budget process including preparation of annual and supplemental budgets (DBM 2016). The Circular aimed at systematizing methods, techniques, and procedures employed in the preparation, execution, and accountability in local budget operations pursuant to Section 354 of RA 7160.

The city and municipal LGUs, practiced participation of the CSOs in the planning and budgeting process. The budget plan is expressed in financial terms the sources and uses of funds. It also includes the financial and policy decisions that the local government will implement during a fiscal year. All LGUs practiced similar strategies on budget planning and preparation. Information on the results of the budget process, allocation, and expenditures can be accessed by the public. The strategies utilized to access information on budget and finance were through memorandum circular, by posting in bulletin boards and other conspicuous places, and pronouncement in programs, assemblies, meetings, and similar gatherings. The community which is the direct beneficiary of the LGUs services is the least informed of the budget processes and finance of the LGU. Only few members of the community are informed on the process.

Based from the given observation, it can be construed that valid and reliable measures of budget and finance transparency are difficult to come up with. This supported by the pronouncement of the Philippine Budget Secretary Boncodin (2007);

> *the budget process is generally not open to public scrutiny except during Parliamentary debates, and the budget performance tracking system is poor.*

> *The engagement of the citizens in the budget process is important, as their participation may improve budget allocation and facilitate fund distribution procedures, and prevent financial corruption and enhance accountability.*

The municipal LGUs employ traditional mode of disseminating information on decisions made by their LGUs especially on financial matters. However, there is already a technological change through the aid of social media that can speed up the availability and safety of public documents.

## Extent of the Observance of Transparency Practices in LGUs

The extent of observance of transparency practices in the city and municipal LGUs show that the personnel of the different LGUs **Almost Always** observed the practices in the three domains with transparency. In city LGU A, the numerical ratings on procurement, access to information, and decision-making ranging from "always to almost always." In the municipal LGUs, the same three domains were rated with similar extent of observation by the personnel with the addition of participation and consultation in on municipality.

Municipal LGUs have lower ratings on procurement. Not all employees, especially those assigned in other offices, were informed of the outcomes of "bids and awards" the reason why some have still doubts on the process. They still hold on to the belief that corruption on the awarding of contracts especially in projects on infrastructure still exists. When the quality outcome of the project is poor or below expectation, the notion is that graft and corruption took place. Table 1 shows the comparison in the observance of transparency. It presents the result of the statistical analysis made on the comparison of the observed transparency practices in three domains in city LGUs. Results show that city LGUs do not differ significantly in their transparency practices on decision-making and access to information but not in the procurement function.

The two LGUs differed on their observed practices on procurement of equipment and materials,

**Transparency and Accountability in the Philippine Local Government, Table 1** Comparison on the observed transparency practices in city LGUs

| Domain | Computed statistic | P value∗ | Decision |
|---|---|---|---|
| Decision-making | −1.156 | 0.248 | Not significant |
| Procurement | −4.504 | 0.000 | Significant |

| Access to information | | | |
| Decision made | −1.610 | 0.107 | |
| Budget and expenditure | −1.610 | 0.107 | |
| Bids and awards of projects | | | Not significant |
| Procurement of equip. & mat. | —0.365 | 0.715 | |

$*p < 0.05$

**Transparency and Accountability in the Philippine Local Government, Table 2** Level of accountability of the LGUs on decision-making

| LGUs | Extent of transparency Practices observed | Accountability level |
|---|---|---|
| **City** | | |
| **A** | Almost always | High |
| **B** | Always | Very high |
| **Municipality** | | |
| **C** | Always | Very high |
| **D** | Always | Very high |
| **E** | Always | Very high |
| **F** | Almost always | High |
| **G** | Always | Very high |

and hiring and promotion of personnel. There are no significant differences noted on the LGUs practices on consultation and participation, and access to information. Significant differences are noted on practices in procurement although the two LGUs abide with the Procurement Law, some personnel still believed that projects are awarded to the "elite" and "behind the scene influence" still prevails. Meanwhile the Table 2 below depicts the comparison on the observed transparency practices in municipal LGUs reveal that the personnel transparency practices on decision-making, consultation and participation in activities, and access to information did not differ significantly in the five municipalities. There are significant differences on their practices on procurement.

In both city and municipal LGUs, practices on decision-making, consultation, and participation are not significantly different. In the study of Neupane et al. (2012), public e-procurement technology plays a role to reduce corruption in government procurement. The results showed that public e-procurement system indicated anti-corruption capabilities particularly in the automation and audit trail and can potentially increase transparency and accountability of the government procurement process. The procurement procedure in Philippine government goes electronic through PhilGEPS, to promote transparency and efficiency in the procurement system. It serves as the primary source of information on all government procurement. But according to Neu et al. (2015), the e-procurement system may have limitation on internal control and monitoring practices in corrupt contexts.

## Accountability Level of the LGUs in Relation to the Extent of Observance of Transparency Practices

### In Decision-Making

Table 2 shows the data on the accountability level of the LGUs in decision-making based on the extent of transparency practices observed.

Generally, the LGUs have high and **very high** level of accountability in decision-making.

The practice of participative and consultative decision-making is always practice in the LGUs.

### In Procurement

Table 3 presents the data on the accountability level of the LGUs based on the extent of the observed practices on procurement. Data suggests the high and very high level of the LGUs based on the practices observed on procurement.

The participation of concerned personnel mandated by the Rules on Procurement during the bidding process is noted. Some personnel believe, however, that the practice of *palakasan* still holds at times. Indeed, stakeholders are encouraged to participate in the formulation of Annual Procurement Plan, as well as to observe the bidding process. The integration of public participation led transparent, competitive, and accountable bidding processes in all government agencies.

### In Access to Public Information

Table 4 presents the data on the accountability level of LGUs on access to public information based on the extent of practices observed.

The two city LGUs and three municipal LGUs have high level of accountability on their practices on access to public information. Two municipal LGUs are very highly accountable in their practices. As disclosed by some employees, information dissemination is always done, but some clients have difficulty in accessing public documents from some offices.

## Concluding Notes

The observed transparency practices in city and municipal LGUs do not significantly differ on decision-making and access to information but not in the domain of procurement.

Majority of the subject LGUs are observed to include the participation of the department heads in decision and policy-making. They are often consulted and their suggestions matter in every decision. The practices of transparency and accountability of government personnel in the Local Government Units of Nueva Ecija, Third Congressional District, was *highly* observable. It is noticed that the concerned LGUs still follow the traditional method of public information. With the recent advancement of technology, they must take advantage of the social media and other modes of publication as means providing information of interest to the constituents. In the accountability levels of the LGUs, procurement is the most

**Transparency and Accountability in the Philippine Local Government, Table 3** Level of accountability of the LGUs on procurement

| LGUs | Extent of transparency practices observed | Accountability level |
|---|---|---|
| **City** | | |
| **A** | Almost always | High |
| **B** | Almost always | High |
| **Municipality** | | |
| **C** | Always | Very high |
| **D** | Always | Very high |
| **E** | Always | Very high |
| **F** | Almost always | High |
| **G** | Almost always | High |

**Transparency and Accountability in the Philippine Local Government, Table 4** Level of accountability of the LGUs on access to public information

| LGUs | Extent of transparency practices observed | Accountability level |
|---|---|---|
| **City** | | |
| **A** | Almost always | High |
| **B** | Almost always | High |
| **Municipality** | | |
| **C** | Almost always | High |
| **D** | Always | Very high |
| **E** | Almost always | High |
| **F** | Almost always | High |
| **G** | Always | Very high |

argued domain. It is a sensitive subject to be addressed, and their responses are bare interpretations and understanding. Although there are gray areas in some of the government operations, the effort of government officials to comply therein are observable.

The practice of transparency and accountability differs from country to country and is affected by the levels of government, regime types, and cultural context. It is also the foundation of the public trust to the public sector organization. The chapter showed that transparency and accountability practices may differ from one local government unit to another although similar in many aspects. The variances in some matters and parameters measured would justify the necessity for the government in the local level to invest in the measurement of the twin principles. Not only to lessen incongruence between theory and practice but also to ensure that sustainable, participative, and inclusive local development is maintained. Standardization of observance is called for. The LGU being the nearest to the people in the countryside and the nexus to democracy, public service delivery must at all times be guided by the dictum "public office is a public trust," which in itself is the benefit of observing transparency and accountability in the local level.

[2]Research Centre in Political Science (CICP) and Faculty of Economics, University of Coimbra, Coimbra, Portugal

## Synonyms

Accountability; Corruption; Socioeconomic development; Transparency

## Definition

The term "transparency" in economics and finance is defined very broadly as a process by which information about existing conditions, decisions, and actions is made accessible, visible, and understandable. Transparency is understood as the effective flow of information or as the process in which the information is prepared and disclosed in a safe, understandable, and timely manner (IMF Working Group 1998; Kopits and Craig 1998; Vishwanath and Kaufmann 1999). In particular, transparency is the opposite of secrecy (Florini 2000). One of its main underlying assumptions is that transparency is always closely connected to accountability.

Transparency in public administration gives greater openness about political and economic decisions and promotes the accountability of organizations (ibid.). Therefore, the need to establish transparency mechanisms is essential to improve public managers' decision-making and to optimize the information then disclosed to the citizens. Finally, economic development and transparency go together. Logically, transparency is negatively correlated with corruption and positively correlated with economic development.

Corruption and socioeconomic development indicators help analyze how countries have evolved and how they are positioned relatively to each other, to support transparency. It is important to realize how these countries have behaved and the main differences because the best transparency practices can serve as example for the others.

In the last two decades, South American countries' indicator interrelationships with transparency towards accountability have displayed several differences (del Campo et al. 2020). Regarding the contextual issue and the analyzed indicators, Uruguay and Chile can be identified as the best performing countries, while Venezuela leads the list of the least transparent countries. The Human Development Index (HDI) shows that Chile and Argentina have very high human development. In recent years, Chile, Uruguay, Brazil, and Colombia have presented a progressive growth.

## Introduction

Currently, at an international level, governments are making great efforts to reduce and control certain economic variables to improve public services performance (Heinrich 2002; Propper and Wilson 2003). There is also a need to establish transparency mechanisms to improve public managers' decision-making and to optimize the information then disclosed to the citizens (Meijer 2013).

The importance of information for effective democracies is essential (Hood and Heald 2006; Stiglitz 2002) as well as transparency promotion (De Simone et al. 2017; Florini 1999). Therefore, the disclosure of key indicators and their comparability is crucial, as it reinforces the democratic relationship between governments, citizens, and international communities, contributing to increase the citizens' trust and their feeling of safety (Rodríguez et al. 2015).

In the same line, in the contemporary global discourse, large questions of legitimacy, effectiveness, and accountability of governance matters are raised (Backstrand 2008). The appropriate arrangement to assure the public financial sustainability "value for money" is transparency of information in governments (Jaeger and Bertot 2010). The key to achieve a better governance is recognizing the importance of information for effective governance democracies (Stiglitz 2002) and the role of the international financial institutions in promoting fiscal transparency (Vishwanath and Kaufmann 1999).

Transparency in public administrations gives greater openness about political and economic decisions and promotes organizations' accountability (Bushman and Smith 2003). The key to enhance transparency is to pay attention to incentives to disclose basic information because if there are incentives for information disclosure, the actors' behavior can be modified and adjusted toward best practices (Florini 1999).

Academic literature has highlighted transparency as a requisite toward accountability (Lourenço 2015; Fox 2007). Furthermore, previous research identifies accountability as the concept intertwined with transparency that implies actors being held responsible and having obligations to act in ways that are consistent with accepted standards of ethical behavior (Schedler 1999). Thus, mechanisms for appropriate accountability must adhere to the delegation and participation of public managers (Grant and Keohane 2005).

The disclosure of corruption indicators is crucial as a best practice of transparency toward accountability. When studying abuse of power, the democratic governments of the world demand adherence to transparency in their management (Han and Demircioglu 2016).

While there seems to be a wide range of literature addressing management transparency and accountability issues at the organizational level within the public sector, there is scarce research about the link between countries' performance and transparency and accountability. This paper aims at contributing to fulfill this gap, as it addresses countries' corruption and socioeconomic indicators' relationship toward transparency and accountability. In particular, considering the context of South American

(SA) countries, this research analyzes trends and main differences between countries regarding corruption and socioeconomic development indicators.

## Transparency, Accountability, and Socioeconomic Development

There are academic research and world institutions' reports addressing interrelationships between corruption and socioeconomic development indicators, toward transparency and accountability. According to those, it is expected that less corruption and better socioeconomic contexts will favor transparency pushing for improved accountability.

Transparency is researched as a cause for greater efficiency and effectiveness. When the economic development increases, citizens expect to receive better services and require more information to assure that their taxes are being used effectively. Filgueiras (2016) points out that a transparency policy perspective through normative arguments, principles, and rules for the construction strategy in the accountability concept toward stronger public management processes improves the quality of information.

At the same time, when studying the way in which corruption affects transparency, the democratic governments demand adherence to transparency in their exercise, as "corruption" is undoubtedly the biggest obstacle in the delivery of aid and development (Mauro 1995). It has been demonstrated that reducing corruption has a significant impact on economic development and investment. Important evidence about corruption was presented in a study on the Corruption Perception Index (CPI) by Transparency International (2018), ranking 180 countries and territories by their perceived levels of public sector corruption (according to experts and business people). This index uses a scale of 0 to 100, where 0 is highly corrupt and 100 is very clean. Currently, still more than two-thirds of countries score below 50 on this year's CPI, with an average score of just 43.

In order to achieve accountability, public administrations' transparency is one of the major issues (Romzek 2000). In this context, Guthrie et al. (2010) address the concept of sustainable accountability, arguing that it that plays an important role in the provision of public services. Transparency, as a requisite for accountability, should help users to evaluate the capacity of an entity to meet its sustainability commitments. In a different line of research, other authors (Alcaraz-Quiles et al. 2018) have pointed out that transparency is positively linked to the levels of Internet access, electronic government, and sustainable economic development. Evidence of governments' ICT efficiency shows that they are improving its transparency and accountability (Pina et al. 2007, 2010).

Several international organizations, such as the G-20 and the International Federation of Accountants (IFAC 2013), have demonstrated the need to increase transparency and accountability in public administrations to achieve sustainable development. Factors, such as public administration organization, the size of the jurisdiction, and the audit of financial information by private firms, can influence on Internet Financial Reporting practices in the public sector (ibid.). Rodríguez et al. (2015) find that the international financial reporting standards through the use of new accounting models, as the introduction of the fair value accounting, aim to improve governmental transparency and accountability.

Some studies associate accountability as a human right of public value creation (Douglas and Meijer 2016; Hood 2010). Accountability and transparency as principles of governance complement one another smoothly to produce countries' good governance. Observers often cite transparency as a response to the accountability concerns of global actors and how the disclosure and openness affect their behavior and their actions to be transparent (Hale 2008). Other researchers relate accountability with corporate social responsibility reporting platforms, enabling transparency for accountability (Bauhr and Grimes 2014).

The worldwide increase in access to information laws reflects a growing concern for

transparency, accountability, and participation in the economic and political mechanisms. Calland and Bentley (2013) conclude that the Freedom of Information (FOI) legislation often plays an important part in state- or citizen-led transparency initiatives as access to information is having an impact on socioeconomic conditions.

To assess commitment of transparency and accountability in public sector, Radcliffe et al. (2017) propose administrative control by asking five questions about the level of disclosure to citizens by public sector organizations and governments regarding financial and performance reports; how taxes are being spent; organizations' or governments' achievements and what remains to be done; and how citizens are being affected by specific programs.

The idea underpinning the studies about accountability practices on performance is that they permit meaningful cross-country comparisons as well as monitoring over time, using aggregate and individual indicators. Additionally, the study of accountability is a challenge that public administrations must face. The advantages of considering transparency and social accountability strategies to improve the lives of marginalized groups are increasingly being used in an effort to expand basic public services (Joshi 2017).

Likewise, the use of digital technologies through online and offline tools can bring policy making and accountability of public decision-making to be more participatory in developing countries. A recent evidence of online participation through civic technology and e-democracy platforms is presented by Rumbul (2016), who identified how citizens use civic technologies and how these platforms shape their attitudes and opinion concerning their respective governance structures; the author found the number of users believing that such civic platforms enable them to hold governments and politicians to account was extremely high across all surveyed platforms. In addition, Rautiainen et al. (2017) suggest that different governments have incorporated the promotion and development of advances in information and communications technologies (ICTs). This adoption, such as developing websites for public entities, data portals, social media tools, and online meetings, has caused a significant change in the relationship between governments and their different stakeholders in order to promote government transparency toward the countries' growth.

## South American Countries' Context

This section provides a review of the recent academic and professional literature addressing practices and issues related to the aforementioned topics, in the South American countries' setting, that include concepts such as social accountability (Joshi 2017), e-government (Bayona and Morales 2017), the perception of corruption (Relly 2012), the public sector reform (Gálvez et al. 2012), and financial accountability (Rodríguez et al. 2015).

The promotion of ICTs by governments toward transparency and accountability is significant and has gained an increasing weight with authors proposing accountability indexes applied to SA governments (Hermosa et al. 2019). Several South American countries, such as Argentina and Venezuela, have applied the model of e-government development, where urban information and interaction are the most developed components but not transactions and e-democracy, being transaction services one of the most sensitive aspects of the development of official web pages (Bayona and Morales 2017). The analysis about e-democracy and trends suggests that all governments have developed portals and have a strategic and/or action plan. For example, the creation of a sectorial forum has been promoted in Bolivia; virtual legislative programs in which citizens may participate have been created, such as the virtual parliament in Peru and virtual senator in Chile, which allows people to know and discuss bills; virtual mailboxes have been implemented to write to the president in Paraguay; the strong use of ICTs was the constitutional convention in Ecuador. However, there is a great difference among actions (Welp 2010).

The perception of corruption is an issue related to the lack of governance. Canache and Allison (2005) argue that Latin America countries are quite aware of the seriousness of corruption in

their countries. The negative side of mass opinion on corruption is that pervasive misconduct can trample public sentiment toward democratic politics. Inadequate anti-corruption strategies may affect users' economic decisions and efficiency (Relly 2012). As a result, it should be considered the examination of the determinants of corruption (Berthin 2008) as well as the influence of information access on the control of corruption and the capacity to design and implement transparency (Relly 2012) together with the anti-corruption strategies' design that can be useful to articulate a long-term vision against corruption.

Gálvez et al. (2012) describe that experience in self-regulation is the factor that most influences in the requirement of transparency. Using the public sector reforms, Ramio (2008) explains the positive association between innovation strategies and more effective and efficient public services, although there are important risks related to the introduction of institutions based only on private sector values.

In this modernization process of the public sector, a key concept is accountability, which can influence the success of public administration reforms (Schedler 1999). There has been a great advancement of public finance systems, namely, by the issuance of a series of public sector accounting standards (IPSASB 2017) in order to increase the quality of financial statements to improve financial transparency (Rodríguez et al. 2015).

Transparency and accountability practices have been analyzed by a number of academic and professional studies in many South American countries, although no studies or reports were found about Suriname and Guyana.

In the case of Argentina, the renegotiation of the external debt, the inability of political parties to represent large sectors of the citizenry, and the weak judiciary system are some of the factors that are undoubtedly reflected in the budgetary resources allocated to the public sector and threaten the very foundations of a minimally civilized social coexistence. Currently, there are a growing number of organizations responsible for measuring the degree of transparency and ethics of public bodies at international, regional, and national levels (Aldao et al. 2015; Carmona et al. 2013).

In **Bolivia** the level of public information disclosure is still low. There has been an overall absence of a culture of transparency, which has not been able to advance due to little democratic experience, bureaucratic inefficiency, tradition in corruption with more or less intensity in the different governments, absence of a democratic culture in citizenship with the principle that people have the right to demand accountability, and public official giving in to inefficiency (Apaza 2012).

Five main transparency measures stand out in **Brazil:** in 1997, the possibility of following up remote biddings by any citizen through the Purchasing Portal of the Federal Government Purchases (www.comprasnet.gov.br); in 2000, initiatives to inform citizens about public decisions or as tools to improve governance, such as the promulgation of the fiscal responsibility law and municipal public finances law; in 2004, the creation of the federal government transparency portal (www.portaldatransparencia.gov.br); and in 2007, the creation of a computerized system of management "siconv" (http://portal.convenios.gov.br), for the process of voluntary decentralization of resources toward the states, municipalities, and non-profit private entities; and) Law 5228/2010 of access to public information (Moreira and Claussen 2011).

In **Chile**, the institutional transformation represented by a policy of transparency was complex, since it implied the modernization of the state and a change in the way of doing things. Among several initiatives, there were the creation of the National Commission on Public Ethics in 1994, Law 20285/2008 on access to public information, progress in reforms of state regulations to social control – the law of lobby (www.infolobby.cl), the probity of public officials (www.infoprobidad.cl), the financing of political parties, hiring of the state and public works awards, Law 20128/2011 of fiscal responsibility, the improvement of factors such as the functioning of public services, public sector contracts, and innovation in making data visually accessible in contexts of

limited digital management (Zalaquett and Muñoz 2008; Sousa 2010; Moya et al. 2012).

**Colombia** has been a pioneer in the hearings and public disclosure of the preliminary projects of administrative acts, namely, in the Constitution of 1991. Since then there were the issuance of laws to incorporate new technologies: Law 962/2005 that structures the online government strategy, the Decree 1151/2008 of electronic government, the creation of the Anticorruption Statute in 2011, and the creation of an open public purchase system, the Decree 4170/2011 – the portal Colombia Compra Eficiente (Gómez and Montesinos 2014).

In **Ecuador** there has been some progress in laws on access to public information (Organic Law on Transparency and Access to Public Information – LOTAIP – 24/2004) that establishes the publication on the Internet of, e.g., the budget, information on salaries and benefits of public servants, concessions, permits and contracts, subsidy programs, and results of audits of the internal and external control bodies (Cunill 2006; Jara 2017).

In **Paraguay** there have not been significant measures, although it has begun the construction of bases for the fight against corruption, with the National Integrity Plan (PNI) of 2002, and the creation of the Transparency International Paraguay chapter (Velázquez and Pereira 2008). More recently, there was also the creation of the National Anti-Corruption Secretariat (SENAC) by Decree 10144/2012 and the National Corruption Prevention Plan of 2016, and, within the policy of greater transparency of information, the country entered the Open Government Partnership initiative in 2017 (Andrade et al. 2019).

**Peru** started promoting citizen's participation in the monitoring and control of public administration with Law 2630/1994 and Law 27806/2002 of access to public information and its regulation. The implementation of the Standard Transparency Portal was approved to Public Administration entities (DS 063-2010-PCM), and the Directive 001-2010-PCM/SGP established "Guidelines for the Implementation of the Portal of Standard Transparency in Public Administration Entities," setting the obligation to have certain information in the standard transparency portals. Lately, the country entered the Open Government Partnership, and there was a specific initiative, at national and regional level, for Transparency in Extractive Industries (Da Cruz et al. 2016).

In **Uruguay**, the application of ICTs in government, namely, e-government, has been considered an important strategy for government reform, highlighting the possibility of transforming the fundamental relationships between government, citizens, companies, and other interest groups. The country has passed anti-corruption measures, such as Law 17060/1998 on anti-corruption of officials or the "Crystal Law," the creation of the Transparency and Public Ethics Board (JUTEP) by Law 17.060/1998, recent advances in a retributive justice, judges more liberals and more receptive presidents, the creation of the Consultative Council by Law 18250/2007, which is composed by the Judicial Branch, the Legislative Branch, the Public and Prosecutor's Office, the academy and the civil society, and the creation of the Law on the Right of Access to Public Information LDAIP, Law No. 18.381/2008 (Skaar 2013).

**Venezuela** has been in an emergent situation; eradicating corruption requires re-engineering in the justice system, comptrollers, and police. So far, there is no law on access to public information, so citizens should demand the approval of such a law because in no case must it depend on the will of an official or a political leader (Belloso and Primera 2015).

These above-referred studies highlight that, in the majority of the South American countries, there has been an accelerated progress in regulations and laws on access to public administration information, especially referring to critical issues, the budget being the most important. Those countries have ratified international conventions, created anti-corruption offices for criminal responsibility, and established bodies for the protection of whistle-blower corruption reporters. Some case studies highlight experiences and situations in South America that are related to transparency and the fight against corruption.

## Data and Methodology

This paper uses data from the 12 South American countries for the period of 1996 to 2016. These countries are, in alphabetic order, Argentina, Bolivia, Brazil, Colombia, Chile, Ecuador, Guyana, Peru, Paraguay, Suriname, Uruguay, and Venezuela.

Given that the objective is to analyze how countries behave in terms of certain indicators, associating these with transparency and accountability issues, secondary official sources of data have been used. Accordingly, the indicators used in the study were collected from the together: "databases" of Transparency International (2018), the United Nations Development Programme (2016), and the World Bank (2016). It must be noted that some data for Suriname, Guyana, Paraguay, and Brazil were missing. Missing data are a serious problem for any study and can compromise the integrity of the analyses. A common approach to account for a large number of missing data in many analyses is to exclude the years for the indicators that have any missing data. However, as the missing values for indicators in the present study along the different years were less than 3%, those values could be estimated using linear regression.

Through the present analysis, the best countries in terms of corruption and socioeconomic development indicators and how they have evolved in the last decades toward better transparency and accountability have been identified. This analysis could also encourage a benchmarking behavior among governments of the countries considered, pushing for continuous improvements. Based on the previously described indicators, groups of SA countries that present similar characteristics are identified, trying to determine what are their most important features and their role in the whole territory of the SA continent.

## Results

Results show that the indicators such as Control of Corruption (COCO) and Corruption Perception Index (CPI) together with Gross Domestic Product (GDPPPS) present very low levels in most of the SA countries. There is a declining trend that depicts possible problems in transparency. Uruguay is perceived as the least corrupt with the best evaluation of the South American countries, followed by Chile according to the results. On the other side of the spectrum, Venezuela ranks among the 20 most corrupt countries in the world (Transparency International 2018).

The Control of Corruption (COCO) is part of the set of the two corruption indicators together with CPI. It captures the perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption. In general, the tendency of the Control of Corruption indicator in every SA country is relatively stable with the passage of time, that is, the country that has a high COCO keeps it high all the time, while a country that has a COCO low stays with the COCO low almost all the time. It is observed that the average of the *Control of Corruption* (COCO) indicator for the region of 45.05. The lowest values are in Venezuela and Paraguay, whereas the highest values are in Uruguay and Chile.

The countries with the best indicator are Chile and Uruguay, while Venezuela is the country with the lower COCO (see Fig. 1). Ecuador and Paraguay have had an improvement in the indicator in recent years, although they have low values throughout the study period.

Argentina has an initial value of 54 in 1996, which decreases smoothly with small undulations, to grow a little at the end of the study period, standing at 46 in 2016. **Bolivia** has a highly variable behavior in the indicator, starting at the value of 24 and, after several ups and downs, settling at 28 in 2016, with a slightly upward trend. **Brazil** begins the study period, at 56 and after having alternately an ascent, a descent, and a smooth ascent, it reaches a maximum value of 62 in 2011, after which it descends continuously down to 38 in 2016. **Chile** is a country with a good COCO value, which maintains a value of 90 almost all the time, with the exception of values of 85 in 2003 and 88 and 82 in 2015 and 2016, respectively. It is expected that the country will recover from the small dip in the last 2 years

**Transparency in South American Central Governments, Fig. 1** Control of Corruption for the 12 South American countries, 1996–2016

and have again values equal to or greater than 90. **Colombia** starts with the indicator at 36 in the year 1996, and after having slight ascending and descending variations, it is placed at the value 44 in 2016. **Ecuador** index begins on 30 in 1996, has minor ascents and descents, and is placed at almost the same value of 29 in 2016. **Guyana** begins in 52 in the year 1996 and then descends continuously until reaching its minimum at 26 in 2012, rebounding year after year to finish at in 45 in 2016. **Paraguay** is one of the countries that has the lowest indicator. It starts in 10 in 1996 and drops to 2 in 1998. Since then it began a recovery behavior until reaching a maximum of 24 in 2010, then progressively decreases to 14 in 2013, and ends with a rising behavior until it reaches the value of 24 in 2016. **Peru** begins its behavior in the value of 42 in 1996 and, after gradually increasing, reaches a maximum value of 56 in 2003. After having a descent and then several ups and downs, it reaches a minimum value of 32 in 2014. It finally manages to have a slight recovery and is placed at the value of 44 in 2016. The behavior of COCO is surprising in **Suriname**. It starts at 61 in 1996, reaches a maximum value of 70 in 2000, and then has a progressive decline, with small recoveries, until it reaches its minimum of 40 in 2014. It has a small recovery in 2015 and then falls to a final value of 42 in 2016. There are weaknesses that perpetuate corruption including inadequate institutional structures, mechanisms, and processes; weak enforcement such as regulation, political governance, and citizen access to information; and limited participation of the civil society. Legislative reform is necessary. **Uruguay** COCO's behavior is very good. The indicator has been almost continuously increasing from 82 in 1996 to reach the value of 89 in 2016. **Venezuela** started with an indicator of 22 in 1996, fell a little in 1998, and then reached its peak of 30.46 in 2000. Since then the tendency has been mainly downward, standing at the end of the analyzed time period at the value of 8.

The Corruption Perception Index (CPI) is an index published by Transparency International (TI) which ranks countries by their perceived level of public sector corruption, where a score of 100 indicates that no corruption is perceived in the considered country. The trends show that ten South American countries have high levels of corruption (see Fig. 2). Their global average is only 36.22 without making significant progress in their struggle against corruption despite the fact that there are now laws and mechanisms to counteract the phenomenon. Only Uruguay and Chile are better performers in the corruption conflict.

Countries such as Argentina, Bolivia, Colombia, Ecuador, Guyana, Paraguay, and Peru

**Transparency in South American Central Governments, Fig. 2** Corruption Perception Index for the 12 South American countries, 1996–2016

obtained a qualification between 30 and 35, still very far from the best world qualified countries, for example, Canada with 82. Additionally, Brazil and Suriname obtained a qualification between 40 and 41; however, Venezuela performs worst every year. More detailed analysis follows below. It has to be noted that some values are missing at the beginning of the study period for Ecuador, Guyana, Paraguay, Peru, Suriname, Uruguay, and Venezuela.

Argentina begins on 34 in 1996, has minor ascents and descents, and is placed at almost the same value on 36 in 2016. **Bolivia** starts in 34 in 1996, drops to 20 in 1997 and 2001, rises to 22 in 2002, and then has a linear ascending behavior until it achieves a value of 41 in 2016, with small ups and downs at the end. Bolivia has undertaken significant efforts to enhance transparency. Evo Morales declared "zero tolerance" against corruption, and his government has created an institutional and legal framework that appears robust. Yet, despite these positive initiatives, Bolivia still performs below global and regional averages in most governance areas, including corruption. The lack of capacity and resources undermine new institutions, while low salaries, lack of training, and a burdensome bureaucracy continue to create opportunities and incentives for corruption. **Brazil** obtained a qualification of 29 in 1996. It has small ups and down through the study period and is placed at the value of 40 in 2016. **Chile** standing at 66 in 2016 has lost qualification with respect to 2014 and 2015, although it has had a similar score since 1996. **Colombia** received the score of 37 in 2016 with an average rating of 34.55. The lack of adequate regulation and accountability mechanisms is a cause for concern. **Ecuador**, despite being at low levels, starts with a rating of 31 and improves the rating since 2009. It has an average rating of 26.10. **Guyana** starts at 30 and has an almost flat behavior during most of the study period whose global average stands only at 27.33. **Paraguay** begins on 15, has minor ascents and descents, and is placed at the value of 30 in 2016. **Peru** has a slight downward tendency since 1997. It has a global average of 37.74. **Suriname** starts at 38 and then has a small increase at the end of the study period, standing at 45 in 2016. **Uruguay** hovers close to Chile in South America, with a score of 71 in 2016, reaching an all-time high score of 74 points in 2015 and a record low of 43 points in 1998. **Venezuela** maintains the lowest result of 17 in 2016, with an average value of 21.84, a value that reflects the systemic and persistent corruption that exists in the country.

In terms of socioeconomic indicators, the Human Development Index (HDI), elaborated by the United Nations Development Programme (UNDP), is a summary measure of the average achievement in three key dimensions of human

**Transparency in South American Central Governments, Fig. 3** Human Development Index for the 12 South American countries, 1996–2016

development: a long and healthy life, being knowledgeable, and having a decent standard of living. It emphasizes people and their capabilities as the ultimate criteria for assessing the development of a country, not the economic growth alone.

The average values of the HDI approximate countries in the SA region; still, the lowest average value of 0.62 is in Guyana, and the highest of 0.79 is in Chile; the regional average is 0.70. The trends show that most countries have a similar behavior in the form of an increasing almost linear behavior (see Fig. 3). Venezuela departs slightly from this behavior, especially at the end of the study period, in which its values have a very slight tendency to decrease. The average increase value of the indicator in the period varies between 0.08 and 0.11; only Guyana differs from this behavior, since its average growth is just 0.04.

Argentina ascending line begins at 0.74 and ends at 0.83, with a sustained increase between the starting and the ending point of 0.09. The only decrease occurs in 2002. **Bolivia** increasing curve begins at 0.58 and ends at 0.67, with a sustained growth value of 0.09. **Brazil** ascending curve starts at 0.66 and ends at 0.75, with a sustained growth value of 0.09. **Chile** continuously increasing tendency begins at 0.74 and finishes with 0.85, with a sustained growth value of 0.11. **Colombia** ascending curve begins at 0.63 and ends at 0.73, with a sustained growth value of 0.10. **Ecuador** ascendant trend begins at 0.66 and ends at 0.74, with a sustained growth value of 0.08. The only slight decline occurs in 1999. **Guyana** continuously ascending curve starts at 0.59 and ends at 0.63, with a sustained growth value of 0.04, the smallest of all SA countries, as it was already mentioned. **Paraguay** linear ascending curve begins at 0.65 and ends at 0.74, with a sustained growth value of 0.09. **Peru** linear ascending curve begins at 0.61 and ends at 0.69, with a sustained growth value of 0.08. **Suriname** continuous increasing curve begins at 0.62 and ends at 0.73, with a sustained growth value of 0.11. **Uruguay** linear rise starts at 0.71 and ends at 0.79, with a sustained growth value of 0.08. **Venezuela** ascending curve begins at 0.66 and ends at 0.77, with a sustained growth value of 0.11. As it was previously mentioned, it is the only curve that has some undulation, with a slight descending behavior at the end of the study period.

Finally, the Gross Domestic Product per capita in Purchasing Power Standards (GDPPPS) is a widely used indicator which refers to the total gross value added by all resident producers in the economy, as the World Bank states. This indicator will be analyzed from 1996 to 2016 as well. The trend shows that the countries experiencing the greatest expansion in 2016 are Chile and Uruguay (see Fig. 4), which also have the highest average throughout the study period with

**Transparency in South American Central Governments, Fig. 4** Gross Domestic Product (PPS) for the 12 South American countries, 1996–2016

$9,320.34 and $9,357.03, respectively. However, several SA countries registered a negative growth in the last few years. For example, Brazil's economy has been growing negatively since 2011, and Colombia and Suriname present negative growth value since 2014.

Argentina starts with a value of $7,721.35 in 1996 and, after having ascending and descending variations, is placed at the value of $12,790.24 in 2016. Bolivia starts with the indicator at just $950.86 in 1996, and, after having slight ascending variations, it is placed at $3,076.66 in 2016. Bolivia has the lowest GDPPPS of all SA countries. Brazil starts at $5,166.16 with a downward trend that changes to upward between 2002 and 2011. However, in the last few years that trend has turned down again with a value of $8,710.09 in 2016. Chile started the study period with an indicator of $5,349.80 and maintains a quite steady upward tendency up to 2013. In 2016, it shows a slight upward trend again finishing with a value of $13,753.59. Colombia started with an indicator of $2,620.54 reaching its peak in 2013, since when it has had a downward trend finishing with a value of $5,871.22 in 2016. Ecuador starts with value of $2,155.52. After growing steadily almost the entire period, it reaches the value of $6,060.09 at the end. Guyana begins on just $927.19 in 1996, has a slim upward trend, and is placed at the value $4,542.62 in 2016. Paraguay has a slight ascending behavior during the whole study period but for the last 2 years. It starts with $2,002.69 in 1996 and ends in $5,319.41 in 2016, with an almost continuous growth in its annual values throughout the study period. In spite of the almost linear rise for Peru from $2,232.08 in 1996 to $6,756.75 in 2013, the value has sunk in the last few years to a value of $6,204.99 in 2016. Suriname starts at $1,921.88 and has an ascending behavior until its peak in 2014 with $9,472.01. It ends in $5,539.07, in a quite abrupt downward trend. Uruguay starts with the indicator at $6,317.57 in 1996, and, after having ascending and descending variations, reaches its peak at $16,973.67 in 2013. It is placed at $15,387.14 in 2016. Venezuela starts at $3,151.27 in 1996 and has many upward and downward variations to finish.

After the analysis of these indicators, contrasting cases can be clearly identified, where Venezuela and Paraguay seem to be in the worst situations and Chile and Uruguay in the best. Across the SA region, the main differences are in corruption perception and control indicators, in GDPPPS. These differences reflect different routes countries have been following in order to improve transparency toward accountability.

The case of Chile seems to be derived from the fact that it has signed and ratified international treaties regarding corruption, money laundering, intellectual property, and tax crimes, seeking to

increase the catalog of crimes that generate a type of criminal responsibility (Moya et al. 2012; Sousa 2010; Zalaquett and Muñoz 2008).

The findings regarding corruption are rather curious for the countries with lower values (Venezuela and Paraguay), especially when looking to the other indicators too. On the one hand, their population indicates a lower perception of corruption in the public sector, and, on the other hand, perhaps because of this perception, they have lower level or control of corruption. However, Venezuela presents high values in the socioeconomic development indicators, compared to the average of the region – HDI of 0.72 above the average of 0.70 and GDPPPS of $7,702.89 well above the $5,531.47 average of the region.

Accordingly, these countries should look to their neighbors' practices, so as to reach some accountability improvements.

## Conclusions

The findings presented above show how SA countries have evolved in the last two decades, seeking for better transparency and accountability. The analysis was based on key variables of each country's institutional context, in relation to anti-corruption policies, socioeconomic conditions, and the effectiveness of the government within the legal framework. Considering indicators representing these issues, countries were compared in the last 21 years, trying to determine their most important features and their role in the SA continent. As became evident, there are countries assuming a clear leading role, hence pushing for transparency toward accountability, whereas other countries still have a long way to run.

The previous results show that the indicator in which SA central governments have achieved a better general performance is the Human Development Index (HDI). However, Control of Corruption (COCO), Corruption Perception Index (CPI), and Gross Domestic Product per capita (GDPPPS) present very low levels in most SA countries. Namely, there is a declining trend and that depicts possible problems in the governance according to the reported figures, although more attention and study are needed.

Although in general SA countries have improved, data analyzed from 1996 to 2016 shows that in relation to Control of Corruption and Corruption Perception Index (CPI), most SA countries have not improved in the last two decades except for Uruguay, Chile, and Guyana. The highest average value in Control of Corruption was in Chile and the lowest was in Venezuela. Contrary to the index name, the higher the value is, the more transparent and clean the country is, so the highest average value in Corruption Perception Index was in Chile and the lowest average value was in Venezuela, ranking among the 20 most corrupt countries in the world (Transparency International, 2018). Regarding the performance of the socioeconomic indicators, the GDPPPS highest average value was in Uruguay and the lowest average value in Bolivia. The highest average HDI value was in Chile and the lowest average value in Bolivia. Regarding trends, Uruguay is perceived as the least corrupt with the best evaluation of the South American countries, followed by Chile, according to the results. Countries such as Argentina, Bolivia, Brazil, Ecuador, Paraguay, and Peru and Venezuela present difficulties in the tendency of most of the governance indicators. Regarding GDPPPS, the trend shows that the countries experiencing the highest expansion with the best average are Chile and Uruguay. However, Brazil, and Suriname are countries that registered a negative growth in more recent years. Human Development Index (HDI) trend shows that all countries have an almost linear ascending behavior. However, Venezuela decreases slightly at the end of the study period.

Regarding the contextual issue and the CPI, Uruguay and Chile can be distinguished as the countries with the better performance evaluation, while Venezuela heads the list of the least transparent countries. It is important to highlight that the levels of public debt have been reduced in recent years mainly in countries such as Chile, Paraguay, and Ecuador, while Brazil, Argentina, and Colombia still tend to have a high level of indebtedness.

Additionally, it can be observed that there are countries in South America, such as Chile and Uruguay, that have the best values for their CPI and economic variables. Oppositely, Venezuela has the lowest values in most indicators. Colombia, Peru, Bolivia, Guyana, Ecuador, and Paraguay only differentiate in the GDP values, while Argentina, Brazil, and Suriname have a quite high GDP and average values in the remaining variables.

Our research is in line with Piotrowski (2009) and Filgueiras (2016), as economic development and transparency go together. In the same stream, transparency must be negatively correlated with corruption and positively correlated with economic development. Accordingly, the main findings in this study point out that better performing countries in terms of the analyzed indicators must also have better accountability. When corruption decreases and socioeconomic development increases, countries also enhance their transparency level toward accountability.

During the last decades, most SA governments have expanded their presence on the Internet with integrated platforms, so initiatives have been developed on open government in order to facilitate citizens' access to accountability processes. These results show that SA leaders in implementing those practices are following those of world leader countries, such as New Zealand, Australia, and Canada (Pollitt and Bouckaert 2004), consequential in trends toward better transparency, accountability, and socioeconomic development.

The results of this study show how countries have evolved, as a consequence of initiatives related to transparency, online availability of information, and citizen's participation, which have been relevant to improve transparency and accountability in the SA continent. Evidence was found of significant differences across countries, which tend to reflect the level of implementation of New Public Management (NPM) reforms. However, in the better performing group, there are countries in which NPM has been implemented to a lesser extent. The worst performer overall is Venezuela, which is also the country with lower implementation of NPM and of initiatives promoting corruption control and transparency toward accountability.

Transparency and interactivity are critical elements for the accountability function of a government. Citizens are not able to hold their government accountable if they do know about government financial information and performance report and what is doing in specific public administrations' programs and their impact. Whereas there is evidence that the best SA countries (Chile and Uruguay) have already adopted some of these good practices, the worst performers (e.g., Venezuela and Paraguay) might have to follow the leaders if they want to improve their transparency and accountability levels.

Countries such as Chile and Uruguay have high Control of Corruption and Political Stability, indicating that these countries respond to citizens' demands for similar information. However, in Venezuela, Paraguay, Ecuador, Bolivia, Suriname, Argentina, Guyana, Peru, Colombia, and Brazil, the levels of accountability do not compensate for the traditional low levels of responsiveness.

With the e-government evolution, citizens demand to reduce the time spent on administrative tasks, especially if routine governmental transactions are possible online (Pina et al. 2009). In SA, most governments have web sites that publish reports and services, transforming the relationship between administration and citizens. The implementation of reforms, such as those carried out in Chile, Colombia, Peru, Argentina, and Brazil, has helped countries to improve corruption control and to boost socioeconomic development. E-government can be compatible with all bureaucratic administrations styles, therefore being expected that, sooner or later, all countries, even less progressive, come to adopt it.

This paper contributes to the theoretical and empirical framework by making three important advances. First, it shows the SA countries according to corruption and socioeconomic development indicators. Second, it compares the countries to each other regarding performance in the past two decades and provides information of value for the practitioners in the form of reliable

indicators and their interrelationships with transparency. Third, it creates the opportunity to advance in theoretical concepts resulting from the interrelationship between the analyzed corruption and socioeconomic development indicators. These three advances provide an international comparative perspective, which is practically nonexistent in the SA region.

# Transparency Measures in an International Context

Luke Justin Heemsbergen
School of Social and Political Sciences, Melbourne School of Government, The University of Melbourne, Melbourne, VIC, Australia

## Definition

Contextually accurate modes of assessing the openness, accessibility, and value of government and third-party disclosures which can shape political, economic, and social realities.

## Introduction

While transparency continues to be, prima facie, tied to good governance, accountability, and democratic process itself, current debates have shifted to efficacy and questioning the political assumptions baked into what transparency is and how it is accomplished in specific contexts. That is to say that specific forms that transparency takes in governance vary considerably in both normative and methodological planes depending on the context. Contextually accurate modes of assessing the openness, accessibility, and value of government and third-party public disclosures, which can shape political, economic, and social realities, are at the core of international measures of transparency. However, the unique forms of transparency and how to measure them remain a complex question and one that this entry covers in abbreviated fashion.

## Measuring Spectra of Transparency

The idea(l) of universal – or even comparable – measures of transparency is fraught with complexity. Indeed, even without a miscellany of various international approaches or actors, David Heald cautioned against the construction of indexes of transparency as whatever algorithm of aggregation is used will poorly interpret the "multiple directions and varieties of transparency and the mediating effects of habitat" (2006, p. 41) that exist in practice. Employing Heald's language to measure of upward, downward, inward, and outward transparency, both in terms of organizational inputs, outputs, and out comes (i.e., performance) and in terms of transformation processes (i.e., the workings of government), make for overly complex and sometimes conflicting measures. A key problem is that the political, administrative, institutional, cultural, and demographic contexts vary considerably where transparency is constructed and when it is measured.

The point is that practitioners cannot ask and design around if there is too little or too much

transparency, but instead seek to discern what the desirable mix of transparency outcomes or practices are that serve specific purposes of good governance in specific contexts. The comparative contextual and political forces considered in international measures of transparency shift the debate once again to acknowledge that there might be multiple desirables created within/through transparency in terms of expectations of governance that practitioners are trying to account for; not all political process are equal, even if "transparency" is valued across them.

This, at worst, makes international transparency indexes risk-prone to organizations "gaming" them for international clout even if their measures are contextually ineffective. Further, countries can become stuck in reinforcing networks of measurements, activities, and outcomes as many index scores leverage the findings of another that create reinforcing feedback loops that may be based on narrow methodology or theoretical hubris. That is to say that the empirical understanding and function of transparency differs across cultures and publics, and thus its measurement instruments must also vary.

A brief review of the evolution of transparency as a measurable concept (what is this an instance of, that we are trying to measure?) introduces the practical history of international transparency measures. This entry then turns to modern and expanded measures of transparency that are currently shaping the way we govern. While transparency continues to be, prima facie, tied to good governance, financial accountability, and democratic process itself, current debates have shifted to questions of efficacy and acknowledging the contextual political assumptions baked into what transparency is and how it is accomplished. The goal of current scholarship on transparency measures in the international context is to recognize specific uses, contexts, and outcomes and how these affect governance.

This entry first points out that traditional metaphors that are used to understand organizational performance and process transparency such as opening windows, shining lights, or lifting veils of secrecy, mix with assumptions of accountability through public forums (Bovens 2010) in relation to measures. In this sense, transparency mechanisms and their measures must have both an abundance of quality information disclosure and ways that this information can hold governors in account. For example, a free and/or widely distributed press is often cited as a predominate forum for government accountability, and this measure is backed up empirically across international contexts that show it correlates with lower corruption. Tying transparency to accountability incites solving an information problem by citizens in the classical liberal sense, where powerful actors are contained by the public disclosure of their actions in forums where they might be constrained through law, shame, or other forms of social control. This, however, does not tie measures of transparency positively to measures of trust. Numerous experimental results suggest that transparency can have negative effects of trust and that these effects are largely decided by context and culture. The accountability assumptions put to transparency may also increase pressure for watchdog expansion, moral entrepreneurship, and "shock-horror self-dramatization" (Meijer et al. 2015), all of which offer good examples of ways to erode trust. This accountability-based measure of transparency – regardless of trust valence – always functions as a fatalist control-based form of government and does not speak to positive productive or participatory outcomes and measures of governing.

In other words, while an interest in accountability might be necessary to think of how transparency functions in democracy, it is not sufficient. If increased transparency is to offer increased "citizen social control" (Attard et al. 2015), then we must also consider other modes of interaction transparency affords. This entry offers two more (of possibly many) ways to measure based on productive and participatory outcomes of transparency that stem from contextually accurate modes of assessing the openness, accessibility, and technical value.

Productive uses of transparency hinge on open data initiatives and other activities that widely distribute public information being put to social and commercial use in a way that adds value. Such productive transparency encourages innovative

and participatory uses by the public sector and private enterprises. Measurement here must consider what is made available for whom and how it is utilized – issues not of access but of accessibility and the resulting utility of social outputs. Further, in this consideration are whether the performance metrics are made – or even considered – by local publics or are they offered solely for international bodies and key private actors such as credit rating agencies with less local democratic legitimacy? Here, scholars such as Erkilla (2012) provide the example of how shifting toward a solely economic perception of transparency might conflict with local democratic assumptions of public access to government information. Further, proprietary commercial use of public data offers some lines of criticism linked to new forms of digital divides in well-developed open data and civic tech movements.

Past productive uses and measures, transparency can enable participatory governance processes such as participatory budgeting that allow citizens to govern not only by limiting their agents in new ways (as above) but by using forms of public disclosure of both government output and citizen input to construct new modes of direct democracy. Think here of measures concerned with the successes of participatory budgeting at local levels that might not be captured by more abstract indexes of transparent national accounts.

Finally, these three avenues of accountable, productive, and participatory concepts for measurement intersect with the technical mediation of the information to be made transparent. One can of course hope for complete and timely data to feed into the above three concerns, but also has to remember that there is no such thing as raw data. All communications are crafted (to) in form. Any chosen medium is laden with a set of affordances that lend certain uses over others. Often there is an assumption that transparency data is digitally distributed to/for citizens or those abroad. Some literature finds corollaries in measurement for the ways in which transparency data are mediated between sender and receiver and Tim Berners-Lee's (2006) strata of linked data. Specifically, in ascending order, data should be available on the web, in a machine-readable format, that is nonproprietary, that uses open standards for interoperability, and finally, that is linked to/through other sources of data. This entry will now survey a brief history of international transparency measures before highlighting some of the specific approaches and inclusions international transparency indexes have made in the current years.

## Historical Trajectory

Acknowledging how shifts of expectations are tied to the continued development of transparency measures brings into focus two inflection points in good governance more generally. In the 1980s, as NPM and other international market-oriented metrics interfaced with the idea of good governance, the idea of transparency was being reinforced with mass mobilizations against corruption in developing countries and the so-called BRICs. International market entry meant discussion of previously taboo topics like corruption could occur more easily.

Then in the mid-1990s, the international community and regional organization saw the need to form new ways of meeting emerging governance needs vis-à-vis transparency. Transparency was mostly referenced by international organizations as a way to control corruption. The Organization of American States (OAS) Inter-American Convention Against Corruption (1996), the Organisation for Economic Co-operation and Development (OECD) Convention Against Bribery (1997), the Council of Europe's Criminal and Civil Conventions (1999), the African Union Convention on Preventing and Combating Corruption (2003), and the UN Convention Against Corruption (2003) provide examples.

This decade saw Transparency International (established 1993) as an opportune organizational breakaway from the World Bank, while South Africa saw it fit to have a requirement for transparency written into their new constitution. Transparency International developed methodologies around integrity that spanned society across nine "pillars" including the executive, civil society, private sector, champions of reform, judiciary, enforcement agencies, media, watchdog agencies,

and parliament. South Africa's 1996 constitution stated "transparency must be fostered by providing the public with timely, accessible and accurate information. . .in administration in every sphere of government; organs of state; and public enterprises." The South African case highlights the need for transparency measures to be implemented and understood at the local level and through local cultural contexts.

A shift to measures of transparency that attempt to apply local knowledge and experts (rather than western observers' perceptions) offered a revitalization to the democratic authority of transparency measures. These "second-generation" governance measures overlook global perception data and instead opt for local researchers and experts to rate their own countries according to more clearly defined and broken down measures. For instance, in the OECD's case, officials in charge of implementing openness measures in country provide the data. However, this does not alleviate the problem of contextually specific expectations, including multiple desirables of transparency.

## New Interpretations

Rather than calculative indexes that aggregate transparency positions, interpretive frameworks offer more latitude to match context and culture, while discerning transparency across political, economic, and social criteria. Meijer et al.'s (2015) work offers the state of the art in this thinking, though other heuristics have offered more detailed disaggregation in the past. For instance, Eijffinger and Geraats' (2006) approach distinguishes economic transparency in terms of data, models, and forecasts; political transparency in terms of policy accessibility or openness of objectives; policy transparency in terms of timely explanation of policy design and outcome goals; procedural transparency in terms of how decisions are made; and operational transparency in terms of how those decisions are operationalized and affected by facts on the ground. Attard et al. (2015) expand on methodologies of measurement across technical, policy/legal, economic, organizational, and cultural concerns, all of which function through independent variables that can affect the use and utility of data that is passed to the public.

Other modern approaches to measuring transparency offer less diversity and instead add value by zeroing in on one indicator or proxy value to considerable depth. Some examples include measuring the timeliness with which countries report data to the international institutions or, instead of timeliness, quantity measures of collection and dissemination of aggregate data at the national level once certain quality metrics are passed. Other measures of global governance have come to include transparency as key indicators. The World Bank's global competitiveness report asks whether businesses find it easy to "obtain information about changes in government policies and regulations" that affect their activities, pointing out again that even for business, corruption is not the sole function nor measure of transparency.

## Conclusion

Measures of transparency that are both simple and exhaustive seem destined to failure when implemented in the international context. Differences in democratic political assumptions, methods of governing, and targets of reportage offer a miscellany of preferred approaches – for both normative and positivistic reasons. Utilizing measures of transparency in the international context requires discerning which conceptual impact of transparency is being considered, finding accurate and exhaustive local proxies that can measure this, and remembering to consider the factors and actors that are not made visible in the political landscape that transparency measures are shining a light on.

# Trust in Government

Christophe Alaux[1] and Tonya T. Neaves[2]
[1]IMPGT: Public Management and Territorial Governance Institute, Aix Marseille University, CERGAM, Puyricard, France
[2]School of Policy, Government, and International Affairs, George Mason University, Fairfax, VA, USA

Trust is a key concept in many social scientific fields. A cross discipline review of the concept emphasizes the economist vision as "either calculative (. . .) or institutional" and the psychologists' vision to "assess trust in terms of attributes of trustors and trustees" (Rousseau et al. 1998, p. 393). In marketing, trust was listed as a core concept of relationship marketing to maintain fruitful relationships between partners (Morgan and Hunt 1994).

The cross discipline vision for the concept of trust wouldn't be "so different after all." Rousseau et al. state that "confident expectations and a willingness to be vulnerable are critical components of all definitions of trust reflected in the articles" (Rousseau et al. 1998, p. 394).

As a consensus administrative sciences suggest, a recent definition of trust as "a psychological state comprising the intention to accept vulnerability based upon positive expectations of the intentions or behavior of an actor" (Karens et al. 2016, p. 3).

In public administration, recent researches focus on the role of trust in government in public policy performance. However the relationship between trust in government and performance of services is not so direct, and it raises issues with causality (Van de Walle and Bouckaert 2003). Indeed, "it is obvious that performance of the public administration has a certain impact on trust in government, but existing levels of trust in government may also have an impact on perceptions of government performance" (Van de Walle and Bouckaert 2003, p. 891).

## Trust in Government: Concept and Dimensions

According to previous definitions, trust in government refers to the confident expectations and the willingness to be vulnerable from citizens toward government (as a body, its individuals or its policy). Trust is not viewed as an attribute but as a perception of the trustworthiness of another (Grimmelikhuijsen et al. 2014). For trust in government, it encompasses the general relations of trust between citizens and individual politicians, between citizens and the global governmental organization (global governmental body), and between citizens and policies.

In the literature, trust is often seen as a multidimensional concept (Karens et al. 2016). Grimmelikhuijsen and Meijer insist on a three-dimensional comprehensive measure of trust (Grimmelikhuijsen et al. 2014):

– Benevolence refers to the ethical perception of the government who really follows policy in the interest of citizens.

- Perceived honesty of government depends on its ability to tell the truth and maintain its commitments.
- Competence refers to "whether people perceive a government organization to be capable, effective, skillful, or professional in making decisions" (Grimmelikhuijsen et al. 2014, p. 8).

## Trust as a Variable of Public Performance

Trust in government is a central concept for public performance on its "competence dimension." A deepening of scientific knowledge about the performance of public policies has focused on the question of trust in the relationship between the governors and the governed. Its relations with public performance require to deepen the concept of public performance.

As a complex topic, discontinuities in public performance of policies may be related to erroneous assumptions on which they are based. The latter may relate to the factual starting situation but also to the probability of generating the desired future state. Cognitive approaches to public policy have thus revealed that public decision-makers sometimes ignore the reality on which they intervene and that they possess a truncated representation of the behaviors they seek to modify (Sabatier and Schlager 2000). Moreover, this effectiveness can cause adverse effects. Indeed, although effective, policy instruments can produce unexpected consequences; which can lead to uneffectiveness of public policy.

The concept of trust is a key variable in many social sciences. It's often operationalized as an independent variable (causal), an intermediate variable (moderating or mediating), or a dependent variable (consequence). For instance Morgan and Hunt identified trust as a key mediating variable in relationship marketing between companies (Morgan and Hunt 1994). Karens et al. focused on trust as a consequence of a branding policy at the European Union level (Karens et al. 2016).

Trust in government can be viewed as a consequence and a determinant of public policy performance. The broad spectrum of performance offers different evaluation criteria for an efficient public sector. It makes it possible to concentrate on efficiency criteria by costs and outputs or on effectiveness criteria that more specifically concern the societal production function. Outside this perimeter of performance, the proposed extension to confidence focuses on the relationship between performance and inputs, outputs, and outcomes (Bouckaert and Halligan 2008). In the management of public policies, this broad spectrum of performance makes it possible to envisage different perimeters of the performance according to the different objectives pursued.

Following the first extension of the performance appraisal to the effects produced, a second extension of the perimeter thus extends the concept of performance to trust. Effects are not an end in themselves in the public sector, as the ultimate goal is to ensure a level trust by citizens toward all institutions and public organizations (Bouckaert and Halligan 2008). Thus, the outputs of public action must generate effects that will generate trust in governments (Van de Walle 2004). Indeed, an effective school, health system, or security police can generate a level of trust in these policies and systems. Trust can then be seen as a consequence of effective public policies.

In a circular way, these levels of trust will also contribute to the achievement of higher "outcomes" that will ensure the effectiveness of the public policy implemented. The link between effects and trust is the second "Grand Canyon" of the public sector (Fig. 1).

Assuming that effects can positively influence confidence is, however, a weak assumption that has not been corroborated by theories or empirical studies (Van de Walle and Bouckaert 2003). Nevertheless, it is recognized that nonmarket organizations need the trust of their publics for their "legitimacy, effectiveness, and non-financial or financial support" (Bryce 2007).

This relation between effects and trust thus presents a circular causality in which trust can also produce effects according to a "moderate opposite causal relationship" (Van de Walle and Bouckaert 2003). Indeed, trust can be an input for the public sector and not just an outcome. The effectiveness of public environmental policy can

**Trust in Government, Fig. 1** The canyons of public performance. (Adapted from Bouckaert and Halligan (2008))

thus depend on the confidence that is sought to be increased through citizen participation and consultation (Collins et al. 2003).

The degree of public confidence in public organizations contributes, in fact, to their effectiveness. Indeed, trust levels can also have an impact on the level of outputs and satisfaction, but also outcomes (Bouckaert and Halligan 2008). For example, in the field of coproduction of a public service, trust is essential to enable the same quantity and quality of outputs to reach higher levels of efficiency. Moreover, it also contributes to the legitimacy of the organization. Transposed to the management of public policies, this confidence can also impact the "outcomes" because it will guarantee the effectiveness and especially the efficiency of the outputs. Indeed, the different instruments of public policy are all the more effective than they are based on a relationship of trust between governments who implement them and the governed who must comply with them. This conformation will therefore be facilitated by high levels of trust in instruments aimed at orienting the behavior of the target groups.

From a scientific point of view, theories of public sector management should increasingly integrate topics such as expectations management and perception management, which is a combined form of public sector marketing, as well as trust (Bouckaert and Halligan 2008). Models need to bridge these gaps between management concerns internal and external to the public sector. As long as there are gaps between public policy intentions and perceptions, citizen satisfaction and trust will remain key elements in achieving public policy performance. Actions must therefore be taken by public policy actors and researchers in the field in order to understand the impact of confidence on improving the outputs and outcomes of public action.

It constitutes a combined form of public marketing and trust management applied to the meso-performance of the public sector. However, this concept of trust is difficult to measure with indicators of satisfaction or governance (Van de Walle 2005). Indeed, public production is more frequently evaluated by its cost than by its capacity to meet expectations (Bureau and Mougeot 2007). Trust has thus been measured by more or less general scales of opinions, which are often difficult to relate to the outputs and outcomes observed.

Trust in government is a central concept for reforms of public policies based on performance.

Perceived in its ethical, commitment, or competence dimensions, trust in government is not a steady concept. It can be viewed as a cause or as a consequence of public performance. From a practitioner perspective, it can be considered as a mean or as an objective. This circular vision might reflect the reality and the complexity of public administration. Managing trust in government is similar to managing the three main objectives of public performance: efficiency and quality of outputs and effectiveness of outcomes. It can be a very helpful integrated concept to improve citizen orientation of managerial practices in public administration.

# Trust in Government and Income Inequality

Nurgul R. Aitalieva
Department of Public Policy, Indiana University – Purdue University Fort Wayne, Fort Wayne, IN, USA

## Synonyms

Confidence; Economic inequality; Evaluation of government performance; Perceptions; Public opinion

## Definition

Political trust is an evaluative orientation of citizens toward their political system, or some part of it, based upon their normative expectations.

Income inequality is the extent to which income is distributed in an uneven manner among a population.

## Introduction

In the mid-1960s, Americans had confidence in their political institutions. However, between 1964 and 2017, the percentage of Americans who trusted that the government in Washington would do what was right "most of the time" or "just about always" fell from 76% to 20% (Pew Research Center 2017). A number of comparative studies examined whether other Western democracies experienced a similar reduction in trust of their political institutions. These studies revealed that declining trust in government was not unique to the United States. Indeed, diminished levels of trust in government were happening simultaneously in countries with different political systems and cultures (Houston et al. 2016). As trust in politicians and institutions decline, support for democracy did as well. Thus, declining trust is one of the central problems in modern politics. Another recurring topic that has emerged in both academic literature and popular culture is increasing income inequality. The literature suggests that the gap between the rich and the poor has been rising not only in the United States but also around the world. Income inequality is an important indicator of government performance. Studies show that high levels of income inequality decrease citizens' trust in government across various countries around the world.

## Definition of Political Trust

The concept of trust is both simple and complex. It is simple because it is used in daily language. Yet, it is inherently complex because it is used to explain a wide variety of social concepts. Houston and Harding (2013) define trust as "a willingness

to rely on others to act on our behalf based on the belief that they possess the capacity to make effective decisions and take our interests into account" (p. 55). These scholars distinguish two dimensions of trust: competence and care (trustworthiness). The competence or cognitive dimension is based on rational judgments about the ability of the trustee to accomplish a stated goal and act consistently. On the other hand, trustworthiness is an effective dimension. It is grounded on the belief that the trustee's action is not motivated by self-interest but rather takes into account the interests of the trustor. LaPorte and Metlay (1996) describe it as "the belief that those with whom you interact will take your interests into account, even in situations where you are not in a position to recognize, evaluate, and/or thwart a potentially negative course of action by 'those trusted'" (p. 342).

Levi and Stoker (2000) suggest that a definition of trust entails elements described below. Trust is a belief about the future actions or inactions of others and their outcomes. Trust is relational: X trusts Y to do A, in doing so, X makes him/herself vulnerable to Y. Thus, trust involves risk since there is no certainty about the future outcomes. Trust is a judgment. One can trust or distrust the other, or trust or distrust to a certain degree. Trust judgments inspire a course of action. Distrust may inspire vigilance in and monitoring of a relationship. Thus, trust judgments reflect a fundamental belief about the trustworthiness of other people, groups, or institutions. The aforementioned definitions of trust entail to some extent interpersonal trust which is trust one person places in another individual. In contrast, political trust is the trust that people place in political institutions or their leaders.

## Importance of the Trust

Why is trust so important? According to Putnam (2000), "Honesty and trust lubricate the inevitable frictions of social life" (p. 135). In many ways, trust acts as a facilitator for solving the shared collective problems of a pluralist society. Trust links citizens with the government and institutions that represent them therefore trust enhances both the legitimacy and the effectiveness of democratic government. No government can have the absolute trust of its citizens because the power of any government represents a threat to individual freedom and welfare. Notwithstanding this affirmation, government should have a minimum level of confidence of its citizens to operate effectively. Trust is fundamentally important for a healthy and functioning democracy (Mishler and Rose 2005). It engenders citizen compliance with public policies, encourages political participation, and contributes to perceptions of governmental legitimacy (Levi and Stoker 2000).

At stake is the efficacy and stability of democratic government, its ability to represent interests, and solve social and economic problems. Institutional trust translates into diffuse political support and is critical for "the survival and the effective functioning of democratic institutions" (Mishler and Rose 2005, p. 1051). Trust encourages the public's acceptance of democratic values and ideals. To the contrary, political distrust undermines government legitimacy, threatens political stability, and facilitates support for undemocratic regimes (Mishler and Rose 2005). Further, trust stimulates citizen participation in political life (Uslaner 2002). Citizens who trust the government are more likely "to vote, follow politics, feel a sense of civic duty, and have high levels of political knowledge" (Mishler and Rose 2005, p. 1068). According to Gamson (1968), political mobilization and activism are driven by political trust. In the context of government, political trust influences whether or not citizens view the state as being politically legitimate, determines to what degree citizens will consent to government demands, and impacts the levels of political participation undertaken by citizens. Simply put, political trust is essential for the proper functioning of democratic governance.

In order for a democratic state to wield its authority in a productive fashion, it must be judged by its citizens as being legitimate. As Tyler (1998) declares, "Beyond being able to secure compliance, authorities need to be able to gain voluntary acceptance for most of their decisions. Legal, political, and organizational theorists have long recognized that voluntary acceptance of the decisions and rules of

organizational authorities is important to the ability of those authorities to function effectively" (p. 271). As trust in politicians and institutions decline, so too could support for democracy itself. Without trust, citizens are less likely to pay taxes and support government policy (Yang and Holzer 2006).

Trust is especially important for generating public support for programs that entail some perceived risk or sacrifice (Hetherington 2005). Specifically, political trust is significant for the support of redistributive programs, such as welfare and food stamps, and race-targeted policies. When trust is high, the "haves" are more likely to make the sacrifices necessary to assist the "have-nots." Hetherington observes that public policy making in the United States has become more conservative since the 1960s. However, public attitudes in American society have not become more conservative since this time. Hetherington explains this seeming contradiction by demonstrating a strong link between political trust, public opinion, and policy outcomes. Generally speaking, when the public is more trustful, the government responds with more liberal public policy. In contrast, when the public is more distrustful, the government responds with more conservative public policy.

At the same time, "a certain amount of rational distrust is necessary for political accountability in a participatory democracy" (Barber 1983, p. 166). In the extreme case, one can argue the public choice view of government as a Leviathan. Citizens should mistrust their government as this would be a natural position for them to defend themselves against a Leviathan. Distrust could be interpreted as a realistic view of government. However, this view fails to explain why the level of confidence was high in the past.

## Declining Trust in Government

During the last several decades, many countries have moved from a nondemocratic government to a democratic one. However, it seems paradoxical that the geographical spread of democracy has been followed by "erosion" of its essential elements in old advanced democracies on both sides of the Atlantic. Crozier et al. (1975) define this phenomenon as a "crisis of democracy" in the nations of North America, Europe, and Japan. The main symptoms of weakening democracy are "erosion" of confidence in political institutions and the leaders of those institutions (Hetherington 2005). Decades of responses to the same survey questions show diminished political trust in government in a number of advanced industrial democracies (Levi and Stoker 2000).

The erosion of confidence has common traits across nations. First, the erosion of confidence is not a one-time phenomenon that is attached only to a particular economic or political event. The analysis of several surveys conducted since the 1960s has demonstrated that it is rather a persistent phenomenon that has been observed over the last three or four decades. For example, the decline in trust in the USA in the 1960s and 1970s was triggered by citizens' reactions to the war in Vietnam, Watergate, and civil rights initiatives; however, the level of trust did not increase as the politicians associated with these events left political office (Levi and Stoker 2000). Such research findings suggest that declining trust is reflective of more than simply dissatisfaction with incumbents in office (Levi and Stoker 2000).

Second, the decline of public trust is an international phenomenon. It has been observed across the North American and European nations. Third, the decline of trust is structural in nature by permeating all political and social strata. Citizens lost confidence not only in political institutions but also in unions, big businesses, churches, televisions, and printed mass media as well as a decline in social capital (Putnam 2000). Lastly, the disenchantment is rather pragmatic and not of an ideological nature which has worsened with the economic difficulties in the nations.

## Importance of Studying Income Inequality

There are two different types of distribution of income: absolute deprivation and relative income inequality. Absolute deprivation is the amount of

income that the poor have relative to some measure of "minimally acceptable" income. For example, in the United States, the standard for measuring absolute deprivation is the poverty line. The relative income inequality is the amount of income that the poor have relative to rich. One can argue that once the poor reach a bare essential level of consumption, it should not matter how much money the rich have. Accordingly, why does income inequality matter? Should citizens care about how much the poor have relative to the rich? Does income inequality have a negative effect on trusting attitudes?

Social capital literature demonstrates that social polarization in the form of income inequality reduces generalized trust (Bjørnskov 2007). Thus, public trust is likely to decrease when the social distance between the citizens in a nation increases. In other words, the decline in confidence originates from greater polarization among citizens (otherwise known as the heterogeneity hypothesis). To illustrate the social polarization hypothesis and explain the decline in confidence, it is useful to discuss the median voter theorem. According to this theorem, a majority rule voting system will lead to the outcome most preferred by the median voter. The main assumptions of this theorem are that two candidates (or parties) are rational actors, they care only about winning, and they do not have policy preferences of their own. The full convergence of two candidates' platforms will ensue regardless of the distribution of voters' preferences. Figure 1 illustrates three different distributions that share the same median voter position. In other words, for all three preference distributions, the equilibrium policy is the same.

In example A, the distribution of voter preferences is relatively tightly clustered around the median. In example B, the distribution is much more spread out as compared to example A. Thus, two randomly chosen people from distribution B will be further from the median voter position, i.e., further from the selected policy. Therefore, dissatisfaction with government among citizens will be higher in example B. A similar argument could be applied to example C. The distribution in this case is bimodal. The median distance from the policy choice for a randomly chosen person is higher for example C as compared to example A. As the median distance from the policy choice increases, the level of trust in government decreases. Thus, the level of trust in government may be different in countries with different voter populations. In more homogeneous countries (example A), the level of trust is higher. In more heterogeneous countries with preferences distributed as in example B and example C, the level of trust is lower.

There has been an increase in the number of studies on the effects of societal heterogeneity on trust. Investigators have found that societal heterogeneity has a negative impact on trust: the more homogeneous a country is, the higher its trust, and vice versa. The explanation is that societal heterogeneity is conducive to the development of bonding trust in individuals of the same ethnicity, religion, and language at the expense of generalized (or bridging) trust. The previous research demonstrates that diverse societies are often challenged in generating and sharing public goods, trusting each other, and establishing well-functioning public institutions (Delhey and Newton 2005).

A homogenous society is more likely to induce a feeling of solidarity. Uslaner (2002) argues that "what matters is not *how rich a country is*, but *how equitable is the dispersion of income*" (p. 181; italics in original). Studies show that the level of inequality in society is negatively associated with measures of well-being. Luttmer (2005)

**Trust in Government and Income Inequality, Fig. 1** Distribution of voter preferences over a single policy issue

finds that individuals' self-reported happiness rises as their own income rises, but falls as the earnings of others in the area rise. Thus, relative income, and not absolute income, determines well-being.

There is ample theoretical and empirical evidence in the literature that wealthier citizens have different preferences when it comes to redistribution than poorer citizens and the wealthy have a disproportionate influence on government policies in democracies (with the implication that as inequality increases, the wealthy's influence will increase as well). In addition, more affluent citizens have a broad understanding of the state of the economy and will hold the government accountable for the condition of the economy (Gilens 2005, 2012; Bartels 2009).

## Multilevel Models for Cross-National Analysis

Multilevel models (also known as hierarchical models or mixed models) refer to models with a nested data structure (Hox 2010). Generally speaking, the individuals and the groups to which they belong are conceptualized as a hierarchical system of these individuals and groups, with individuals and groups each defined as a separate level of this hierarchical system. Thus, the sample data are viewed as a mutlistage sample from this hierarchical population. In educational research, for example, the population is schools and students nested within each school. Other examples include cross-national studies where the respondents are nested within their countries, or organizational research with workers nested within their firms.

Traditional regression methods only allow analyzing data on one level. Therefore, historically, multilevel data were either aggregated or disaggregated to one single level and then analyzed using either an ordinary multiple regression routine or any other "standard" statistical method. Aggregation involves moving variables at a lower level to a higher level, for example, by assigning to the countries the country mean of the respondents' income levels. Disaggregation refers to moving variables to a lower level, for example, by assigning to all respondents in the countries an unemployment rate of the country they belong.

However, analyzing variables from different levels at one common level is inappropriate for two reasons. The first problem is statistical. First, aggregation leads to the loss of information and as a result to a loss of the statistical analysis power. On the other hand, disaggregation generates from a small number of country-level variables a lot of individual-level variables leading to an increase of the sample size of the data. However, the proper sample size for these data is a number of higher-level units, i.e., the number of countries. Ordinary statistical methods treat all these disaggregated data values as if all observations are independent from each other. As a result, statistical analyses produce "significant" results that are simply spurious (Hox 2010).

The second problem is conceptual. If researchers analyze data at one level but formulate conclusions at another level, they commit the fallacy of the wrong level. The ecological fallacy refers to interpreting aggregated data at the individual level. For example, Robinson (1950) finds that states with larger immigrant populations tend to have higher literacy. It is invalid to draw a conclusion that immigrants tend to be more literate than those born in the United States. In contrast, using relationships between variables on the level of the individuals to make conclusions about groups leads to the atomistic fallacy. For example, a study of individuals may find that an increase in income leads to an increase in trust. If it is inferred from these data that countries with higher gross domestic products have higher trust, then the atomistic fallacy is committed.

In the past, multilevel data were analyzed using conventional multiple regression analysis with one dependent variable at the lowest level and a set of independent variables from all available levels (e.g., Boyd and Iversen 1979; Van den Eeden and Huttner 1982). However, this approach leads to all of the statistical and conceptual problems discussed above. Standard statistical tests assume the independence of the observations. However, pooling hierarchically structured data into one sample violates this assumption. It is

expected that two randomly selected individuals from the same group tend to be more alike than individuals selected from different groups. For instance, if a country experienced a major breach of public trust shortly prior to the administration of the survey, respondents in this country are likely to be watching the same news reports, reading the same newspaper account, reading the same editorials, and even talking with one another about the event. Thus, these respondent attitudes are not independent of one another as is assumed by OLS. Failing to account for this effect among respondents in distinct clusters (i.e., groups) results in OLS standard errors that are smaller than they should be and making it more likely that the null hypothesis of no relationship will be rejected. Hence, it increases the likelihood that a Type I error is made. In the extant literature, this effect of cluster sampling is known as a "design effect" (e.g., Kish 1987, 1995).

There are two ways to correct this lack of independence among respondents in a cluster (i.e., group unit). One is to report clustered standard errors. Cluster adjustment assumes that observations within groups are correlated but observations across groups are independent. These standard errors allow for a general form of heteroscedasticity but do not allow for errors to be correlated across or within groups (Huber 1967; White 1982). Thus, clustered standard errors account for both a general form of heteroscedasticity as well as for any intra-cluster correlation.

However, combining variables from different levels in one statistical model requires more complicated technique than estimating and correcting for the design effect. Multilevel models are designed to analyze variables from different levels simultaneously. It is the more sophisticated approach to addressing the issue caused by clustered cases. Multilevel models allow for simultaneous estimation of relationships at individual and country levels. They also allow for the relationships at the individual level to vary across countries. Furthermore, multilevel models permit the inclusion of cross-level interactions – i.e., examining how country-level factors influence individual-level relationships. In sum, multilevel modeling enables measuring the effect of different variables and explaining variation both within and across countries (Gelman and Hill 2007; Goldstein 2011; Raudenbush and Bryk 2010; Steenbergen and Jones 2002).

## Conclusion

Dahl (1947) argues that comparison is what helps public administration achieve scientific status. Comparative studies of political attitudes are especially fruitful when they combine the particular political context in which people form those attitudes with critical individual-level variables. It leads to a more general model and comprehensive understanding of the forces that shape citizen political behavior. More and more comparative studies in public administration have started to examine politically and culturally diverse set of countries. Numerous studies have demonstrated and examined a declining level of trust in government and income inequality. Studies indicate that when inequality rises and trust in government falls, individuals may be less willing to support the maintenance and/or expansion of those features of government that have been found in the literature to reduce income inequality: public employment and certain types of welfare spending (Pontusson et al. 2002; Bradley 2003).

# Trust in Public Institutions in Greece and Turkey

Mehmet Ali Özçobanlar
Department of Psychology and Sociology of Management at Faculty of Management, University of Warsaw, Warsaw, Poland

## Synonyms

Culture; Greece; Public institution; Trust; Turkey

## Definitions

**Public institution** is an organization founded by governmental units, with duties and liabilities framed by the law, which provides public services to the citizens.

**Trust** is to be confident about something or to have confidence on others or to believe in someone or something.

## Introduction

The public institutions are vital agencies for the functioning and the continuation of a state. Besides this crucial fact, the purpose of these institutions is to provide the public services which are essential to facilitate the citizens' everyday life. Though there is not a commonly accepted definition for the public institution, it may be understood as an institution which has the authority to access the public sources and to utilize them in favor of the public welfare.

As it has been rightly observed (Thoenig 2003) for a long time, "public institutions were taken for granted. They were neither an issue for knowledge, nor a problem for action." Although during the 1970s the topic got a wriggle on, the significance of public institutions came into prominence in the 1980s.

Thoenig (2003), "*considering institutions as dependent variables as well as autonomous actors*," claims that "*the public institutions has become less normative and more empirical*." It should be also taken into consideration that the background of public institutions may differ in each country and could have its own particular structure. There can even exist differences from one public agency to another within the same country.

Scholars have tried to define what exactly public intuition means, or how it could be classified. Darbel (1972) wrote that the form and structure of public institution, as well as the tasks which are assigned to them, could shape and allocate them. Institutions' relative state, or the stage in their progress, could be also considered as one of the fundamental elements to delineate the public institutions. Public institutions are also leading factors for the processes to function the public tasks normally. Therefore they are indispensable. Often the power of public institutions may determine the country's operations, and they play a crucial role in its future.

The fact is that the public institutions are considered as public proctors producing a physical effect appropriate in their particular area of interest, which contributes values and concern in the civic union. The mutual correlation between the local communities and the public institutions may affect the decision-making process and adopting strategies of these institutions. Thoenig (2011) sees a certain fragility in public institutions because, although they are "action-oriented systems," they are "the non-intended outcomes of permanent collective tinkering." Solomon and Flores (2001) clarify that each one of these institutions is also an organization. Thereof every one of them has a set of established forms and specific criteria of how to achieve the goals assigned to them and provide the public services that they ought to. The public institutions were identified as fundamental principles of political assortments, as a result of social assessments and self-assembled social systems. One also should bear in mind that any changes of public institutions spread over a comparatively long time.

In this research, trust in public institutions is examined in between Greece and Turkey. The results of social support and relation, trust to other people, political participation, and trust in public institutions analyses are given and shown by tables. The important public institutions in Greek and Turkish societies are evaluated in terms of trust factor. The difference between Greek and Turkish participants is found to be statistically significant ($p < 0{,}05$). The study is based on research that was carried out in Greece and Turkey within the framework of the "Third European Quality of Life Survey Questionnaire" – European Quality of Life Survey, 2011–2012.

## Culture: Institutions

The reciprocal relation of culture and public institutions has always drawn the attention of academic researchers in the field of sociology. What kind of a configuration type is peculiar to these public institutions? Do they exert the service which it is asserted to be for the public good in favor of folks? Do the activities that these

institutions are engaged with have an influence on their public identity or not? Such questions emerge when one strives to understand the logic behind the institutions. The outward way, in which public institutions act, especially toward civic has been delved in relation to the culture. Patterson (2011) assigns to Bourdieu (1993) thinking the observation that "the field of cultural production is a collective product of all cultural institutions. Any particular cultural institution, no matter how powerful, must work within the established rules of the field – in this case, conventional Western ideologies of high culture. By reinforcing these rules, they reinforce their own base of power."

The influence of the public institutions, as a significant component of culture, should not be undervalued. DiMaggio (1997) argues that the culture passes through institutions. The role of public agencies is a decisive factor pertaining to the essence of a society. In the research of Patterson (2011) are outlined the public institutions as falling within four categories: legal, normative, economic, and class-based. It is a certain fact that public agencies are not the same as private entities or profit-based businesses. Public institutions have their legal statutes within the frame of public functioning. Relative to normative approach is the efficiency of public institutions, the social responsibilities they have, and whether they possess the ability and the necessary skills to respond to the social aims and expectations. From the economic perspective, public institutions, although they present an affinity to certain forms of cultural production, still, when examined from a sociological perspective, leave many researchers with unanswered questions. Di Maggio suspects "*that public institutions facilitated class reproduction by enshrining the cultural tastes of the upper class as naturally superior and more refined*." Pierre Bourdieu has classified this as "misrecognition": "public institutions exist to recreate class divisions by fostering a sense of misrecognition that leads all classes to accept bourgeois tastes as superior" (Bourdieu 1984; DiMaggio 1982; Patterson 2011).

Institutions, by maintaining, suppressing, or spreading information, may influence and shape the public opinion in favor or against a particular person, or a form of artistic expression (Fine 1996; Griswold 1986; Lang and Lang 1988). The impact of public institutions as the key determinants of culture can result to changes in the lives of the citizens of the country. Almond and Verba (1980) believe that "culture affect public and political life, but does not determine societal structures and dynamics."

## Trust: Institutions

One of the recognized key drivers of network commitment is trust. Some authors define trust as the aspect of relying on partner's confidence; others define trust as a confidence of exchange in partner's reliability, as well as integrity. It's important to believe that one's partner is reliable and has a high level of integrity (Geyskens et al. 1996; Gounaris 2005). Thomas (1998) questions the whole conception of trust by arguing that trust is based on beliefs, rather than expectations. Erikson (1951) speaks about "basic trust" as a personality trait, which is in the form of trust in others and oneself, as feelings of inner goodness and optimism, while Rosenberg (1956, 1957) argued that "trust in people" scales as a single form. Weber identifies trust as a faith. However the social-psychological approach has the apparent restriction that changes in trust among large segments of a country's population cannot be explained; nevertheless it influenced the shaping of the literature on trust.

The society's expectations on public services appear as one of the vital aspects for the identical equation of public institutions. Trust factor is very much associated with that. Each public institution differs from the other, and of course every citizen of a country has different prospects from institutions. Due to this fact, trust value may differ regarding to every single institutions' liabilities and responsibilities. It could be seen that the people feel more trust for some institutions than for others because of the public duties assigned to it and the way this institution performs. The public institutions responsible for national security, such as police, or military, may have more trust by

citizens. The reason behind it is that they want to feel safe and secure. It may also be argued that the legal authorities may have as much trust as the institutions which operate in security, because people want to believe in justice. The means by which beliefs, practices, traditions, laws, religious practices, and customs such as cultural phenomena, as well as the history of a nation, should also be considered as trust factors for the public institutional agencies.

According to Thomas (1998), trust is inferred from three specific instances. The fiduciary trust, such as the trust in a professed expertise, is an important component of public trust in government, which may lead to "asymmetric relationships and attendant opportunities for malfeasance" (Barber 1983; Kass 1994).

The mutual trust refers to relations between persons. The relations between people are established upon mutual trust and develop interpersonal relations. The last conception is that social trust which is embedded within institutions. It is also considered as social capital by scholars. Social trust can be found in a group of many individuals. Intentionally giving false information or using the power incorrectly and deliberately giving apocryphal statements may cause the loss of trust and may make peoples to not trust the public officials who are responsible for such discreditable cases. This may also be considered as betrayal of trust and cause the loss of citizen's confidence in public institutions. Therefore public officials are one of the leading actors to produce the public trust, to bring it forth in public, and to preserve the trust and spread it between the people. In addition to all these, officials may overtake the responsibility to re-establish public trust.

## Trust in Public Institutions: The Reality

An indication of what really happens today is given by the results of a relative research in two neighboring but different countries, Greece and Turkey. The people of the two countries lived together for about four centuries, during the Ottoman Empire, but for the past two centuries follow independent roads. Turkey and Greece are similar in ethic and religion homogeneity and are also similar in religiosity since, according to the Eurobarometer 2005, 95% Turks and 81% Greeks believe that there is a God, thus ranking among the most devoutly religious countries (Eurobarometer 225 2005; CIA Word Factbook 2011). The main difference is that in Turkey the predominant religion is Muslim and in Greece the predominant religion is Christian Orthodox. The different religion and the different historical background formed different cultures; nevertheless in both countries, the results of the research show that trust in public institutions reflects the current political situation.

Putnam (1993) and Fukuyama (1995) consider social trust as a cultural feature engrained in all members of a regional or national society. However trust and reliance on institutions as governments, markets, and corporations – the socio-political dimension – seem to be reserved, reluctant, and limited. Although institutions are human entities, the appeal to them is not personal, face-to-face. Reliable institutions may influence the character of civil society, build trust, make the citizens more "trustworthy," and contribute to the coherence of the society.

The social and cultural model, developed as an alternative to the social-psychological theory, argues that human being's existence conditions and experiences, involvement in a group of people with a cooperative culture, and participation in voluntary activities create social trust and collaboration, civic-mindedness, and reciprocity between individuals. The above is an important factor for the creation of successful social organizations and institutions, including political groups and governmental institutions in which people can invest their confidence. Confidence in political institutions depends on the governmental performance in the same way as trustworthiness of others and willingness to trust them, which are based on the experience of how others behave (Hardin 1996). The institutional performance model is a systemic one to be tested with aggregate data for nation-states. It is neither a psychological nor a social-cultural one.

Table 1 gives an indication of the social trust in Turkey and Greece. The question asked to both countries' participants was: "*If you needed advice about a serious personal or family matter, from whom would you get support?*" Although in both countries most of the participants choose to get help from their family members, or relatives, Turkish participants are excessively keen to get support from other people more than Greek participants. One of the answers to this question was about choosing a service provider, institution, or organization for support. The results show that Turkish participants are more willing to get an advice from institutions than the Greeks. There is an obvious difference in between the two countries. The difference between participant groups was statistically significant ($p < 0{,}05$). Thus, it may be argued that social relations in Turkey are stronger than in Greece.

These results indicate that the participants trust that these institutions can provide them with a solution to their problems, so they ask support from these institutions. Another social trust indicator can be seen in the trust on people. People are living in a society and are surrounded by people. Public institutions are organizations administrated and directed by people from the same society. Trust to people rises as a core value in this research. Regarding this crucial factor, the question "*Would you say that most people can be trusted? (in a scale of 1 to 10)*" *was* asked of the participants from both countries (Table 2).

The answers given to the question indicate that Greeks have less trust point (4, 28 ± 2, 31) than Turkish participants (4, 88 ± 2, 55). Analysis results showed that the difference between participant groups was statistically significant ($p < 0{,}05$). Thus, it may be argued that Turkish participants trust other people more than Greeks do. People who trust each other are also more inclined to trust public and private institutions (Table 3).

The question measures the voluntary work for political parties: "*How often did you attend/did voluntary work for Political parties, trade unions in the last 12 months?*" Again a statistically significant difference between Turkey and Greece regarding the frequency of participation in political parties or trade unions is observed. It is seen that Turkish participants volunteer more for

political party or trade union participation. This could also be seen as an indicator to measure the trust factor to political parties, because people rather prefer to support, attend, and do the voluntary work for the political parties which they trust. Nevertheless there are also a large number of people who rather prefer not to attend/participate in any kind of political parties or voluntary work (Table 4).

People voluntarily congregate to discuss local issues and public interactions, so high social trust is associated with a dense and vibrant network of social capital. The social-cultural model shows that trust in people and confidence in institutions are associated with the social position, cultural identity, and personal life experiences of an individual. Citizens who are most active in voluntary organizations and community associations would develop the social trust and cooperative habits that lead to confidence in public institutions. Breuskin (2012) observes that Berman, attempting to bridge the political gap in social capital literature, discerned the interrelation between "civicness" of society and the strength of political institutions: "a strong government can generate social trust among groups by involving various associations in the realisation of services beneficial to the whole society."

The participants were also asked the questions: (Q23a) "*whether one attended, over the last 12 months, a meeting of a trade union, a political party or a political action group*," (Q23b) "*whether one attended a protest*," (Q23c) "*whether one attended a demonstration, signed a petition, including an e-mail or on-line petition*," and (Q23d) "*whether one contacted a politician or public official over the last 12 months*."

According to the results of the analysis, most of the participants did not attend a meeting of a trade union, a political party, or a political action group in both countries ($p > 0{,}05$). Similarly, most of the participants did not contact a politician or a public official in both countries ($p > 0,05$). On the other hand, attending a protest or demonstration and signing a petition, including an e-mail or online petition distributions, showed statistically

significant differences between participant groups ($p < 0{,}05$). According to these results, Greek people attended more protests, demonstrations, or political events than Turkish people. Recently, Greece was faced with a serious financial crisis. Due to the crisis, many Greek people protest against the government. For this reason, findings may be affected by recent developments. It should be also considered that recent political issues in Turkey led to a cognitive change on results.

The question Q28 is "How much you personally trust each of the following institutions?" The trust in the following institutions was evaluated: national parliament, legal system, press, police, government, and the local (municipal) authorities.

As seen in the Table 5, all political institutions are considered more trustful in Turkey, a fact that is related to "trust in people," since if people trust each other, they are also more inclined to have confidence in the authorities who enforce the law. All differences between countries are statistically significant ($p < 0{,}05$). In this respect, it may be argued that participants in Turkey are more conservative than in Greece. In addition, it is seen that both participant groups think that police is the most trustful institution of the country.

## Conclusions

Trust is an important element in any kind of association. To trust in people and to trust in institutions are basic pillars of representative democracy and society. Therefore to develop a trustful atmosphere in institutions and between people is an essential factor for maintaining an efficient society.

As it was mentioned above, the public institutions which operate in national security may have more trust by citizens. The results of the analysis indicate citizen's intentional cognitive behavior. Turkish participants have shown more respect to the legislative power, which is the parliament, in terms of trust factor. After a referendum accepted by voters with a small difference, the latest constitutional change, which allows Turkey to have a presidential system of governance, will be implemented after the 2018, June 24, elections. Some concerns regarding the form of the power of legislation have been voiced. Until legislation was exercised by the parliament, but after the implementation of the new presidential system, it will pass to the President.

One of the more noticeable differences between the two countries is government trust. In Turkey, more people trust the government than in Greece. The financial crisis in Greece, which goes on for more than a decade, and the economic austerities may be reflected on these results. The administration of public funds that led to this crisis may be the cause why Greek citizens do not consider the government institution as a trustful agency.

After a very dramatic economic crisis in 2001, in Turkey, the results of the following elections showed that the citizens lost their trust to all parties that had governed the country till then. Somehow the trust factor was restored in between the citizens and public institutions. Here, it should be taken into consideration that the personality of

public officials and welcomed reforms may have a positive effect in increasing trust to the public institutions.

Greeks consider the police, the local authorities, and the legal system as trustable institutions. This could be due to the fact that people in Greece feel closer to their local authorities and because they are better able to decide about themselves in their small own territory, for instance, by electing a mayor that they know. Legal system takes the third place in trust factor. It may be argued that the Greek citizens are deeply attached to their principles and they have a high trust to their judicial system.

Many aspects can have a negative effect, resulting to the loss of trust for institutions. Social and political institutions, which have managed to acquire the social trust, are usually effective means for the governments in order to carry out their policies more successfully. Therefore governments encourage confidence in civic institutions. Since trust is going to be one of the major issues of today's world, the policy makers strive to restore respect for values in Greece and to rebuild the trust at the top. In Turkey the recent demonstrations regarding the corruption in government, a fact which could create an extensive social distrust, are taken seriously into consideration by policy makers who strive to rebuild an atmosphere of stability in the country. The failed coup attempt of July 2016 intensified the mistrust of people to the army and created a strong, although short-lived, coherence in the country. For the first time, Turkey's ruling party and the opposition parties were united in condemning the coup attempt. A few days after the coup, supporters of different parties congregated together in huge demonstrations in support of "Republic and Democracy." However a year later, the opposition leader claimed that it was a "controlled coup," eliciting strong reactions from the leading party.

# The Turkish Presidential Model: A Hybrid System?

Mustafa Altunok
Public Administration Department,
Abant İzzet Baysal University, Bolu, Turkey

## Synonyms

Comparative management and policy reviews; Parliamentary system; Political systems; Presidential system; Semi-presidential system; Systems of government

## Definitions

The Turkish Presidential Model is the latest system of government that entered into force in Turkey. This system can be expressed as a Hybrid Model because it can not be explained by one of the theoretically discussed main systems. Since it is a model that does not suit to the pure version of the main prominent democratic systems (parliamentarism, presidency and semi-presidency), but has some common characteristics with all of them, it may be regarded as a hybrid system. This new model brings into force such a system that may be defined as a *strong presidential system based on the parliamentary.*

## Introduction

Democratic systems are mainly divided into three groups which are the presidential system (American model), the semi-presidential system (French model), and the parliamentary system (British model). It is not quite possible to locate the political system preference of the Republic of Turkey within this classification. It would be appropriate to look at the development process of the political system in Turkey in order to see through the historical background of the current system and understand the progress made without mentioning the remarkable aspects of the model of the system introduced by the 2017 referendum and named as the Turkish Presidential system. In this chapter, the traits of the Turkish Political System as of the years of the Ottoman Empire, with a focus on the current systemic change will be evaluated.

## The Historical Development of Government Systems in Turkey: The Years of the Ottoman Empire

The positions of legislative, executive, and judicial powers, known as the three main power of the political system, in relation to each other and their relationship with each other help the political system acquire its quality. Within this context, Turkey's democratization adventure that began in last period of the Ottoman Empire advanced with constitutional developments and different political models were encountered within this process.

The name of the first model encountered can be expressed as a *parliamentary monarchy.* Although it bears qualities of the structure and

functioning of a great many Eastern and Western state organizational structures, the state structure of the Ottoman Empire can not be said to be the same as the Western monarchs in the classical sense, especially with the Byzantine. Westernization, which started in the late period of the empire, and attempts to be a part of the modern world in terms of the political system first manifested itself in 1876 Constitution. This Constitution, known as *Kanun-ı Esasiye* (The Ottoman Basic Law), separated execution from the legislative body and a dual parliamentary structure was formed with the name of the *Heyeti Ayan* (The Chamber of Notables or Senate) and the *Heyeti Mebusan* (The Chamber of Deputies). Members of *Heyeti Mebusan* were determined by a limited election, whereas Members of *Heyeti Ayan* were personally elected by the Sultan. In this system where the executive power was possessed by the Sultan, the Sultan was using the authority with the Committee of Ministers (Gözübüyük 1997). However, it is not possible to talk about the existence of a parliamentary system as in the English system, since the Committee was solely accountable to the Sultan and not to the Parliament.

## From The Parliamentary Government System to Presidential Parliamentarism

The 1921 Constitution adopted a parliament-centred government system called *the Parliamentary Government* since it coincided with Independence War years and since the new state was not formally established at that time. In this model, legislative and executive powers were gathered in the Grand National Assembly of Turkey. There were no official ministries and presidential mechanism in the system where parliamentarians were appointed by the parliament and taken out of office. The consecutive 1924 Constitution adopted a mixed system as a transition to the parliamentary system. In this model, called the *Unity of Powers and Separation of Duties System* because of its mixed nature, there is a government composed of the president and ministers, although the Assembly is still very strong (Özbudun 1998: 20–33).

The 1961 and 1982, Constitutions are based on the parliamentary system. As is known, the moderate separation of legislative, executive, and judicial powers is essential in this system. In essence, both implementations are referred to as parliamentary systems because the parliamentary system, besides the separation of the moderate forces, bears some other characteristics, most of which are available in the systems introduced by the 1961 and 1982 constitutions (Gözler 2007: 45–53). For example, as generally adopted in the parliamentary system, the execution has two headings: a politically responsible and executive prime minister and a ministerial board in coordination with him; on the other hand, there is a politically irresponsible president or representatives of dynasty who have the authority to represent the state. Moreover, in this model (where they may be exceptions), the president, who is generally objective, neutral, and above party member identity, is elected not by the people directly but by the parliament. While the 1961 Constitution foresees a model closer to the pure state of the parliamentary system, the constituent power which prepared the 1982 Constitution preferred to strengthen the execution and especially the presidency, which is executive's irresponsible wing, due to some problems experienced in the pre-1980 period. Therefore, according to this system, the determinant power of the presidency increased in terms of the installations and the executive system. It seems that the presidential authority, which is the irresponsible wing of the execution, became stronger with three basic mechanisms as 1982 Constitution adopted. These can be listed as the Secretary General of the Presidential Office, the Presidential Decree, and the State Supervisory Board and their characteristics. In addition to these installations, the Presidential Office was given the right to determine the majority of the heads and members of the constitutional institutions. For this reason, some authors state that this system is stronger than the semi-presidential system and even call it *presidential parliamentarism*. Despite all these features, according to the first version of the 1982 Constitution, the president was elected by the parliament, not directly elected by the people. With the constitutional amendments enforced in 2007, this situation was changed and the

procedure of electing the President directly by absolute majority of people was introduced and the level of representation was further increased. Thus, a model which is named parliamentary system but which approaches the presidential system more closely emerged.

## The State of Affairs After the 2017 Constitutional Referendum

By the year 2017, the system obtained its final state with a new constitutional referendum. First of all, overwhelming majority of the provisions introduced by the 2017 constitutional amendment will enter into force after 2018. The name of the new implementation put forward by these constitutional amendments is called *Turkish Type Presidential System* or *Turkish Presidential System*. Regardless of the changes introduced with the referendum and the features of the new system, it should be noted that this system was not anticipated; however, it developed as a result of the exceptional circumstances experienced in the aftermath of the 15 July coup attempt. For that reason, it is difficult to say that the system is prepared with a long enough public debate and an achieved consensus. On the other hand, despite some incomplete and problematic aspects, this constitutional amendment and the basic features of the new system were not created under the control of a military structure like the previous constituent powers, but by the support of purely civilian political parties.

The old system had significant problems. As a result of the fact that the President is elected by the people, among the responsible and irresponsible wings of the execution there occurred the risk of system blockage due to development of disagreements regarding subjects such as the establishment of the ministerial board, senior appointments, the approval of the legislation, and so on. In such a systematic crisis, the government, which constitutes the performative wing of the execution, and the president, who is the irresponsible wing holding the handbrake of the executive wing, often confronted. Taking into consideration that in the past serious problems were experienced between the presidents and governments with the same political tradition and even from the same political party, it would be almost impossible to carry out the work if the president and the government with very different political ideologies were in the same office. In case of dissidence that would be encountered when both the prime minister and is a parliamentarian elected by the people and the President is elected by the people it would be inevitable to question who will be held responsible or whose legitimacy is bigger.

One of the most decisive elements in the Turkish political system, which is specified in the 1982 Constitution, is the obligation of organizing the *election laws* in a way that will conform to the principles of *justice in representation* and *stability in administration*. This, on the one hand, aims to promote democratization but, on the other hand, aims to ensure administrative stability. When we look at the issue in terms of the parliamentary system as one of the representative democracy and as a system it embodies, politicians frequently express that it is difficult to achieve both at the same time and that it is necessary to renounce from one to prefer the other. Because providing justice in representation requires the removal of the electoral threshold or the reduction of the election threshold to a very low level. Otherwise, political parties that receive millions of votes are either unable to represent themselves in the parliamentor they are not adequately represented because they are hindered by the minimum election threshold. On the other hand, if there is no electoral threshold or if it is too low, justice is achieved in the representation, but this time parliament is faced with a multi-component structure. As a result, it becomes almost impossible to have a strong ruling party, and coalition governments that are difficult to establish and easy to disperse quickly become inevitable. In this respect, it is seen that the parliamentary system in Turkey has been debated and criticized for a long time. On the other hand, it is fair to say that Turkey has been managed by a parliamentary system for decades, and it has a political experience in this context. In addition, the entire political and administrative organization is structured in line with the characteristics of the parliamentary system. From this point of view, it is undoubted that a system change

will be accompanied by material and moral disadvantages. One of the main arguments highlighted in the 2017 referendum is the idea of providing justice in the representation and stability in administration together. Besides, the administrative structure of the *presidency system* brought forward is also advocated because it will be able to benefit from the administrative functioning quickly and effectively. What kind of system is this system in the first place?

The characteristics of the new system can be summarized as follows: In this system, which is called the presidential system, the presidential election procedure does not change much from the last application. The previously accepted referendum procedure will also apply to the new system. Citizens who meet the basic requirements for nomination can be nominated by the parties who have received 5% of the current votes or 100 thousand signatures. The president who takes office for 5 years may have the right to be elected for the second time. As the head of the state and the government, the president can use the executive power on its own, and the dual-headed administration in the parliamentary system ends because the prime ministry and the council of ministers are abolished in this model. Another change in the system is the increase of the number of parliamentarians in parliament from 550 to 600. In addition, the president is given the authority to appoint their deputies, ministers, and all senior public officials. Moreover, the system has been changed in such a way that the President directly elects the four of the members of Supreme Council of Judges and Public Prosecutors, where the Minister of Justice and his undersecretary will become natural members, whereas seven of them will be selected by the Grand National Assembly of Turkey. Similarly, three members of the Constitutional Court, whose number of members has been reduced to 15, will be appointed by the Assembly and the remaining 12 members will be selected by the President. As it is evident, the determinant power of the President has been further increased with regard to senior appointments.

With the amendment made, the party presidential model has been adopted. In this model, the obligation to cut off the connection with the party of the President, which had a more symbolic meaning in the previous application, has been lifted. It is called symbolic because although in the old system since many presidents have been chosen as candidates for the party they have established and they have officially cut off their ties with their parties, it is difficult to say that they cut their ties completely in reality.

As it is known, according to the 1982 Constitution, while the parliamentary system is in effect, there is a Presidential Decree application. However, in that implementation, while the Presidential Decree was limited to the foundation of the General Secretariat of the Presidency, its organization and functioning rules, and the appointment of personnel, the scope of the decree to be enforced by the Presidency in the new system has been expanded. Accordingly, the President may issue a presidential decree on issues regarding executive power. However, a restriction has been made in this matter, and a provision has been adopted that the presidential decree cannot be issued in matters that are clearly laid down in the Law. In addition, fundamental rights and freedoms and political rights and freedoms are excluded from the scope of decree of the president. This regulation has two meanings: Firstly, in case there is not a relevant law or there is a legal gap, the President may issue a presidential decree having the power of law, which may be considered as a legislative function in a sense. The second dimension of the matter is related to whether this regulation is law or not. To be more precise, since the Presidential decree is not a law in a formal sense, the parliament may terminate the enforcement of these decrees by enforcing laws.

With this arrangement, it is aimed to ensure that the president as a head of the execution can make decisions more quickly and effectively. It is argued that this regulation will bear some risks as it will surely accelerate the functioning of things. With a similar arrangement, the authority to issue statute, which was the duty of Council of Ministers, was abolished, and the President was given the authority to issue regulations for the execution of laws. The Regulation is already a type of legislation present in the system and the actual application of the laws in the existing system is ensured

by means of statutes. Therefore, the statute is placed higher than the regulation in the hierarchy of norms. Since the statute has been lifted in the new practice and the application of the regulation in the classical sense continues, it is possible that the regulations that will serve as statues may cause some confusion and difficulties. In this sense, even if the name is not a statute, there is a need for a regulatory procedure separate from the classical regulations that will replace it.

Another regulatory authority granted to the presidency is the state of emergency issue. This authority previously enjoyed by the Council of Ministers has now been transferred to the President. The President is now authorized to declare a state of emergency if the conditions set forth in laws are fulfilled. The presidential decrees to be issued during the state of the emergency period will not be subject to the restrictions in the ordinary period. Therefore, the president will be able to issue a decree on fundamental rights and freedoms and the presidential decrees to be issued during the state of emergency period will not be taken to the Constitutional Court for cancellation.

In the new system, there is also a difference in the supervision of the President. Since previously the parliamentary system adopted the concept of irresponsible presidency of the parliamentary system, the President could not be put on trial except for treason. With the new amendment, in view of the allegation that the President has committed a crime, it will be possible to start an investigation about the President with the proposal that the absolute majority of the Assembly members presents. However, in order to make the decision of the investigation 3/5, and in order to bring it to the Supreme Court 2/3 majority is stipulated. As in the previous procedure, parliament can exercise its authority of supervision by means of "parliamentary inquiry, general meeting, parliamentary investigation and written question." But the application of "no confidence" has been terminated.

Another very significant change concerns the organization of the Turkish Grand National Assembly and presidential elections. With the amendment brought by referendum, parliamentary and presidential elections will be held on the same day every 5 years. In addition, the President can decide on the renewal of the parliamentary elections without any justification and condition. Likewise, parliament will be able to decide on the renewal of the elections with a majority of 3/5 of the total number of members. This arrangement is striking because, as it is known, the principle of distinctive or solid separation of powers in the classical presidential system is determinant; neither legislation can put an end to the legal entity of the execution nor execution can annul the legislative body and hold new elections. In the parliamentary system, however, the government can be dismissed from the duty by the legislative body by motion of non-confidence before the period of office comes to an end. The arrangement introduced here makes both ways clear. Also, since the balance-balance mechanism is evident in the presidential system, parliamentary elections and presidential elections are often held in different times and for different periods. It is predicted that the forces will balance each other accordingly. However, in this model, as can be understood from the arrangement made, elections are held for the same duration and together.

## Conclusion

To summarize briefly, a new model called the Turkish-type presidency or presidential system was introduced with the 2017 referendum. The demands in this regard are not new but currently things are the result of the extraordinary circumstances in the country. It cannot be said that the system is neither a presidential model nor a parliamentary system. It is possible to say that it is a *strong presidential system based on the parliamentary system* in terms of its main features. This system is likely to face many problems in the course of time. The first important issue in this sense is adapting the public administration apparatus to the new system by enforcing the harmonization laws as soon as possible since it is

necessary to make changes in hundreds and perhaps thousands of the laws.

# Turnover at the Top: Causes and Consequences of Leadership Change in Public Agencies

James C. Clinger
Department of Political Science and Sociology, Murray State University, Murray, KY, USA

## Synonyms

Executive tenure; Exit; Leadership rotation; Managerial change

## Definition

This essay will define leadership turnover as change and replacement of the occupants of formal, non-elected executive and managerial positions within public agencies.

## Introduction

Since at least the time of the Volker Report (The National Commission on Public Service 1989), the phenomenon of personnel turnover in the federal civil service, particularly at or near the top of agencies, has been regarded as a problem. Comparable issues of turnover in state and local government agencies have also been recognized as a matter of some concern, with articles by scholars and practitioners and speeches by politicians and interest group leaders expressing concern over this trend. Whether we see this as a "quiet crisis" (see Lewis 1991; Light 2008) or simply a natural, manageable problem, the issue deserves careful examination. This essay surveys the scholarly literature that examines the causes and consequences of leadership turnover within public agencies. The focus of the essay is not turnover among elected leaders, or of rank-and-file personnel, although some of the research on those topics may be instructive. The focus is upon turnover in occupants of formal executive and managerial leadership positions. The research in the business literature on turnover among CEOs and boards of directors may also be of interest but is not the essential issue to be studied.

The essay proceeds as follows. The first section very briefly summarizes the research on the causes of turnover. Of necessity, this section relies to a great degree on literature covering rank-and-file employee turnover. The next section discusses research on the implications and consequences of executive turnover. Finally, the concluding section discusses how and why the meaning and significance of turnover is context specific and dependent upon opportunity structures of not only agencies but of the entire labor market.

## Causes of Turnover

In public organizations and in many private ones, leaders can be evaluated based upon the performance of the programs that they lead. If their programs appear to be successful (e.g., if a coach's team wins ball games), leaders are retained and

even rewarded. In the political science literature, an argument about the way that voters make decisions about candidates (particularly presidential candidates) has been based upon this tendency. The political science scholarship describes this phenomenon as "retrospective voting" (Fiorina 1981). According to this argument, voters evaluate the incumbent based upon the performance of the government that he/she leads. In most of the research, the incumbent who is examined is the incumbent president, and the major focus of the voters' evaluation is the state of the economy. There is considerable evidence that these retrospective models do explain quite a bit of the variance in citizen evaluations of the president and the vote share obtained by incumbent presidents and the presidential candidates of the incumbent's party. Nonetheless, the near-exclusive focus on the state of the economy offers a somewhat incomplete view of the concerns of all voters, since most voters care about a wide variety of other issues (see also Berry and Howell 2007).

Public agency leaders may not be held accountable by the public in general (although there are many executive agencies at the state level that are chosen through election). Nonetheless, the biggest problem in evaluating many agency leaders is the multiplicity of the tasks that they perform and the difficulties in measuring and monitoring their performance. Most of the evaluation of these leaders is done by elected officials and administrative superiors in their organizational hierarchy. In practice, though, much of the research literature, particularly in public administration and human resource management, does not view turnover as primarily a function of unfavorable evaluations of performance, but as a result of unfavorable conditions within the workplace. In other words, much of the research explains turnover as a choice made by dissatisfied employees. This tendency may be attributable to the prevalence of civil service rules that make dismissal difficult. However, agency leadership would not normally be covered by those rules.

One of the notable characteristics of much, although not all, of the literature is the usually unstated premise that turnover is something to be avoided (see, e.g., Lewis 1991; Light 2008). For that reason, the research seems dedicated to the quest of identifying variables that tend to reduce the frequency with which public employees or officers leave office. Much of the research is quantitative, with regression-based analyses that predict turnover or turnover intention among public employees for a given set of agencies within a particular period of time. In some cases, the research does not aim to account for individual turnover or turnover intentions but instead attempts to explain a rate of turnover among personnel within an organization, management team, or program leadership structure. To a great extent, with some notable exceptions, there is not much elaborate and elegant theorizing in this research. For the most part, the literature tests the importance of a number of favorable inputs (i.e., nice stuff to have) that might discourage personnel from leaving their agencies. In general, better pay and benefits (Lee and Whitford 2007), friendlier co-workers, on-site child care (Selden and Moynihan 2000), and better relationships with superiors all tend to discourage turnover (Whitaker and DeHoog 1991). Sometimes a measure of fiscal stress in a community is a strong predictor of turnover (e.g., Tekniepe and Stream 2012). Some behavioral indices of attitudes, such as organizational commitment, organization-person fit, and public service motivation, as well as aggregated indicators of supervisor practices, are also negatively associated with turnover, although somewhat surprisingly opportunities for "voice" are not significantly related to turnover (Moynihan and Pandey 2008; Selden and Sowa 2015). Some research indicates that turnover diminishes as employees are supervised by someone of their own race or gender (Grissom et al. 2012). It does appear that turnover may be greater in rural locations than in urban or suburban locations, perhaps because the rural areas are not as attractive for some households (Grissom and Andersen 2012). However, Watson and Hassett (2003) find that some of the longest serving city managers are located in small, homogenous towns. It also seems to be the case that public university presidents have much shorter tenures than private university presidents (Monks 2012).

Agency leaders who came up through the ranks appear to stay longer in their positions than leaders who were recruited from outside the organization (Grissom and Andersen 2012). Ironically, managers with higher education may have shorter tenures than those with less (Mani 2014).

There are some troubling aspects of this literature. In addition to the generally low quality of theorizing, there is only occasionally a distinction made between voluntary and involuntary turnover. It also is not clear whether turnover reflects a departure from the agency or simply a move to another unit within an agency. Also, there tends to be a focus on variables that pertain to agency or supervisor characteristics. The environment outside the organization in most instances does not get as much attention. It is also the case that institutional arrangements regarding particular positions (e.g., employment contract length, vesting rules within pension systems, post-termination restrictions on employment) are often unexamined, perhaps because the large-N survey-based studies do not include items regarding those issues on their questionnaires.

## Consequences of Turnover

Just as much of the literature seems implicitly aimed at reducing turnover, much of the research on the consequences of turnover presumes that the results are bad. Turnover can reduce, at least temporarily, the workforce available to do agency tasks. It can involve a loss of human capital, agency expertise, and institutional memory (Duffield et al. 2011). It may affect the time horizons and the capacity of the agency to make credible commitments to fulfill long-term commitments, such as municipal bond issues and service contracts of long duration (Clinger et al. 2008). However, the research also finds that the results of turnover may be contingent upon what kind of turnover is involved and how the agency was performing prior to turnover. Ironically, involuntary turnover may be associated with improved organizational performance, while voluntary turnover appears linked to performance declines (Boyne et al. 2011). Furthermore, turnover in general seems to lead to improved performance in agencies that had been performing poorly, while turnover seems to be followed by performance declines when an agency had been performing well. In some cases, moderate turnover is associated with performance improvements, but very high turnover is associated with declining performance (Meier and Hicklin 2008). Whether these relationships are actually causal or just a statistical artifact, a "regression toward the mean" is not clear. But it does seem likely that a badly performing organization is not likely to improve unless some changes are made.

## Recommendations Regarding Understanding Turnover

Understanding turnover in personnel at the top, middle, and bottom of an organization should be enhanced by the accountability movement that is manifested at all levels of government now in the form of organizational report cards, Program Assessment Rating Tool (PART) evaluations, performance measurement, etc. Perhaps most obviously, in the realm of education, school leaders will be scrutinized on the basis of how their students perform. That does not mean that dismissals will take place immediately after a poor showing on standardized test. It does mean that elected officials, citizens, and the media will begin to ask some questions. Resistance to this scrutiny could lead to "voluntary" turnover, even if involuntary dismissals do not take place.

One aspect of the research that is mostly lacking is a recognition that agency leaders are often participants in a national or at least regional market. Some scholars, such as Grissom et al. (2016), have emphasized this aspect of the employment of agency leaders, but many other researchers ignore it. When viewed in this way, turnover is a phenomenon that should increase as job opportunities for advancement exist in other agencies, often in other states and sometimes in other levels of government. Such opportunities may also exist with nonprofit organizations, think tanks, and for-profit firms. Research that only examines workplace variables or the

behavior of immediate supervisors will miss the significance of the broader labor market. When examining these market effects, researchers should take care to take into account the agency-specific or position-specific human capital that agency leaders bring to a job (or take away from a job) should they leave their present positions. Opportunities outside current agencies are going to be much more numerous and lucrative for certain individuals than for others. Of course, some of the human capital that agency leaders have is not just technical. Some may have more general administrative capability or personal political connections than other agency leaders. Whether "who you know or what you know" is more important is a promising question for research to answer.

More research should also be focused on formal policies that agencies use to discourage turnover or at least shape behavior after leaders leave office. For example, many agencies have policies regarding post-termination employment. Specifically, regulatory agencies may forbid their employees form going to work for the firms that they formerly regulated. This presumably promotes a more ethical stance by the regulators and prevents conflict of interest. Perhaps it was assumed that with more restricted employment opportunities available after working for the agency, staffers and commissioners would remain with the agency longer. Ironically, research by Law and Long (2012) indicates that these post-employment restrictions by state utility commissions lead to the recruitment of employees with weaker credentials who subsequently serve shorter tenures with the government. The implications of restrictive employment rules of this kind deserve to be explored.

Currently, little attention has been paid to the question of whether turnover has different implications in different task environments or in positions with different professional specialties. Monks (2012) does find that university presidents with degrees in social science, business, medicine, or law are more likely to leave office for "non-presidential" positions than are presidents with other backgrounds. It is not clear if this is because of greater job opportunities for those with these specializations or if these kinds of presidents are not as eager to pursue a presidential career. It is also not clear whether turnover in a more technical as opposed to a managerial position has different kinds of repercussions for agency performance. One might presume that turnover of leaders with highly specialized, highly scarce, and highly valued skills would have more detrimental consequences for the organization than would turnover among individuals whose skill set was not as unique or in such high demand.

Finally, it would be interesting to learn whether turnover in positions for which there was substantial succession planning was as significant as it might be in organizations that had done nothing formally to respond to the departure of agency leaders. Unfortunately, there is a substantial number of articles written on succession planning, but most are very anecdotal and prescriptive (see, e.g., Pynes 2004; Rothwell and Poduch 2004; Gothard and Austin 2013). Very little empirical analysis of the consequences of succession planning for leadership turnover exists.

## Conclusion

Leadership turnover in public agencies has various causes and consequences. Some of the causes of leadership turnover have their origins in the attributes of individual leaders. Other causes exist at the level of the organization or the work unit within the organization where leaders are located. Finally, some turnover is caused by factors at the societal level, particularly involving market opportunities or opportunities for advancement in other agencies. Unfortunately, much of the research has focused upon factors at only one level rather than looking at the issue more holistically. To the extent that public administrators perceive turnover to be a problem, they must consider all the factors that are pertinent. Some factors may not be subject to control. They are embedded in a political and economic context that public administrators can only modestly influence.

Turnover among agency leaders may not be something that, from a normative standpoint,

should be reduced. Whether or not turnover is a matter of concern should depend upon the consequences that it will have for public service. In general, the research does not find that leadership turnover necessarily results in lower performance in organizations. Often turnover in poor-performing organizations is followed by better subsequent performance. Turnover in high-performing organizations, not surprisingly, is often followed by lower performance. Leadership turnover may in some cases lead to decisions that reflect the different preferences of the new occupants of those offices. Consequences of turnover may also reflect different levels of competence between the new and old leaders. In short, turnover's impacts will depend upon who has been replaced and who has been chosen as the replacements.

No matter what the quality of the new occupants of leadership positions, it is likely that extremely high levels of turnover will cause certain kinds of difficulties for public agencies. Uncertainty in organizational functioning may be created, and long-term commitments with employees, contractors, and political superiors may result. Such uncertainty may be more problematic for certain functions and for certain agencies than for others. For example, high turnover might be unacceptable for agencies that are concerned with long-term commitments, such as pension fund management, capital project programming and finance, and comprehensive planning. Turnover might be much less of a problem in functions where the environment is more fluid, and responsiveness to market or political conditions is valued. For example, leadership turnover among individuals involved in economic development, human services administration, and emergency services may be an advantage. In these areas, leaders must respond to changes in policy or circumstances that are outside the control of their agencies. This responsiveness may be easier to achieve with new leaders than with those accustomed to the status quo. In short, the consequences of leadership turnover, both empirically and normatively, vary according to the circumstances in which the turnover occurs.

# Turnover of Personnel in the Federal Government

Jennifer Symonds Morrison
Department of Political Science and Sociology, Murray State University, Murray, KY, USA

## Synonyms

Intent to turnover

## Definition

A voluntary or involuntary movement across the membership boundary of organization through quits, transfers, layoffs, promotion, reduction in force, deaths, or retirement.

## Introduction

Employing 2.2 million workers over 100 agencies, the US federal government is one of the largest employers in the country. Employee turnover has been an issue since the early days of the government (White 1948). While a loss of employees can have positive effect on an organization, negative consequences, including loss of human and knowledge capital, morale, and productivity, and increased costs for replacements, can be problematic for governance (Bertelli and Lewis 2012; Kim and Fernandez 2017). Research conducted by the US Senate, the National Commission on Public Service, the Society for Human Resource Management, and the Office of Personnel Management found that the rate of turnover in the federal government was higher than in other industries. This article reviews the scholarly literature on various definitions of turnover, as well as theories, causes, and consequences. While the focus of the article is on turnover in the federal government, general turnover is vital to this discussion.

The first section will review definitions and types of turnover. The next section will review theories and models used to explain turnover. The third section will discuss many determinants and consequences of turnover. The final section will discuss the impact of turnover on the federal government and future trends.

## Definitions

Researchers have been unable to agree on one definition of employee turnover. Definitions range from "movement across the membership boundary of an organization" (Price 1997, p. 532) to the withdrawal, leaving, or physical separation from an organization or the labor force (Mobley 1982; Mobley et al. 1978, 1979). Turnover applies to quits, transfers, layoffs, promotions, deaths, and retirement (Becker et al. 1977; Borjas and Rosen 1980; Borjas 1982). Bluedorn (1978) and Allen (2008) referred to two types of turnover: involuntary, initiated by the organization, and voluntary, initiated by the

employee. Turnover may not be leaving an organization, but a change in the relationship with the organization, specifically separations, moving out of the organization, and accession, moving within the organization (Bluedorn 1978; Kirschenbaum and Weisberg 2002).

Intention to leave, or turnover intention, is the probability of a purposeful intent to leave, not necessarily an actual turnover. This is a conscious decision and the last step in the cognitive process of withdrawing from the organization (Cho et al. 2009). The intention to stay is the cognitive decision to remain (Tett and Meyer 1993).

## Theories

Various theories have been proposed to explain turnover, with many based on motivation theory:

**Herzberg's Two-Factor Theory of Satisfaction and Motivation**: proposes that certain factors, defined as motivators (recognition, achievement, responsibility, job advancement, and job growth), are effective in motivating employee performance, leading to job satisfaction, commitment to the organization, and less intent to turnover. Hygiene factors, such as company policies, pay plans, and worker conditions, foster dissatisfaction in employees and are more likely to lead to turnover.

**Vroom's Expectancy Theory**: assumes that employee behavior and performance result from conscious choices, beliefs, values, and attitudes. Individuals who are satisfied with their job are more likely to remain, as long as the rewards (pay, etc.) satisfy their wants and needs.

**Models of Intrinsic and Extrinsic Work Motivation**: hypothesizes that performance leads to either intrinsic (feelings of accomplishment, achievement, personal growth, and skill enhancement) or extrinsic (pay raises, promotion, status, and security) rewards, which will determine job satisfaction and intent to turnover.

**Kahn's Theory of Engagement**: states that when an employee is engaged in and derived meaning, usefulness, and value from their work, they are less likely to leave the organization.

**Social Exchange Theory**: presumes that employees feel a sense of obligation to employers who are supportive, addressing their social and financial needs. In exchange for this support, employees feel obligated to perform effectively, a sense of organizational commitment, and less desire to leave.

## Working for the Federal Government

Before determining why employees leave, it is necessary to understand why they choose to work for the federal government. According to Lewis and Frank (2002), "preferences for government or business jobs reflect not only their own job priorities, but their perceptions of which sector will better satisfy their needs" (p. 396). It is assumed that people who place a priority on pay generally choose private sector positions, whereas those who prioritize job security and public service motivation choose government jobs. This leads to the conclusion that the better educated, minorities, veterans, older workers, and those with public sector contacts are more likely to prefer public sector jobs.

There has been some discussion regarding the wages and pensions of federal workers. Ippolito (1987) argued that low turnover rates in the federal government meant that wages were too high. However, the low turnover rates may be because early retirement leads to the loss of pension. Federal employees may choose to delay retirement due to anticipated pension wealth.

Another issue is the differences between private sector and federal government pension funding. Private sector employers are not required to provide pension plans, but for those that do, standards set by Employer Retirement Income Security Act of 1974 must be followed. One standard is employer prefund pension obligations that protect "employees who have earned the right to receive a pension, even if the firm goes out of business" (Issacs 2015, p. 2). While it is

unlikely that the federal government will go out of business, the Federal Employment Retirement System (FERS) requires all pensions be fully prefunded, ensuring recognition of the costs in the agency budgets.

The US House of Representatives Committee on Oversight and Government Reform Subcommittee on Federal Workforce reviewed differences between federal workers and "workers at large private sector firms as to the best salaries and benefits" (Biggs 2010, p. 3), reporting that:

- The federal salary is 10–20% over similar private sector salaries.
- New hires (1st year) in the federal government received salaries 8% higher than similar jobs in the private sector.
- Federal workers receive benefits equivalent to 36% of their salaries; benefits in the private sector equal 40%.
- Federal employees average 41 days of paid leave, compared to 32 in the private sector.
- Job security in the federal government is equivalent to an extra 29% of pay or 11% of compensation.

The Congressional Budget Office (CBO) compared the wages, benefits, and compensation of federal and private sector employees from 2011 to 2015, finding:

- Federal employees, on average, earned approximately 3% more than comparable private sector employees did.
- Benefits for federal workers cost approximately $26 per hour worked, compared to $18 for private sector employees.
- "Federal civilian workers whose highest level of education was a bachelor's degree earned 5 percent more, on average, in the federal government than in the private sector."
- "Federal civil workers with no more than a high school education earned 34 percent more, on average, than similar workers in the private sector."
- "Federal workers with a professional degree or doctorate earned 24 percent less, on average, that their private-sector counterparts."
- "Average benefits were 52 percent higher for federal employees whose highest level of education was a bachelor's degree than for similar private-sector employees."
- "Average benefits were 93 percent higher for federal employees with no more than a high school education than for their private-sector counterparts."
- "Among employees with a doctorate or professional degree average benefits were about the same in the two sectors."
- "Among workers whose education culminated in a bachelor's degree, the cost of total compensation averaged 21 percent more for federal workers than for similar workers in the private sector."
- "Among workers with a high school diploma or less education, total compensation costs averaged 53 percent more for federal employees."
- "Total compensation costs among workers with a professional degree or doctorate were 18 percent lower for federal employees" (Falk 2012, pp. 2–3).

## Causes

There has been a great deal of research on the causes of employee turnover in the public and private sectors, and for the most part, there is a lot of similarity. Ting (1997) proposed that "the job satisfaction of federal employees is determined by three sets of variables: job characteristics (i.e., pay satisfaction, career growth, task clarity, and significance), organizational characteristics (i.e., organizational commitment, relationship with coworkers and supervisors), and individual characteristics (i.e., public spirit, age, education, race and sex)" (p. 313). Pitts et al. (2011) concurred, dividing the factors into three categories: demographic, workplace satisfaction, and organizational factors.

Demographic factors are frequently studied in terms of turnover in the public and private sectors. Research has found that the older a person, particularly women, the less chance of turnover. Family size and responsibility have a greater

turnover impact on women than on men. Tenure research has had conflicting results, as well as research on personality characteristics.

Generational differences and turnover have been studied. The 2017 Federal Employee Viewpoint Survey defines the four generations currently working for the federal government: 1% are Traditionalists, born 1945 or earlier; 43% are Baby Boomers, born between 1946 and 1964; 42% are Generation X, born between 1965 and 1980; and 14% are Generation Y, born 1981 or later (Management 2017c). In 2018, the youngest Traditionalists will be 73 years old, and the youngest Baby Boomers will be 54; babies born in the new millennium are turning 18 and entering the workforce. Different generations working together lead to age and value issues, resulting in workplace tension and stress, which can lead to turnover (Derrick and Walker 2006). As the values (job security, importance of family, and leisure time) of the generations differ, turnover will result in the loss of knowledge and talent from the older generations and the loss of new ideas and innovation from the younger generations.

Research on workplace factors or job characteristics is common. The theory is that the job satisfaction, regardless of personal factors, is significantly affected by job characteristics. If an employee is satisfied with their job, leaving is less likely to be considered. Person-Organization Fit (P-O Fit) is defined as the compatibility between the individual and the organization. Kristof (1996) illustrates P-O Fit as the relationship of the basic traits between the organization and the individual. A high level of P-O Fit is negatively related to intention to quit; lower levels are predictive of intention to leave.

Organizational characteristics, or relational factors, including public management reform, incentive structures (i.e., performance-based rewards), management techniques (i.e., performance-supporting supervision), employee empowerment, relationships with management and coworkers, person-organization fit, and justice climate have been researched from the human relations perspective. This perspective hypothesizes that the environment of the organization plays a role in job attitude, leading to job satisfaction and then to turnover or intent to turnover.

Attitudinal factors, such as stress, job satisfaction, and commitment to the organization, influence turnover. Research has examined the influence of commitment on work behavior, turnover intention, and turnover. Organizational commitment "can be characterized by three factors: (a) a strong belief in and acceptance of the organization's goals and values; (b) a willingness to exert considerable effort on behalf of the organization; and (c) a strong desire to maintain a membership in the organization" (Mowday et al. 1982, p. 27). Commitment and support decrease intention to leave.

One factor that separates turnover in the private sector from turnover in the public sector is public service motivation (PSM). Perry (1996) defined PSM as "an individual's predisposition to respond to motive grounded primarily or uniquely in public institutions" (p. 368). This means that an individual who works in the public sector is likely to be intrinsically or altruistically motivated by the idea of public service due to public morality or spirit, a desire to serve the public interest, loyalty to duty, or social equity (Perry and Wise 1990). Scholars have found that not only is PSM associated with public employees' work preferences but that those with high levels of PSM are less interested in financial opportunities and more interested in satisfying intrinsic or higher-level needs (Bright 2009, 2011). Naff and Crum (1999) proved that there is a statistical significance between PSM and job satisfaction in the federal government.

## Consequences

What are the consequences of turnover and why is it so important in the federal government?

In the private sector, replacement costs can run from 50% to 200% of one employee's annual salary, depending on rank, rate, seniority, specialization, performance level, and training (Partnership for Public Service and Booz Allen Hamilton 2010). According to Cascio (1991), the cost of turnover is equal to separation costs plus

replacement costs plus training costs (p. 23); however, this does not include the costs of lost productivity, employee morale, administration costs, loss of talent and knowledge, and governance (Bertelli and Lewis 2012), which cannot be fixed with a dollar amount.

Reducing turnover can have negative consequences. While this may occur due to a lack of growth or opportunity in an organization, for an individual the result may be a positive upward career move. There may be increased earnings, career advancement, better person-organization fit, as well as use of skills, and increased self-development and esteem (Mobley 1982; Dalton and Todor 1979). In the long term, this may be economically beneficial as it "reduces inequitable distribution of income, contributes to the long-term growth rate of the economy, and reduces market "stickiness" (Dalton and Todor 1979, p. 229).

Not all consequences of turnover are dysfunctional, negative, or undesirable to the organization. For example, it can increase the effectiveness of the organization by allowing new blood and ideas, as well as balance the cost of turnover with the cost of retention. In some instances, it costs more to retain an employee who is a poor performer than to have that employee separate from the organization, either voluntarily or involuntarily. On the other hand, it may cost more to lose highly trained employees (Abelson and Baysinger 1984) than to lose a poor performer.

## Current Trends

Raw data from OPM on turnover numbers show that 130,344 people quit, retired (RIF), were terminated or removed, or died from federal service between January 1 and September 30, 2017. Approximately 38% quit, 32% retired, and 2% died. Regardless, quit, retirement, and death accounted for 72% of the federal turnover rate for the first 9 months of 2017.

The Department of Veterans Affairs had the greatest number of separations in 2017. The cause for these high numbers is unknown; however, since 2009, the VA has experienced incidents of employee misconduct. Medical issues include exposure to HIV and hepatitis B and C at a dental clinic in Wisconsin; outbreaks of Legionnaire's disease in 2011, 2012, and 2014 at facilities in Pennsylvania; and exposure to infectious diseases during dental procedures in St. Louis. Furthermore, a scheduling scandal was uncovered in 2014 in which employees were manipulating appointments and wait times. An audit revealed that between 2004 and 2014, thousands of veterans were either never seen by a doctor or never scheduled for appointments, and more than a thousand had died due to lack of medical care or malpractice (CNN.com). By November 2014, 5600 employees had been disciplined. This may have played a role in the high number of separated VA employees in 2017, even though the number of terminated employees is relatively low.

The Partnership for Public Service posted articles in late 2017 regarding federal employees related to turnover.

- Federal News Radio reported that OMB is encouraging agencies to not just consider improving employee engagement but take action.
- Bestplacestowork.org posted the Best Places to Work Agency Rankings for 2017. Using the question from the OPM Federal Employee Viewpoint Survey, rankings show that in large agencies (i.e., Cabinet-level agencies), NASA is ranked number 1, while the VA is ranked 17th out of 18, with DHS ranking 18th.
- In January 2017, President Trump ordered federal agencies to cut staff immediately in order to shift funds to the military. However, between January 1 and September 30, 2017, federal civilian jobs only declined by 6000 (Lange 2017).
- Finally, in early December 2017, NBC News reported that morale in the federal workforce is up this year; however, the State Department, the FBI, and other intelligence community organizations are experiencing lower

morale. A decline in moral, or job dissatisfaction, could lead to turnover in these organizations.

## Conclusion

Turnover can cost an organization financially in terms of recruiting, selecting, hiring, and training new employees, loss of productivity by the departing employee as well as other members of the organization, decrease of employee morale, loss of human capital, and loss of knowledge.

Research in the twenty-first century acknowledged that the federal government will experience retirement waves in the 2010s (Lewis and Cho 2011; Tobias 2011; Cho and Lewis 2011). Retirement-eligible employees and new hires are the most likely to leave the federal government. However, a loss of employees at either end of the workforce can affect the remaining employees. According to the GAO, these losses influence the number of "middle-level career bureaucrats to pass this institutional knowledge to new hires and organizational performance can suffer" (US Government Accountability Office 2009). The federal government would be wise to determine the necessary steps that would generate a greater retention rate with the younger workers.

# Types of Local Governments' Intervention to National Politics/Central-Local Cooperation and Antagonism by Political Parties and Government

Ken Victor Leonard Hijino
Graduate School of Law, Kyoto University, Kyoto, Japan

## Synonyms

Intergovernmental relations/dynamics; Local and national government policy coordination and conflict

## Definitions

Coordination over policy that is shared or overlapping across levels of government; administrative and partisan channels of interaction/coordination between central and local government.

## Introduction

An important element of intergovernmental relations (IGR) in modern democracies are the various channels by which different levels of government coordinate over policy that is shared or overlapping across levels. The need for greater coordination, vertically between local, national, and supranational governments, has been driven by trends affecting most states. These include an expanding welfare state, the standardization of public services across regions, increasingly interdependent and complex policy areas which cannot be exclusively dealt with by one level alone, and demands for greater policy autonomy and ownership from local governments (Bolleyer 2009; Loughlin 2007; Bolleyer et al. 2014).

A range of formal/informal and administrative/partisan channels exists by which local governments engage with the national policy-making process. They include, for example, secondary chambers in national legislature which directly represent local governments and give them veto powers over national laws affecting local governments (such as the German Bundesrat); regular meetings of executives and bureaucrats from different levels of government (such as the Canadian First Minister's conferences); mechanisms to resolve disputes across government levels (such as the UK Joint Ministerial Committee); or procedures in which local governments provide feedback and express preferences over national policy (such as the Swedish *remiss* system). Various informal (nonstatutory), personal interactions between individual actors at different levels of government can also play a significant coordinative role.

In addition to these administrative channels, local actors resort to partisan routes to exert influence in the national arena. These can be formal intraparty channels and arenas which link local politicians and party organizations to the national level of the party. In addition, less formal interactions through personal connections between national and local party officials can lead to coordination of decisions over policy decisions at both levels.

This entry, then, briefly describes and explains the recent evolution of such IGR dynamics in Japan. Specifically, it looks at the various routes by which Japanese local governments participate in the national political arena. It will explain how local governments possess both administrative and partisan channels to influence national policymaking in Japan. It argues that decentralization and increased multilevel partisan incongruence (where different parties control different levels of government) in recent decades have led to more conflictual relations between central and local governments. This trend has been accompanied with the establishment of new formal mechanisms of IGR and an expanded role for more traditional channels and fora linking the two levels.

## Traditional Administrative and Partisan Routes of IGR in Japan

Japan's modern constitution (Articles 92–95) guarantees local autonomy and the establishment of local government authorities with directly elected executives and legislatures that exercise administrative and legislative power within the scope of national law. The Local Autonomy Act, adopted simultaneously with the Constitution in 1947, further specifies the basic organization and operation of these local governments. The law specifies two tiers of local authorities – prefectural and municipal governments, of which in 2017 there were 47 and 1,718 respectively.

The Constitution and Local Autonomy Act stipulate a number of mechanisms by which local governments may express their preferences over and indirectly influence national policymaking. The following are what can be considered the more traditional mechanisms of local participation in national policy-making, which have been complemented by new mechanism which emerged around the mid-1990s.

First, Article 95 of the constitution requires the central government to conduct a local referendum if it seeks to enact special laws applicable only to a specific local government. This provision gives local communities an opportunity to reject national policy which affects them exclusively. Such special laws requiring local referendums, however, have not been enacted since 1952.

Second, Article 99 of the Local Government Act grants Japanese local legislatures to pass "written opinions" (*ikensho*) on matters relating to the public good of local government. WOs are passed by prefectural and municipal legislatures, and are addressed and submitted to the Diet (usually to the Lower House and/or Upper House chairman) and/or the executive (usually to specific ministries and ministers). Oftentimes these written opinions express local support or opposition to national decisions that are being planned or have been legislated. Although not legally binding, these WOs tend to be reported in the media and signal to the general public the reservations or support a local legislature may have for national policy (Hijino 2017).

Third, Article 16 of the Constitution stipulates the right to petition for all individuals and legal entities, including local governments. Diet Act no. 77 grants local governments the right to formally appeal to national legislature and ministries (Narita 1979, 5). These petitions, submitted by local government chief executives or chairpersons of local assemblies, are screened by relevant legislative committees in Diet or within ministries, and for those selected, the government must report on how it processed the appeals. There is no legal requirement for public bodies to act upon the contents of these petitions, however (Harada 2010, 127).

Fourth, there are a number of ad hoc channels by which local governments and their representatives are asked to provide comment over national policy matters. Certain laws (such as city planning or pollution controls) have included provisions which oblige central government ministries to conduct hearings of affected local governments before policy implementation. Local government representatives are also invited to provide testimony and comment in national advisory councils (such as the Local Government System Research Council) relating to local government issues as experts or affected parties (Narita 1979).

Besides these channels of IGR, various partisan channels have linked national and local governments, providing a more influential route for local preferences to be reflected in national policy-making.

Muramatsu (1988) indicates how local actors drew out benefits from the center by participating in a bottom-up and inclusive policy-making process. This bottom-up dynamic involved a "rugby scrum" linking local politicians, local governments, local Diet members, and national-level bureaucrats (Muramatsu 2010). Policy demands were channeled upward to the ruling party and coordinated among ministries and various sectional interest groups. Local governments, through local politicians representing these areas, competed among each other in "horizontal political competition" to capture a greater share of expanding governmental spending to various regions (Muramatsu 1988).

Local politics influenced national policy not only through such vertical linkages within the ruling party at national and local level, but also in providing an arena for opposition parties to challenge the center. During the mid-1960s and 1970s, local governments controlled by leftist governors and mayors challenged local and national conservatives on a platform questioning unregulated growth (Flanagan et al. 1980). These Socialist and/or Communist-backed governors implemented local ordinances expanding welfare services and enforcing pollution regulations which superseded or even contravened national laws and regulations. Many of these initiatives were then copied by other local governments or were co-opted into national standards. Local opposition thus served to alter national policy by representing policy preferences which could not emerge nationally.

These partisan channels were particularly important through much of the post-war period, enabling local preferences to shape national policy even though the state was administratively and fiscally centralized. A notable feature which enabled such strong bottom-up influence from local level into national policy-making was the highly decentralized, but vertically integrated nature of the ruling party (Fukui and Fukai 1996) as well as the fact that the same party (the Liberal Democratic Party, LDP) dominated many of the national and local legislatures in the post-war period, especially in rural areas (Scheiner 2006). The LDP's national network provided formal coordinative arenas over policy (such as the prefectural policy research councils) as well as informal vertical linkages connecting national and local politicians. These linkages helped transmit local demands into national policy, both programmatic and particularistic.

## Evolving Channels of IGR Since the 1990s

These key features shaping IGR in Japan were altered considerably since the late 1990s, however. Hijino (2017) identifies several trends leading to a decoupling of traditional multilevel

linkages during this period. Decentralization reforms since 2000 expanded local autonomy and an overall reduction in central government grants and subsidies to local governments (prominently between 2000 and 2006) reduced fiscal links to the center. Electoral system reforms (1994) at national level and municipal mergers (2000–2003) weakened vertical intraparty linkage between national and local politicians. And an overall increase in electoral volatility nationally as well as the rise of independent governors since the mid-1990s have led to more partisan incongruence between national and local levels of government.

As local government autonomy expanded and partisan links weakened across levels, various new channels of formal IGR have emerged to coordinate between levels.

First, as part of the Omnibus Decentralization Act implemented in 2000, a Central and Local Government Dispute Management Council was established to arbitrate between national and local governments, along with rules of how local governments can sue the central government over interference (Local Government Law Article 250:7–20, 251:5). The system was established as a way to protect local government autonomy from unwanted encroachment and interference from central government ministries. Since its implementation, only three local governments (Yokohama city, Niigata prefecture, and Okinawa prefecture) have sought dispute arbitration through this system, although in two of these cases the committee rejected the request for arbitration.

Second, an arena of discussions between central and local government representatives was established between 2004 and 2006 on an ad hoc basis to negotiate over the highly contested content of fiscal decentralization policy. Following this initial experiment, local government representative (led by the National Governors Association) sought to institutionalize the "forum of discussions between central government and regions." In 2011, the Democratic Party of Japan administration passed a law to institutionalize these meetings. The committee consists of the cabinet chief secretary and ministers, but not the prime minister, and the representatives of the six local government organizations. The six organizations are national associations representing governors, city mayors, town and village mayors, as well as prefectural, city, and town/village assemblies. Topics have covered a range of topics from tax and welfare, local economic revitalization and finances, as well as decentralization measures.

Evaluations of how effectively local governments have been able to collectively bargain for their interests in this forum remain divided. The earlier forums, having no legal basis and thus unable to bind policy decisions, became merely an informal place for local governments to express preferences, rather than a place where decisions took place (Kanai 2008). Even after being regularized and institutionalized since 2011, the outcomes of discussions in these fora do not bind central government behavior. Yet there are signs that some local government demands were reflected in eventual policy in the round of meetings in 2011 (Oosaka 2012). In addition, there are concerns as to whether the diverse interests between wealthier urban local governments and smaller, poorer rural local governments among other divisions can be effectively represented by these national umbrella organizations.

Third, there has been a further expansion of channels in which local governments can express opinions on national policy. The addition of Article 263:3–2 in the revision of Local Government Law in 1993 provides the right to the six national local government associations to collectively express opinions to the cabinet or Diet on matters affecting local government. This channel was further strengthened in 2000 with an addition of a clause requiring the central government to provide relevant information prior to formulating laws or cabinet orders which affect local governments. Likewise in 2000, Article 17.4 was added to the Local Allocation Tax Law giving local governments right to provide opinion on how local grants are calculated. Thus far the local government national organizations have submitted comments through the Article 263:3–2 mechanism to the central government only twice.

Fourth, the collective bargaining role of the National Governor's Association changed

considerably since the mid-1990s. NGA meetings were traditionally politically neutral and ceremonial, but these became more active in negotiations over fiscal decentralization reforms under the Koizumi administration (2000–2006). For example, the NGA meeting hosted by Gifu prefecture in 2003 was unofficially but popularly called "the NGA which fights." During this meeting, prepared statements were replaced by free debates and the rules for selecting the NGA chairman was changed from discussion to majority vote. NGA meetings increased in frequency under the Gifu governor who became the first NGA chairman to be selected under the new election procedure. The central government also began since 2003 to host annual "government-hosted NGA meeting," regularizing these collective discussions with governors.

The NGA also has been more active in publically pressuring the central government over various national policy decisions. The NGA has increasingly passed resolutions and made public appeals (many of them labeled "emergency" appeals or demands) against national policy since 2000 (Hijino 2017). The association for governors also stepped away from maintaining strict partisan neutrality in the 2005 general election by assessing and ranking party platform promises relating to decentralization and local government. The NGA has continued with this practice of evaluating party manifestos.

Fifth, although not intended as a mechanism for local governments to engage in national policy, the emergence of local referendums based on bylaws since the mid-1990s have been used to signal local preferences on national projects. Non-binding local referendums on the siting and usage of nuclear power plant and military base facilities have been implemented by various municipalities since the first such referendum occurred in 1996 (Hitomi 2008) (Table 1).

Finally, not only have these new and expanded forms of IGR emerged since the 1990s, but there is also evidence of more active use of traditional forms of IGR. Hijino (2016) traces an increase in the passing of written opinions by local prefectural assemblies since the mid-1990s, as local politicians (both from the ruling and opposition parties) opposed various top-down national policies seen to damage local interests. In particular,

**Table 1** List of formal IGR channels by which local governments engage in national arena in Japan

| IGR channel | Relevant law | Year law was implemented |
|---|---|---|
| Local referendums for national laws affecting only specific local governments | Constitution, Article 95 | 1947 |
| Right of local legislatures to submit written opinions | Local Government Law, Article 99 | 1947 |
| Right to petition | Constitution, Article 16 | 1947 |
| Ad hoc laws obliging consultation with local representatives | Various | Various |
| Participation in government committees | Various | Various |
| National/local Dispute Resolution Committee | Local Government Law, Article 250:7–20, 251:5 | 2000 |
| Forum of Discussion between national and local governments | Law concerning the Forum of Discussion between national and local governments | 2011 |
| Local government national organizations' right to submit opinions | Local Government Law, Article 263:3–5 | 1993 (expanded in 2000) |
| Right to submit opinions on local grant calculations | Local Allocation Tax Law, Article 17.4 | 2000 |
| Local referendums based on bylaws | Various local bylaws | 1996 |

Compiled by author

there was a surge of such written opinions during the administration of the Democratic Party of Japan, which resulted in widespread partisan incongruence between national and local levels between 2009 and 2012. Even under congruent conditions, local party organizations, legislatures, and governors have challenged major national policy projects to defend territorial interests through a variety of channels. This has taken place through administrative routes such as written opinions, but also by diverging from and campaigning against national policy platforms (Hijino 2016, 2017).

## Conclusion: The Dynamics of Decentralization, Partisan Incongruence, and IGR

Although the effectiveness of these new institutionalized channels for securing local government interests are ambiguous, these developments in IGR can be interpreted as a reaction to growing tensions between national and local governments since the 1990s. From below, local governments have reacted to undesired national policy (such as the reduction in redistributive grants through fiscal decentralization) by politicizing its national associations. They have also called for greater participation in national policy, particularly in collective multilateral fora, rather than through bilateral channels. From above, central governments have been trying to contain this tension by setting up new IGR channels and institutionalized fora. These mechanisms are based on the decentralization principle of "discussion on equal footing," but fall short of providing actual vetoing power to local governments over national policy.

Finally, it is notable that this expansion of more institutionalized and multilateral fora of IGR in Japan echo some comparative findings in countries like the United Kingdom and Italy which have similarly undergone decentralization since the 1990s.

In the United Kingdom, devolution in 1999 moderately heightened intergovernmental and intraparty tensions between the central government and the devolved regions of Scotland, Wales, and Northern Ireland. Under initial conditions of multilevel partisan congruence, coordination was achieved primarily through informal intraparty channels. Formal mechanisms of IGR – including the Joint Ministerial Committee (JMC), a key executive body set up to coordinate between levels following devolution – were rarely used. Following the 2007 regional elections, however, multilevel congruence was lost which led to a moderate increase in the use of more formal and institutionalized channels of the JMC (McEwen et al. 2012). As in Japan, however, the continued dependence of regional governments to the center for both policy and fiscal resources and the lack of a constitutional basis for regional governments to effectively challenge the center has dampened overt conflicts. Pragmatic actions prevailed with IGR becoming moderately more institutionalized and more multilateral, though informal bilateral negotiations between levels continued to be prevalent (Bolleyer et al. 2014).

In Italy, which underwent significant decentralization reform since the 1990s, local actors sought to expand their engagement in the national policy process through formal and more multilateral channels. Palermo and Wilson (2014) find that formal channels of intergovernmental coordination were overall weak, although new channels were created and others were made more institutionalized and prominent following decentralization, such as the State-Region Conference. Under the new context, territorial leaders have also sought to coordinate their negotiating position with the central government through collective lobby groups representing regions and municipalities. Despite some movement towards greater multilateral fora to defend local interests against the center, interactions tend to be dominated by informal, bilateral negotiations. Partisan incongruence was limited in Italy for most periods since the late 1990s, thereby largely limiting partisan-based conflicts between national and regional governments.

Despite these new intergovernmental channels and substantial decentralization reforms, local governments in all three states share difficulty in ensuring that local interests are reflected in critical

national policies which affect them. This underlines the ultimately consultative nature of these engagement mechanisms in unitary states: local governments may be invited to speak, but there are no guarantees to be heard when legislation is made.

# Typology of Agency Models of Corruption

Andrei Ivanov
Graduate School of Management, St. Petersburg University, St. Petersburg, Russia

## Synonyms

Bureaucratic corruption; Corruption; Efficient corruption; Principal-agent model

## Definition

The corruption is acts in which public power is used for personal gains in a manner that contravenes the rules of the game (Jain 2001, 73). It is the principal-agent model that is most often used as a methodological framework for modeling corrupt behavior. In the principal-agent model, the payoff to the principal depends on an action taken by the agent. The mainstream of the corrupt behavior modeling is model of bureaucratic corruption, which considers agent as potential bribee and examines its behavior for given regulation.

## Introduction

From a great many definitions of corruption, we select the typical one: "The corruption is acts in which public power is used for personal gains in a manner that contravenes the rules of the game" (Jain 2001, 73). The above-cited author suggests that there are two forms of corruption, each occupying extreme positions on a scale of corrupt activities: "grand corruption" generally refers to the acts of the political elite by which they exploit their power to make economic policy and "bureaucratic corruption" refers to corrupt acts of the appointed bureaucrats in their dealings with either their superiors (political elite) or with the public (Jain 2001, 73–75, 2011, 3).

In this article, we will prove that despite of the fact that all corrupts can really be divided on political elite and appointed bureaucrats, this approach is not sufficient to construct the typology of the corruption models. To do so, we will use the approach, which is based on the applying of the principal-agent or agency model to the examination of corrupt behavior (Ivanov 2015).

It is the principal-agent model that is most often used as a methodological framework for modeling corrupt behavior: "Pathologies in the agency/principal relation are at the heart of the corrupt transaction" (Rose-Ackerman 2008, 330).

This model has been developed for describing processes in the private sector and understands the agency relationships as "a contract under which one or more persons (the principal(s)) engage another person (the agent) to perform some service on their behalf which involves delegating some decision making authority to the agent" (Jensen and Meckling 1976, 308). Accordingly, the principal faces the task of shaping a system of incentives for the agent, in which agent's preference relation, defined on a corresponding set of alternatives, coincides with (or, in extreme case, equal to) preferences of the principal.

In turn, the starting point for modeling public sector processes is the assumption that to meet public needs the political elite (principal) delegates some decision-making authority to government agencies or other public entities or, other words, to appointed bureaucrats (agents). In this case, we can see that all core assumptions of the original principal-agent model are true or can be redefined very close to original ones. Actually, the agent takes an action that determines a payoff to the principal, the principal can readily observe the outcome but not the action of the agent, the agent's preferences can be assumed to differ from the principal's ones (asymmetry in preferences), and so on.

However, in contrast to the private sector, the applying of the principal-agent model in the public sector has its own specifics related to the fact that in a democracy the political elite, in turn, is an agent, who is elected by the populace for the achievement of social objectives. Thus, the ideal preferences in this case are not the preferences of political elite but society's preferences, and we have some reasons to denote the society as a basic principal. Hence, there are three *dramatis personae* in the model, and this property can be considered as an attribute of public sector principal-agent model.

In the paper, the correspondence of the preferences of the principal and the agent to the basic principal's preferences lays in the base of suggested typology of corruption models.

## The Typology's Basics

Let us consider some set of alternatives $\Omega$, fix alternatives $x$ and $y$ from this set, and assume that for basic principal (principal, agent) alternatives, $x$ is strictly better than $y$ or indifferent to it: $x \succcurlyeq_{BP} y$ ($x \succcurlyeq_{P} y$, $x \succcurlyeq_{A} y$). The set of pair $x$ and $y$ ($x$, $y \in \Omega$), for which basic principal considers $x \succcurlyeq_{BP} y$, we will call the preference order (or preferences) of basic principal, defined on the set $\Omega$, and denote it as $\succcurlyeq_{BP}$. The preferences of the principal and the agent ($\succcurlyeq_{P}$ and $\succcurlyeq_{A}$) are introduced the same way.

Assume that on the same set of alternatives, the preferences of the basic principal, the principal, and the agent are defined.

**Definition 1** We call that the principal (agent) is *mala fide* if its preference order is different from

T

the basic principal's preference order, $\succcurlyeq_P \neq \succcurlyeq_{BP}$ ($\succcurlyeq_A \neq \succcurlyeq_{BP}$), and bona fide if otherwise.

If we construct the typology of models of corrupt behavior or corruption models on the base of the Definition 1, we will find that theoretically five models can be created depending on the combination of the *bona/mala fides* of principal and agent.

The applying of given approach to the modeling of corrupt behavior is connected with the identification of bona fide*s* of principal and agent. It appears that the first step of assessment is to determine the bona fide*s* of the principal. Indeed, if the principal is bona fide, the vesting of agent with principal's preference order will inevitably lead to the achievement of public objectives and, otherwise, will not allow of achieving them.

To determine the bona fide*s* of the principal is necessary (Ivanov 2015):

1. To put forward assumptions about the properties of society's preferences and build up a model of basic principal's preference order
2. Then, based on the proposed regulation, to model the principal preference order
3. And, finally, to find out whether they match or differ

In the paper, if otherwise stated, we confine discussion to matching given typology of corrupt behavior models with public procurement issues. We will designate policy-makers, legislators, and other people and bodies, who are responsible for the public procurement regulation development and enforcement, as a principal, and contracting authorities (or public buyers), who are acting in the framework of given regulation rules, as an agent.

In the paper, we will use simplified way of the principal's *bona fide* identification: we will say that principal is *mala fide* if the proposed regulation goes against international practice, which is concluded in the clauses of UNCITRAL Model Law on Procurement of Goods, Construction and Services (UNCITRAL Model Law 2011) (hereafter: Model Law) and *bona fide* if otherwise.

In turn, the agent's *bona fides* can be identified on the base of accumulated enforcement practice.

From the five models, main hypotheses of which are given in Table 1 are well-known two ones: the model of bureaucratic (or administrative, according to the World Bank's terminology) corruption (#2) and the model of efficient corruption (#3). In the next sections, we will consistently consider all models and give the rest of them absent titles.

## The Models with Bona Fide Principal

In this section, we assume that the discussed regulation lies in the framework of the clauses of Model Law, and, respectively, the principal is bona fide.

### Conflict-Free Model

If the accumulated legal practice does not give us reasons to consider agents as *mala fide*, we obtain the model that is trivial in terms of the agency relationships ($\succcurlyeq_P \equiv \succcurlyeq_A \equiv \succcurlyeq_{BP}$). Let us call this model the conflict-free one: agent has the opportunity to choose and is prone to selection of the optimal alternative for the society.

When the assumptions for conflict-free model are true, the researchers tend to focus on the study of the efficiency of public contracts, trying to identify the most exact sources of agency costs

**Typology of Agency Models of Corruption, Table 1** The main directions of corrupt behavior modeling

| # | Principal | Agent |
|---|---|---|
| 1. | Bona fide $\succcurlyeq_P = \succcurlyeq_{BP}$ | Bona fide $\succcurlyeq_A = \succcurlyeq_{BP}$ |
| 2. | Bona fide $\succcurlyeq_P = \succcurlyeq_{BP}$ | Mala fide $\succcurlyeq_A \neq \succcurlyeq_{BP}$ |
| 3. | Mala fide $\succcurlyeq_P \neq \succcurlyeq_{BP}$ | Mala fide $\succcurlyeq_A \neq \succcurlyeq_{BP}(\succcurlyeq_A \neq \succcurlyeq_P)$ |
| 4. | Mala fide $\succcurlyeq_P \neq \succcurlyeq_{BP}$ | Mala fide $\succcurlyeq_A \neq \succcurlyeq_{BP}(\succcurlyeq_A = \succcurlyeq_P)$ |
| 5. | Mala fide $\succcurlyeq_P \neq \succcurlyeq_{BP}$ | Bona fide $\succcurlyeq_A = \succcurlyeq_{BP}$ |

and assess their value (Laffont and Tirole 1993; Moszoro Spiller 2012).

## Model of Bureaucratic Corruption

Assume that the law enforcement practice allows us to identify the existence of agents, who violate the rules and, possibly, policy of the regulation: $\succcurlyeq_A \neq \succcurlyeq_P$. They are obviously *mala fide*: $\succcurlyeq_A \neq \succcurlyeq_P \equiv \succcurlyeq_{BP}$. Models based on the assumption of principal's *bona fides* and agent's *mala fides* ($\succcurlyeq_P \equiv \succcurlyeq_{BP}$, $\succcurlyeq_A \neq \succcurlyeq_{BP}$) are called models of bureaucratic or administrative corruption.

Models of bureaucratic corruption are most frequently arisen in the studying of public procurement issues. Actually, in this case, the agent is endowed with a discretionary power and a certain budget to carry out procurement. In this situation, two of the three necessary conditions of corrupt behavior arise (Aidt 2003, F633): the relevant public official possesses the authority to design or administer regulations and policies in a discretionary manner, and this discretionary power can allow him the extraction of existing rents or creation of rents that can be extracted.

In the pioneer research, based on the assumptions of principal's *bona fides* and agent's *mala fides*, Rose-Ackerman examined the situation in which a private individual attempts to corrupt a bureaucrat in order to obtain a government contract (Rose-Ackerman 1975, 187). In this case, the agent is considered as a potential "bribee," and the actual level of corruption is determined by how well the institutions governing the (corruptible) bureaucracy are designed (Aidt 2003, F635).

Modern studies of bureaucratic corruption develop ideas of Rose-Ackerman's paper and are usually associated with the modeling agency costs and/or analysis of the specificity of the asymmetry of information between involved parties (Lambert-Mogiliansky et al. 2007).

The question is, is there some room for bureaucratic corruption in the country's public procurement system? For developing countries, the answer gives the data of Business Environment and Enterprise Performance Survey (BEEPS), a joint initiative of the European Bank for Reconstruction and Development (EBRD) and the World Bank (http://data.worldbank.org/data-catalog/BEEPS).

Let us consider the World Bank data concerning the assessment of countries' corruption level (http://www.enterprisesurveys.org/data/exploretopics/corruption). The data on Russian public procurement corruption, selected from the surveys BEEPS II–BEEPS V, look like as follows.

Thus, the data of Table 2 give the evidence of bureaucratic corruption existence in Russia and, moreover, let to assess the scale of it. The data dynamics is fit with the fact that intense economic reform (in Russia: beginning 1990–beginning 2000) is objectively accompanied by growth of corruption (Huntington 1968, 59).

## The Models with *Mala Fide* Principal

Bureaucratic corruption model implicitly assumes that the political elite has developed regulatory rules relying solely on the interests of its principal, the society. At the same time, consideration of the political elite as an agent hired by the society naturally leads us to perceive politicians as "...maximizing agents who pursue their own selfish interest rather than as benevolent agents seeking to maximize aggregate welfare" (Grossman and Helpman 1994, 48). Corruption, directly related to activities of the political elite, was above called "grand corruption," unlike "petty

**Typology of Agency Models of Corruption, Table 2** The assessment of the corruption level in Russian public procurement

| Economy | Year | Percent of firms expected to give gifts to secure government contract |
|---|---|---|
| All countries | | 26.1 |
| High income: nonOECD | | 10.6 |
| Russian Federation | 2002 | 28.9 |
| Russian Federation | 2005 | 30.1 |
| Russian Federation | 2009 | 47.0 |
| Russian Federation | 2012 | 30.9 |

corruption," which is treated in the bureaucratic model.

Thus, in the model of grand corruption, the principal is *mala fide* ($\succcurlyeq_P \neq \succcurlyeq_{BP}$). There is another source of principal's *mala fides*, his bounded rationality (Simon 1947, xxiv), caused by some specific features of country's institutional environment.

In the modern information-transparent world, the corruption in the public procurement inevitably reflects in the mass media in the form of the numerous corruption cases and creates the demand on the strong anti-corruption policy, which had been formed in Russia by the beginning of 2000. However, due to lack of experience in the public procurement area and weak institute of Regulatory Impact Assessment, Government and Legislator had chosen tools, which are rarely used in international practice; in particular, the electronic price reverse auction was selected as the main procurement method. This selection is against international experience, since Model Law recommends applying electronic reverse auction (hereafter: ERA) to simple and off-the-shelf goods and standardized services only (Guide 2014, 226). Thus, we consider principal as *mala fide* ($\succcurlyeq_P \neq \succcurlyeq_{BP}$) in spite of there are no reasons to suspect grand corruption in ERA promotion.

In the assessment of the legal act, involving the use of regulatory tool for which there is certain enforcement practice, improvement of the regulation rules, and, possibly, regulatory policy is heavily dependent on the specific of agent behavior.

If we reject the assumption of principal's *bona fides*, assume him *mala fide* ($\succcurlyeq_P \neq \succcurlyeq_{BP}$), and continue to consider *mala fide* agent ($\succcurlyeq_A \neq \succcurlyeq_{BP}$), then, depending on whether the agent is prone to break the existing regulation ($\succcurlyeq_A \neq \succcurlyeq_P$) or not ($\succcurlyeq_A \equiv \succcurlyeq_P$), we must distinguish between two types of models.

## Model of Efficient Corruption

In the "queue model" and the "auction model" (Aidt 2003, F634), corrupt bureaucrats try to correct preexisting government failures. In these models, agent's actions violate accepted rules of regulation that allows us to identify differences in preferences of the principal and agent ($\succcurlyeq_A \neq \succcurlyeq_P$) and, correspondingly, the agency problem existence.

The models of this type, based on assumptions of *mala fides* of both a principal and an agent, form the class of "efficient corruption" models ($\succcurlyeq_P \neq \succcurlyeq_{BP}, \succcurlyeq_A \neq \succcurlyeq_{BP}, \succcurlyeq_A \neq \succcurlyeq_P$) (Ibid, F633).

As an example of this kind of corruption, J. Nye viewed corruption of some factory managers in the former Soviet Union, which gave some flexibility to the centralized planning system (Nye 1967, 420), and Laffont and Tirole some instructions of the US Department of Defense (Laffont and Tirole 1993, 476).

It seems that in the case of an efficient corruption, the modeling of agent's behavior must be primarily aimed at the identification and elimination of the sources of regulation's inefficiency and, accordingly, to the conversion of efficient corruption into the bureaucratic one. In this case, the modeling is aimed at a changing of both regulatory legal acts and regulatory policy.

## Model of Totalitarian Corruption

Nevertheless, the principal can create a system of incentives for the agent, which prevents him from any actions in opposition to existing regulation. This model ($\succcurlyeq_P \neq \succcurlyeq_{BP}, \succcurlyeq_A \equiv \succcurlyeq_P$) we suggest to call a model of totalitarian corruption.

After the theoretical background of totalitarian corruption had been discovered, the case of it was found in the Russian regulation of single-source procurement. Following the Model Law propositions, the modern Russian public procurement law – Federal Law #44 "On the contract system in the procurement of goods, works and services for state and municipal needs," which came into force from 2014 – permits single-source procurement for small contracts (up to 100,000 rubles, 1 ruble is about US $0.015 on July 2017) but only if the total amount of such purchasing is not more than 2,000,000 rubles.

Thus, the contracting authority that has spent the quota and need to buy something very cheap has to apply open tender (ERA or contest) to do it. And actually, the Russian unified information system in the field of procurement gives many examples of very small purchasing by means of the ERA, including contracts for one ruble! In this case, the principal is obviously *mala fide* and agent *mala fide* too, because she has no chance to avoid of open tender providing.

Thus, in the case of a totalitarian corruption, the modeling is aimed at the identifying of what underlies the ineffective regulation: grand corruption (Jain 2001, 73–74) or bounded rationality. It should result in a changing of regulatory policy and practices of regulation, especially in terms of the expansion of discretionary powers and responsibilities of agents.

## Quasi-Corruption Model

Let us consider the last model from Table 1 (#5), which is based on the assumptions of principal's *mala fides* and agent's *bona fides* ($\succcurlyeq_P \neq \succcurlyeq_{BP}$, $\succcurlyeq_A \equiv \succcurlyeq_{BP}$).

**Definition 2** Bona fide agent's actions violating the rules of regulation created by the *mala fide* principal will be called quasi-corrupt behavior. The model, which examines bona fide agent's behavior in institutional conditions created by *mala fide* principal, will be called quasi-corruption model.

It follows from the Definition 2 that in conditions of quasi-corruption agents have discretionary power broader than in totalitarian case. Therefore, analysis of the applying of this power may enable us to determine the main directions of the changing of regulatory policy and, respectively, regulation rules.

The question is how it is possible to identify fact of quasi-corrupt behavior. Actually, the quasi-corruption model was constructed on the survey of Russian public procurement in 2011.

In the Russian Federation in 2011, the open outcry auctions were replaced completely with ERA for the all types of public procurement bodies. The government was convinced that applying e-auctions would help suppliers to become involved in the procurement process, to ensure reducing corruption, and to hinder the possibility of collusion by suppliers, which would subsequently lead to improved competition in auctions and increase the size of price reductions.

However, the reaction of the system was unpredictable: the competition in auctions had significantly decreased, and, moreover, according to the data of the Federal Antimonopoly Service, at least 60% of e-auctions in that period did not take place due to the receiving of one bid only.

Thus, the sharp decline in competition in auctions and the significant number of failed auctions cannot be explained by anything other than unscrupulous actions by public buyers restricting competition in favor of a preselected "favorite."

At the same time, the different surveys, including the BEEPS survey, showed that the level of corruption in the Russian Federation, in total, and in public procurement, in particular, was significantly lower (Table 2). One possible hypothesis for explaining identified inconsistencies involves assuming the existence of "quasi-corrupt" behavior of the contracting authority. In this hypothesis, competition may be restricted by both, the *mala fide* and bona fide public buyers, to avoid of attributive auction risks (Ivanov 2015). The first seeks to obtain bribes (efficient corruption); the second tries to obtain effectiveness in public procurement (quasi-corruption).

## Conclusion

As it was mentioned above, A. Jain, trying to develop the typology of corruption models, offers to dispose the cases of corrupt behavior in between bureaucratic corruption and grand corruption – two extreme forms, restricting the scale of corruption activity. We have seen that this linear approach is not quite satisfied for constructing the typology due to, in particular, different forms of models connected with grand corruption.

The introduction of quasi- and totalitarian corruption models allows us to complete the construction of a typology of corrupt behavior

**Typology of Agency Models of Corruption, Table 3** The typology of agency models of corruption

| # | Principal | Agent | Model title |
|---|---|---|---|
| 1. | Bona fide $\succcurlyeq_P = \succcurlyeq_{BP}$ | Bona fide $\succcurlyeq_A = \succcurlyeq_{BP}$ | Conflict-free model |
| 2. | Bona fide $\succcurlyeq_P = \succcurlyeq_{BP}$ | Mala fide $\succcurlyeq_A \neq \succcurlyeq_{BP}$ | Bureaucratic corruption |
| 3. | Mala fide $\succcurlyeq_P \neq \succcurlyeq_{BP}$ | Mala fide $\succcurlyeq_A \neq \succcurlyeq_{BP}$ ($\succcurlyeq_A \neq \succcurlyeq_P$) | Efficient corruption |
| 4. | Mala fide $\succcurlyeq_P \neq \succcurlyeq_{BP}$ | Mala fide $\succcurlyeq_A \neq \succcurlyeq_{BP}$ ($\succcurlyeq_A = \succcurlyeq_P$) | Totalitarian corruption |
| 5. | Mala fide $\succcurlyeq_P \neq \succcurlyeq_{BP}$ | Bona fide $\succcurlyeq_A = \succcurlyeq_{BP}$ | Quasi-corruption |

models, which is based on the methodology of the agency relationships (Table 3).

In the paper, we have complemented grand corruption as the source of inefficient regulation with the bounded rationality and demonstrated that based on the agents' reaction, grand corruption (and bounded rationality as well) can bring one of the three corruption forms: efficient, totalitarian, or quasi-corruption.

On the one hand, the introduced typology let us construct a corresponding public policy aimed at the prevention of some type of corruption and substitution of some types of corruption with other ones. On the other hand, the introduced corruption models (quasi-corruption and totalitarian corruption) point out the new area of corrupt behavior examining and give us the chance to forecast the consequences of public policy and regulation improvement in a more detailed way.

## Uncertainty in Crisis Management

Thomas W. Haase
Department of Political Science, Sam Houston State University, Huntsville, TX, USA

### Synonyms

Naturalistic models of decision-making; Participative decision-making and crisis management; Policy making and crisis management; Rational model of decision-making

### Definition

Uncertainty is a sense of doubt that inhibits a decision-maker from acting.

### Introduction

A crisis is an event that poses a "serious threat to the basic structure or the fundamental values and norms of a system, which under time pressures and highly uncertain circumstances necessitates making critical decisions" (Rosenthal et al. 1989, 10). During such events, public administrators must be aware of, and seek to reduce or manage, the uncertainties present in their operational environment. While the meaning of uncertainty has been explored in fields such as mathematics, economics, statistics, and philosophy, decision-making and organizational theorists define uncertainty as a sense of doubt that blocks or delays action (Lipshitz and Strauss 1997). This definition frames the subsequent discussion of uncertainty.

To ensure clarity, a distinction must be made between the concepts of uncertainty and complexity. Complexity relates to the characteristics of a system and its components and subcomponents. By way of example, complexity can refer to the number of actors in a system, the way these actors are organized, and the number and nature of the interactions exchanged among these actors. In contrast, uncertainty does not relate to a system's characteristics or behavior but, rather, to a specific level or state of knowledge.

The sections that follow begin with an overview of the sources of uncertainty, which can stem from the characteristics of the problem under consideration, the availability and characteristics of the information connected to the problem, or both. The focus then shifts to the types (or dimensions) of uncertainty that exist in a decision-making environment: objective uncertainty and perceived uncertainty. Finally, references will be made to the rational and naturalistic decision-making literatures, which provide insights into how decision-makers might manage uncertainty.

## Sources of Uncertainty

The presence of uncertainty in decision-making situations is often attributed to problems of information quantity and quality. Lipshitz and Strauss (1997) identified three specific information problems that can constrain decision-makers. One problem is the lack of information. This constraint occurs when a decision-maker does not have any information or when a decision-maker has incomplete information. The two other problems relate to issues of information quality. For instance, the information possessed by a decision-maker could be ambiguous. This ambiguity means that a decision-maker has information, but the information causes the decision-maker to become overwhelmed by the "abundance of conflicting meanings that [the information] conveys" (Lipshitz and Strauss 1997, 151). Alternatively, a decision-maker could hesitate to act because the available information has created a conflict. In such instances, the uncertainty is not caused by the presence of multiple meanings, but rather, by the presence of information that provides the decision-maker with multiple, and equally attractive or unattractive, alternatives (Lipshitz and Strauss 1997, 151). The uncertainties caused by problems of information quantity and quality can inhibit decision-makers from taking action, whether as individuals, as managers of an organization, or as members of an organizational network.

## Types of Uncertainty

A separate line of inquiry considers the types, or dimensions, of uncertainty that occur in decision-making situations. Scholars involved in this line of inquiry suggest that there are two categories of uncertainty, objective and perceived, both of which relate to a decision-maker's relationship with the operational environment. Scholars who focus on objective uncertainty consider uncertainty to be an intrinsic property of the operational environment. Robert Duncan (1972, 317), for example, suggests that environmental uncertainty can be conceptualized as three different problems. The first problem is that decision-makers are not able to predict the outcome of a certain event. The second problem is that decision-makers do not have sufficient information to generate conclusions about cause and effect relationships. The third problem is that decision-makers cannot assign probabilities to events that will happen in the future. Although they approach the problem of uncertainty differently, these conceptualizations are unified in that the source of the uncertainty is both objective and outside the direct control of the decision-maker.

The second category of uncertainty is called perceived environmental uncertainty. Scholars who fall into this category consider environmental uncertainty to be contextual, meaning that uncertainty is a result of the subjective perceptions of individual decision-makers. Frances Milliken (1987) suggests that a decision-maker can experience three types of perceived environmental uncertainty. The first is state uncertainty, which occurs when a decision-maker perceives some part of the operational environment to be uncertain. This situation can occur when a decision-maker does not understand the actions taken by others or, more broadly, when a decision-maker does not understand that the operational environment has begun to shift from one state to another. The second is effect uncertainty, which refers to a decision-maker's inability to predict how an event or shift in the environment will affect his own organization. As suggested by Milliken (1987, 137), while one might know that a hurricane is approaching his home, this does not mean that he knows exactly how that hurricane will affect his specific home. The third is response uncertainty, which Milliken (1987, 137) refers to as "a lack of knowledge of response operations and/or an inability to predict the likely consequences of a response choice." In such cases, a decision-maker may not understand what should be done during a crisis, or they may not understand the "value or utility" of the available response options.

The preceding discussion focused on decision-making and perceived uncertainty at the individual and organizational levels. There also scholars who investigate decision-making and perceived uncertainty in networked systems. In a networked

system, decision-makers can adopt different frames of reference as they work, both individually and collectively, to interpret and respond to problems. Joop Koppenjan and Erik-Hans Klijn (2004, 37) argue that the emergence of such divergent frames of reference is the result of "an excess of ambiguity." This ambiguity can become problematic for decision-makers who must address wicked social problems, which are problems that are complex, technically complicated, and cross-jurisdictional and sectoral boundaries. For example, in a crisis management or disaster response system, which is comprised of a collection of decision-makers who have to operate as a networked system that crosses jurisdictional boundaries, an excess of ambiguity can create uncertainties that inhibit or constrain collective action. In such circumstances, decision-makers may disagree about the nature of a problem, the means that are available to solve a problem, and their desired or expected outcomes. Regardless of how a problem is framed, decision-makers can also deviate from each other in terms of how they perceive the status or adequacy of the information and knowledge that is generated about a problem. When a network of individual decision-makers encounter ambiguities such as these, they can end up participating in a never-ending series of asymmetric debates about a problem's source, nature, and solution (Koppenjan and Klijn 2004, 37).

The distinction between objective and perceived environmental uncertainty enables decision-makers to understand the source of doubt that has blocked or delayed their action. By extension, this distinction also suggests that decision-makers may be able to manage or avoid some types of uncertainty, especially during periods of stability. This distinction, however, provides decision-makers with little insight into how they might manage uncertainty.

## Management of Uncertainty

In the crisis management context, decision-makers must protect the structures, values, and norms of the system that has come under threat. Whether acting individually or collectively, decision-makers must not only recognize that uncertainties may exist, they must also take steps to reduce or eliminate the uncertainties that might block or delay their ability to act. To this end, scholars have explored the strategies that decision-makers use to manage conditions of uncertainty. Although the strategies discussed below are directed toward the sources of uncertainty, they may also be instructive for the management of both objective and perceived environmental uncertainty.

## The Rational Model

Decision makers could use the rational model of decision. Making to manage uncertain conditions during a crisis situation. The rational model of decision-making suggests that an appropriate decision can be reached by those who follow a sequence of established steps. These steps include identifying the problem, collecting all relevant information, establishing a decision criterion, developing a comprehensive set of alternatives, and choosing the alternative that maximizes utility (Lindblom 1959). Despite being the touchstone for the analysis of economic and social problems, the utility of the rational model of decision-making has been called into question.

Herbert Simon, a prominent critic of the rational model of decision-making, argued that the rational model has three limitations. According to Simon (1997, 93–97), the model was built upon the assumption that decision-makers operate in conditions where information is complete and attainable. Simon further noted that the model assumes that decision-makers will be able to develop a comprehensive set of alternatives and that decision-makers will be able to accurately anticipate their future preferences and the consequences of their choices. Recognizing that the assumptions of the rational model would be difficult, if not impossible, to meet in the real world, Simon maintained that decision-makers operate according to the principles of bounded rationality, meaning their decision-making processes are bounded by their cognitive limitations and the

constraints present in the decision-making environment. In making this argument, Simon does not suggest that decision-makers make irrational decisions, but rather, they satisfice (Decision-makers that satisfice take into consideration only those factors that are relevant and crucial to the problem at hand and then select the best of the available alternatives (Simon 1997, 119)) by selecting a course of action that is "good enough" for the circumstances (Simon 1997, 119).

## Naturalistic Models

Building upon Herbert Simon's insights, other scholars developed naturalistic models of decision-making, which describe how decisions are made in real-world contexts. The naturalistic models of decision-making have been used to explore the decision-making processes of individuals (Klein 1998), teams (Weick 1993), organizations (Weick and Sutcliffe 2001), and systems (Hutchins 1995). While the naturalistic models differ in terms of their specific areas of attention, they are unified in that they seek to specify how decision-makers navigate uncertain and high-risk situations.

As an illustration, Lipshitz and Strauss (1997, 156–157) indicate that decision-makers use five strategies to cope with uncertainty. These strategies are employed by decision-makers in response to the type of uncertainty that is encountered. For instance, if the uncertainty relates to a lack of information, decision-makers use assumption-based reasoning and rely on their mental models about the situation, which can evolve after a shift in assumptions or the discovery of new information. If the uncertainty relates to the lack of understanding, decisions-makers reduce the uncertainty by searching for new information, soliciting advice, or following standard operational procedures. If the uncertainty relates to a conflict among alternatives, decision-makers weigh the pros and cons of their potential decision, seeking to evaluate the gains and losses connected to a course of action. In response to all three types of uncertainties, decision-makers may also choose to use forestalling or suppression strategies. To forestall uncertainty, a decision-maker will delay action until additional information clarifies the situation. To suppress uncertainty, decision-makers will ignore the uncertainty, act on intuition, or gamble that their choice of action is the correct choice. While not comprehensive, these five strategies may provide decision-makers who encounter uncertainty the ability to overcome the sense of doubt that can block or delay action.

## Conclusion

The decision-makers responsible for the management of a crisis event must have the capacity to take the rapid and effective action that is needed to save lives, protect critical infrastructure, and bring the crisis to an acceptable resolution. The ability of decision-makers to take such actions, however, can be blocked or delayed by uncertainty (Lipshitz and Strauss 1997). The uncertainties that occur during crisis management situations can come from a variety of sources, including the lack of information, ambiguous information, the inability to predict outcomes, the inability to generate conclusions about cause and effect relationships, and perceptional disagreements about social problems and information adequacy.

During a crisis, a decision-maker should neither ignore these sources of uncertainty nor succumb to the consequences of uncertainty. Rather, a decision-maker should face the uncertainty that exists within their operational environment and, by extension, take steps to eliminate or manage this uncertainty. As an initial step, a decision-maker must improve their awareness of the situation by identifying the source and type of the uncertainty that inhibits their ability to act. Once the source and type of uncertainty are identified, a decision-maker can then adopt a strategy that will help them to manage the uncertainty. These strategies can include satisficing, the reduction of uncertainty, the acknowledgment of uncertainty, and the suppression of uncertainty. The use of these strategies does not guarantee that all uncertainty will be eliminated or that a crisis will be brought to an acceptable resolution. What these strategies can do, however, is help a decision-

maker involved in the management of a crisis to overcome, or at least reduce, the sense of doubt that can block or delay their ability to act when their actions are needed most.

# Uncertainty Management

Michael W. Kramer
University of Oklahoma, Norman, OK, USA

## Synonyms

Ambiguity; Equivocality; Meaning-making; Sensemaking

## Definition

Uncertainty management is the process by which individuals create meaning or understanding in situations in which something unpredictable, unusual, unexpected, or out of the ordinary occurs and when there is a need to determine the appropriate meaning.

## Introduction

Employees and volunteers in nonprofit organizations frequently experience uncertainty. They experience uncertainty when something unpredictable, unusual, unexpected, or out of the ordinary occurs. Uncertainty management is the process by which an organization's members create meanings in situations involving uncertainty and when there is a need to determine what course of action to take in response to the uncertainty. To understand uncertainty management, this entry begins with a brief explanation of the concepts of uncertainty reduction and uncertainty management. Then it focuses primarily on uncertainty management from the perspective of individuals by exploring how organizational members, including volunteers and employees, experience and manage uncertainty about aspects of their work. Then it briefly examines how decision makers in nonprofit organizations experience uncertainty about the environment and their relationships to others.

## Uncertainty Reduction and Uncertainty Management

The study of uncertainty as a personal experience began in interpersonal communication research. The seminal study in this area focused on how individuals responded to the uncertainty they experienced when they met someone new. According to the initial theoretical conceptualizations of uncertainty reduction theory (URT), when faced with uncertainty, individuals are motivated to seek information to reduce uncertainty, and then as their uncertainty decreases, their liking

increases (Berger and Calabrese 1975). So for example, when an employee of a nonprofit organization meets a new volunteer for the first time, the employee experiences uncertainty about the new volunteer and will be motivated to seek information about that volunteer. Then the employee will like the new volunteer more as uncertainty is reduced by gaining additional information about the volunteer. As research on URT accumulated, a number of adjustments were made to the initial theory when it became apparent that individuals are not always motivated to seek information in the face of uncertainty and that information seeking can actually result in an increase in uncertainty and reductions in liking. Recent, comprehensive summaries of the interpersonal research on uncertainty exist elsewhere.

Given the accumulative evidence regarding URT, research on uncertainty management has focused on the various ways in which individuals may potentially respond to uncertainty. For example, research in health contexts found that patients faced with uncertainty about their health-related conditions did not always seek information. In some instances, patients actually avoided new information that could confirm or disconfirm their diagnosis because reducing their uncertainty about their illness could prevent them from being hopeful and make it impossible to deny their situations (Brashers 2001). This and other research illustrated that people may prefer to maintain their current level of uncertainty, or even increase uncertainty, rather than reduce it. For example, a hospice volunteer may choose not to seek updated information about a patient because maintaining rather than reducing uncertainty about the patient's prognosis allows the volunteer to remain positive in interactions with the patient and family members.

Various forms of uncertainty management theory (UMT) have contributed to developing an understanding of how individuals manage uncertainty rather than seeking information in order to reduce it. There is evidence that individuals frequently manage their uncertainty by employing various internal cognitive processes without seeking new information (Kramer 2004). For example, a volunteer may deny that the uncertainty exists by thinking "I can figure this procedure out on my own." Another volunteer may simply tolerate or accept the uncertainty as inevitable by assuming that "no one else knows when we will get a new volunteer coordinator, so why ask?" Alternatively, a volunteer may manage the uncertainty by comparing it to previous experience and think, "since we handled this problem in a particular way at my last place, this is probably how I should handle it here." Finally, volunteers may imagine the information they will likely receive if they seek information, such as, "I'm sure the volunteer coordinator would tell me to do it this way." Accordingly, individuals often persist in managing uncertainty without attempting to obtain any new information about the uncertainty in a situation, even though their efforts to manage the uncertainty may be based on inaccurate assumptions or thoughts.

According to UMT, even when an individual is initially motivated to seek information, several factors may prevent them from following through. Research found that an individual's motivation to pursue new information depends on their awareness and interpretation, of the discrepancy between the amount of uncertainty they are actually experiencing and the amount of uncertainty they are willing to tolerate (Afifi and Weiner 2004). As such, individuals consider the cost and efficacy of seeking information and compare that to the potential benefits. Thus, in many situations, a nonprofit employee may simply accept the level of uncertainty they are experiencing if the employee believes either that it will require too much effort to obtain the necessary information or that they are not likely to find useful information despite their efforts. There are other competing motivations such as impression management or social appropriateness that may also supersede efforts to reduce uncertainty through information gathering (Kramer 2004). For example, experienced volunteers may be embarrassed to ask about something that they think they would be expected to already know or have learned, causing them not to ask out of a fear of appearing incompetent. An employee may feel that asking for certain information should be done privately, so it is inappropriate to request the information in

front of the volunteers at a meeting and so fail to seek information.

In sum, when employees and volunteers experience uncertainty as part of their involvement in nonprofit organizations, they are often motivated to manage, rather than reduce, that uncertainty. Unlike initial conceptualizations of URT which suggested that they would always seek new information to directly confront uncertainty, UMT suggests that people are often inclined to manage their uncertainty using internal cognitive processes. If those cognitive processes are unsuccessful in reducing their uncertainty, they still may not seek information due to the perceived costs and benefits of seeking information, impression management concerns, or the social inappropriateness of seeking information. Balancing these various choices and goals makes managing uncertainty a complex problem for organizational members.

## Uncertainty at the Individual Level in Nonprofit Organizations

Much of the exploration of how organizational members manage uncertainty has focused on new members whether they are volunteers or employees. The research has helped to identify and categorize different types of uncertainty individual experiences, strategies, and sources for seeking information to reduce uncertainty and important outcomes related to managing uncertainty. These efforts have expanded to include investigations into how more experienced or established organizational members manage uncertainty.

**Types of Uncertainty** New employees and volunteers experience various types of uncertainty. In an effort to reduce these to a manageable level, these are categorized into four main types of uncertainty newcomer's face including task, relational, organizational, and power uncertainty (Kramer (2010). *Task uncertainty* concerns knowing what one's job duties and how to complete them. For example, new traveler's aid volunteers at an airport information desk needed to learn the information about the airport and the proper way to answer questions from airport patrons (McComb 1995). *Relational uncertainty* addresses developing and maintaining relationships with other organization members, and possibly customers or clients as well. For example, volunteers working with at-risk youths have to develop relationships with each other but also had to determine the appropriate relationship to have with the youth they serve (Haski-Leventhal and Bargal 2008). *Organizational uncertainty* involves knowing and understanding the organization's culture and norms. For example, new community choir volunteers needed to understand the rehearsal and performance norms to reduce their anxiety about preparing for their first concert (Kramer 2011). Finally, *power or political uncertainty* relates to understanding who is in charge and who has real influence in the organization. For example, volunteers in human services nonprofits were unclear which organizational policies and directives the leaders mentioned needed to be followed closely and which could be ignored because there was no real power behind them (McAllum 2013). Taken together, it is clear that nonprofit employees and volunteers experience a great deal of uncertainty about tasks, relationships, the organization, and power within the organization. To manage their uncertainty, they rely on certain information-seeking strategies and a range of communication sources.

**Information-Seeking Strategies** Employees and volunteers have a variety of strategies at their disposal when seeking new information to alleviate uncertainty. These strategies include asking overt questions, employing indirect inquiry, resorting to third-party inquiry, observing for specific information, surveying for general information, and testing (Miller and Jablin 1991).

When asking *overt questions*, an individual makes a direct request for information to the source of uncertainty. For example, an employee or volunteer could ask a supervisor in the nonprofit organization, "how often should I report to you about my progress on this job?" This direct approach should result in the maximum amount of uncertainty reduction, assuming the supervisor

does not provide an ambiguous answer, but it also involves the greatest potential for losing face if the supervisor believes this information has been given out previously.

Two somewhat similar strategies are *indirect inquiry* and *disguising conversations*. In indirect inquiry, a volunteer might ask at supervisor a non-interrogative question like, "I keep wondering if I should report to you more than once a week." In disguising conversation, the volunteer only hints at a question. The volunteer might say, "the last place I volunteered, I reported my progress to my supervisor only after I completed a job." Both of these strategies involve interacting with the source of uncertainty, the supervisor in this example. Both of them allow the volunteer and supervisor to do some impression management because neither demands a response. Of course, because they do not demand a response, it is possible that the volunteer will not receive information to reduce uncertainty.

Two alternatives to interacting with the source of uncertainty involve *third-party inquiry* or *alternative source inquiry*. Third-party inquiry involves asking someone other than the source of uncertainty for information. For example, the volunteer could ask another volunteer, "how often do you think should I report to my supervisor about my progress." Of course, there is the possibility that the third party may provide incorrect information. The advent of technology has made alternate source inquiry an increasingly viable option for obtaining information. Volunteer and employee handbooks are more readily available online, making it possible for a volunteer to search one of these alternative sources instead of interacting with anyone to reduce uncertainty. If the information is available, it may describe the formal practices of the organization, but not the informal norms.

Two other alternative information-seeking strategies do not involve direct interaction with the sources of uncertainty. *Observing* involves watching the source of uncertainty for information. For example, a volunteer may watch to see if the supervisor responds to text messages while at work to determine the norm for cell phone use. *Surveillance* involves watching for information without any specific purpose. A volunteer may notice rather accidently that all the volunteers leave about 15 min before they are scheduled to end their shifts and conclude that it represents the norm of the organization. In both of these situations, there is no real cost to seeking the information, but there is a risk that the information gained is incorrect because it represents an exception rather than the norm.

The final strategy, *testing*, is the least commonly used strategy for obtaining information. *Testing* involves trying to intentionally break organizational norms in order to gain information. For example, a nonprofit employee might be uncertain about the time allowed for lunch even after observing other employees for a number of weeks. Using a testing strategy, the employee could first take a 45-minute lunch. If no one comments on this, the employee could try a 60-minute lunch. If no one says anything, the employee could try a 70-minute lunch. If that results in negative comments or reprimands, the employee learns that 60 minute for lunch is acceptable, but beyond that it is a problem. Volunteers could use a similar strategy. Of course, the potential consequences for a volunteer using this strategy are limited compared to an employee who could be in trouble for violating the rules of employment.

Together these strategies for information seeking provide a wide variety of methods for gaining information for managing uncertainty. Depending on the importance of gaining accurate or complete information and various competing motives, like impression management and costs, different strategies are more advantageous than other.

**Information Sources** In addition to a variety of strategies for seeking information, researchers have identified a variety of sources of information that employees consult. The most common sources are workgroup members including supervisors, peers, and even subordinates for those in supervisory roles as employees or volunteers. These individuals are easy to approach due to their proximity, but there are greater potential costs or impression management concerns if they think that the person should already know the information. In addition to workgroup members, volunteers and employees may consult other organizational members such as a trusted mentor or

staff member. Because they are not directly related to the workgroup, there are fewer impression management concerns, but the individuals may not have information that is accurate. The remaining options are all external to the organization, so there may be little concern over asking for information. In some cases, they may provide better information, but they may also be uninformed. They may also consult with individuals associated with the organization such as customers, suppliers, or clients. Family members and friends can also provide information, if, for example, the uncertainty is about an interpersonal conflict between volunteers. Given the multitude of potential sources, the employee or volunteer may choose to consult more than one source, and the choice of those sources may depend on the likelihood of gaining accurate information and the costs involved in being vulnerable by asking.

**Outcomes of Uncertainty Management** The research findings for uncertainty management are fairly consistent. In the case of new employees, managing uncertainty by acquiring information is associated with various positive outcomes. For examples, newcomers who reduce their uncertainty are more satisfied, more knowledgeable, and more likely to remain in their organizations (Kramer 2010). Women entering male-dominated occupations who are involved in acquiring information through overt requests, third-party inquiries, and indirect inquiries experience more role clarity (Holder 1996). Volunteers in a community choir who manage their task and relational uncertainty are more satisfied with their participation, identify more with the choir, and are more likely to recruit other choir members and invite people to concerts (Kramer et al. 2013). Overall, then, managing uncertainty is associated with positive outcomes for employees and volunteers.

**Uncertainty Management and Experienced Employees** Although the previous sections focus on the uncertainty management of newcomers, it should be apparent that employees and volunteers must manage their uncertainty throughout their time in their organizations. For example, they experience task uncertainty when their duties change, relational uncertainty when there are personnel changes around them, organizational uncertainty when aspects of the organization's structure or culture change, or political uncertainty when the people in powerful positions change positions or behaviors. Two less obvious areas of uncertainty for experienced organizational members have received particular attention.

Volunteers turnover at an estimated rate of 20–40% per year. This high turnover rate leads to two special cases of uncertainty for established employees and volunteers. First, because volunteers are not necessarily replaced immediately, if at all, their departure creates uncertainty as the established employees and volunteers consider how this change will affect them. For example, even though they felt understaffed before a volunteer quits, they may be expected to take on additional duties to cover for the individual's departure. If the person leaving had supervisory roles, it may create opportunities to move up in the organization's hierarchy, or it may mean adjusting to a new supervisor. These are just some of the uncertainties that the departure of a volunteer or employee create for others.

When replacements are found, those newcomers are also sources of uncertainty for experienced employees and volunteers. They experience uncertainty concerning the newcomers' backgrounds and skills, the ways which the newcomers' work habits will influence their own job duties, as well as the type of relationships they will have with the newcomers (Gallagher and Sias 2009). The high turnover rate of volunteers means that experienced employees and volunteers in most nonprofit organization are routinely managing their uncertainty due to the departure of volunteers and then the arrival of new ones taking their positions in their organizations.

## Uncertainty at the Group or Organizational Level in Nonprofit Organizations

Whereas the previous discussion has focused the ways that individual employees or volunteers may

experience and manage their uncertainty as members of nonprofit organizations, uncertainty is also felt collectively, particularly by decision makers at the group or organizational level. Groups in organizations experience uncertainty concerning the resources available to them and their relationships to other groups they work with interdependently among other uncertainties. Group leaders can assist in managing these uncertainties. Leaders can serve as boundary spanners to other groups or organizations, can serve as representatives of the group who shape and mold how those outside the group view it, can coordinate and negotiate resources with others, and can filter information that may unnecessarily increase group members' uncertainty or by providing information to reduce their uncertainty (Ancona and Caldwell 1992).

At the organizational level, nonprofits, like for-profit businesses, face an uncertain environment where it can be difficult to accurately access the available resources, as well as the short-term and long-term effects of various decisions. In the same way that group leaders serve as boundary spanners within the organization, organizational leaders assist in managing uncertainty for the organization by serving as boundary spanners to the larger environment. A common way for leaders to manage uncertainty in this larger environment is to develop collaborations with other nonprofits to create access to additional resources and coordinate activities with funding agencies and other nonprofits (Guo and Acar 2005). Uncertainty management at the organizational level involves broader concerns than at the individual level but still involves gathering and understanding information.

## Conclusion

Managing uncertainty is a nearly constant concern for employees and volunteers of nonprofits. They routinely experience uncertainty about the roles, their relationships to others including power, their organization, their relationship to other groups within the organization, and their relationship to the environment beyond their organization. Rather than always trying to reduce uncertainty, they attempt to manage their uncertainty to acceptable levels by seeking information through a range of strategies from a variety of sources. New and established employees and volunteers who are able to manage their uncertainty are more likely to be satisfied with their participation in the organization and remain in their positions. As organizational members leave and are replaced by others, established employees and volunteers continue the need to manage their uncertainty as they adjust to a changing organization. Group leaders and organizational leaders must also manage uncertainty between groups within the organization and with other organizations.

# Unconditional Transfers and Fiscal Autonomy

Rogelio Alicor L. Panao
Department of Political Science, University of the Philippines Diliman, Metro Manila, Philippines

## Synonyms

Central-to-local subsidy; Fiscal decentralization; Fiscal grants; Fiscal transfers; Intergovernmental grants; Intergovernmental transfers; Internal Revenue Allotment (IRA); Public transfers

## Introduction

Intergovernmental transfers supposedly usher development and address fiscal imbalance in favor of under-resourced local governments. When transfers are unconditional, however, what happens to fiscal autonomy? Does it have any bearing on social expenditure?

Most policy debates on decentralization focus their attention on issues such as efficiency and governance and only slightly on the contextual and institutional features of decentralization policies that affect developmental outcomes. There may be a need, however, to reexamine the debate as more and more governments in fledgling democracies deliberate on the most suitable system of transferring authority and responsibility for the delivery of public goods to citizens. In the Philippines, for example, the question of whether there is need to adopt a federal form of government almost inevitably accompanies any discourse on regional inequality and ethno-religious conflicts. This is in spite of local autonomy being constitutionally guaranteed and decentralization having been statutorily enshrined as early as 1991.

As contribution to the literature on decentralization and public administration theory and practice, this entry underscores both the ambivalence of fiscal transfers as vector of fiscal governance and the inclination in developing economies toward transfer dependency. The analysis focuses mainly on the Philippines, but the findings can well apply to any developing economy that is democratizing, or with at least a quasi-democracy as a defining feature of the political system.

Overall, this short piece gives a brief empirical validation of apprehensions raised against unconditional transfers as mode of fiscal decentralization. It proceeds as follows. First, a short glossary is introduced for some of the most important concepts readers will encounter all throughout. This is followed by a short overview of the theoretical motivations behind intergovernmental transfers and whether or not these are supported in the literature. Afterward, the piece gives a brief comparison of transfers and revenue decentralization as fiscal devices and their respective effects on subnational expenditure. The article then proceeds to discuss the limitations of transfers as a mode of fiscal decentralization in developing countries, citing the experience of the Philippines as case. Unconditional fiscal transfers in the Philippines are shown to produce at least two undesirable outcomes. First, it gives local governments

a disincentive to improve local revenue generation, consequently making them overly reliant on central government for expenditure financing. Second, local governments which are more dependent on central government grants also tend to spend less on social expenditures, suggesting that the unconditional nature of transfers dilutes electoral accountability and has welfare consequences. The article concludes by reiterating the important observations and their implications on local governance.

## Definitions

We first define key concepts which will appear throughout the discussion.

**Local fiscal autonomy** refers to the capacity of subsidiary government units to create sources of revenue independent of central government infusion, as well as to decide on expenditure policies without need for central government's authorization. A broader term is fiscal decentralization, which contemplates a governance setup in which some responsibilities for expenditure and revenue are shifted to lower tiers of government. In this entry, both fiscal autonomy and fiscal decentralization are taken as synonymous. Fiscal autonomy has become a defining feature of legislative reforms in many parts of the world in order to reduce the situation in which revenues do not match expenditures at the local level. Fiscal autonomy is also thought to enhance the delivery of public services and make politicians more responsive to the needs of the citizens. In practice, however, complete fiscal autonomy is illusory, and subsidiary governments normally do not operate solely on the basis of locally generated income. In the experience of many countries, local fiscal autonomy is effected through a system where the central government subsidizes expenditures and finance local programs through intergovernmental transfers.

**Intergovernmental transfers or grants**, on the other hand, refer to any resource flow from one level of government to another, including, but not limited to, a portion of national tax collections shared by a central government authority to local governments (e.g., provinces, cities, or municipalities). These grants can be thought of as a compromise between revenue powers and expenditure responsibility. The central government authority would have the prerogative to keep on levying key tax bases but guarantee subsidiary units their reasonable share in the collection.

**Social expenditure**, meanwhile, refers to redistributive allocations intended to have substantial direct or indirect benefits across households in a locality. This can be construed as the amount of resources in money terms committed to policies or programs related to education, culture and sports, manpower development, health and population control, labor and employment, housing and community development, and social services and welfare.

**Local revenue generation** is the capacity of subsidiary governments to raise their own sources of income. Revenue-generating capacity is an important indicator of fiscal autonomy in both developed and developing countries. Usually, this is effected through policies that allow taxing powers for municipalities so they can fund public services such as local kindergartens, public parks, and garbage collection. Taxes can come in many forms including levies on property, sales, licenses, and, in some cases, even income.

**Local development** refers to the use of resources and the endogenous potentialities of a community, city, or locality through the provision of local infrastructure and the delivery of public goods or services.

Typically, there is disparity in the capacity of subsidiary government units at various levels and across regimes to produce infrastructure and services necessary for productive inputs. As such, grants have become familiar to almost all countries with a multi-layered government structure as a means of stabilizing and equalizing the provision of public services. In advanced economies such as those in the OECD, for instance,

intergovernmental grants are used to transfer money from national to subnational governments and practically finance about a third of subnational expenditures (Broadway and Shah 2009). Central government grants given to local governments, such as fiscal transfers, for instance, are known to address intergovernmental mismatch by subsidizing the revenue-generating process and equalizing the challenge of meeting basic national priorities at the local level (Kim and Smoke 2002). Be that as it may, many studies raise attendant problems that come with this, such as distributional inequality, inefficiency in tax administration, and a subsidy-dependency effect among recipient subsidiary governments.

## Do Intergovernmental Transfers Work?

Theoretically, there are important motivations for why governments ought to consider transfers as fiscal device. The most immediate is to ensure vertical balance, that is, to use transfers to fill the gap between what is available as revenue for subnational governments and their actual expenditure needs. Because expenditure needs can be practically limitless, the amount of intergovernmental transfer is usually based on a designated minimum, central budget constraint, or a fixed formula as in the Philippines. Equity is another consideration, especially where there is wide disparity in the economic and human resource makeup of component municipalities. Naturally, municipalities that are less endowed cannot be expected to provide public goods at the same level and magnitude as its more affluent neighbors. Transfers are also used to offset the externalities that result when fiscally autonomous subnational governments underspend on policies that are generally desirable (e.g., spending on health, education, and the environment). Supposedly grants, especially when they are conditioned to target specific social expenditures, can guarantee spending for these important policies. Administrative efficiency is another reason for the inclination toward intergovernmental transfers as a mode to effect fiscal decentralization. According to this view, it is more efficient for central governments equipped with better administrative capacity to simply collect taxes and then distribute the revenues to local governments through transfers.

Whether or not these outcomes are achieved in practice though is another story. Empirical evidence based on the experiences of several countries seem to indicate that the relationship between fiscal transfers and their developmental objectives is inconclusive at best.

While transfers may have a role in facilitating the implementation of government policies at various government levels, the developmental outcomes are mixed and mired with distributional inequities. In Africa and Asia, there is evidence of complementary benefits between fiscal transfers and local revenue capacity (Masaki 2018). Similarly, in Russia regional dependence on intergovernmental fiscal transfers from the federal center is positively associated with economic growth (Yushkov 2015). Meanwhile in Turkey, Gbafi and Sarucs (2004) find that local managers tend to match intergovernmental grants such that municipalities that have higher population and higher grant increase rates exert more revenue effort for financing local expenditures.

On the other hand, transfers are also known to be susceptible to political capture, especially in poorer areas. Intergovernmental transfers are also prone to local overfinancing and fiscal misapprehension. At the level of citizens, they are known to dilute voters' bargaining power. At the level of communities, there are studies that suggest they can exacerbate regional poverty (Reinikka and Svensson 2004). Transfers as distributive component of fiscal decentralization is also likely to deteriorate and lead to uneven income distribution (Aslim and Neyapti 2017). Not only are fiscal transfers likely to be unsustainable in the long run, they do not seem to remedy fiscal imbalance and even create a common pool problem at the county level (Jia et al. 2014). A common pool problem happens when a resource that supposedly benefits a group of people is being used up or is enjoyed only by a few individual because everyone else overuses it but no one is willing to pay for its upkeep. There are studies contending that transfers have mixed effects on regional

inequality, depending on the target of the fiscal device and the incentives made available to local governments. However, an analysis of fiscal spending in Mexican municipalities suggests that dependence on transfers induces overreliance and binds local governments to finance public goods that in the future may be very difficult to sustain (Sour 2013).

## More Transfers or More Locally Sourced Revenue?

There is already ample evidence, based on the experience of OECD countries, that fiscal autonomy improves when subsidiary governments are less reliant on transfers. This suggests that being able to independently raise revenue and reduce the share of expenditure financed by transfers can be good in the long run. However, there remains to be sparse empirical introspection on the impact of intergovernmental transfers on fiscal autonomy with respect to developing countries. Moreover, studies examining the impact of decentralization in fledgling economies largely focus on the implication on electoral accountability, public infrastructure, and poverty reduction. Within these, a small but important strand of literature implies a negative correlation between fiscal autonomy and inequality when municipalities are not highly dependent on transfers for their programmatic expenditures. Evidence thus far suggests that fiscal decentralization minimizes income inequality conditional on the capacity of subsidiary governments to engage in redistributive government spending and mechanisms by which local governments are made to rely more on self-generated revenue sources instead of transfers.

In many developing countries, however, despite the devolution of service provision, the taxing authority of subnational units is limited. Consequently, intergovernmental transfers comprise the largest funding source for social expenditures.

The Philippines, where local fiscal autonomy has both constitutional and statutory basis, is an interesting case to examine further the implications of fiscal transfers on local autonomy. Under the Local Government Code passed in 1991, the transfer originating from the central government is known as Internal Revenue Allotment (IRA). This Philippine variety of central-to-local intergovernmental transfer is automatic, derived based on an exogenous formula, and makes up a large part of local budget that it practically subsidizes the entire operation of certain local government units. Philippine local governments' overdependence on the IRA is attributed to at least two limitations that the law failed to address. First, even though in paper, subsidiary government units in the Philippines are encouraged to create their own revenue sources; in practice the bulk of productive tax bases is still restricted to the national government. However, since LGU type also determines IRA share, local governments are motivated to vie for reclassification into cities to attract more IRA amidst apparent lack of fiscal capacity. Interestingly, the splitting of provinces into cities is also an opportunity to create political spaces for budding political families and out-termed politicians. A new local government is entitled to a local executive and council members. If it is a new province or independent city, a new local government unit is even entitled to at least one district congressional seat. Second, despite decades after the law's implementation, many LGUs still fail to make full use of their already limited taxing powers and tend to be lukewarm about exploring possible tax bases under the law. For instance, many provinces and cities have yet to update the schedules of market values for real property within their jurisdiction despite a law prescribing this be done every 3 years.

## What Does the Philippine Case Suggest?

In the Philippines, the average locally sourced income in cities is more than three times the average for provinces. If this amount is construed as what local governments can theoretically excise, there is clearly imbalance in revenue capacity. The most tax efficient city according to

the data has a revenue-generating capacity nine times bigger than the most financially capable province.

The magnitude of Internal Revenue Allocation (IRA) received by local governments also invites a number of insights. The average internal revenue allotment for provinces is already almost double of what cities receive. If the proportion of IRA over total income is construed as gauge of fiscal dependence, then provinces are practically sourcing a whopping 82% of their income from the national government. There are even provinces which depend completely on central government financing for their day-to-day operations. While cities are less dependent on these lump sum automatic grants, the degree of fiscal dependency for cities is still high at 64% on average.

An empirical examination of election turnout and annual fiscal spending data for 81 provinces and 144 cities in the Philippines from 1992 to 2016 (Panao 2020) suggests that unconditional fiscal transfers tend to dampen local revenue generation, particularly among provinces. According to the study, a 10% additional increase in IRA as a proportion of total income among provinces decreases local revenue by 45.3%. This effect is almost twice as large as that for cities (24.7%). In fact, the relationship between local income generation and IRA is consistently negative across tested models. The findings also suggest that the crowding out effect of transfers on local revenue generation is more substantial for provinces than cities. Whereas a percent increase in IRA as a proportion of total income crowds out local revenue generation by somewhere between 3% to 5% in provinces, it is just within 3% for cities.

If transfers are automatic anyway, why should citizens worry about their municipalities not raising enough of their own sources of income?

An interesting takeaway in Panao's (2020) study is evidence tying local revenue generation to social spending. The study seems to suggest that subnational governments which depend less on central government and generate more local revenue also tend to spend more on social expenditures – education, culture and sports, manpower development, health and population control, labor and employment, and the like. However, this effect seems to hold only for local governments which have substantial taxing capacity like cities. Also, the study notes that given the distributive nature of social expenditures, their release could also be strategically manipulated to coincide with elections and used as a vote-buying device.

## Conclusion

A scant but emerging literature in developing economies suggest that revenue decentralization correlates positively with efficient public service delivery, particularly if local governments rely more on self-generated revenue sources instead of transfers. The Philippines' experience with fiscal transfers suggests that when these grants are allocated unconditionally, they create a common resource pool problem, giving local policymakers a disincentive to improve their revenue-generating capacity. In contrast, local government units that are less reliant on unconditional transfers not only seem to exert more effort generating their own financial resources, they also tend to allocate more for social expenditures.

The findings lend credence to doubts raised in previous studies about the welfare consequences of transfers in developing countries when they are provided unconditionally. Redistributive allotments are tricky but at the minimum, fiscal administration to be efficient must consider widening the tax-raising power of local governments and rationalizing, not outright increasing, central government subsidy.

Overall, the findings suggest that in developing countries a balance between intergovernmental transfers and fiscal decentralization induces optimal service delivery.

# Underground Railroad as Social Policy, The

Victor Eno
Department of History and Political Science, Florida Agricultural and Mechanical University, Tallahassee, FL, USA

## Synonyms

Emancipation; Freedom struggle; Social engineering

## Definitions and Keywords

Underground Railroad – the informal process through which enslaved African Americans escaped the bondage of slavery from the South and northern slave states into freedom in northern Free states such as Ohio, Indiana, and Illinois,- and as far away as Canada; Fugitive Slave Act; Harriet Tubman; Emancipation Proclamation; Thirteenth Amendment, etc.

## History

Imagine this scenario: Close your eyes and imagine having to hold your breath and being fearful of who to trust. Afraid that at any given moment someone could come and turn you in and the world as you knew it could come to an end. Now, open your eyes and you see yourself a free individual in another state or country! The Underground Railroad was the process through which enslaved African Americans escaped from the South and northern slave states into freedom in northern Free states and as far away as Canada. The process brought with it a lot of trepidation and the feeling of terror about the unknown -the escapees were terrified by the prospect of being caught by slave hunters and bounty seekers under the Fugitive Slave Act passed by the U.S. Congress in 1850. But at the same they were spurred by the thought and expectation that, upon attaining freedom or Liberty, they would never be in bondage again and never be whipped again.

African American slaves had to continuously endure these conflicted feelings on their route to freedom. As Kathryn Schulz notes in an article in the *New Yorker* magazine (August 22, 2016 issue), slavery itself as an institution, and the arduous efforts made to recapture and re-enslave African Americans who struggled to wrest themselves from bondage, was a moral disaster for the United States and a terror for fugitive slaves. The obligation to return slaves to their owners was enshrined in the Constitution and in subsequent legislations (the third paragraph of Article IV of the U.S. Constitution stated that No person held to Service or Labor in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or labor, but shall

be delivered up on Claim of the Party to whom such Service or Labor may be due). This constitutional provision was further codified in 1793 and enhanced by the Fugitive Slave Act of 1850. The 1850 Act was one of the most draconian laws ever enacted in the U.S. It rendered impotent any Northern ordinances (that is, legislation enacted in the Northern states) that were designed to protect fugitives. It compelled citizens to assist in capturing escaped slaves and set harsh civil and criminal punishments for failing to do so. The Fugitive Slave Act also created a legal document that ordered a specific fugitive to be returned to his or her master that could not be challenged in any court of law, and established a fee system (or incentive) whereby judicial and law enforcement officials adjudicating fugitive-slave cases earned ten dollars if they decided in favor of the owner and five if they decided for the slave.

The Thirteenth Amendment did not result in the cessation of the institution of slavery nor did it immediately clean off the dark marks of the vestiges of slavery. The Amendment, which was ratified on December 6, 1865, following the end of the Civil War, stated in Section 1 [Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction]. However, traces of slavery as an institution remained especially in the Deep South, and it took strict and vigilant implementation of the Amendment to completely abolish the practice of slavery and slaveholding. The Underground Railroad tells the story of the pain, anguish, courage, and bravery of enslaved black men and women who attempted to free themselves from the chains of bondage and the incredible faith and goodwill of a few white people who assisted them to attain Freedom and Liberty.

It is not known when the Underground Railroad movement first began but it most likely began in the early 1800s. The term Underground Railroad began to be used in the 1830s but no one really knows who coined the term. Some people attributed the term to a thwarted slave owner and yet others said it was first used by a runaway slave. It first appeared in print in an abolitionist newspaper in 1839, at the end of a decade when railways had come to symbolize prosperity and progress, and three thousand miles of actual track had been laid across the United States. In a formal sense, Frederick Douglass used a similar term in his 1845 autobiography – where he lamented that indiscreet abolitionists were turning it, (that is, the discrete and risky enterprise of helping enslaved Africans gain freedom) into an *upperground* railroad. Harriet Beecher Stowe used the term in 1852, in her book, *Uncle Tom's Cabin*, when one slave-catcher cautions another against delaying pursuit of a fugitive "till the gal's been carried on the underground line." In 1853, the *New York Times* reported that the term had come into very general use to designate the organized arrangements made in various sections of the country to aid fugitives from slavery into freedom.

The Underground Railroad consisted of homes and businesses that harbored runaways and provided them an avenue and escape route into freedom. These homes and businesses were known as "stations" or "depots" and were run by "stationmasters." "Conductors" moved the fugitives from one station to the next. The Underground Railroad's "stockholders" (who included free black men and women as well as sympathetic white people) contributed money or goods. The latter sometimes included clothing so that fugitives traveling by boat or on actual trains would not give themselves away by wearing their worn work clothes. Once the fugitives reached safe havens – or at least relatively safe ones – in the far northern areas of the United States, they received assistance to find lodging and work. Many went on to Canada. It was the case that sometimes a "conductor" pretending to be a slave would go to a plantation to guide the fugitives on their way. Among the best known "conductors" is Harriet Tubman, a former slave who returned to slave states 19 times and brought more than 300 slaves to freedom including her parents – using her shotgun to threaten death to any who lost heart and wanted to turn back. Harriet Tubman had emancipated herself from slavery in 1849 at age 27 after which she become a conductor of the "Underground Railroad". Tubman became such an iconic figure during that era that Massachusetts'

governor sent her, at the beginning of the Civil War in 1861, to spy on the South where her duties including serving as a hospital nurse and a support for the Union armies. Along the way she earned the name "Moses" for helping or facilitating freedom from bondage of so many black people. Another iconic figure in the Underground Railroad enterprise was William Still, a free black man who lived in New Jersey and also helped free a significant number of slaves from bondage.

The fugitives who participated in the Underground Railroad were people desperate of emancipation. The Underground Railroad went undetected because it was a network that operated in secrecy. Most of the information on the Underground Railroad was found out through word of mouth. The railroad consisted of trails and shelters for runaway slaves from the southern United States to the North or Canada during the Civil War. It is unknown as to how many people were involved or escaped fugitives but it was estimated that more 3,200 "railroad workers" (or fugitive slaves) escaped from the northern states to Canada between the late 1840s and the formal abolition of slavery via the Thirteenth Amendment in 1865. It should be noted again that slavery was a historic tragedy and it took the Civil War to end it. As Christopher Densmore, the Curator of Friends Historical Library of Swarthmore College, has argued, slavery was ultimately extinguished by blood – the Civil War Densmore (n.d.).

Many of the Underground Railroad routes crossed several free northern states including Ohio, Indiana, and Illinois. Swamps and rivers provided escape routes for the fugitives (Bial 1999). One watchword used by participants was: "Keep your eye on the North Star." By keeping their eye on the star in front of them, the runaway knew that they were heading North (as in the northern free states of the United States as well as Canada to the far north). The movement was made up of abolitionists who opened their homes and barns as safe places for runaway slaves. Some of the earliest abolitionists were Quakers, although side by side with Quakers were abolitionists who were more secular in orientation such as William Lloyd Garrison, one of America's leading white anti-slavery activists. The Quakers were a religious minority who belonged to the Society of Friends who had once owned slaves but very early on changed their stance on slavery and slave-holding and viewed it as an evil institution. The Quakers generally received the most credit for resisting slavery with secondary acknowledgment going to the wave of evangelical Christianity that spread across the United States during the first half of the nineteenth century, in the movement known as the Second Great Awakening. However, not much attention has been given in the Underground Railroad narrative to the role of the independent black church movement in the fight against slavery and how it promoted the Underground Railroad. Historians have paid scant attention to the African Methodist Episcopal Church, which was established in 1816, in direct response to American racism and the institution of slavery, and which played a significant role in raising money, aiding fugitives, and helping former slaves who had found their way to freedom make a new life (Schulz 2016).

The prominence of the Quakers as helpers in the Underground Railroad was on account of their very early position that slavery was evil; and even though they did not believe in activist intervention to stop the practice, they felt that they had a religious duty or obligation to do something to help the enslaved. Densmore records that even before the adoption of the U.S. Constitution in 1787, which while avoiding the use of the word "slave" required that "fugitives from labour," meaning enslaved people, escaping from one state to the another, must be returned to their so-called owners (Article IV), and also more than a century before the infamous *Dred Scott v. Sanford* Supreme Court ruling of 1857, in 1754, the Philadelphia Yearly Meeting of the Religious Society of Friends told its members "To live in ease and plenty, by the toil of those whom violence and cruelty have put in our power, is neither consistent with Christianity nor common justice." By the 1770s, all of the Quaker Yearly Meetings in North America were united on the proposition that the enslaved had a "natural and just right of liberty" and no Quaker should think to claim a human being as property.

## Mechanism of the Underground Railroad

The participants and operators in the Underground Railroad faced enormous difficulties and dangers: being caught in a slave state while aiding runaways was much more dangerous than being caught within the Free states in the North. One of the methods for facilitating the escape of enslaved persons was by hiding them in attics of homes, in barns, and other secret locations from prowling bounty hunters who were hired by slave owners. The punishments included prison, whipping, or even hanging – assuming that the accused made it to court alive instead of perishing at the hands of an outraged mob. White men caught helping slaves to escape received harsher punishments than white women, but both could expect jail time at the very least. The harshest punishment-dozens of lashes with a whip, burning or hanging-were reserved for any blacks caught in the act of aiding fugitives. If someone living in the North was convicted of helping fugitives to escape he or she could be fined hundreds or even thousands of dollars, a tremendous amount for the time; however, in areas where the anti-slavery movement was strong, the "secret" railroad operated quite openly. Stephen Myers of upstate New York, a former slave, wrote in his own newspaper, *Northern Star and Freemen's Advocate*, about his work helping other slaves escape. Myers became the most important leader of the Underground Railroad in the Albany area. "Vigilance committees" that formed within communities for the purpose of aiding runaways sometimes openly advertised their meetings. (In other eras of American history, the term "vigilance committee" often referred to citizens groups who took the law into their own hands, trying and lynching people accused of crimes, if no local authority existed or if they believed that authority was corrupt or insufficient).

In a nutshell, it took courage almost everywhere in pre-Civil War America to actively oppose slavery, and according to Schulz, some white abolitionists paid a price. A few were actually killed; some died in prison; others, facing arrest or worse, fled to Canada. But these were the exceptions. Most whites faced only fines and the opprobrium of some in their community, while those who lived in anti-slavery strongholds, as many did, went about their business with near-impunity. Black abolitionists, on the other hand, always put their life and liberty on the line: If caught, free blacks faced the possibility of being illegally sold into slavery, while fugitives turned agents faced potential re-enslavement, torture, and murder. Harriet Tubman indeed deserved to be called a legend or heroine of the Underground Railroad because of how boldly she faced those risks: first when she fled slavery herself; then during the roughly twenty return trips she made to the South to help bring others to freedom; and, finally, during the War, when she accompanied Union forces into the Carolinas, where they disrupted supply lines and, under her direction, liberated some 750 slaves. By that time, slaveholders in her home state of Maryland were clamoring for her capture, dead or alive, and even, publicly debated the different cruel devices by which she would be tortured and put to death when caught.

In addition to the heroic roles played Harriet Tubman, William Still, Stephen Myers, Frederick Douglass, and a large number of other black abolitionists in the Underground Railroad, two Quakers, Levi Coffin and his wife Catherine, also played a pivotal role in the Underground movement. It is estimated that the couple single handedly assisted over 3000 slaves and escapees within a short span of time. Levi Coffin is sometimes referred to as the president of the Underground Railroad. He and his wife used their eight-room Indiana home as a "station" before they moved to Cincinnati. Their home is now a National Historic Landmark in Fountain City near Ohio's western boundary.

## Social Policy

As a social policy, the Underground Railroad metamorphosed into a historic movement that liberated thousands of African Americans from the bondage of slavery. To the extent that the courage and perseverance of black people

undergirded the movement there is a need to acknowledge and credit their place in history. Gara (1961) observed that the historical record of the Underground Railroad was always almost focused exclusively on the assistance given to freedom seekers by whites, particularly Quakers, and ignored the larger story of African Americans liberating themselves and the role of African American institutions and communities in assisting the fugitive. He called for refocusing the story on the freedom seekers and role of African American communities and institutions, north and south. This is because the Underground Railroad was not merely a physical structure but an interweaved network of persons with the heart and conviction to take risks to either initiate the risky enterprise of escape or help the enslaved to attain freedom. The lesson for social policy is that the courage and resilience and strong spirit of people can be harnessed to achieve common goals. Also, the institutional support of the black church was critical to the success of the movement. There is no doubt that the black church has been a place of gathering that, historically, had brought succor, comfort, and hope to suffering black people. The black church built solidarity and keen spirit among the enslaved and has been a powerful force and resource for social service delivery for vulnerable and disadvantaged people and it also served as a platform for political education and participation of black people in the political process.

# Understanding and Operationalizing Financial Accountability in Government Contracting Systems

Soojin Kim
Public Policy and Global Affairs Programme, School of Social Sciences, Nanyang Technological University, Singapore, Singapore

## Synonyms

Contracting performance; Financial accountability; Government contract

## Definition

Financial accountability in government contracts refers to the cost control in the proper use of financial resources, protection of assets against financial corruption, and transparent financial reporting and billing.

## Introduction

Over the past few decades, there has been a spike in research activity regarding government contracts (also known as public procurement) in the area of public administration and policy. Notably, despite such progress in research, what is commonly acknowledged in past and recent scholarship is that, as governments have increasingly relied on goods and services provided by private contractors over time, government contracts have been more associated with fraud, abuse of taxpayers' funds, conflicts of interest, and general waste (Kim 2017; Prager 1994; Savas 2000; Van Slyke 2009). From a conventional (normative) standpoint, research dealing with transaction-cost theory and principal-agent theory has argued that the problem is due to information asymmetry between government and the self-interested contractors (subcontractors). Given that government contracts are easily vulnerable to financial corruption and ethical

mismanagement issues based on contractor's opportunistic behavior, there is no doubt that the production of public goods and the delivery of public services are barely handled in an effective and accountable manner. In the end, it is more likely that many government agencies will struggle with incomplete contracts or contract failure (Prager 1994; Savas 2000).

To limit the contractors' ability to behave opportunistically, many researchers have attempted to identify and examine a variety of different organizational, managerial, and contextual factors affecting contracting performance (e.g., see Amirkhanyan et al. 2007; Brown and Potoski 2003a; Fernandez 2007, 2009). However, they failed to provide a deeper discussion of the *financial* aspects of contracting performance in general. Particularly, they tend to be devoid of analysis around the contracting financial performance beyond generally accepted cost-saving rationales (Kim 2017), acknowledging that more research is needed. In other words, there has been little research, to our knowledge, of which factors (conditions) matter for spending and managing public funds in an accountable and transparent manner throughout the entire contracting process. In this sense, there is a need to widen and deepen our understanding of the rationale of financial accountability as a proxy for contracting financial performance, including factors that help minimize unexpected opportunism and financial corruption by contractors and instead produce certain financial benefits and related performance gains.

## Operationalizing Financial Accountability as Contracting Financial Performance

Unlike cost-effectiveness (total cost savings), as noted above, research on contracting out seems to have overlooked a potentially important dimension of contracting financial performance – *financial accountability* – in the accompanying analyses. This requires us to broaden and sharpen our focus of inquiry by espousing several sources of accountability mentioned in the public administration literature.

In the public sector, accountability has long been regarded as answerability for one's actions or behavior, often to a higher legal or organizational authority in a formal, bureaucratic, or inter-organizational chain of command (Dicke 2002; Kearns 1995). Importantly, such a definition raises the question of exactly who is answerable, to whom, and for what. Applying the definition to the contracting schemes, Dicke (2002, 456) suggested that "[t]he 'who' [that is] usually identified as answerable is an agent (a contracted provider) to a principle (a government agency) and the 'for what' responsibilities are identified in the provisions of the contract."

Accountability ranges from "an obligation for keeping accurate records of property, documents, or funds" to "a wide spectrum of public expectations and performance standards that are used to judge the performance, responsiveness, and even morality of government organizations" in a broad manner (Kearns 1995, 7). If this is true, one can argue that the basic rationale of accountability should also apply to financial accountability. As stated by Dicke (2002, 456), "when accountability methods fail, public funds may be used inappropriately and service clients can be placed at risk for harm, neglect, or exploitation – especially when they are ill, frail, or vulnerable." In the specific context of government contracts, scholars also have responded to the issue, arguing that without proper safeguards, contracting governments could face difficulties in managing public funds and overseeing contractor performance (Kim 2017). In short, it is likely that contracting financial performance declines as time goes by because public funds are not properly used according to the contract. In the literature, the improper use of public funds, for example, tends to be described as the risk of fraudulent or criminal use of funds by contractors, including abuse (mismanagement), conflicts of interest, and waste of taxpayers' funds (cost overruns) (Prager 1994; Savas 2000; Van Slyke 2009). To tackle these problems, contracting governments must thus ensure that assets are adequately protected against fraud, waste, and abuse by contractors, because they are responsible for protecting public interests.

On the whole, it is reasonable to assume that financial accountability reflects the managing of public resources against financial corruption (e.g., fraud, waste, and abuse) in general and thus encompasses transparency, integrity, honesty, and legal compliance along with ethical managerial mandates. Financial accountability also seems to embed relatively less straightforward and more complex aspects of contracting management and performance. No single dimension could describe and define the central underlying logic of financial accountability. Accordingly, ensuring financial accountability in the context of government contracting can be viewed in one of the following ways:

1. Cost control in the proper use of financial resources
2. Protection of assets against financial corruption (fraudulent or criminal risks)
3. Transparent financial reporting/billing for delivery of goods and services

More importantly, two different aspects of contracting financial performance – cost-effectiveness and financial accountability – do not necessarily reflect certain managerial trade-offs since they both present concrete and specifiable organizational financial outcomes. They can thus complement each other both theoretically and empirically. While cost-effectiveness focuses on the outcomes of financial resources measured by perceived total cost savings, financial accountability places greater value on procedural aspects of good management based on compliance with contract requirements and standards, integrity, and transparent use of public funds. In short, cost-effectiveness and financial accountability implicitly deal with "how much public money is spent" and "how public money is spent" throughout the entire contracting out process, respectively.

## Factors Ensuring Financial Accountability in Government Contracts

It is also important to note a set of organizational, managerial, and even relational factors embedded in the government contracting process, believed to increase the likelihood of achieving financial accountability.

### Contract Specificity

Ensuring that contractors will produce what they are being paid for is not easy to predict due to asymmetric information. Thus, there is a need to design a clear and specific Request for Proposal (RFP) in the contracting out process. Scholars have argued that tight contract specifications (clarity) will be helpful not only to protect risk-averse principals (here, the government) from untrustworthy agents (here, contractors) during the period of negotiation prior to the awarding of the contract (Amirkhanyan et al. 2007; Savas 2000), but also to hold the contractors accountable for their performance (Fernandez 2009; Kim 2017). Thus, when the government prepares to advertise contract bids, the solicitation package representing the contract's anticipated tasks, scope of work, and evaluation steps/tools should be specified and, if possible, should include procedures (e.g., payment and evaluation), rules, penalties, and incentives in clear language (Kim 2017; Fernandez 2009).

### Competition in the Bidding Process

The extensive literature on government contracting has highlighted that injecting competition into the bidding stage can reduce the risk of bureaucratic monopoly and the threat of corruption. Each private vendor might have an incentive to offer its services at the lowest possible price and, in addition, be required to reveal honest information about its experience, expertise, or performance capabilities to win the contract (Fernandez 2007). Thus, whether the bidding process is fairly opened and frequently available for potential contractors seems to matter (Brown and Potoski 2003b). In practice, government agencies have used a wide range of solicitation channels to release information, for example, advertising in media (i.e., major newspapers, relevant trade journals, and agency websites), public hearings, electronic bid databases (e-commerce), etc.

### Monitoring

In the contracting out literature, monitoring is well known as a critical managerial tool to ensure contract success. By increasing the chance that contractors' behaviors will be detected, monitoring helps replace their utility-maximizing, opportunistic behaviors with goal-sharing with governments (Fernandez 2007, 2009; Savas 2000; Witesman and Fernandez 2013). In practice, however, direct site visits by government representatives or separate auditing work by agencies seldom take place and instead, contracting governments tend to rely heavily on contractors' self-reporting (e.g., monthly or quarterly financial reports) (Kim 2017, 761). In this situation, a contracting government could be more vulnerable to contractors' opportunistic behaviors (e.g., fraud, waste, and abuse of public money), which in turn lead to lower levels of contracting performance at the end. Given such challenges, governments thus need to conduct their monitoring efforts more frequently and regularly (and, sometimes, unexpectedly) and further employ more rigorous methods based on the viewpoints of diverse stakeholders, such as citizen or client feedback (satisfaction or complaints), the media, an Ombudsman policy, and additional independent audits (Kim 2017).

In addition to the intensive and frequent use of performance-monitoring methods to gather adequate contract information, the extent to which governments fairly and appropriately monitor and evaluate the performance of contractors matters for overall contracting performance. It has been mentioned in the literature that although a nonprofit contractor's performance is not easily observed and measured compared with that of its for-profit counterparts, nonprofit contractors are likely to be monitored less than for-profit ones (see Brown and Potoski 2003b; Fernandez 2009; Witesman and Fernandez 2013). If these arguments are valid and the phenomena described common in the contracting out process, contracting governments could find it harder to ensure financial accountability over time. To overcome this challenge, as Amirkhanyan et al. (2007, 709) argued, well-designed monitoring tools are necessary to meet the requisites for validity and reliability and be free from bias. Indeed, procedural fairness (appropriateness of measurement) that shapes the monitoring efforts employed by governments seems to be a critical part of effective contract management and further performance.

### Use of Rewards and Sanctions

Scholars have drawn on principal–agent theory, stewardship theory, and incentive theory to explain that appropriately designed sets of monitoring-based incentives and penalties, the so-called "carrot and stick" approaches are useful in curbing contractors' opportunistic behaviors (Girth 2012). Such monitoring-based incentive provisions may work as contractors are frequently confronted with different levels of risk in the *ex post* monitoring process. The literature indicates that extrinsic rewards for satisfactory performance typically include contract renewal (extension), gain sharing, and financial rewards (e.g., fees and bonus payments), whereas intrinsic rewards include trust, enhanced reputation and involvement in goal setting and program evaluation, discretion, stability, tenure, and mission alignment (e.g., Fernandez 2007; Girth 2012). The sanctions for inadequate performance seem to range from less severe sanctions, including written document and monetary penalties, temporary suspension, threat of contract termination, and being prohibited from future bidding, to more severe sanctions like legal litigation (Brown and Potoski 2003b; Girth 2012). Based on these distinctions, it is reasonable to expect that rewarding satisfactory, strong performance, and sanctioning poorly performing contractors (e.g., via the threat of financial sanctions or loss of the contract/termination) will be feasible strategies, since such incentives help motivate contractors to avert risks and maximize contract performance.

### Government Capacity

The importance of a government's in-house capacity in effectively managing the entire contacting-out process – beyond simply monitoring contractor performance – has elicited a significant amount of discussion in the literature (Brown and Potoski 2003a, b). From make-or-buy decisions and the designing and

implementing of contracts to the monitoring and evaluating of contracting performance in order to bestow rewards or impose sanctions (penalties), such capacities are broad and critical to contract success.

Interestingly, scholars have constructed several different measures of government capacity through a variety of criteria in their empirical research. For example, Brown and Potoski (2003b) classified government capacity into three phases, the first being feasibility assessment capacity, which refers to the capacity to determine whether a particular good or service is appropriate for contracting and has sufficient market competition. It may include hiring trained staff and forming legislative study groups (Brown and Potoski 2003b, 138). The second phase is implementation capacity, which involves the issues of contract bidding, vendor selection, contract negotiation, and contract writing. The third phase is evaluation capacity, which concerns monitoring and evaluating the contractor's performance to determine whether the contractor has fulfilled its responsibility.

Liu et al. (2007) framed the topic more simply by stating that, to a large extent, government purchasers need two basic capacities – financial capacity and managerial capacity. Financial capacity includes sufficiency and sustainability of financing, financial-management capacity, and timely payment to providers. On the other hand, managerial capacity includes procurement, oversight, performance assessment, and problem-solving capacity. Such differentiation seems to be in line with the arguments by Amirkhanyan et al. (2007), who noted that the contracting government agency needs to have enough financial resources to be able to hire staff qualified to perform the required monitoring tasks and to ensure that staffing levels are adequate (709). Adequate administrative capacity is also required to ensure that resources are efficiently distributed (716).

### Contractor Capacity

As one of the main parties in government contracts, contractors, regardless of their sector status (nonprofit or for-profit), are expected to meet or exceed performance expectations both before and after the awarding of the contract (Witesman and Fernandez 2013). Although the issue of contractor capacity has not received as much attention in the literature as government in-house capacity, with regard to the aspects and dimensions of contractor capacity, a variety of criteria have been suggested in the literature. For instance, drawing upon a conceptual framework of contracting out at the health-system level, Liu et al. (2007, 203) argued that the capacity of contracted service providers could contain the capacity to deliver specified services, the level of autonomy of individual providers (particularly financial autonomy), contract-management capacity, motivation, and the capacity of the providers to implement performance self-monitoring. Likewise, in more recent studies (Amirkhanyan et al. 2012; Fernandez 2009; Witesman and Fernandez 2013), it has been argued that contractor capacity may include the staffing capacity and financial capacity (financial health or dependency on government funding) needed to complete government contracts effectively. Analyzing over one hundred childcare centers and Head Start agencies in Ohio, Amirkhanyan et al. (2012) divided contractor capacity into two categories – internal management capacity and environmental conditions (financial autonomy from the contracting public agency) – and found that although a contractor's financial autonomy was somewhat negatively associated with a collaborative contracting relationship between the government and the contractor, its internal management capacity was positively associated with that relationship. In other words, effective contracting out may depend on how many skilled managers contractors have or how much time and energy they invest in improving the process (Amirkhanyan et al. 2012, 345). Interestingly, Fernandez (2009) and Witesman and Fernandez (2013) extended this perspective to the contractor's financial viability, technical capacity, cost of service delivery, reputation, and total previous experience performing the work, as well as the previous performance of other contractors with governments.

### Contract Length

Government contracting is based on the contractual relationship between governments and contractors over a certain period of time. Interestingly, empirical evidence of the relationship between contracts of longer duration and contracting performance has been unclear in past and recent literature. For example, in Fernandez's two empirical studies (2007, 2009), it was found that duration of the contract appeared to have no effect on overall contracting performance. On the other hand, more recently conducted research by Amirkhanyan et al. (2012) found a positive relationship, albeit somewhat limited, between the length of the contracting relationship and accountability effectiveness of government contractors. The findings may suggest that contractors are more likely to cooperate in the implementation of long-term contracts, thereby, at least, keeping contractor performance constant during this period (Amirkhanyan et al. 2012).

Despite such inconsistent findings, the existing literature mostly tends to argue that long-term contracting relations help contracting governments to overcome opportunistic behavior by contractors and provide greater opportunities for the parties to develop mutual understanding and trust by facilitating learning with each other (Fernandez 2007, 2009; Witesman and Fernandez 2013).

### Extensive Two-Way Communication

The communication gap (poor communication) between government and contractors can be a huge barrier to effective contract management and satisfactory performance. For instance, based on interviews with public and private managers engaging in local government contracts in New Jersey, Kim (2017) found that government employees seemed to be less familiar with the tasks of contractors and even the demands of the community. When facing complex issues or problems, the so-called purchasing hierarchy (contracting government) is likely to rely on third parties such as judges, mediators, attorneys, and arbiters rather than confront the issues by communicating with their counterparts (contractors) (Kim 2017, 763–764). In addition, after monitoring contract performance and tracking wrongdoing, government agencies tend to bestow rewards or impose sanctions on contractors in top-down fashion, which tends to create a somewhat unpredictable atmosphere where sharing interests and feedback is concerned.

However, for successful government contracts, extensive and open communication can help reduce information asymmetry by offering more opportunities for parties to familiarize themselves with each other and predict each other's behavior in the future (Fernandez 2009, 75). In this vein, Amirkhanyan et al. (2007, 710–711) stated that in situations where there are cooperative norms or shared beliefs that two parties have to work together for contract success, miscommunication problems between the two are more likely to be reduced. In turn, the contracting governments are more likely to reduce transaction costs because of the reduced need for rigorous screening or monitoring work (Witesman and Fernandez 2013, 690). Ultimately, the move toward "collaborative contracting" and "relational contracting" will be helpful not only to hold stakeholders accountable for their decisions and subsequent outcomes, but also to yield better performance results (Amirkhanyan et al. 2007; Van Slyke 2009; Witesman and Fernandez 2013).

## Conclusion

In today's uncertain and complex environment, ensuring financial accountability in government contracts appears to be one of the key issues in the field of public administration and policy. To advance the study and practice of successful government contracting, much has to be learned about the financial accountability. In order to better understand how government can exercise financially accountable contract management, accompanied with satisfactory performance, scholars and practitioners should continue to discover the conditions (strategies) and factors that lead to improved financial outcome of contracts and decreased corruption.

# Understanding Governance Challenges in Africa

Harrison Adewale Idowu
Adekunle Ajasin University, Akungba-Akoko, Nigeria
Obafemi Awolowo University, Ile-Ife, Nigeria

## Synonyms

Crises; Government; Leadership; Shortfall

## Definitions

| | |
|---|---|
| Challenge | This refers to a barrier, a draw back to the ability to achieve certain set goals and objectives. It is the difficulty facing the accomplishment of a task. |
| Governance | This refers to the act of policymaking and implementation to drive the affairs of the state. It involves providing political leadership to the people and the country at large. |

## Introduction

In Africa, governance remains a major and critical challenge facing the continent. The people have been denied and are continuously being denied good governance over the years. Whereas, the continent has freed itself from the shackles of colonization several decades ago, yet it has not been able to really chart a path for undisputable and functioning governance structure for itself. The potentials for development that decolonization was envisaged to bring has been jeopardized and missed in the face of governance failure. Hence, rather than make significant progress, many African states look worse off when compared to their colonial days. While only a few have made some level of progress, others have retrogressed significantly, raising questions over justification for their independence, when actually

they cannot take charge of their affairs and people. The continent seems to have been placed under a curse of governance failure and irresponsible governance.

It is no doubt that governance rules the affairs of the state and set the pace for human and capital development. The circumstance, therefore, that Africa is significantly lagging behind in terms of quality governance explains the resultant lack of human and capital development so visibly rampant on the continent. Challenges like corruption, democratic erosion, insecurity, electoral violence, conflicts and manipulation, and state capture of institutions, among others, continue to ravage the prospects of quality and good governance in Africa. Africans have continued to be governments for themselves, striving to provide for themselves services and public goods which are ordinarily the sole responsibilities of the state. Nothing could better describe governance failure. The series of challenges which continue to beset the continent – infrastructural decay, dilapidated schools and hospitals, educational challenges, and increasing crime rates, among others – speak to the high level of governance failure in Africa.

Despite the fact that Africa is blessed with massive mineral and natural resources, with huge population of highly industrious people, the continent continues to languish in developmental challenges, poverty, hunger, and debt (Antonio 2010). The absence of quality governance to coordinate this caliber of population and exploit the abundant resources to drive development has led to conflicts of various dimensions across the continent. Given this governance challenge, natural resources have thus become a curse rather than blessing for Africa, often spiking violent conflicts, most of which have last through several decades and impede development among countries. Glaringly, Africa has continued to struggle with the political and governance institutions and practices that were passed on to it by colonial masters, which completely do not fit into the African system (Afegbua and Adejuwon 2012). These institutions and practices have hence, not been able to resolve the many governance challenges on the continent. Over the years, African post-independent state continue to struggle with the challenges of finding and building the right political and governance institutions and practices that best fit the peculiar challenges on the continent.

How then do we interpret and give meanings to these governance challenges in Africa for clearer understanding of the enormity of these challenges as a first step toward addressing them? This is the concern of this entry – to paint these critical governance challenges vividly and how they reflect and impact on governance in Africa. However, the entry does not claim an exhaustive approach to these issues. The entry thus provides an insight into how corruption, insecurity, democratic erosion, leadership challenge, and state capture of relevant institutions continue to pose serious challenges to governance on the continent. It discusses the interrelatedness of these challenges and governance under performance in Africa. Understanding the governance challenges in Africa is important as it is the first crucial step toward addressing these challenges and taking them heads on. This is correct to the extent that understanding a problem increases the prospects of finding tenable solution to the problem and vice versa.

Following this introduction, the next section addresses the governance challenges in Africa – again these challenges are not exhaustive but are deemed critical among other numerous challenges. The subsequent sections present these challenges systematically, while the final section provides a conclusion for the entry.

## Governance Challenges in Africa

Five critical governance challenges besetting Africa are discussed in the following sections.

### Corruption

Arguably, corruption remains the greatest bane of governance and development in Africa. Corruption spans through every aspects and facets of society in Africa. From followers to the leadership, including public officers, corruption permeates the continent. The gross diversion of public funds by those who have been saddled with the

responsibility to govern has left Africa largely underdeveloped. The menace of corruption runs through most government institutions that it has become practically impossible to transact in any public space without having to give bribes in Africa. Politicians who are privileged to get into public offices steal money and export them to be stashed in bank accounts abroad. This has occurred in wantonly and frightening levels, so much so that the natural resources which the continent is so blessed with now amounts to naught. For instance, 22 years after the rule and death of the military dictator General Sani Abacha of Nigeria, the country keeps receiving repatriated billions of US dollars and Euros stashed in bank accounts abroad by the one-time Head of State. This speaks volume of the rate of mass looting of state treasury going on in Africa. Money and resources that could have been deployed for socioeconomic, infrastructural, and human capital development have been siphoned into private individual pockets. This has left public roads, hospitals, schools, and other public services in a devastating state in Africa.

Corruption has affected every facets of life in Africa – economic, political, and social – causing a major drawback in these aspects of life. It is with no doubt one of the biggest governance challenge on the continent, as its adverse effect on governance inadvertently impacts on other aspects of society. It has impacted on the well-being of societies, families, and individuals, causing many households to be plunged into hunger and poverty. This is correct to the extent that resources which could have been directed toward socio-capital development of citizens and families end up in the pockets of those in whose hands such resources have been entrusted. For instance, the covid-19 pandemic has further unraveled the awful state of public health facilities in Africa. Many years of corruption and embezzlements of public funds have resulted in the diversion of funds meant for health research institutes and upgrading medical facilities in Africa. The adverse effect of this has been brought to the open by the covid-19 pandemic, which is now revealing more glaringly the devastating state of healthcare system in most parts of the continent.

With respect to corruption in public institutions, most Africans think that corruption is rising fast on the continent, with more than one in four Africans having to give a bribe to access public services like healthcare, Police, and education services (Transparency International 2019). This corruption in government institutions ensures that the poor is continuously deprived unlimited access to public services and are made to spend their meager savings on bribes to access these essential services where available. Corruption has crept into every government institutions – from the Police to other institutions. The Police has been found to be the most corrupt government institution across Africa (Transparency International 2019). In fact, the Nigerian Police now gives smaller denomination of the naira (change) to citizens who give them higher denominations as bribes because they have no smaller denominations. They confidently practice this on Nigerian highways in the glare eyes of the public and none has been convicted or dismissed for such act. A show of some confidence that those at the top of the hierarchy are in support of their sharp practices.

Given the spate of corruption in Africa, including its ravaging effects, it has been correctly captioned as the AIDS of democracy on the continent which has continued to destroy the hope and future of many societies (Hope and Chikulo 2000). The greatest contribution and enhancement to corruption in Africa could be explained in the politicization of bureaucracy on the continent. This has allowed a sort of agreement between politicians and bureaucrats to loot the treasury dry. This has continued to advance corruption in Africa. Until bureaucracy is depoliticized in Africa, corruption may continue unabated and consume the continent. In African Parliaments, parliamentarians receive kickbacks to sponsor and pass bills in favor of certain big firms and corporate bodies, including the executive. While they do this, they continue to receive bogus pay from public treasury for which they deliver no significant development to the respective constituencies which they claim to represent. Where and when they ever execute projects in their constituencies, contracts are awarded in the most corrupt

manner to the highest bidder of contractors who can give the highest kickback and not necessarily those who can do the job better.

At citizen level, while Africans continue to complain about corrupt politicians and those in public offices (elected or appointed), citizens themselves involve in corrupt practices, cheating one another. In the market places, business owners simply increase prices to catch in on any situation, without any increase in production cost. Transporters hike transport fares even when there is no increment on Premium Motor Spirit (PMS). These are only but a few of such citizen corruption going on, on a large scale in Africa. The engagement in the production of counterfeits to make quick money is on the increase by the day. Counterfeits of consumables are produced without recourse to how this poses threat to the health of fellow citizens who may end up consuming them – this is corruption indeed.

Quite undeniably, African politicians and elites have been involved in massive corruption and looting of state treasury, nevertheless, citizens themselves are not spared of the corruption pandemic going on in Africa. This has posed and continue to pose serious challenge to the governance on the continent.

### Insecurity

The increasing spate of acts of insecurity in Africa constitute yet another governance challenge on the continent. Over the years, Africa has continued to deploy huge resources that could have been directed toward socioeconomic development on addressing security challenges. African budgets have seen an increasing rise in security allocations, far higher than what have been allocated to other critical sectors like health, education, and infrastructural development. Boko Haram in the Lake Chad Basin, activities of the Islamic State in West Africa (ISWA), kidnappings, and farmer/herder clashes in Sudan and Nigeria, proliferation of local wings of Al Qaeda and ISIS, banditry in most parts of the continent, small arms proliferation across Africa, among others, are serious challenges to governance. Besides, as the resources insecurity is currently gulping in Africa, the needed attention that government should give to other critical governance issues is being diverted to address serious security issues capable of tearing the continent apart. Where insecurity thrives, as in Africa currently, development, peace, and stability are jeopardized (Afolabi and Idowu 2019). This explains the lack of significant development, the chaos, and instability ravaging most parts of the continent. For example, the destructive activities of Boko Haram terrorist sect in the Lake Chad Basin have resulted in retarded and distorted economic, social, and political developments, especially in North Eastern region of Nigeria.

The farmer/herder crises ravaging most parts of Sudan, Nigeria, and other parts of Africa constitutes a serious drawback for governance and development. The series of intrastate conflicts going on in Africa is another source of concern for the prospects of good governance on the continent. The ravaging effects of wars and ethnic conflicts in Nigeria, Somalia, Ethiopia, Eritrea, Burundi, Angola, Democratic Republic of Congo (DRC), Sudan, Liberia, Sierra Leone, and Rwanda have ensured stunted socioeconomic and political growth in the countries. While years of civil and ethnic wars may sometimes pass, the devastating effects they leave behind continue to pose threat to good governance. Years of resource commitment are required to rebuild the effect of such wars and insecurity. For economic, social, and political development to be achieved in such society, states must deploy huge and expensive resources to rehabilitate the society. This is often at the expense of resources that could be utilized to provide better life for citizens and improve public services to midwife societal development. It suffices to add that while the world is currently directing all its resources toward containing the Covid-19 pandemic, some African countries are faced with insecurity challenges to deal with alongside the pandemic. This is as terrorist groups and bandits have continued their deadly terror attacks on towns and villages. This diverts both attention and resources from the Covid-19 pandemic which currently demands full scale global attention.

The point must, however, be made that while insecurity negatively impacts governance in

Africa, often times, insecurity is a product of governance failure. Whereas most governments have failed to carter for citizen's welfare – education, jobs, and healthcare, among others –, citizens give the excuse of poverty, neglect, and marginalization to get involved in acts that threaten state security. For instance, the Niger Delta militant groups in Nigeria took up arms against the Nigerian state, citing years of government's total neglect as reason for their actions. While the Niger Delta region produces the main stay of the Nigeria's economy – oil –, the region have suffered years of neglect and marginalization over the years. Although politicians steal money accrued from oil exploration from the region, they stash these money abroad and build luxury houses at the nation's capital, leaving the region in abject poverty, gross infrastructural decay, and environmental degradation. To attract government's attention, therefore, several militant groups have emerged in the region, causing serious security challenge to date. The Boko Haram, ISWA, and other terrorist groups in Africa have also enjoyed broad and easily enticed membership recruitment, thanks to governance failure on the continent. With so many impoverished and out of school children in Africa, these terror groups find it quite very easy to recruit men against the state that has abandoned them and caused their predicaments.

The autocratic and greedy nature of African leaders has led to conflicts and ethnic crises on the continent. The major conflicts in Sierra Leone, Guinea-Bissau, Liberia, and Cote d'Ivoire over the past decade are traceable to leadership autocracy and greed (Adebajo and Rashid 2004). The antidemocratic practices and ethnic favoritism of African leaders, which often alienate and threaten certain groups and pitch them against one another or to take up arms against the state, constitute a major trigger of insecurity in Africa. Lopsided and highly politicized appointments into public positions, ethnic and tribal favoritism, nepotism, complacency, and strategic marginalization of certain groups have instigated dissatisfied groups to take up arms against the state. Such marginalized groups see it justifiable, therefore, to instigate violence and conflicts against the state. The secessionist groups that such acts of leadership produce often threaten peace, stability, and development. In the end, serious resources are directed toward quailing these crises and putting an end to the destructive actions of such groups. Resources could be deployed more reasonably to other aspects of governance. The point must be made, therefore, that while good governance is critical for peaceful and stable society, so is a stable and peaceful society crucial for good governance.

All the insecurity challenges, whether naturally created or those that arise from governance failure, obviously mitigate sustainable and all-round development in Africa.

### Democratic Erosion

Democracy spread across the African continent in the early 1990s, albeit there is so much pessimism about the actual practice of democracy across the continent today. This is because many African leaders have continued to hide under the guise of democracy to engage in autocratic practices. This has denied the continent of good governance. Evidences abound across the continent where critical democratic tenets of rule of law, separation of powers, periodic, free and fair election, constitutionalism, and human rights have been subjected to gross abuse. In most parts of Africa, laws are made for the poor and ordinary masses; the rich, politicians, and highly influential personalities continue to breach the law and go scout free. Politicians are especially seen flouting court orders and going against the law in Africa. Also, the executive arm of government continue to lord over the judicial and legislative arms. In most parts, legislature merely projects and executes the whims and caprices of the executive. The judiciary still takes orders from the executive arm in Africa, in strict deferment of separation of powers. For instance, in most parts of the continent, appointment and dismissal of chief justices of countries still rest in the hands of the president who can fire them whenever he deems fit or they refuse to dance to his tune of music.

In Africa, elections still remain largely a veneer which politicians use to keep themselves in power (Idowu and Mimiko 2020). Elections are consistently and grossly manipulated in favor of

incumbent presidents just to remain in power. The democratic constitutional term limit in Africa remains constantly under threat. While several attempts have been made to tinker with constitutional term limits on the continent, 15 countries have succeeded in this regard since 2000 (Stremlau 2016: 23). Human rights abuses are still very rampant in Africa; with citizens (especially those belonging to opposition governments) being continuously intimidated and detained in prisons. The Police and other state institutions in Africa have continued to disrespect the rights of citizens in gruesome manner. These have continued to impede good governance on the continent.

The undemocratic attempts and actualization of unconstitutional change in term limits or age limits is a serious governance challenge in Africa. In 2015, for instance, Rwanda and Burundi succeeded in tinkering with the constitutional term limit for the office of the president, just to keep the incumbent president in power. In 2018, Uganda succeeded in adjusting the presidential age limit and extended parliamentary term limit. This was a sought of bargain between incumbent President Yoweri Museveni and parliamentarians to allow him contest in the 2020 presidential elections, while also allowing those parliamentarians whose term limit would have reached by the next election to be eligible to contest. Currently, President Alpha Conde of Guinea is lobbying the country's parliament to adjust the constitutional term limit to enable him contest in the next election at the expiration of his second term. Togo, Gabon, Chad, Cameroon, Djibouti, DRC, Sudan, Eritrea, and the Republic of Congo have also gone the way of extension or outright removal of constitutional term limits. The likes of Gambia, Ethiopia, Lesotho, and Morocco never have any term limits in place. Attempts to tinker with presidential term limit have failed elsewhere in Africa – Nigeria (2005), Burkina Faso (2014), Niger (2009–2010), and Zambia (2001) (The Conversation 2018). These practices, no doubt, weakens good governance on the continent as they continue to prevent capable hands who can propel Africa out of its numerous challenges from taking over at the helm of affairs, while those who continue to plunge the continent into its current awful state are maintained in power. This has continued to promote and sustain mediocrity in governance, resulting in poor leadership and poor governance.

While popular participation by the people in the decision-making process of the state usually via elections constitute an important aspect of good governance, in Africa, elections are largely not the "people's business" and are not for the people to decide who is elected leaders over them. Indeed, in Africa, those who vote decides nothing, those who count the vote (electoral management bodies largely compromised by incumbents) decides everything. Incumbents and politicians continue to manipulate the electoral process and resort to any acts including violence to come out "victorious" in the process. This hampers good governance on the continent. The democratic erosion or pseudo democracy which has become prominent in Africa, results in poor governance currently demonstrated by poverty, hunger, economic backwardness, corruption, frequent crises, wastefulness, lack of patriotism (Diamond 2002: 6), incompetence, and complacency. Good governance cannot exist where, in fact, those indices which suggest it are missing. The rule of law, constitutionalism, free and fair elections, and respect for human rights are epitome of good governance; where they are lacking, there is governance deficit.

## Leadership Challenge

Leadership and good governance are intrinsically intertwined. One cannot talk of governance without the mention of those at the very helms of governance structure – leaders. Leadership demands high level of charisma and discipline, including intelligence and a foresight. Where the leadership of any country is lacking of these, governance will most certainly encounter some challenges. Most of Africa's leaders lack the leadership charisma capable to provoke good policies which are necessary for good governance. While some of them have claimed all sorts of qualifications to enable them to be eligible to stand for elections, some have simply been "packaged" and presented to the people by those who want to

benefit from their leadership. In actual terms, most of them lack the requisite training and experience to provide quality leadership. Hence, most African leaders continue to face the critical question of fitness for leadership. To a very large extent, Africa seems to lack the type of decisive and charismatic leadership needed to propel good governance and socioeconomic and political development currently eluding the continent.

The bulk of Africa's governance challenges has been of leadership failure. Most political leaders on the continent are not innovative to think or work out the solutions to the numerous challenges bequeathing the continent, rather they are much interested in state capture and taking control over state resources. This underscores the willingness of African political leaders to do just about anything to get to power and remain there. No clear-cut ideologies among leaders, they are mainly driven by power; as such, African leaders align wherever they can fetch themselves political power and not to any specific ideology. This has resulted in "vision-less" African leaders. In the midst of lack of vision and ideology to make the right policies and take the right decisions to drive good governance, the prospects of development become bleak in Africa. Political power and rule has been largely personalized by African leaders, thus having significant consequences and adverse impacts on robust public policymaking capable to drive good governance and development (Hyden 1992: 23).

African continent continue to lack, to a very large extent, truly patriotic leaders with genuine intentions for the people and the state. The leaders have mostly sought personal gains to the detriment of the people and the state. While the people remain in abject poverty and are denied access to quality life and public services, African political leaders loot the state treasury and make themselves comfortable. They seem to be least concerned about the future of their countries and people, provided they can get luxury life for themselves and their families. This points clearly the lack of patriotism on the part of these leaders. The political will to do good both to the state and the people is grossly inadequate and, in some cases, is out rightly missing among African political leaders.

African leaders have also taken toward autocratic tendencies, presenting themselves as demigods that all state institutions must bow to. Leadership has simply been personalized and deployed for self and personal aggrandizement, rather than for national development. There is, indeed, outright poverty of leadership on the continent, hence everyone tend to behave the way they like. This has been a major governance challenge in Africa. Indeed, Africa needs more Nelson Mandela, Kwame Nkrumah, Obafemi Awolowo, and Julius Nyerere with the right leadership insight to drive good governance and the much desired development.

### State Capture of Relevant Institutions

In Africa, another critical governance challenge has been the one of strategic state capture of relevant institutions that were ordinarily designed to act as watchdogs to the state. African leaders continue to oppress, intimidate, and suppress these relevant institutions critical to force state to implement development driven and progressive ideas and polices. The media and civil society which were supposed to mount pressure on government and criticize its policies that are anti-people and anti-developmental have been pocketed by most African leaders. This creates a situation which has left the continent with a proliferation of governance style and policies that are largely anti-people and lack the requisite rigor to drive development. While some of these institutions have been suppressed, others have simply been bought over by state governments.

Press freedom has been dealt a blow in Africa via the continuous use of imprisonment, pressure, and acts of harassment to suppress independent reporting on the state of governance on the continent (Freedom House 2015). Only a few Africans live in a country where there is free media reporting on government activities and independently playing the watchdog role for effective governance. Also, opposition governments are nonexistent in Africa. Whereas opposition government is another relevant institution expected to put the incumbent government on its toes, in terms of delivering good governance and development, sadly, opposition has been largely silenced in

Africa. Incumbent governments continue to harass, intimidate, and suppress opposition groups on the continent. This is grossly inimical to governance and development as the watchdog role of the opposition is eliminated by these acts.

Nongovernmental Organizations (NGOs), democratic groups, civil society groups, and human rights defenders have suffered and continue to suffer harassment and suppression form state governments in Africa. This has resulted in the silence of most of the groups in their course to ensure that the government delivers good governance and development to the people. It is also correct, however, that some African governments have simply bought some of these groups over, sometimes creating and funding their own groups. These groups, the ones bought over and those created by the state, do no longer see anything wrong with whatever the government does. Their ability to provide constructive criticism to the government has, thus, been dashed a huge blow. For good governance and development to be achieved in Africa, these relevant institutions must be allowed to play their roles freely and independently.

## Conclusion

This entry has been able to shed light on critical governance challenges in Africa. While the challenges presented in the entry are not exhaustive, they are, however, considered the most delicate and the most disturbing governance challenges which currently confront the continent. If the continent must make significant progress in governance and development, these challenges must be addressed heads on and holistically. By so doing, Africa will be set on the path of greatness again.

# Understanding Performance Appraisal

Benati Igor
CNR – National Research Council of Italy, Torino, Italy

## Synonyms

Employee appraisal; Performance assessment; Performance evaluation

## Introduction

Human resources are a relevant productive factor within any organization, whether public or private

U

(Boudreau and Ramstad 2007). That is why the improvement of employee's performance is a crucial issue in management science. Performance appraisal (PA), the formal management system that provides for the evaluation of the quality of an individual's performance in an organization, is a fundamental step along this path. In concrete terms, PA is the process by which an observer, often a supervisor, assesses an employee's work performance (DeNisi et al. 1984), comparing current performance with explicit or implicit standards, and then providing feedback.

PA is a key tool used in public or private companies to measure employee performance and ensure proper and efficient personnel management. The first experiences of performance appraisal are very old and can be traced back to the Chinese Han dynasty (206 BCE–AD 220), where PA was used to determine public officials' careers. However, its institutionalization in modern times is linked to the industrial revolution. The first large-scale use of PA took place in Scottish cotton mills to measure organizational efficiency. Nowadays, PA is widespread in companies and public administrations and is often part of broader performance management systems (PMS). PMS is the set of activities, approaches, and tools that enable organizations to achieve their goals efficiently and on time by aligning resources and measuring performance (Harris et al. 2003). The complete understanding of an appraisal performance system goes through the illustration of its purposes, methods, process, and actors.

## Purposes of Performance Appraisal

PA can have different aims within organizations. It can be used to communicate, make decisions, and motivate (Ikramullah et al. 2012). PA system must ensure all three objectives to achieve real growth and development of employee potential. Communication between managers and employees is essential within an organization, and it must be bidirectional, from manager to employee and from employee to manager (Johlke and Duhan 2001). Using a PA system, managers can communicate to the employee the characteristics of the expected performance and the company's greater or lesser satisfaction with the employee's specific performance. At the same time, a sound PA system should allow the employee to express problems that limit their productivity.

PA systems can also enable management to make decisions about employees (Aggarwal and Thakur 2013). Accurate information on employee performance is necessary to redesign organizational processes and increase productivity. Information from PA is useful to reward the best employee by distributing prizes or rewards, such as salary increases and promotions. At the same time, PA can stimulate lower-performing employees to improve their productivity, allowing punitive measures such as downgrades and dismissals.

Finally, a PA system can also motivate employees to improve their performance, helping them know and share their organization's goals (DeNisi and Pritchard 2006). PA can be useful in spreading awareness among employees of the goals of an organization and how to achieve them properly, stimulating them to review their professional behaviors and increase their propensity to perform adequately. In other words, the PA, through the provision of professional behavior standards, can help create a shared organizational culture.

## The Process of Performance Appraisal: Steps and Actors

Performance appraisal is a process, which takes place cyclically in organizations, involving different actors. The performance appraisal process is highly variable based as much on the organizational context as on management choices. However, at least six typical steps can be identified:

1. Establishing performance standards
2. Communicating established performance standards to employees
3. Measuring the actual performance of employees by administering suitable methods
4. Comparing actual performance with standard performance

5. Communicating and discussing appraisal results
6. Rewarding for best and taking corrective actions for poor performers

In the first step, performance standards must be established for the work or assignment under observation. Standards can be formulated in different ways, but they have to be realistic and measurable. Products, results, or skills related to a role can all be used as a standard. The standards can be decided by the management of the organization either autonomously or jointly with the employees.

In the second step of the process, performance standards have to be communicated. The communication of standards serves to ensure that the employees of an organization know in advance what measures will be used to trace their performance to comply with the organization's expectations and goals. Standards must be correctly communicated by management: written form is most often appropriate, but standards may also be communicated orally in some cases.

The third step of the process deals with measuring the performance of the employees. Measurement can be carried out using qualitative and quantitative techniques, choosing the most suitable one for a specific working situation: it can be done on the basis of information obtained from written, oral, and statistical reports, as well as through personal observation.

The fourth step is to compare the employee's actual performance with the expected or standard performance. The employee's performance may be below or above/equal to expectations so that the result of the comparison can be negative or positive.

The fifth step deals with discussing the results of the appraisal. In this step, managers or supervisors have to communicate the feedback of appraisal to employees, discussing the employees' gaps in performance. This can be done on a one-on-one basis or in a collective manner.

The appraisal process's final step coincides with rewarding for best and taking corrective actions for low performers. At this stage, the supervisor provides rewards (promotions, salary increases, bonuses) to compensate good employees' performance and punishments (demotions, layoffs, penalties).

As stated in the definition, performance evaluation is a multi-stage process, usually involving at least two actors: the evaluator (employer, manager, head office) and the person being evaluated (employee, worker). Often those who judge the performance of the worker are the closest responsible in the hierarchy of the organization (supervisor), but sometimes the evaluation can be conducted by external evaluators, peers, or even customers.

## Methods and Techniques of Performance Appraisal

Human resource management employs a variety of performance appraisal methods built over time based on public and private organizations' needs. PA methods are classified in different ways. The most relevant classifications of PA methods are based on three elements: nature of data used, subject of the appraisal, and term of comparison. Concerning the nature of data used, methods can be grouped into subjective and objective (Daley 1992). The former type is based on information collected on employee's achievements at work and the latter on subjective judgments on employees' performance expressed by people within or outside the organization (customers, colleagues, managers). Regarding the object of analysis, the PA can be based on two distinct elements: behaviors and employee results. Behaviors subject to evaluation can be an expression of mental activities (such as synthesis, analysis, abstraction, diligence), technical and organizational activities (control skills, human resource management), and relational activities (leadership, communication skills, sales skills). Employee results used in PA may differ from one case to another, changing according to the sector and the employee's role under review.

Concerning the term of comparison, PA can be based on absolute references or relative ones. In PA based on absolute references, employee assessment is based on a priori defined performance standards. Evaluations based on relative

references, on the other hand, compare the employee's performance with those of the average of other employees.

A more widely used classification, which comprises the three perspectives described above, is a chronological one that distinguishes appraisal methods into two categories: traditional and modern (Deb 2006). Traditional methods emphasize the subjectivity of the appraiser's judgment, while modern methods are more objective and worthwhile. A short list of methods includes the following:

**Traditional Methods**

1. Ranking
2. Graphic Rating Scale
3. Critical incident
4. Narrative essay

**Modern Methods**

1. Behaviorally Anchored Rating Scale
2. Management by objectives
3. 360-degree appraisal

Among traditional methods, ranking is probably the simplest way to appraise performance. It consists of ordering employees from best to worst on a particular trait, choosing highest, then lowest, until all ranked. The ranking method is simple and easy to use, but it is suitable for a small workforce because strengths and weaknesses cannot be easily determined for a large number of workers (Aggarwal and Thakur 2013).

The Graphic Rating Scale is a checklist that a manager can use to assess performance on a scale. Scale continuum structures the judgment from the lowest performance level to the highest performance level and can be qualitative (excellent, good, average, fair, and poor) or quantitative (e.g., from 1 to 5). The main problem of this method is that the single characteristics on which the evaluation is built have all the same weight in determining the final judgment.

The critical incident method is a method based on the written recording of an employee's positive and negative performance throughout the observation period. The evaluator has to record the way an employee performs a task, positive or negative, underlying the elements that have worked or that should be changed in his performance. Although critical incidents are commonly used for development decisions, they are also used to evaluate retention or dismissal purposes.

In the narrative essay method, the rater compiles a document detailing the employee's strengths and weaknesses, often including reasoning about the employee's past performance and overall potential. The method is simple to use and provides good feedback to the employee, but the main criticisms are related to the fact that it is very much tied to the rater's writing ability and that the information that goes into it is almost exclusively qualitative in nature.

Among modern methods, the Behaviorally Anchored Rating Scale (BARS) measures an employee's performance by describing ways to perform a work task along a continuum, ranging from least desired to most desired. Descriptions of the employee's specific behavior are also paired with numerical scores to provide a quantitative reading of the data. Providing a true description of performance for each rating along the continuum, rather than a simple word (excellent, good, fair), overcome the problem of subjectivity by the rater.

The management by objectives (MBO) is a method in which employee performance is detected on the basis of professional objectives. Most of the time, an MBO chart is an operational translation of a company's or a public administration's strategic plan into an implementable program. The achievement of these objectives is periodically controlled by supervisors, who reward employees based on results. This method requires to define individual goals and plans for each worker or working unit. Objectives can be set by managers or jointly with employees. The measurement of employee performance takes place against their goals. In this method, employees should receive continuous feedback on how they are doing, usually during meetings at scheduled time intervals.

360 degree is a method in which employees can receive performance feedback from multiple subjects within the organization as well as external. The ratio is that the employee's performance must be assessed from different perspectives to be

truly objective. Sources of the appraisal can be supervisors, peers, staff members, co-workers, and customers. The method is based on feedback forms, which include questions measured on a rating scale. 360-degree method allows managers to have a better understanding of the strengths and weaknesses of their organization.

## Conclusions

Performance appraisal is an essential evaluation tool because it ensures organizations the best utilization of human resources to achieve their goals and objectives. Empirical evidence has demonstrated that performance appraisal leads to improved productivity, job satisfaction, and trust (Guthrie 2001; Chiang and Birtch 2010; Kuvaas 2008; Mayer and Davis 1999; Pettijohn et al. 2001).

The presence of performance appraisal systems helps managers in their work, but it is also a guarantee for workers, to the extent that such a system specifies the expected characteristics of job performance and provides an instrument for professional growth.

Performance appraisal tools, however, must be carefully and expertly constructed to ensure their effectiveness. The abstract models need to be adapted to the individual operating contexts and characteristics of organizations. Performance metrics, in particular, must be very accurate. For this reason, modern PA systems are increasingly careful to ensure the objectivity of measurement, leaving less room than in the past for subjective judgments.

# Understanding Political Dowry in Iran's Public Administration

Hassan Danaeefard[1] and Masoumeh Mostafazadeh[2]

[1]Tarbiat Modares University, Tehran, Iran

[2]University of Tehran, Tehran, Iran

## Synonyms

Political gear; Political privilege

U

## Definition

Privilege a manager promises to bring by himself/herself to an organization.

## Introduction

The behaviors of political and executive managers and experts in public sector have always attracted the attention of theorists and practitioners of public administration area. Political sciences, public policy-making, and public administration are the domains of attempt to theorize the actions of political managers, employees, and political and executive institutions in different political systems in a variety of ways. Theories, models, and frameworks are the instruments used to describe and explain the actions and activities. Thus, each of these domains transfers the knowledge produced about each of the aforementioned phenomena through administrative degrees (BA, MA, and PhD) and administrative events (workshops, seminars, and conferences) to ensure efficient, effective, and fair administration based on human rights. Although a few authorities from these domains claim their theories, models, and frameworks are universal, the reality is that, most of the produced knowledge is context- and culture-oriented, and it may not be used in other contexts. Thus, comparative public administration tries to promote belief in local public administration models of the public sector and public policy-making, although it follows the design of general theories in its essence.

Based on this, comparative public administration researchers have developed certain models for explaining managerial behaviors in the public sectors of developed and developing countries. In referring to "political dowry" in third-world countries, the authors in this study attempt to describe this phenomenon by relying on interdisciplinary theories. Our belief is, in countries with more political approach to public administration, this phenomenon is popular. Political officials with a dominant role over the highest state officials maintain strong control over those senior civil servants who after the onset of political functions are not replaced, which creates a strong (political) pressure and ultimately reduces professional independence (Čehovin and Haček 2015, 139). Prismatic society theory, cooptation theory, public managers' displacement theory (Danaeefard and Alvani 2007), and new public administration theory could be noticed as theoretical foundation of this phenomenon. Reviewing these theoretical foundations, we will talk about some mechanisms of this phenomenon in third-world countries.

## Theoretical Roots of Political Dowry

### Prismatic Society Theory

Fred Riggs one of the most famous of scientist of public administration, tried to explain local models and theories in developing countries. His theory of prismatic society and the Sala (administrative subsystem) model of administrative systems have a certain place in scientific studies on comparative public administration. In the theory of prismatic society, he places fused, diffracted, and prismatic societies in one class, where prismatic societies are between the two other types. According to him in a fused society with a structure (king, leader, etc.), governors perform all governance tasks, and citizens and people are absolute servants of governors and do not seek any reward or compensation in lieu of serving the governors. In these societies, the government is not responsive to people, but the people have certain moral commitments in terms of obeying the government's regulations. Furthermore, intrasocietal relationships are so weak, and the relationship between the nation and the government is of the lowest level. A diffracted society is so disintegrated (in terms of structure, behavior, and process) that its degree of differentiation is considered the criterion for its development. In such societies, specialization governs, and every structural element' performances and functions are integrated. All structures are somehow designed there on from rational considerations. Economic systems are based on the market axis and affect other aspects of society. Fred Riggs used the term "marketized society" to refer to such societies. In such societies, the government

shows some sensitivity toward people's demands and defends their rights. Public authorities do not have absolute power, and people are expected to obey regulations. The third type of society that is intermediate to the two aforementioned types is the prismatic society. According to Riggs, this society combines the features of two other types of societies. There is a certain level of differentiation along with specialization of necessary roles for administration and new technology. However, in terms of social integration, there are some difficulties. Although such a society is not fused, it is not completely diffracted (Riggs 1964).

### Cooptation Theory

In the realm of environmental administration, various theories, mechanisms, and strategies have been proposed for managing turbulent environments. One of the theories of Philip Selznick (1949, 1996) the father of institutionalization is the cooptation theory. According to this theory, managers try to manage their environments in various areas by communicating with critics and key influencing factors. By establishing aggregations (committee, council, commission, etc.) in their organizations and inviting these critics, managers try to direct organizational players toward turbulent areas to alleviate any environmental crisis in the organization that can threaten the organization. Instead, the organization makes these people members of the board of directors, committees, and commissions, and such people try to bring some kind of dowry to the organization. The dowry brought by each individual might differ. Sometimes, through these individuals, the organization gets loans, facilities, foreign trips, and wins bids or competitions for various projects. For example, a few research organizations try to acquire research projects of organizations in which these individuals are members by attracting said individuals to their high councils of research and guaranteeing their survival.

### New Public Administration Theory

Each of the managerial movements in the public sector has its own managerial approach (Danaeefard 2012). One of the managerial movements in the public sector is new public administration that is based on the political approach toward administration in the public sector (Frederickson 1980). According to some researchers, politics is the main axis of the administrative system in this approach. Sayer (1978) effectively referred to this point. He believed public administration is in fact a part of main core of political theory. The fundamental issue in democracy is the responsibility toward public control. Thus, the responsibility and organization and administrative bureaucracy's sensitivity toward selected authorities has central importance and the government emphasizes severely on imposing discretionary power by administrative organizations."

Appleby (1945) refers to this issue and considers public administration as policy making. In Big Democracy, he refers to three main features of public managers: territory and the effect of action, public responsiveness, political behavior and attributes.

In the linkage between democracy and bureaucracy, according to some authors, a democratic society requires democratic organizations. So when executive power is in control of the winning party, said party hands over the control of all managerial and key positions to its fans and members because it believes that people have voted for the values of their intended winning party. Thus, the selected government is required to change managers and bureaucrats to implement its agenda. In this case, the political approach toward administration in the public sector shows itself in the form of change or displacement of managers, deputies, and even top managers, and somehow, in the lowest rung of people in the public sector organizational pyramid. Political rationale and party-oriented strategies are the specifications of this approach toward administration in public sector and competency is not the only initial and main index of managers and employees.

## Theorizing the Political Dowry Theory

When a society has the characteristics of Fred Riggs' prismatic society, a Sala-like administrative system is formed. Moreover, when the

political approach to administration governs the public sector and the theory about displacement of public managers confirms the transfer and displacement of public managers and the cooptation theory governs the managerial styles of managers in the public sector, the administrative system will witness behaviors appropriate to such communities. Top civil servants form the organizational link between elected political executives and the administrative hierarchy that forms the backbone of the public sector (Christensen et al. 2014, 217). In such an administrative system, any public manager tries to show its performance in terms of good public opinion instead of focusing on real and democratic performance. Thus, managers seek different ways of presenting the organization as being good and effective. In this political market that governs the public sector, various displacements occur across various organizations. Some individuals attempt to promote their professional and specialized roles within political games and by transferring from a low-level organization to a higher organization. Since these individuals have obtained high places through political interactions and there is the possibility that these places can be taken back after political revolution, they try to find positions in certain professional and specialized centers to remain safe. Thus, by resorting to higher authorities, they create the grounds for transfer to target organizations. Because it is likely that these individuals do not have the required professional competencies and the main body of the target organization contradicts with their entrance, they enter the target organization by appealing to political pressures and inattentiveness to service regulation. Moreover, since the managers of organizations and specialized institutions are selected through such a political managerial style, they try to place their party members in their organizations. However, they expect compensation from the newcomers. In other words, an individual with high political and managerial place enters such organizations and brings a dowry to the organization that the authors call "political dowry." Such dowry has different forms and shapes. The volume and significance of such dowry depends on the target position and the individual's influence on the national and executive policy-making in the country. The allocation of certain budgets, receiving of land and public facilities, linking of target organization with power centers, paying debts, and receiving surplus budgets are a few examples of such dowry. The severity and duration of this phenomenon is different in different government functions (economic, cultural, and educational). Meanwhile, in explaining the incidence of this phenomenon, one could say that governance in the political approach to public sector administration increases the inclination toward achieving public treasury in political players because in this case, the possibility that they return to political power is in doubt. Thus, the winning political party tries to strengthen its roots in various managerial sectors so that it cannot be withdrawn easily. By contrast, the next winning party will not be able to dominate other professional and political centers. Furthermore, because the professional and specialized centers have good face in society and protect the abilities of professional individuals and the possibility of rapid confrontation with experts in such centers is slightly problematic, politicians try to obtain certain professional and specialized places after losing their political positions to be able to enter political realm at any given opportunity and to stay in public consciousness.

Accordingly, such individuals try to promise heavy dowry to target organizations, usually by quoting their political status, to gain entry into the target organization by persuading the manager of the organization. Because such an opportunity is not always available to them, they try to allocate the professional and specialized positions to themselves when their party is in power. Political opportunity-seeking defines such individuals because after departure of their political party from the political and executive administration of the country, the possibility for them to enter such organizations is low. The destructive and negative outcomes of this phenomenon include showing the country environment as based on rent, building of revolutionary spaces in organizations, pessimism toward parties and politicians, questioning meritocracy, degradation of the spirit of law and regulation in society, increase in the

**Understanding Political Dowry in Iran's Public Administration, Fig. 1** Political dowry phenomenon

avarice of other political players in using political positions when in power, diminished public trust in the trusteeship of politicians, politicization of professional and specialized organizations, disappointment in society – based on the fact that without party dependency, progress is difficult – destruction of national motivation of experts in said organizations, and pessimism and distrust of managers in said organizations. In Islamic society, where policy based on religious guidelines, this phenomenon seems to be strange because "political opportunities" in such a society is a divine trusteeship, where unfaithfulness has religious consequences. Figure 1 shows the incidence of political dowry graphically.

Figure 1 shows that when the political approach governs the entire political system and public sector administration, winning party is willing to guarantee its political survival through different ways and by appealing to various mechanisms. Thus, the inclination toward political survival is very high in the winning political party, and it tries to make maximum use of national assets (political, economic, cultural, professional, and specialized) to sustain its survival. The drive to use public facilities is very high, and the party in power tries to increase partisanship in all aspects of life, including sociocultural, politico-economic, legal, as well as professional and specialized administration. Accordingly, the inclination toward partisanship is high. The link between three mentioned dominant inclines leads party players to stabilize and occupy the political, managerial, and professional positions. Thus, they try to focus on obtaining professional and specialized positions that have higher survival in society. Based on this strategy, professional-specialized interorganizational transfers occur in the public sector, and a phenomenon called political dowry facilitates the confirmation of political positions.

Notably, the authors focus on transfers in professional-specialized organizations. However, because the political space governs such transfers and displacements, it is likely that even the individuals transferred to such organizations do not honestly declare the amount of their dowry; however, the manager of target organization wishes to gain some advantages for the organization before the entrance of such an individual because of knowledge about the political place of that individual or because the individual clearly creates the impression in the manager of the target organization that his entrance will benefit the organization. However, some individuals might enter target organizations after presenting their dowry. Overall, the following states are possible:

- An individual first enters the organization and then offers dowry to the organization; however, the speed of dowry injection to organization might vary. It might happen that such an individual would not succeed in bringing

dowry but benefit from membership of the organization.
- Before entrance to the organization, an individual submits dowry to the organization and might not enter the organization because of changes in the situation.
- Manager inducts an individual into the organization expecting to receive dowry, and by entrance of the individual, the organization may or may not benefit from the dowry offered.

## Mechanisms of Political Dowry

### Receiving Public Loans or Public Budgets

Managers of public organizations present their prestige and extent of administration by increasing their credits and budget because one of the indicators of public managers' success is obtaining greater financial resources and a larger share of public budget. Any public sector manager who can increase the inflow of funds into an organization seems to be more effective. To fulfill such an aim, a public manager should be powerful in budget brokerage within or outside the relevant ministry or should be able to supply finance through beneficiaries. The dowry of these individuals might be the injection of major or average budgets into such organizations; however, the injection of such dowry happens legally. For example, such individual can directly or indirectly (as a member of government) inject a major budget by approval of the government and authorities or enter a big load into the organization by approval of the government or other related communities.

### Acquisition of Public Buildings

In the revolution era of organizations' activities, considering rapid spread of public organizations' activities, one of the issues confronting public organizations is the physical structure of such organizations. Undoubtedly, the spread of activities in some organizations requires physical places, including various uses of employees and managers' training, the participation of the children of managers and employees of the target organization in sporting and cultural events, and use of recreational complexes. Based on this, an individual who enters a target organization might acquire some buildings of other public sector organizations to give it to the target organization, delegate recreational centers to the target organizations, attach certain research centers to the target organization, or assign sporting facilities to the target organization.

### Land and Public Facilities

One of the dilemmas facing public organizations is a lack of physical space and weakness in presenting welfare services to employees and managers. There are various ways of acquiring such lands and increasing the number of recreational centers available to employees. However, land and public facilities are the main conditions of political dowry placed on an individual to be transferred from an organization or a political position to the target organization.

### Linking of Target Organization with Power Centers

Occasionally, the political dowry of an individual who enters a target organization involves building some relation between the target organization and power centers, policy makers, and executive managers of the country and many organizations try in different ways to communicate with certain centers. A dowry that a person can bring to the organization is "the link of the organization with such centers," including major economic projects (dam, bridge, and power plant construction) and research projects, public buildings, and land and government facilities. At times, such links prevent destruction of the target organization because the entrance of such a person into the target organization might bring with it increased budget and other facilities for the organization.

### Debt Relief or Tax Exemption

Undoubtedly, one of the success indices of managers is debt reduction or receipt of postponed budgets and tax exemption. In this regard, managers try to achieve success in different ways, for instance through legal reasons and by justifying the specialty of activities and delegations of their organization in a given area. One mechanism that

managers employ is attracting influential individuals who can settle the organization's debt legally, reduce them, or fulfill financial demands via other organizations. These individuals try to achieve this by means of their influence in executive, regulatory, and judicatory systems. This phenomenon is called political dowry because of what the individual brings to the organization directly or indirectly.

### Transaction of Public Policies

Any society depends on the government's policies for its survival. When general policies emerge, they do not always benefit of all people in a society or an organization. General policies create some constraints and increase the freedom available to individuals, organizations, and various communities. There are various ways in which influential groups try to change policies to their benefit or to prevent their constitution. One of the key mechanisms of these influential groups is to supply individuals who can fulfill these aims. Sometimes, by attracting these individuals, organizations try to delegate such "transaction of national policies" to these individuals in order to encourage policy-making centers to develop policies that are beneficial to the organization or prevent policies that are detrimental to organization. This is the heaviest component of the dowry that such individuals bring to target organizations.

## Conclusion

The authors have tried to describe and explain "political dowry," its foundation and its mechanism. We do not claim our theorizing of this phenomenon and its process of operation is perfect and accurate but we tried to understand a common phenomenon in some countries. Although, political dowry has various forms, its financial implication on the public treasury is important. In the political approach toward administration in the public sector, de-politicization of policies and administration creates the ground for various political activities in administrative systems of countries. The new public administration theory confirms the prismatic nature of such systems. Governing political parties try to make use of various instruments and mechanisms to remain in power. Using the public treasury in legal and illegal ways is one of these mechanisms. In this approach, although the civil servant is a person who is employed into the civil service and should not be a political or judicial office holder and his remuneration should be solely paid out of government funds (Briggs 2007, 144), political managers try to takeover specialized areas, so they try to guarantee their entrance to professional-specialized areas through the injection of political dowry.

Authors propose serious studies on "political dowry" in public administration in all countries because this is a dangerous reality that could cause irreparable damage to governments. Injection of this phenomenon to public administration domain in academic level could lead to more studies and researches.

# Unintended Consequences of the Public Sector Reforms in KZN, South Africa

Zamazulu Mthembu and Sybert Mutereko
School of Management, IT and Governance, University of KwaZulu-Natal, Durban, South Africa

## Synonyms

Contracting out; Privatization; Procurement; Tendering

## Definition

Outsourcing refers to the procurement of goods and service from external sources by private or public organizations based on contractual agreements. Market reforms refer to applying market/business models to public administration and governance in South Africa.

## Introduction

The state had widely been recognized as an instrument of socioeconomic development from 1948 to 1970, and the effective administration was viewed as the primary agent in the formulation and implementation of programs and development plans (Bertucci 2009). The public sector represented by the executive and its bureaucracy constituted the key apparatus for the execution of the functions of the state. Up to the 1970s, the state became a direct investor, in not only the infrastructure and public utilities such as water, electricity, housing, and telecommunications but also in the operation of industries, agriculture, banking, marketing, and various commercial activities. Increases in governmental activities led to a bloated public sector, and it became clear that the state was working on far too many activities. By the 1970s the state began to be weak and inefficient and this facilitated the need to reform the public sector by shifting from the state and public sectors to the private sector (Bertucci 2009; Dzimbiri 2008).

Using a case study of the outsourcing of cleaning services in a South African government department to understand the lived experiences and perceptions of workers employed by outsourced companies, this study adopted a qualitative analysis of outsourced workers and examined the reasons for outsourcing cleaning services.

Following this introduction, the next two sections provide a brief background of public sector reforms and review-related literature on outsourcing of services in order to establish the context of the study. The sections will explore the stated reasons and management of outsourcing as well as examine its impacts. The fourth section outlines the research methods that the study adopted in order to glean empirical data for this study. This is followed by the fifth section which shows how outsourcing impacts on workers in a KwaZulu-Natal government department. The sixth and last section draws together prominent trends to articulate an emerging framework for the impact of outsourcing of workers.

## Public Sector Reforms: A Brief Background

The new public management (NPM) emerged in the1980s to improve public sector efficiency through the application of private sector management techniques. The main drivers of the reform were to reduce the direct involvement of the state in economic activities, to create an environment for the enhancement of the growth of the private sector, and to develop public-private sector

partnerships. During the era of NPM, many African countries had to cut their civil services drastically and some public enterprises were sold to the private sector. The state ceased from being the single vehicle in social development and economic growth, and there was greater reliance on the market forces in solving most development problems (Bertucci 2009: 3). Dzimbiri (2008) maintains that the NPM promoted greater reliance on the private sector, on service delivery through contracting out and outsourcing, on public-private partnerships, on competition and reliance on market forces, and on the creation of an enabling environment for the growth of private enterprise, which led to increased outsourcing.

Outsourcing combines the resources of government with those of private agents in order to deliver the goals of the society. It includes contracting out of services, business management of public entities, and the design of hybrid organizations for risk sharing and co-production between government and private agents. Governments can choose to realize societal goals directly through public employees or indirectly by means of business and nonprofit organizations. Outsourcing was introduced to improve service delivery, reduce costs, increase efficiency, and to create job opportunities (Cali et al. 2015).

While the NPM narrative is theoretically sound and defensible, outsourcing has had a negative and unintended impact on all parties involved. One criticism against outsourcing and by extension NPM is that there is minimal evidence to support the claim that outsourcing reduces cost (Petersen and Hjelmar 2014). It is difficult to determine whether or not outsourcing improves quality of care compared with a direct provision of services, as quality has been either not defined or inconsistently defined across different contracted projects. There has been a harmful effect on the community that has been brought about by contracting out of public service including worsening of inequality and lowering wages instead of helping the government to save (Heires 2014). Furthermore, Heires's (2014: 3) study reveals that private providers cut their spending by lowering the wages and benefits of workers and this occurs at a great cost to the community. Heires adds that "these private providers face pressure from the government to keep costs low and flexibility high while at the same time they have to prove the value of their service compared to their competitors." Over and above this, there is the lack of unions and collective bargaining institutions to negotiate better wages and working conditions for the outsourced workers. Thus, private providers control the issue of wages and working conditions unilaterally (Doellgast and Pannini 2015). Outsourcing is thus viewed as an exploitative practice (Luckett and Mzobe 2016). The public sector is presently experiencing problems of violent protests by outsourced employees demanding that the government should do away with outsourcing.

Despite this glaring empirical evidence of the unintended effects of outsourcing, it has remained one of the main mechanisms of service delivery in South Africa. Frustratingly, there is a dearth of scholarship on the impact of outsourcing in the South African public sector. Although there have been studies on the effectiveness of outsourcing in reducing the costs to the public sector (Petersen and Hjelmar 2014), researchers have paid little attention to the effects of outsourcing on workers who are retrenched and later hired by the new private providers. One major weakness of such studies is that they fail to consider the short- and long-term effects of outsourcing on workers who are at the coalface of service delivery. As a result, our understanding of the lived experiences of such workers is based on speculation, which does not help in evidence-based decision-making.

## The New Public Management: The Theoretical Argument for Outsourcing

Outsourcing draws on the NPM approach. According to Alonso et al. (2015), NPM tries to incorporate the management ideas from business and the private sector into the public services. Furthermore, they suggest that NPM is a two-tiered phenomenon consisting of an inspiration to enhance the public sector and a set of policies and practice to reform the public sector. A further definition of NPM is provided by Simonet (2015), and in concurrence, with other scholars like

Dzimbiri (2008), he describes NPM as relying greatly on the market forces in providing public services and by promoting competition at all levels. Further, Simonet (2015) maintains that there is competition between local units and communities with private providers over talent and resources for the purpose of fulfilling government's mission where public providers are incapable of handling the demand.

A number of studies have looked into the impact of NPM. For example, Alonso et al. (2015) evaluate the effects of NPM on the public sector size. Due to the budget deficit experienced by the government across the European Union, the government had to cut its expenditure; therefore, in their paper NPM is portrayed as a means to reduce the public sector budgets. Moreover, NPM is regarded as a drive to slim down the size of the public sector by applying management techniques borrowed from the private sector. In particular, their study focused mainly on two major policies associated with NPM, namely, outsourcing and decentralization. The study concluded that government outsourcing in Europe did not reduce the size of the public sector neither did it lead to a reduction of government expenditure. However, decentralization led to a smaller public sector and ultimately reduced government expenditure.

This entry on the NPM theory makes the argument that some of the main drivers of the public service reform in South Africa were to reduce the direct involvement of the state in economic activities, to enhance the role of the private sector, to create an enabling environment for the growth of the private sector, and to develop public-private sector partnerships. NPM promoted greater reliance on the private sector, on service delivery through contracting out and outsourcing, on public-private partnerships, on competition and reliance on market forces, and on the creation of an enabling environment for the growth of private enterprise. NPM's theory conceptualizes outsourcing and privatization as generative for achieving public sector partnerships with the private sector in public service delivery. Alonso et al. (2015) state that outsourcing was introduced as part of the NPM movement from the 1980s to reduce the size of the public sector and to curtail government expenditure. NPM theory is of value for informing the reasons why institutions undertake outsourcing which among other things is to improve quality of care, reduce costs, and increase efficiency (Cali et al. 2015). NPM's emphasis on cutting government expenditure as the reasons for outsourcing is especially useful to this study's analysis of the impacts of outsourcing on workers as it allows one to think through whether or not outsourcing does guarantee public service efficiency.

## Reasons for Outsourcing Services

Most researchers agree that the common reasons for outsourcing are to reduce the operating costs, improve quality of service delivery, and to improve performance. For instance, in a study that sought to establish the cost and benefit of outsourcing cleaning services at a hospital in Botswana, Cali et al. (2015) reveal that in the private sector, managers will be in a position to cut costs, introduce new methods for delivering services including new technology. However, literature around outsourcing support services is not conclusive as to whether or not contracting out actually reduces the cost of service delivery and increases efficiency (Cali et al. 2015). Similarly, the decision to outsource is often based on the fact that new companies can realize efficiency through specializing and investment in new technologies (Doellgast and Pannini 2015). This argument is also supported by Taponen and Kauppi (2017) who assert that outsourcing is the best option for all of the organization's noncore functions to minimize the risks and to maximize cost efficiency.

However, critics of NPM and outsourcing have argued that while reducing costs is most frequently the reason for outsourcing; savings are on average trivial and generally total costs are greater when performed by private contracting companies than they are when they are performed internally. For instance, Heires's (2014) study shows that savings are short-term and over time they are reduced due to lack of competition and other factors (Heires 2014). In another study, Cali et al. (2015) report that outsourcing was more

costly when including indirect costs such as pension contribution, although it provided great value for money in that there was improved quality of services.

In support of outsourcing, Cali et al. (2015) point out that even if outsourcing may be more costly than providing the service in-house, it may still be justified if it delivers a significant increase in the level of quality of the service. Consistent with this argument, Alonso and Andrews (2016), after examining how privatization affected public service quality, determined that there was no deterioration of quality following the privatization of prisons in England and Wales. Another study by Agrawal et al. (2016) showed that there was an improved performance and access to health care due to outsourced supply chain logistics from private operators. They report that incidence of commodities running out of stock was no longer experienced after supply chain logistics were outsourced to the private providers. In their paper, they further mention that the success of service delivery managed by the private providers depends on the strong commitment of government, roles that are clear, accountability mechanisms, and effective collaboration of the various stakeholders (Agrawal et al. 2016). All these studies provide a comprehensive theoretical as well as empirical analysis of the benefits of outsourcing, but they fail to provide a holistic view. One criticism of much of the literature on outsourcing is that it fails to show how workers' lives are affected by such privatization. Our knowledge of how outsourcing affects these workers emotionally as well as financially is based largely on conjecture except for the studies mentioned in the next section.

## The Impact of Outsourcing

A few studies have convincingly demonstrated the impacts of outsourcing on workers. In a recent study, Luckett and Mzobe (2016) illustrate how, in order to reduce public spending for tertiary institutions, universities in South Africa had embarked on extensive retrenchments and contracting out of all support services such as security, catering, cleaning, maintenance. Their study shows that with outsourcing, some workers went from being university employees to being outsiders providing a service. Outsourced services were "noncore" services which required low skills, while the core services were rendered by skilled workers and were mostly white and middle class. In the post-apartheid South Africa, this outsourcing reinforced apartheid-like social and economic divisions; therefore, outsourcing had a negative material impact on workers (Luckett and Mzobe 2016). When comparing the wages before and after outsourcing, workers earned more before outsourcing, the study revealed. Similarly, contracting out of public services has a negative impact on the community. This argument emerges from the fact that contracting out has the effect of lowering wages of employees, and it worsens inequality in the community at large. This is consistent with Heires's (2014) assertion that private service providers often achieve savings by lowering the salaries and benefits of employees, and this happens at a great cost to the society. Similarly, Doellgast and Pannini (2015) observed that a major source of cost saving is the ability of private contractors to save cost through the adoption of a lower structure of wages and unilateral control of the flexibility and intensity of labor deployment. In their study that examined the impacts of outsourcing on job quality for call center workers in the telecommunications and call center subcontractor industries, Doellgast and Pannini discovered that wages for in-house employees were 18% higher than the subcontractors' employees. There were also differences in the quality of the work because subcontractors employed a large number of part-time and temporary workers. There were higher turnover and dismissal rates suggesting lower levels of job security.

Although literature cites different reasons for working conditions and wage disparities, Doellgast and Pannini (2015) present some of the reasons behind this. Firstly, they argue that subcontractors face pressure from their clients to keep cost low and flexibility high while at the same time they have to prove the value of their service compared to their competitors. Secondly, call centers have very weak or no collective

bargaining mechanisms; therefore, subcontractors avoid applying collective agreements, giving them unilateral control over pay and conditions, and the characteristics of call centers make it difficult for unions to organize workplaces or to use collective actions to improve pay and working conditions.

The literature on the effects of outsourcing on workers is scarce, and it does not give a clear perspective of the effect on workers. Most of such studies fail to consider the views of the workers as they normally focus on quantifiable variables. This study, that adopted an interpretivist perspective, was able to unlock and elicit the views and understandings of the workers regarding outsourcing.

## Managing Outsourced Services

While the argument for outsourcing sounds practically and financially attractive, management of such a process is not always easy. A number of researchers emphasize the importance of management making an assessment, before taking the decision to outsource (cf. Cali et al. 2015; Roberts et al. 2013; Kahouei et al. 2016; Taponen and Kauppi 2017). Roberts et al. (2013), for example, hold the view that before the senior leadership takes a decision to outsource, they must consider the reasons for doing so, the best practices to outsource, the obstacles to outsourcing, and the implications to management of the hospital or other organization. It is crucial to identify the tasks to be outsourced and to understand how the institution can best utilize the services of the private contractor. Through analyzing the risks of outsourcing, the risk manager plays a vital role in selecting and implementing the tools for risk reduction which influences the success or otherwise of the decision to outsource (Kahouei et al. 2016). If the decision to outsource services is reached, management must conduct a cost-benefit analysis, noting direct and indirect costs before and after outsourcing. The risk manager can also provide advice to government departments that are considering outsourcing on how to conduct an in-depth, cost-risk-benefit analysis (Agrawal et al. 2016). In the same vein, Taponen and Kauppi 2017 suggest three skills that are crucial in managing outsourced services: (i) feasibility assessment of outsourcing, (ii) transferring the service production from in-house to an external supplier, and (iii) monitoring and evaluation of the service delivery. While this management advice provided may be sound, in theory, it overlooks the impact outsourcing has on the workers and how this should be managed. This inconsistency may be attributed to the focus on reducing costs on the side of government departments and on increasing profits on the side of private providers.

## Approach

To get a deeper insight into the experiences of outsourced workers, this study adopted a qualitative research design that allows the researcher to get an in-depth understanding of the views and understandings of workers as it deals with the underlying qualities of subjective experiences and the meanings associated with the effect of outsourcing on workers (Du Plooy-Cilliers et al. 2014). The enquiry in this study was to gain an in-depth understanding of the views and opinions of outsourced workers and management of a cleaning company that provides cleaning services. A case study approach was used to gain an in-depth understanding of the reality of the experiences of the workers. A total of 10 workers and the manager of the company subcontracted to provide cleaning services to a government department in KwaZulu-Natal was purposefully recruited to participate in the study.

Prior to undertaking the study, an ethical clearance certificate was obtained from the University of KwaZulu-Natal Ethics Committee and permission was granted by the gatekeepers. One focus group interview, which lasted approximately 1 h, with five low-skilled workers of the cleaning services company, was conducted. This method was useful in determining the attitudes, behavior, preferences, and dislikes of participants who were interviewed by a facilitator (Du Plooy-Cilliers et al. 2014). The focus group interview was also important in gleaning an understanding of how

the workers feel or think about outsourcing and its effects (De Vos et al. 2005) as were the in-depth interviews as a means to collect data. The first question for the focus group and for the one-on-one in-depth interviews focused on what the workers and management perceived to be the reasons why the government resorted to outsourcing support services. The second and third questions sought to ascertain how outsourcing has benefited the workers as well as the cleaning company. The fourth question allowed all participants to suggest recommendations to address the challenges of outsourcing services.

To solicit the perception of the strategies to manage contracts by management within the public sector, the study conducted a 1-h in-depth one-to-one interview with one purposefully selected manager of the cleaning company. All participants in the focus group discussion and in the one-on-one interview were asked to clarify each issue in the interview schedule and in the focus group schedule and to provide a more detailed explanation, therefore it allowed for more flexibility in the research process (Du Plooy-Cilliers et al. 2014:188). The interview was useful in giving the interviewers a good understanding of the workers' situation as well as in obtaining a deeper insight than surveys and other methods would have provided. The data obtained from the interview and from the focus group were rich and enhanced the researchers' insight by providing more relevant details.

Audio-recorded data from the focus group and from the in-depth interview were transcribed verbatim. Data from the focus group produced four single-spaced A4 pages while that from the in-depth interview produced two and half pages (Du Plooy-Cilliers et al. 2014: 236). This was followed by basic coding of all data that were to be analyzed. The study developed a coding scheme from the raw data that reduced the huge amount of data to manageable and understandable text using individual words in order to develop manageable chunks. In an iterative process, the study rechecked the consistency with which the coding was conducted in order to draw conclusions from the data by interpreting themes or categories identified and by juxtaposing them with existing theories and previously conducted research. Additional analysis was done using Nvivo, software for qualitative data analysis.

## Findings

### Reasons for Outsourcing

The first set of questions sought to understand the perceptions of the workers on the reasons for outsourcing cleaning services. The participants were asked to explain what they thought and believed to be the reasons for outsourcing services. A general sentiment from the focus group was that the reason for outsourcing services such as cleaning was for the government to create employment opportunities in particular for the black people. Respondents from the focus group noted:

> The purpose is to enable people to get bread (FGP1)
>
> To help each other as black people to develop (FGP2)
>
> To create more opportunities for employment (FGP3)
>
> To help black people to be free and be independent and extend assistance to other people (FGP4)
>
> To open employment opportunities for people and be able to get food (FGP5)

Taken together, these results suggest that most outsourced individuals view outsourcing in the context of empowerment of the previously disadvantaged groups in the post-apartheid South Africa. However, it is not clear why these workers concluded that employment in contracted companies would empower them more than direct employment by the government department. Responding to the same question, a slightly different perspective emerged in the interview with management. The interviewee noted:

> To keep the building clean. People employed by the government are not dedicated to doing their job like outsourced workers because we know we are not permanent.
>
> Operating costs have risen instead of decreasing because the government pays a lot of money to the contractors. If the government were to employ these people, operating costs would be lower.

Two main themes can be identified from these statements. First is a general perception by people

and largely proponents of NPM that government and its workers are inefficient. This response seems to affirm such a narrative. The second and important theme relates to costs. Although literature seems to suggest that one of the main reasons for outsourcing is lowering cost, the response from the interviewee suggests the opposite. Because of the exorbitant payment costs charged by contracting companies, government departments end up paying more than they would if they were insourcing. This discrepancy could be attributed to a lack of full understanding of full costs such as bonuses, pension contribution, and medical insurance that the government would have to bear if they were to employ these workers. Anecdotal evidence seems to suggest that most of the contracted companies do not pay such benefits. What could be gleaned from this discussion is that, on the one hand, the response on the reasons for outsourcing of services shows that workers perceived the reasons for outsourcing to be the creation of employment opportunities and empowerment for the black workers to be independent. On the other hand, management response relates to the improved quality of cleaning. To illustrate, in the interview one interviewee noted:

> The government saw the quality as low as the in-house provision of cleaning service, which is why he decided to outsource. The government would not have given the work to private companies if the employees were doing a good job. The government considers the quality of work.

Although the efficacy of outsourcing can be debated, this statement clearly indicates that the private contractors provide quality services that could be better than those that can be provided in-house.

Under the theme of management strategy, the study intended to understand the perception of management of the cleaning company of the strategies of the government department in managing contracts. A question was asked during a one-on-one interview relating to what the departments consider when making decisions about which type of services to outsource and which ones to provide in-house. The study found that government saw the quality as low for the in-house provision of cleaning services, which is why it decided to outsource. The government would not have given the work to private companies if the employees were doing a good job. The government considers the quality of work.

Again, the study aimed at understanding the perception of management on how the departments make a decision to outsource and whether or not they make a preliminary assessment of the benefits and risks of outsourcing services. The participant responded that

> . . .the government discusses and make a decision to take the service outside maybe due to the things that did not go well while the service was in-house.

The last question under this theme sought to understand the perception of management on whether or not the government departments have the strategies in place to manage contracts. The participants perceived that management does well as contractors are paid on time although there are days where there are delays. They also want workers to be in uniform and to be paid by their employer on time.

> If there is a problem between the contractor and its employees they are able to intervene and solve the problems at hand.

There was a positive response from the participant on the questions relating to the management strategy of the government department on outsourcing of cleaning services.

## Outcome of Outsourcing

One important theme that emerged from this study is the intended and unintended effects of outsourcing on workers of the contracted companies. The first set of questions under this theme intended to determine the benefits of working for contracted companies. Unfortunately, in all cases, the participants reported that they are not satisfied with their wages. The wages issue was a central problem for all the respondents. Text query using a Nvivo analysis illustrates the centrality of the issue of wages among the workers of the contracted companies as shown in Fig. 1.

**Unintended Consequences of the Public Sector Reforms in KZN, South Africa, Fig. 1** The effects of outsourcing on workers of contracted companies

From Fig. 1 we can see that wages were a recurrent theme among all the respondents. Although these issues varied from respondent to respondent, one common view was that the wages were significantly lower than what they thought they would have received had they been employed by the government directly. Some respondents noted:

> Monies are deducted from our wages but are not paid back. We have medical aid deductions but we cannot benefit from it. We use public health facilities (FGP1).
>
> . . . we receive our wages not on the date as agreed on the employment contract (FGP2).
>
> According to the contract we are supposed to be earning R3000 but the actual wage is R2000. We are supposed to get salary increment in April of every year but this year 2017 it did not happen. If we ask he keeps on promising to increase out pay (FGP3).
>
> I am not happy with our wages. Our employer is selfish. Monies are deducted from our wages but we are not benefitting from them. For example, I was admitted to the hospital and ideally was supposed to compensate for admission as the money for such is deducted from my wages. They only pay us on the date which suits them and not according to contract. Wages have been reduced. (FGP5)

These responses seem to suggest that the wages issue seems to be the main problem as it overshadows or is connected to other issues. It can be seen from these findings that contracted workers' concerns are around medical insurance, job security, unfair labor practice, and a lack of annual cost of living salary adjustments in the face of inflation. However, this finding may be surprising if one considers that the South African labor is unionized and that there are labor-friendly laws that exist in the country. However, some respondents pointed out that their employer does not like unions and he threatens to fire them because the unions always fight to protect the workers' rights.

Another issue commonly thought to be problematic in contracted companies is the provision of resources and equipment necessary for workers to perform their work. Both manual and Nvivo analysis did not yield conclusive results. Figure 1 shows how resources were a major issue workers complained about as it emerged from a Nvivo analysis. Although unconfirmed reports often state the shortage of resources and equipment for workers of out-sourced companies, the current study did not find anything to confirm this. In fact, a Nvivo analysis shows that resources and equipment were not among the prominent concerns of respondents in the study as it was mentioned only nine times with a weighted percentage of 0.43. Only one respondent was not satisfied with the resources. However, it was clear that the resources were not sufficient and sometimes it took ages to receive them. An explanation for this discrepancy is not clear, but it can be attributed to differences that exist among outsourced companies.

The study further intended to establish whether or not the workers are provided with resources to perform their duties. Turning to the interview with

the management representative, the study sought to understand management's view on the impact of outsourcing on the workers. Interestingly, the response from management was positive. The management interviewee pointed out that the wages were good as workers are able to do a lot of things like buying food, take kids to school, pay school fees, pay bus fare, buy clothes, and contribute to *stokvels*. However, in comparison with the workers that are employed by the government department, the interviewee conceded that workers were not happy with the wages, but for them, it is better when comparing with other contractors, although it is not satisfactory. Management was also asked a question relating to the benefits of outsourcing. The question sought to examine how outsourcing has benefitted the contractor. In terms of the government's policy of economic transformation and empowerment, the interview respondent seemed to suggest that the contractor is benefitting as this firm is growing and has been in service for a while. A comparison of the views from the workers and management on the outcome of outsourcing reveals that workers are not satisfied with the wages they are receiving from the employer while the employer seems to be satisfied with the outsourcing policy.

A general view among the respondents was that there is a need to be employed by the government, not by the private contractors. Some of them noted:

> The government must take us. We will go to pension empty-handed. Always when the new contractor comes, it comes with its own people to employ. (FGP2)
>
> To be insourced by the government and there will be a difference. When the contract ends, you have a problem because you had an account that you had opened like clothing and furniture. (FGP3)
>
> Respondent 4: We must go back to employed by the government. When the contract ends, you are not sure if the next contractor will take you. We cannot take our kids to the universities but we are thankful for the cent that we can get. We will be happy to be under the government at least we will have a pension when retirement comes. When the contracts end you get nothing, yet you have been contributing. (FGP5)

A common view among the participants shows that they are not happy with working for the contractors and they wish to be employed by the government. All participants from the focus group and one-on-one interview recommended that the government should do away with outsourcing. At the center of their concern are the issues of job security and conditions of service. One key question is whether or not it is feasible for the government to rehire the employees and terminate the contracts with private providers. This might be complex but recent trends have shown that most contracts between public universities in South Africa and private providers have been terminated after militant protests which were supported by student bodies. It is difficult to know if this can also happen in the government departments in South Africa.

## Discussion

### Reasons for Outsourcing

The preliminary question in this study sought to determine the perceptions of outsourced workers of the reasons for outsourcing cleaning services. This study established that the government outsourced cleaning services for creating employment opportunities for people to enable them to put food on the table which is in line with the broad government policy on economic empowerment of previously disadvantaged people. The finding is contrary to that of Cali et al. (2015), who found that the most frequently cited reasons for outsourcing; besides improving service delivery is to create job opportunities. The primary argument put forward for privatization and outsourcing by the proponents of NPM is that of efficacy, but views from respondents seem to point in the direction of redress of historical marginalization of black people. However, respondents' views on the importance of outsourcing in improving quality of cleaning are barely distinguishable from Cali et al.'s (2015) findings when they evaluated the effectiveness of outsourcing primary health services in Botswana. Their study established that outsourcing resulted in improved services by reducing the time and effort and adherence to hospital guidelines. Most researchers, consistent with the tenets of NPM, argue that one of the

top reasons for outsourcing services is that it reduces the operating costs to the organization (cf. Heires 2014; Cali et al. 2015). For instance, Luckett's and Mzobe (2016) study reports that in order to cut public spending for tertiary institutions, universities in South Africa engaged in extensive retrenchments and outsourced all support services such as cleaning, security, catering, and maintenance. Contrary to expectations, respondents in this study reported that outsourcing of services has increased the operating costs to the government. Nevertheless, these views seem to provide a different perspective rather than a refutation of the earlier findings.

### Impact of Outsourcing Cleaning Services

While it is undeniable that outsourcing may have a positive impact on service delivery such as in a Senegalese case in which it resulted in improved access to health facilities by outsourcing supply chain logistics to private operators (Agrawal et al. 2016), it is important to observe and note its impact on the workers. This theme that emerged quite strongly from the data has intended and unintended effects of outsourcing on workers. This study found that outsourcing of cleaning services has not benefitted the workers of Xolisisizwe. In many ways, outsourcing has had negative effects on workers of the contracted companies particularly in the area of wages. Consistent with Luckett's and Mzobe (2016) findings, this study established that workers were not receiving their wages timeously in accordance with the employment contract they signed with their employer. Marobela's (2008) Botswana outsourcing case study is illustrative of this impact of outsourcing on the workers. Like Marobela's findings which confirm that outsourcing was associated with low pay and poor working conditions, this study established that wages were paid on the day and time that suits the employer, annual cost of living adjustments were never implemented, and there were other forms of employee exploitation that the in-house government employees never experienced. This case study of outsourcing in South Africa seems to invoke the capitalistic exploitation of workers if it goes unchecked. Regarding the impacts of outsourcing on workers, the International Communist Current (2006) provocatively argues that it is a way of coercing the proletariat to make sacrifices, while those with capital impose conditions of exploitation by reducing the cost of labor through lowering the wages. Consistent with this argument and the findings of this study, more recently, Luckett and Mzobe (2016) and Doellgast and Pannini (2015) assert that workers of the outsourced contractors earn less than they would if they were direct government employees. Doellgast and Pannini's (2015) findings show that the variance was 18% in favor of government employees. These findings match that of Luckett and Mzobe (2016) who found that, when comparing the wages before and after outsourcing, workers earned more before outsourcing. He observed that, as mentioned earlier, a major cost saving is the ability of contractors to adopt lower structures of wages and unilaterally to control the flexibility and intensity of labor deployment compared to their clients. Again as mentioned earlier, wages for in-house employees were 18% higher than the subcontractors' employees. This concurs well with Heires's (2014) findings which extend the analysis to illustrate the unequal impact of outsourcing on people of different gender and racial backgrounds. Heires (2014: 3) notes: "wage disparity between men and women, and between blacks and white, a reduction [of] middle-class jobs and an increase in the dependency on public services." This assertion is particularly worrying in the South African context where the issues relate to inequalities which, to some extent, are a legacy of apartheid and remain a controversial challenge. To support this argument, Luckett's and Mzobe (2016) study of outsourcing in South African public universities established that "noncore" services were mostly rendered by blacks, while the core services which were rendered by skilled workers were mostly white and middle-class workers. This argument appears to support the assumption that outsourcing reinforced apartheid-like social and economic divisions, although this is not explicit in the findings of the current study. This may explain why the powerful leftist *Congress of South African Trade Unions* (COSATU) has raised concerns about

outsourcing in favor of direct government employment.

Going forward, the respondents in this study expressed a lack of hope for workers employed by government contracted companies. Having observed successful demonstrations against outsourcing in public universities in South Africa (see Luckett and Mzobe 2016) most respondents wished government through its various departments could employ them. Consistent with Luckett's and Mzobe (2016) objections, the main grievances they have are a lack of job security, no pension fund, no medical insurance, low wages, and poor working conditions.

## Conclusion

It is common knowledge that outsourcing in the public sector is inalienable from the NPM. The issue in this entry is not so much about the efficacy of outsourcing in the developing world or the manner in which it reduces the cost to the government while improving service delivery. Important as these issues may be in the broader discourse of NPM, the central focus of this entry was to illustrate the impact outsourcing has on the workers of the companies that are outsourced to the government. Drawing on a case study of a company contracted by the South African government to provide cleaning services to one of its departments in KwaZulu-Natal province, this study explored the impact of outsourcing on workers, an issue that is often ignored or is given little attention by researchers and public policy practitioners. By examining, the nuances of the experiences and perceptions of the workers themselves this study established that low wages, poor working conditions, and a lack of job security are some of the major unintended effects of outsourcing in South Africa. Naturally, workers of government-outsourced companies yearn to be employed by the government without any middlemen, a phenomenon called "labor broking" in South Africa. This is not just wishful thinking as there are cases when public institutions have reemployed workers who worked for outsourced companies. In the South African context, where there are glaring inequalities between the rich and the poor, direct government employment is a matter of social justice. In the absence of laws and mechanisms to enforce them, the problems of workers employed by government contracted companies are not likely to end. This study has serious implications for government, policymakers, and government contracted companies. Unless the South African government adopts strict regulations and minimum standards on working conditions for the workers of contracted companies as a condition for awarding tenders, these problems are unlikely to end on their own. However, the generalizability of the findings of this study should be exercised with caution bearing in mind certain limitations. For instance, this study draws on a single but rich case study. A cross-sectional study would be useful to determine the understandings and perceptions of workers from different companies, departments, and provinces. Notwithstanding this limitation, this study presents a crucial initial step toward enhancing our understanding of the impacts of outsourcing on workers who are at the coalface of service delivery.

# United Nations and Crisis Management

Bok G. Jeong[1] and Jungwon Yeo[2]
[1]Department of Public Administration, Kean University, Union, NJ, USA
[2]School of Public Administration, University of Central Florida, Orlando, FL, USA

## Synonyms

Intergovernmental organizations and crisis management; International organizations and crisis management; Transnational organizations and crisis management

## Definition

The United Nations is an international organization, made up of its member states, and founded in 1945 as a replacement for the League of Nations after World War II. The purposes of the UN include maintaining international peace and security and achieving international cooperation in solving international problems of political, economic, social, cultural, human rights, and humanitarian issues.

## Introduction

The United Nations (UN) has been involved in crisis management in a comprehensive range of fields and at multiple stages in disaster responses through its principal organizations and subsidiary entities including programs, funds, commissions, and specialized agencies. Crisis management

cannot be defined by a single dimension or by a single UN agency's activities because of the exigency, multiplicity, and complexity of humanitarian crises, including human-caused and natural disasters. Crisis management affects the health, safety, and well-being of a community or a country. The geographical coverage of humanitarian crisis varies. It could be local, national, and international. The duration of the emergencies and the time required to cope with the damage of disasters cover a wide spectrum of time scales, ranging from weeks, to months, to years, and to decades. Examples of humanitarian crises include natural disasters (such as earthquakes, volcanic eruptions, tsunamis, hurricanes, tornadoes, floods, droughts, wildfires), human-caused disasters (such as armed conflicts, oil spills), combined consequences (such as forced migration, famines), and other emergencies (such as epidemics).

## UN's Approach to Crisis Management

The UN's crisis management system focuses on humanitarian crises. The UN defines humanitarian crisis as "an event or series of events that represents a critical threat to the health, safety, security, or well-being of a community or other large group of people usually over a wider area (UNISDR 2009)." Traditionally, the UN identified crises caused by hazardous events, such as natural disasters or conflicts. However, the UN has recently been including diverse vulnerable social conditions – e.g., health, energy, security, water security, food security, urbanization, population growth, poverty, inequality, and climate change – as emerging drivers of crises and has taken account of complex interactions among these new causes in improving and adapting its crisis management systems.

The UN approach to crisis management shifted from "disaster management" to "disaster risk management." The UN's ultimate goals of risk management are to enhance "(a) resilience–the ability of people, societies and countries to recover from negative shocks, and (b) prosperity–derived from successfully managing positive shocks that create opportunities for development (UNISDR 2009)." This indicates that the UN's risk management approach is not limited to providing disaster relief services to the victims during post-disaster situations, but includes "assessing the risks of crises, reducing the probability and size of loses, preparing for them coping with their effects (UNOCHA 2015)." Along the functional lines, UN agencies have engaged in the risk management through various activities, including developing multi-hazard contingency plans, creating goods stockpiles, and administering vaccinations. In addition, with its member nations, the UN has developed and adopted the disaster risk management framework, "Sendai Framework, and its several global targets and four priorities of actions, which have been endorsed by the UN general assembly. The framework aims to provide international stakeholders across sectors and jurisdictions a further impetus to global disaster risk reductions.

## UN System for Crisis Management

The most comprehensive humanitarian relief and emergency responses of the UN system are centered on the Office for Coordination of Humanitarian Affairs (OCHA). The UN Security Council is mainly in charge of maintaining international peace and security, especially when threats to peace are brought to their attention, such as armed conflicts, wars, and epidemic crises. UN subsidiary bodies and specialized agencies, such as the International Organization for Migration (IOM), United Nations High Commissioner for Refugees (UNHCR), United Nations Development Programme (UNDP), United Nations Environmental Programme (UNEP), World Health Organization (WHO), United Nations International Children's Emergency Fund (UNICEF), UN Food and Agriculture Organization (FAO), and World Food Programme (WFP), are responsible for addressing crises related to their specialized areas or subpopulation groups.

## Office for Coordination of Humanitarian Affairs (OCHA)

The OCHA is the main office for humanitarian relief and emergency responses in the UN Secretariat. OCHA's main responsibility is to make sure that all humanitarian efforts by various actors are coordinated in a coherent and unified platform. The main missions of OCHA include the following: (1) mobilizing and coordinating humanitarian actions in response to disasters and emergencies in collaboration with multi-level actors, including national and international ones, (2) advocating the rights of needy people, (3) preparing for and preventing emergency situations, and (4) developing and implementing sustainable solutions.

### Guiding Principles

The General Assembly of the United Nations places emphasis on humanitarian assistance as the cardinal task for assisting the victims of natural disasters and other emergencies (UN 1991, A/RES/46/182, Section I. Article 1). Humanity, neutrality, and impartiality are the main principles in the UN's humanitarian assistance. The UN's humanitarian assistance work is provided on the fundamental ground of sovereignty, territorial integrity, and national unity of states. The UN understands that management of natural disasters and emergencies falls under the affected state's responsibility. Therefore, UN's humanitarian assistance is only implemented with the consent of and appeal by the affected country. The initiation, organization, coordination, and implementation of humanitarian assistance are deemed as the primary role of affected states (A/RES/46/182, Section I. Article 4). The reasoning behind international cooperation led by UN in emergency management is that the magnitude and duration of emergencies are in many cases beyond a single country's capacity for response and resolution. The UN's emergency measures aim to ensure transition from relief to rehabilitation and development (A/RES/46/182, Section I. Article 9).

### Organizational Arrangement and Responsibilities

1. **The Under-Secretary-General and Emergency Relief Coordinator (ERC)** is in charge of the oversight of humanitarian assistance by the United Nations. The ERC serves as the central focal point for governmental, intergovernmental, and non-governmental relief activities.
2. **The Inter-Agency Standing Committee (IASC)** is the interagency forum that aims to coordinate and develop policies and make decisions on humanitarian assistance in collaboration with the United Nations and non-United Nations actors (UN 1991, A/RES/46/182, Section VI. Article 33). The IASC was established in June 1992 in response to resolution 46/182. By the General Assembly resolution 48/57, the IASC was affirmed as the primary mechanism for the interagency coordination of humanitarian assistance of the UN.

The IASC is under the leadership of the Emergency Relief Coordinator. Primary objectives include the following: (i) to develop system-wide humanitarian policies; (ii) to allocate responsibilities among agencies in humanitarian programs; (iii) to develop a common ethical framework for all humanitarian activities; (iv) to advocate common humanitarian principles to parties outside the IASC; (v) to advocate for the full respect for the rights of the individual in accordance with laws including international human rights law, international humanitarian law, and refugee law; (vi) to identify lack of operational capacity in disaster management; and (vii) to resolve disputes or disagreements about and among humanitarian agencies on system-wide humanitarian issues.

The IASC members are comprised of the heads or their designated representatives of the UN operational agencies including United Nations Development Programme (UNDP), United Nations Children's Fund (UNICEF), United Nations High Commissioner for Refugees (UNHCR), United Nations World Food Programme (WFP), Food and Agriculture

Organization (FAO), World Health Organization (WHO), United Nations Human Settlements Programme (UN-HABITAT), and OCHA. In accordance with the UN General Assembly Resolution 46/182, standing invitees include International Organization for Migration (IOM), International Committee of the Red Cross (ICRC), International Federation of Red Cross (IFRC), the Office of the United Nations High Commissioner for Human Rights (OHCHR), United Nations Population Fund (UNFPA), the Special Rapporteur on the Human Rights of IDPs, and the World Bank. Additional invitees on a permanent basis include the NGO consortia ICVA, InterAction, and the Steering Committee for Humanitarian Response (SCHR).

## UN Security Council

The Security Council is the organizational body in the UN system that takes actions when a threat to peace exists. Main functions and powers of the Security Council include maintaining international peace and security in accordance with the principles and purposes of the United Nations. The UN Security Council investigates disputes and situations that lead to international friction and determine the existence of a threat to peace or acts of aggression and to recommend actions. The UN Security Council has the authority to take military action to prevent or stop aggression. The Security Council collaborates with regional and subregional organizations in maintaining international peace and security.

When a threat to peace is brought to its attention, the Security Council makes an attempt to bring about an agreement by affiliated parties. The Security Council sets forth principles for these agreements, undertakes investigation, dispatches a mission, appoints special envoys, and requests the Secretary-General to make efforts for a peaceful settlement of the dispute. When a dispute leads to hostilities, the Security Council tries to bring the hostile situation to an end by issuing ceasefire directives or dispatching military observers or a peacekeeping force. The Council may consider enforcing measures such as economic sanctions, arms embargoes, financial penalties, severance of diplomatic relations, blockade, or even collective military action.

UN Security Council Resolutions address the following issues or incidences: refugee crisis including Syria (Resolution 2254 (2015)), cross-border trafficking (Resolution 2195 (2014)), sexual violence in conflict (Resolution 2106 (2013)), response to terrorist attacks (Resolution 2309 (2016)), response to the HIV/AIDS epidemic in Africa (Resolution 1308 (2000)), response to the Ebola outbreak in Africa (Resolution 2177 (2014)), and impact of armed conflict on children (Resolution 2143 (2014)).

## UN ECOSOC

The UN Economic and Social Council adopted a resolution (E/RES/2012/3) that reaffirms the principles of neutrality, humanity, impartiality, and independence for the provision of humanitarian assistance. In this resolution, building and strengthening resilience at the local, national, and regional levels is emphasized as a critical element in reducing the impact of disasters. This resolution also stresses the need for continued investment in preparedness, prevention, mitigation, and response capacity. The ECOSOC Resolution reaffirms the significance of ensuring a smooth transition from relief to rehabilitation, reconstruction, and development.

## UN Subsidiary Bodies and Specialized Agencies

### International Organization for Migration (IOM)

The International Organization for Migration (IOM) is committed to assisting in meeting the growing operational challenges of migration management and upholding the human dignity and well-being of migrants. IOM intends to provide solutions to migration problems and humanitarian assistance to migrants in need (e.g., refugees or displaced persons). IOM's activities mainly include nonemergency situation duties;

promotion of international migration law, policy debate, and guidance; and protection of migrants' rights, migration health, and the gender dimension of migration.

### United Nations High Commissioner for Refugees (UNHCR)

The United Nations High Commissioner for Refugees (UNHCR) aims to protect refugees who have fled their homes due to violence, conflicts, and persecution. UNHCR provides shelter, food, water, medical care, and other lifesaving assistance to refugees. UNHCR sends relief supplies and deploys its trained staff as a response to emergency needs. The number of emergency missions carried out by UNHCR specialists totaled 441 in 2014.

In terms of health and sanitation, UNCHR, in collaboration with its partner organizations, provides clean water and nutritious food, sets up sanitation programs, and ensures that refugees have access to basic health care services. The vaccination campaigns to protect refugees from polio and measles conducted by UNHCR are exemplary projects in the health area. UNHCR is committed to ensuring the rights of displaced civilians before and after emergencies. UNHCR provides legal and protection assistance to minimize threats of violence, including sexual assault, exploitation, persecution, and other human rights abuses.

In addition to emergency relief efforts, UNHCR has also been focused on empowering refugees from a long-term livelihood and capability perspective. UNHCR works on improving access to learning for young refugees by supporting teacher training and funding education supplies. It also supports distance learning programs and ensures academic degrees obtained in host countries are recognized in their home country after their return.

UNHCR also supports marginalized women (e.g., unaccompanied women, single mothers, victims of gender violence, and pregnant, disabled, or older women) for their empowerment by providing them equal access to humanitarian assistance and training them with new skills. The special programs – aiming at increasing young women's enrollment in secondary education and building their leadership, life, and vocational skills – have been operated by UNHCR.

### United Nations Development Programme (UNDP)

The United Nations Development Programme (UNDP) has the Emergency Response Division as its operational responsibility for this task. UNDP utilizes its extensive country office network, including offices in all crisis countries, for United Nations-led crisis prevention and recovery activities. In carrying out these activities, UNDP mobilizes partnerships within and beyond the United Nations system, including the Department of Political Affairs, the Department of Peacekeeping Operations, the Office for the Coordination of Humanitarian Affairs, and Bretton Woods Institutions (UNDP 2002).

The main focus of UNDP's projects is to build resilience to conflicts and disasters. Compared to other agencies' work, UNDP's projects have longer-term development objectives, including, but not limited to, helping countries prevent armed conflict, alleviating the risk and effects of disasters from natural hazards, and rebuilding the community. UNDP and its partner agencies address the underlying causes of violence, reinforce governance and the rule of law, support livelihoods, and empower local people to rebuild infrastructure after disasters. UNDP established the Thematic Trust Fund for Crisis Prevention and Recovery that was intended for UNDP's effective and timely response to crisis prevention and recovery needs.

### United Nations Environmental Programme (UNEP)

UNEP has been working on emergency preparedness and response. It has also focused on facilitating the transfer of knowledge for sustainable development. UNEP undertakes environmental causes and consequences of natural hazards and environmental emergencies and attempts to reduce their impacts on vulnerable communities and countries. UNEP's work on prevention aims at reducing ecosystem degradation and utilizing ecosystem services in a sustainable manner for risk and vulnerability reduction.

UNEP project has encompassed both natural and technological hazards and environmental emergencies. UNEP's emergency responses are also aligned with its efforts to implement ecosystem-based adaptation (EBA) measures. EBA measures intend to reduce vulnerability and build ecological and social resilience to climate change risks. UNEP has also implemented the Sustainable Buildings and Climate Initiative in which the UNEP has developed sustainable building guidelines. UNEP's work on Disaster Risk Reduction has focused on early warning, risk, and vulnerability assessments, disaster preparedness and contingency planning for environmental emergencies, disaster prevention, sustainable recovery, and adaptation to climate change-related risks.

The Joint UNEP/OCHA Environment Unit (JEU) was created to address the environmental impacts of disasters and accidents by coordinating international efforts and mobilizing response partners. It mobilizes over 15 different networks and partnerships as well as regional organizations and member states. Although this partnership encompasses the private sector, industry groups and academic and research institutions are also well represented among JEU partners. The JEU aims at enhancing the preparedness of communities, disaster responders, governments, and industries against the potential risks and impacts of environmental emergencies.

### World Health Organization (WHO)

WHO is the principal actor that helps Member States in their emergency responses with regard to public health issues. WHO also serves as the Health Cluster Lead Agency in the Inter-Agency Standing Committee (IASC). WHO established a Global Emergency Management Team (GEMT) to provide overall strategy and management guidance for WHO's emergency response tasks. This team developed the Emergency Response Framework (ERF) in order to clarify WHO's roles and tasks in emergency responses.

WHO has identified its main obligations associated with emergency response as follows: (i) develop an evidence-based health sector response strategy, plan, and appeal; (ii) ensure adapted disease surveillance, early warning, and response systems; (iii) provide up-to-date information on the health situation and health sector performance; (iv) promote and monitor the application of standards and best practices; and (v) provide relevant technical expertise to affected Member States and all relevant stakeholders.

### United Nations International Children's Emergency Fund (UNICEF)

UNICEF is in charge of humanitarian and developmental assistance to children and mothers in developing countries. UNICEF was originally created as the focal point to provide humanitarian assistance to children living in war-torn countries after World War II.

UNICEF's humanitarian actions encompass not only immediate relief responses to save lives but also efforts to cope with underlying causes of vulnerability to disasters, fragility, and conflict. For example, health, nutrition, hygiene, child protection, education, and HIV/AIDS prevention and response are approached both from short-term emergency response and long-term remedy to address their underlying causes.

The focal point for emergency assistance of UNICEF is the Office of Emergency Programmes (EMOPS). EMOPS is in charge of humanitarian assistance and policies, as well as strategic coordination with external humanitarian partners both within and outside the United Nations system. It externally supports interagency early warning and preparedness activities. It internally develops UNICEF's own warning system, enhances preparedness tools, and operationalizes preparedness plans at country, regional, and headquarters.

### UN Food and Agriculture Organization (UN FAO)

UN Food and Agriculture Organization (FAO) focuses on reducing people's vulnerability to hazards by incorporating risk assessment, risk reduction, emergency response, and rehabilitation. FAO's work contributes to recovery and rehabilitation with an emphasis on the resilience of livelihoods. Through longer-term interventions, FAO intends to facilitate transition from relief to development.

FAO's approach incorporates emergency response and post-disaster recovery strategies. This integrated approach was reflected in the FAO's Regional Framework for Disaster Risk Management (DRM). The objective of the Regional DRM Framework is to reduce the impacts of hazards and enhance community resilience, with a focus on establishing food security and developing sustainable food and agriculture systems. The Regional DRM Programme has two main aspects: internally within FAO and externally with all involved stakeholders and partners (such as NGOs, FAO, UN agencies, research institutes, ministries).

### The World Food Programme (WFP)

In the early days of an emergency, Emergency Assessment teams measure the demand for food assistance and work out a delivery plan, followed by drafting of an Emergency Operation (EMOP), which includes a plan of action and a budget. As a next step, an appeal to the international community for funds and food aid is launched by WFP. As funds and food flow in, WFP's logistics team works to transport food to emergency areas. Partnering with governments and non-governmental organizations, WFP delivers food to the needy.

WFP has one of the most comprehensive Early Warning Systems, collecting and analyzing information on natural and human-caused hazards. WFP aims to feed more than 90 million people annually. WFP's scientific partners produce a Rapid Impact Analysis when disaster occurs. Satellite imageries are used to demonstrate the situation on the ground, and computerized modelling is employed to predict change. WFP's mapping specialists add information to create a multilayered picture of the disaster situation.

## Current Challenges and Future Direction for the UN's Crisis Management

In spite of the dedication to risk reduction and active involvement in humanitarian crisis management around the world, the UN and its special agencies have faced problems. The UN agencies have been confronted with intraorganizational coordination issues. The challenge includes lack of formal leadership and monitoring systems among UN organizations involved, functional divisions without proper coordination among the agencies, lack of secure internal funds for crisis management, and continuing interagency rivalries focused on institutional survival. These problems may impede the effectiveness of a UN disaster relief operation in practice. The separated system confused their international and local NGO partners that deliver direct relief services to affected communities and contributed to a series of delays and ultimate failures in overall relief operations in practice.

Existing challenges provide future directions for the UN organizations to improve in their crises management system. One of the major needs is to build an intra-coordination and communication system among the UN agencies involved in disaster relief. This will improve information and resource exchanges among the agencies, identify common goals, prevent unnecessary redundancies and waste of resources, build trust relationships, and ultimately strengthen the UN's disaster response capacity. In addition, the UN organizations can establish a unified decision-making authority. The leadership can monitor, counsel, and support both individual and collaborative efforts across UN relief organizations. Through the roles, the unified authorities will be able to facilitate both intra-UN coordination and support their extended partnership with external organizations and ultimately contribute to improvement of overall UN crises relief operation.

# United Nations and Governance

Neetu Choudhary
School of Human Evolution and Social Change, Arizona State University, USA

## Synonyms

Development governance; International governance; United Nations system

## Definition

"United Nation and governance" indicate the approach and role of the United Nations system in and toward the issue of governance.

## Introduction

The United Nations officially came into existence in October 1945 during the congregation of representatives from 50 countries of the world. United Nations emerged as a system of international governance based on inter-country consensus on the issue of international peace, justice, equality, aide, and development among others. The United Nations is the largest, most internationally represented, and most powerful intergovernmental organization in the world. Its strength

lies in its member states whose assessed and voluntary contributions provide finances for functioning of this organization. As an institution of global governance, the objectives of the United Nations have been to maintaining of international peace and security, promotion of disarmament and human rights, fostering of social and economic development, environment protection, and extension of humanitarian aid in circumstances of famine, natural disaster, internal struggle, and armed conflict.

Over the years the United Nations has consistently been working to promote these issues with greater focus now being on the developing and less developed countries. Along with peacekeeping and rebuilding, development of the developing and least developed countries has been one of the United Nations' central agenda, and several departments dedicated to address different development issues have been created to support and encourage those issues at country level, for example, the United Nations Development Programme (UNDP), United Nations Population Fund (UNFPA), United Nations Entity for Gender Equality and Empowerment (UN Women), and so on. There have also been separate specialized agencies established under the aegis of the United Nations, such as the Food and Agricultural Organization or the International Fund for Agricultural Development, among others, to deal with specific dimensions of development governance. However, the role and approach of United Nations in international governance have been variable in terms of approach and significance at different points of time. It has been influenced by changing global political context in particular, and the United Nations' involvement in global governance has undoubtedly been shaped by political conflicts and systemic power relations (Therien 2015).

## United Nations and Governance in the Cold World Era (Since Inception Until 1990–1991)

Since its inceptions there are many achievements that the world owes to the United Nations. The number of people dying in conflicts has declined rapidly since 1945 – worldwide, justice has been established, the number of famine deaths has significantly declined, and nuclear disarmament got encouragement among others (Spencer 2015). One of the major achievements of the United Nations was decolonization. The United Nations has been fairly effective in providing a platform to developing countries to formulate and share their agenda and coherent ideas, showing the acceptance of sovereign equality (Krasner 1985).

However, the power clash and divide between the USA and United Soviet Socialist Republics (USSR) until 1990–1991 considerably constrained the organization's ability to function effectively and objectively. Each of the two superpowers focused on preserving order and stability in its own sphere of influence while respecting the other's bloc (Cassese 2005). In fact, the United Nations was practically able to intervene only in conflicts that were distant from the two countries and their great divide, so as to avoid the allegations of bias and further confrontation (Meisler 1995). Moreover, the United Nations' mission to preserve world peace was complicated in its early decades by the Cold War between the USA and Soviet Union and their respective allies. Major coercive exercises were undertaken by the United Nations which are also said to have been influenced by the Cold War including those in Korea, Egypt, and Congo (Weiss et al. 1994). In fact, the UN's deployment of United Nations Operation in the Congo (UNOC) in 1960, which happened to be the largest military force of UN until then, is criticized as having become an enforcement army created through Western support (Weiss et al. 1994). The period between 1956 and 1990 was characterized by a long list of unilateral uses of force by the major powers (Higgins 1995).

Subsequently, many of the United Nations peacekeeping interventions, for example, in the Middle East, Vietnam, and Kashmir, witnessed visible failures (Spencer 2015; Meisler 1995). Due to this and with an increasing Third World presence, the United Nations increasingly brought a shift in its priority to different goals of development governance and cultural exchange. It was

under this move that many more specialized organizations were created by the United Nations. By the 1970s, the United Nations' budget for social and economic development was far greater than its peacekeeping budget. However, the United Nations was not a complete disaster, and undoubtedly the Cold War world was better off with than without it (Weiss and Daws 2007: 11). In fact, it did make important achievements in fields other than the maintenance of peace and security and the settlement of disputes (Cassese 2005: 323)

## United Nations and Governance in the Post-cold World Era and Globalization (1990–1991 Onward)

Since the end of the Cold War, there has been a marked decline in the unilateral use of force by the USA outside of the United Nations, and in the peace and security area, the talk was now of peacemaking, peace-building, peace enforcement, and humanitarian assistance (Higgins 1995). Today, United Nations' intellectual leadership is consistently influenced by not only the views and actions of the major Western powers (the USA, the UK, and France, among others) but also those of the emerging countries (Brazil, Russia, India, China, and South Africa or BRICS, among others), and their combined political clout is undeniably greater than that of all the other member states (Therien 2015). After the Cold War, the United Nations witnessed a significant expansion in its role in peacekeeping and democratization in international governance with varying degrees of success. The role of United Nations Transition Assistance Group (UNTAG) in Namibia and United Nations Observer Mission to in Verify the Electoral Process in Nicaragua (ONUVEN) at the end of the decade met with a substantial success (Higgins 1995). However, there were major failures in performance of these duties in Somalia, Srebrenica, Haiti, Mozambique, Burundi, and Sierra Leone – by the United Nations for which it also received much criticism (Henderson 2015; Meisler 1995). In the late 1990s and 2000s, international interventions authorized by the United Nations took a wider variety of forms, wherein other international agencies such as North Atlantic Treaty Organization's (NATO) role become prominent in (forceful) action. In the year 2003, the Iraq action of the USA without the approval of United Nations Security Council resolution for authorization reinforced the questioning of the United Nation's effectiveness. In fact, the United Nations' practice of governance was suddenly restricted to post-conflict rehabilitation and nation rebuilding, police management, and humanitarian operations where its logistical and institutional apparatus, its ability to work closely with nongovernment organizations, and the know-how of some of its specialized agencies (like the United Nations High Commissioner for Refugees, the World Health Organization, and the Department for Humanitarian Affairs) became desirable (Debrix 2005). It was in this context that the issue of reforms in the governance and functioning of United Nations came at the forefront. The then Secretary-General of United Nations, Boutros Boutros-Ghali (1992–1996), kick-started a reform scheme within the United Nations Secretariat. This was taken forward further by his successor Kofi Annan (1997–2006).

Subsequently, the United Nations reworked and almost redefined its agenda to address contemporary challenges of the world and retain its relevance in this regard. The United Nations' activities since have often been illustrated through the metaphor of a triangle of development, freedom, and peace, and more recently the triangle is reconstructed as the three interconnected pillars of human security, human development, and human rights (Therien 2015). Taking a cue from this triangle, as of now the United Nations may be seen to concentrate its functioning along the following issues of global governance.

### Human Security

While in the Cold War era national security was the central notion of security for the United Nations, this notion got weakened with declined probability of conflict between two superpowers after the collapse of the USSR. The quest to redefine human security came to be expressed in 1994

through UNDP's Report titled "New Dimensions of Security." The report argued that individuals rather than states should be the referent of security, that threats to security are not just military but multidimensional, and that security should aim both to protect and empower populations (UNDP 1994).

"The notion of human security is based on the premise that the individual human being is the only irreducible focus for discourse on security. . ..The claims of all other referents (the group, the community, the state, the region, and the globe) derive from the sovereignty of the human individual and the individual's right to dignity in her or his life" (MacFarlane and Khong 2006: 2). The United Nations has implemented its new approach through two types of global policies, i.e., those resulting from a narrow perspective on human security and those emanating from a broad perspective, wherein the narrow perspective is associated with the traditional view of security centered on "freedom from fear" (Therien 2015). Human security now is perceived not just as freedom from armed threat but also as freedom from threats such as food insecurity. Under its various innovations to address nontraditional security threats, the United Nations created Human Security unit and also developed a global strategy for food security.

### Human Rights

Although the United Nations' Charter proclaims the objective of "promoting and encouraging respect for human rights," for a long time human rights stayed on the periphery of the organization's work, and their importance was not fully acknowledged until the 1990s, when communism lost the Cold War against capitalism (Therien 2015). The 1993 Vienna Declaration on "All human rights for all" reflects the shift in United Nations' priority toward human rights issues. Human rights are now considered as cutting across all missions of United Nations and serve as a universal character guiding all other actions. Promotion of human rights and fundamental freedoms to all individuals irrespective of their race, sex, linguistic background or religion, or any other such ground has been a concern of the United Nations, despite several ups and downs that it witnessed in its position since its inception. However, human rights have now come to occupy the center stage of United Nations development design – the driving force that has given a big push to the approach of human rights to development. The agenda got concrete force with the creation of the United Nations Commission on Human Rights in 1993 to oversee human rights issues for the United Nations, following the recommendation of the World Conference on Human Rights. Boasting much greater resources than those devoted to human rights during the Cold War, the Office of the High Commissioner for Human Rights has considerably enlarged the United Nations' stake in the promotion of human rights (Oberleitner 2007).

In addition, the United Nations has been rather proactive in protection and promotion of the rights of the vulnerable groups such as women and child, and separate declarations/obligations have been created to address concerned dimensions under its aegis. However, it should be kept in notice that it was during the Cold War itself that the foundations were laid for post-Cold War initiatives directed at women and children in conflict along with others, e.g., the Convention on the Prevention and Punishment of the Crime of Genocide (1948), the Convention Relating to the Status of Refugees (1951), the Declaration of the Rights of the Child (1959), the Convention on the Rights of the Child (1989), the Declaration on the Elimination of All Forms of Racial Discrimination (1963), the International Convention on the Elimination of All Forms of Racial Discrimination (1965), the Declaration on the Elimination of Discrimination Against Women (1967), the Convention on the Elimination of All Forms of Discrimination Against Women (1979), and the Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (1984) (MacFarlane and Khong 2006). Again, the United Nations' agenda of human rights has not been free from criticism. The emerging developing countries have perceived United Nations' interference in the name of human rights protection as neocolonialism and threat to their sovereignty. These countries have tended to dissuade

United Nations' human right-related interventions on the ground of being their internal matter.

### Human Development Sustainable Economic Development

Another important current area of active engagement for the United Nations is the achievement of international cooperation in resolving international problems related to economic, social, cultural, or humanitarian character. For long, the United Nations went ahead with mainstream development presumption and policy that tended to focus on economic growth as the key objective and the major means for raising living standards. However, persistent poverty and deprivation under neoliberalism in several developing and less developed countries despite decent economic growths brought forth the lacuna in growth-oriented development strategy. By the end of the 1980s and early 1990s, the United Nations began to vouch for growth with a human face (UNDP 1994) and underlined the argument that growth is meaningful only if it results in greater well-being of people. Accordingly, efforts were begun in the direction to be able to better assess the progresses of the nations. It was in this context that the UNDP brought out the first Human Development Report (HDR) in 1990. The development of this approach was largely based on the works of economist – Mahbub ul Haq and Amartya Sen. The HDR defined human development as a "process of enlarging people's choices. The most critical of these wide-ranging choices are to live a long and healthy life, to be educated and to have access to resources needed for a decent standard of living. Additional choices include political freedom, guaranteed human rights and personal self-respect" (UNDP 1994: 1; United Nations 1994). Clearly, the United Nations emphasis on security in multidimensional sense got reflected here as development as a multidimensional process. Grounded in the belief that global capitalism and social inclusion can be reconciled, human development gradually emerged as the United Nations' alternative to the development model fostered by the Bretton Woods Institutions (Therien 2015).

In 2000, the United Nations held its Millennium Summit with the prime objective to reflect upon its role and relevance in the twenty-first century. The summit resulted in the adoption of the Millennium Development Goals (MDGs), by all member states of the United Nations. These goals represented global commitment to achieve international development in areas such as poverty reduction, gender equality, and public health. Undoubtedly, this development gave a new direction to the role of United Nations in international governance. For this the already-existing United Nations Development Programme (UNDP) was given the leading role. Monitoring and tracking of development and dealing with human rights violations emanating from the denials of right to live with dignity, including the right to food, health, safe environment, etc., are the key activities of United Nations today. Of course, there has been huge inter-country variation in achievements of these goals, and there have been more failures than successes. Yet Millennium Development Goals (MDGs) have been able to engage countries simultaneously on relevant development agenda. Subsequently, the Sustainable Development Goals were launched in 2015 to succeed the MDGs, under which various countries are expected to strive for specified targets under these goals.

The UNDP publishes the Human Development Report annually wherein it brings out a comparative measure ranking countries by poverty, literacy, education, life expectancy, and other factors. Alongside, organizations such as the UNICEF (the United Nations Children's Fund), which was created in 1946 to aid European children after the Second World War, are now increasingly visible in developing and less developed country working with nation states to provide right to health and full growth to their children in the light of the Convention on the Rights of the Child.

Within the expanded notion of development with sustainability, climate change has come up as a crucial issue where convergent action and cooperation from various countries are indispensable. Given that environment protection and mainstream development practices often conflict with each other, working for the former has been considered as a compromise on the latter. Obviously therefore, despite global climate being a

common issue, countries have been reluctant to show required willingness in adopting environment protection norms. The role of the United Nations became important in the light of the need for a platform to negotiate this issue and to bargain on taking necessary steps for reducing climatic change such as carbon cuts, etc. The United Nations Framework Convention on Climate Change (UNFCCC) has been a milestone guideline coordinating and building consensus on country initiatives for low carbon emission, despite recurrent disagreements between countries (Bulkeley and Newell 2010).

## United Nations on (Development) Governance

The UN has also become an active advocate for democracy after 1990–1991. Going well beyond electoral assistance, United Nations' programs have sought to reinforce the transparency and the accountability of governance in developing countries (Newman and Rich 2004). With the end of the East–West conflict, the intensification of globalization, the third wave of democratization, and the rise of transnational actors, United Nations' leaders have gradually come to see democracy as a new legitimizing principle of global governance. This also converged with the neoliberal agenda which needs democracy to facilitate the implementation of market-oriented policies.

As the emergence of neoliberalism tended to minimize the role of state, institutions of United Nations particularly the United Nations Development Programme (UNDP) joined the popular discourse which has been speaking more of "quality government" than "all government." This implied that in a liberal economic framework, scope for government interference should be limited and it is the "quality" of the government that should be the prime concern. Quality of governance in turn highlights the instrumental role of government, i.e., it means a manner of governance that facilitates efficient implementation of market reform through effective political institutions. While on one hand global forces pushed the state for minimal interference in market mechanism, on the other, they expect the state to indulge in good development governance. The latter in terms of the World Bank and the UNDP also means supporting donor agencies' work through enabling the civil society. The UNDP (1997) even conceptualized the empowerment of civil society as the true guardians of democracy and good governance everywhere. This simply means that the state has to depend upon and partner with various stakeholders – national and international civil society – to fulfil its various development goals. In fact, on the transnational level, the United Nations has set up a range of procedures to increase the participation of NGOs and other non-state actors in the decisions of all United Nations' bodies, including the Security Council (Therien 2015).

As the United Nations system now is engaging more in promoting development and curbing human rights violations emerging from development deprivation, encouraging the notion of governance or good governance has been its recent tool to seek desired action from its member states. The contention underneath is that development requires limited but good government and rest can be taken care of by the market. The era of Millennium Development Goals and now Sustainable Development Goals laid down by the United Nations has been founded on the philosophy of right to development wherein governance is considered to be the most important requirement for the achievement of these goals. Such governance in turn is based on efficient and effective administration, and elimination of corruption is certainly an important component of good governance. This framework of development governance converges with United Nations' growing partnership with the civil society, particularly the nongovernment organizations which have come to play key role not only in development within countries but also in rehabilitation activities in post-conflict areas.

Moreover, with the advent of globalization, the United Nations laid fresh emphasis on effective governance based on human rights and the rule of law through sound institutions, which are critical to combat corruption. Subsequently, the United Nations General Assembly adopted the United

Nations Convention against Corruption in 2003. The convention endorsed that accountable and transparent institutions are the vehicle for delivering services according to human rights and rule of law principles, whereas corruption diverts resources needed for development and undermines the public trust in institutions.

The United Nations has also created space to engage with corporate in its campaign for good governance. Under this, various companies can engage with the UN Global Compact on the three critical governance topics: anti-corruption, peace, and rule of law. As its website illustrates, the expectation behind the UN Compact project is that at the micro level, companies can enhance good governance by integrating corporate sustainability principles into their own operations and relationships, allowing for greater transparency, accountability, and inclusiveness. At the macro level, companies can contribute to the development and implementation of international norms and standards, for instance, as part of their commitment to the UN Global Compact.

The United Nations also established its United Nations Project Office on Governance (UNPOG) headquartered in the Republic of Korea, to assist its member states improve their governance capacity. Since its inception, the UNPOG has conducted research and capacity-building activities and disseminated global and local best practices on participatory, transparent, and effective democratic governance. The Seoul Declaration of UNPOG calls for policy measures to increase transparent and participatory governance, as ends in and of themselves, and also to ensure that the global community can achieve sustainable human development for the benefit of people in all societies.

## Criticisms of the United Nations System

As noticed earlier, the United Nations system has also invited criticism for apparent failures in achieving desired goals. Often, member states have shown reluctance to achieve or enforce Security Council resolutions, which has repeatedly constrained United Nations' ability to fulfil the role it is created for, particularly in conflict management and peacekeeping. This has resulted in failure in several peacekeeping activities, and in fact the United Nations' own investigations into its failure to prevent mass killings in Rwanda, Srebrenica, and Sri Lanka all identified serial weaknesses, both political and institutional (Ross 2016). Similarly, inertness on the part of the United Nations owing to systemic issues has been held responsible for its failure to complete the peacekeeping operations in 1992–1993 during the Somali Civil War (Meisler 1995). In addition, United Nations' peacekeeping team members have also been accused of child rape, soliciting prostitutes, and sexual abuse during various peacekeeping missions in the Democratic Republic of the Congo and other places as well (Spencer 2015; Lynch 2004).

The divide between the views of the countries in the North and the South has also been problematic in United Nations governance system wherein the Southern nations tend to favor a more empowered United Nations with a stronger General Assembly, allowing them a greater voice in world affairs, while Northern nations prefer an economically laissez-faire United Nations that focuses on transnational threats such as terrorism (Fomerand 2009). Tensions between Western governments, which see the United Nations as bloated and inefficient, and developing countries, which regard it as undemocratic and dominated by the rich, have rippled across the organization as ballooning costs drive the push for reform (McGreal 2015).

It is also argued that the council's founding premise of a world ordered by states no longer holds and the security council has failed to adapt to the changing world where conflicts involving al-Shabaab, Boko Haram or Islamic State originate from particular local circumstances but often have regional and global reach and consequence (Ross 2016). Further, the United Nations system has also been criticized for practices of corruption, for example, in 2004 the United Nations faced accusations that its Oil-for-Food Programme under which Iraq was to trade oil for basic needs to relieve the pressure of sanctions had widespread corruption in it (Spencer 2015). In fact,

the traditional multilateral institutions, including the United Nations and the Bretton Woods Institutions, are increasingly criticized for being very bureaucratic, inefficient, and representative enough (McGreal 2015).

The United Nations, however, has begun to respond to these criticisms through various reforms as discussed above, though consensus on a reform agenda and design has been challenging as well. It has been trying to improve its accountability and democratic legitimacy, and in doing so it has begun to engage more with civil society to foster a global constituency. In an effort to enhance transparency, in 2016 the organization held its first public debate between candidates for Secretary-General (Falk 2016). In 2005, the Human Security Report documented a decline in the number of wars, genocides, and human rights abuses since the end of the Cold War and presented evidence, albeit circumstantial, that international activism – mostly spearheaded by the United Nations – has been the main cause of the decline in armed conflict in that period. Various political initiatives and innovative processes have been underway though they do not yet appear to have been fully integrated in the organizational- as well as task-related outfits of concerned United Nations agencies and bodies (Rechkemmer 2005). However, as Michael Fullilove (2012) states, the United Nations is both flawed and indispensable, and its security council is the world's preeminent crisis management system.

# United Nations Programme on Public Administration, History of

Guido Bertucci
Governance Solutions International, New York, NY, USA

## Introduction

Since its creation in 1945, the United Nations has been concerned not only with the maintenance of peace and security but also with the promotion of economic and social development (Preamble of the United Nations Charter).

Along with the history of the United Nations, the concept of development has evolved from the strict emphasis on economic development to the concept of sustainable development encompassing the three dimensions of economic, social, and environmental.

The capacity of public administration to function effectively and efficiently was recognized from the early days as a key element in helping all countries in the path to development.

The following is a brief history of the contribution of the United Nations Programme on Public Administration to the development process.

## The Early Days

At the very beginning of the history of the United Nations, special emphasis was placed on the needs of those developing countries emerging from colonial rule. They required special assistance in building their government institutions and in training public officials in a number of key capacities.

The specific role of the United Nations Secretariat in providing technical assistance to governments in public administration received its first legislative mandate by the General Assembly in resolution 246 (III), adopted on 4 December 1948. This date is thus officially recognized as the beginning of the "United Nations Programme in Public Administration" (heretofore referred to as the "Programme") (United Nations 1948).

During the first years, it was deemed more desirable to introduce activities to support the development of public administration capacity in most development programs. However, soon the need emerged to ensure coordination of these activities and to create a hub with the capacity to provide substantive support and guidance in public administration to all the development programs.

The need also emerged to design and implement specific technical assistance programs in public administration. A "Revised Programme on Public Administration" was approved by the General Assembly in 1953 in its resolution 723 (VIII), where the Assembly, "Recognizing the increasing important role of governmental administration. . . .for the promotion of economic and social development," approved "a revised United Nations programme in public administration comprising

(a) The provision, at the request of governments, of technical assistance related to public administration, including training for public service, through:
   I. The advisory services of experts;
   II. Fellowships and scholarships;
   III. Training institutes, seminars, conferences, working groups and other means;
   IV. The provision of technical publications
(b) The collection, analysis and exchange of technical information in the field of public administration, in collaboration, where appropriate, with the International Institute of Administrative Sciences and other appropriate

Note: All documents quoted in this paper are available at www.unpan.org

institutions, and assistance to governments to promote, by all suitable means, sound public administration, in relation to economic and social development" (United Nations 1953).

By that resolution, the General Assembly created the comprehensive program responsible for research, analysis, training, exchange of knowledge, and technical assistance in public administration that has lasted for more than 60 years, and it is still operating today.

During the following years, the Programme experienced a rapid growth of its activities, due to its renewed mandate, but also to the growing size of the United Nations technical cooperation activities. In addition to the organization of conferences and of training seminars, large assistance projects were formulated and executed with experts assigned to countries in need of building their public administration institutions and of creating a competent and capable public service.

One of the major achievements of the Programme in the 1950s was the creation of national and regional public administration centers responsible for providing training and capacity building to public officials. These centers were initially established through the implementation of technical assistance projects and subsequently became independently run, relying on the contributions of Member States and individual members. The United Nations was instrumental in establishing the Brazilian School of Public Administration in Rio de Janeiro, in strengthening the Public Administration Institute of Turkey and in establishing national public administration centers in Argentina, Burma (now Myanmar), Colombia, Egypt, El Salvador, Iran, Nepal, Peru, Sudan, and Venezuela. It also provided support to 24 existing centers through advisory services and training.

Inspired by the principle of "Economic Cooperation among Developing Countries (ECDC)", enunciated by the General Assembly, the Programme focused its attention on the exchange of knowledge and capacity in public administration among developing countries and supported the creation of the African Training and Research Center in Administration for Development (CAFRAD), based in Tangiers, Morocco; of the Latin American Center of Administration for Development (CLAD), based in Caracas, Venezuela; and of the Arab Center for Development Administration (ARADO), based in Cairo, Egypt. These regional centers are still very active today and continue to serve as important facilities for exchange of knowledge among the countries of their respective regions.

For a number of years, the General Assembly (GA) and the Economic and Social Council (ECOSOC) provided general policy directions to the Programme on an ad hoc basis through their resolutions. It was felt, however, that more technical and substantive guidance was required to steer the activities of the UN in public administration.

One first step to this end was taken by the Director General of Technical Assistance Administration in 1950, who formed a Special Committee to "prepare a document which could serve as a guide for surveying the status of the public administration of an underdeveloped country; for identifying the steps that can be taken by a newly organized country in establishing its administration; and for determining the measures which might be considered by an older and more established country in endeavoring to its administrative system."

The Committee in 1951 finalized its report entitled "Standards and Techniques of Public Administration with Special Reference to Technical assistance for Developing Countries" (United Nations 1951).

The published report became for a decade an important guide on public administration for development experts, practitioners, and academicians.

## The Consolidation of the Programme

It was followed in 1961 by the publication of "A Handbook of Public Administration: Current Concepts and Practices with Special Reference to Developing Countries." This publication also served for more than a decade as an important guide for government officials and development cooperation experts involved in public

administration institution building and in administrative reforms (United Nations 1961).

A second step to provide substantive guidance to the Programme was taken in 1967 by the creation of the "Group of Experts of the United Nations Programme on Public Administration," which met on a biennial basis to review the activities of the Programme and to make recommendations on its future directions. The Group reported to the Economic and Social Council. Although it reported to the Council, the Group did not have the formal status of "Functional Commission" of the Council, a status enjoyed by other United Nations programs such as those on population, statistics, social development, etc.

Only in 2001, the Group was converted into a full-fledged subsidiary body of the ECOSOC and renamed "United Nations Committee of Experts on Public Administration" meeting on an annual basis (*United Nations* 2001a).

During the decades of the 1950s and 1960s, the theory and practice of public administration focused heavily on the role of the state institutions in the development process. It was a time when many newly independent countries were building their institution and creating a cadre of qualified public officials. The centralized planning and management of the economy was adopted by a large number of countries, some of which also adopted socialist political and economic systems.

The Programme provided extensive assistance in the process of institution building, but also realized that the massive intervention of the state in all facets of the economy and of service delivery chain could give rise to overinflated and costly bureaucracies, operating in a slow and inefficient manner.

The concept of "administrative reform" was therefore introduced in the technical assistance activities in public administration. Projects were thus developed and advisory service provided to improve the efficiency of the administration, to reorganize and streamline the state apparatus, and to improve the competence of civil servants. During the period from 1960 to 1969, more than 2000 experts in public administration were fielded by the United Nations.

## The Effects of the Structural Adjustment Programs and the New Public Management (NPM)

The cost and weight of the growing state apparatus in many developing countries created serious financial deficits that could only be filled through external multilateral aid, such as that provided by the IMF and the World Bank. These organizations began thus requiring as a "conditionality" for the approval of financial aid the implementation of "structural adjustment programs" aimed at reducing the cost and size of the public sector. These programs, although inspired by very valid considerations, were often applied without thorough analysis of the effect they would have on the ability of a country to provide basic social services to their citizens. The capacity of public administration to deliver programs in education, health, housing, and social welfare was drastically diminished, thus creating major social problems and increasing the poverty levels (Bertucci and Alberti 2005).

The United Nations Programme in Public Administration continued to advocate the importance of maintaining and straightening the capacity of public administration to develop and implement economic and social programs. It therefore provided assistance to developing countries in reforming systems and processes to be able to deliver services in a more efficient and effective way, reducing thus the cost of the administration.

In 1975, the Programme issued the publication "Development Administration: Current Approaches and Trends" which became a major reference document for experts and practitioners in the field.

The attack on public administration implicitly contained in the "structural adjustment policies" of the Bretton Woods institutions was further compounded by the emerging "New Public Management" movement. As it is well known, the proponents of the movement considered the state as an obstacle to development and therefore brought forward an agenda of downsizing, deregulation, outsourcing, and privatization.

If the NPM agenda was relatively useful in countries with well- established state institutions

and administrations to promote efficiency, the hollowing-out of the state and the emphasis on the private sector and the market as engines of development further weakened the policy making and service delivery capacity of developing countries still grappling with the problem of lack of institutional capacity.

The Group of Experts on Public Administration during its annual meetings continued to emphasize the crucial role of the state and of public administration in the development process, while at the same time recommending that the Programme assist governments in implementing efficiency measures, in improving the performance of public administration, and in accelerating devolution and decentralization processes. At its 12th meeting, held in 1995, it outlined the important role that public administration should play in the various facets of the development process as well as an agenda for strengthening the public administration capacity of developing countries to fulfill such role.

The United Nations legislative bodies, namely, the General Assembly and the ECOSOC, remained quite dormant during the 1970s and the 1980s with respect to public administration. They were quite involved in addressing major thematic issues such as environment, population, social development, women, human settlements, etc. A series of global conferences on the above themes were organized in the early 1990s that adopted far-reaching agendas in which peripheral mention was made of the role of public administration in implementing such agendas.

## The Historic Special General Assembly Session on Public Administration and Development

The time was ripe to hold a global gathering on public administration. Upon recommendation of the members of the African Group, the General Assembly decided to meet at the highest level for 1 week to discuss the theme of "Public Administration and Development."

The Special General Assembly Session was held in September 1996 in New York and was attended by a large number of heads of government and ministers. The then Secretary-General of the United Nations, Boutros Boutros-Ghali, and the then President of the General Assembly made key introductory interventions outlining the connection between public administration capacity and the implementation of the agendas of the major United Nations conferences.

The Assembly, adopted the landmark resolution 50/225 which reestablished awareness of the centrality of public administration in development by stressing that: "effectiveness of government requires an efficient and effective public administration in all countries that is responsive to the needs of the people, promotes social justice, ensures universal access to quality services and productive assets and creates an enabling environment for sustainable people-centered development" (United Nations 1996).

It acknowledged that "the role of United Nations activities and programmes in public administration and development is to assist Governments, at their request, to improve their responsiveness to meet the basic needs of all, as well as to achieve sustainable development in all countries."

While underlying the key role of the public sector in development, the Assembly realized that administrations could not continue to work as in the past but should adopt some of the efficiency measures promoted by the NPM movement and should work in cooperation with the private sector and the civil society in delivery public services.

In fact it recognized "that there is a need for public administration systems to be sound, efficient and well equipped with the appropriate capacities and capabilities through, inter alia, capacity-building, promotion of transfer, access and utilization of technology, establishment or improvement of training programmes for public service, strengthening of partnership of the public sector with the private sector and civil society, as well as providing an enabling environment for private sector activities."

By that resolutions, the Assembly not only set a global agenda for governments, financial institutions, and development agencies but also

indicated very specific directions for the work of the United Nations in the field of public administration.

This agenda was formulated taking into account the changing environment of international technical cooperation. National execution of development projects was being adopted by multilateral and bilateral donors requiring fewer project personnel and more technical advisors providing external support to governments. The government required access to best practices, opportunity for networking among practitioners, and capacity building for public officials.

The Assembly therefore requested that "the United Nations should carry out these activities through pooling and facilitating access to information in public administration, promoting training and research in public administration and finance at all levels, advocacy and exchange of experiences, advisory services, technical assistance, capacity-building and human resources development."

The substantive discussion in the General Assembly and the resulting resolution had a profound effect on the thinking of the role of the state in the development process. In the following year, 1997, the World Bank devoted its annual report to the theme "The State in a Changing World" in which it underlined the importance of state institutions in promoting growth, in facilitating the operations of the private sector, in fighting poverty, and in protecting the environment. The conclusions of the report somehow contradicted the tenets of the so-called Washington Consensus, accepted by the major donor agencies, which stated that market-like mechanisms, such as trade and private investments, were the key factor in promoting development and that the role of the state should be reduced to that of allowing these mechanisms to function properly (World Bank 1997).

Although the General Assembly did not address specifically the concept of "governance," because of the opposition on the part of a number of countries, concerned about possible interference by the United Nations in their internal political affairs, it clearly stated, upon strong pressure from the European countries, that "Governments in all countries should promote and protect all human rights and fundamental freedoms, including the right to development, bearing in mind the interdependent and mutually reinforcing relationship between democracy, development and respect for human rights, and should make public institutions more responsive to people's needs."

## The Reinvention of the United Nations Programme on Public Administration

Therefore, in reinventing itself to fulfill its new and expanded mandate, the Programme viewed the role of the state in the wider context of governance, addressing thus all institutions and mechanisms involved in the formulation of public policies and in the provision of public goods.

At the same time, it incorporated into its activities the growing awareness of the strict link between development and sustainability advocated by Earth Summit +5 of 1997 in New York and by subsequent resolutions of the General Assembly (Bertucci and Alberti 2005).

The new and revitalized United Nations Programme on Public Administration developed a multipronged strategy along the following lines:

- Institutionalization of the intergovernmental discussion on public administration
- Development of quality analytical and policy tools
- Promotion of innovation and best practices in governance and public administration
- Promotion of knowledge and information sharing
- Building a common understanding on emerging governance and public administration issues
- Assistance to interested governments in public sector capacity building

## Institutionalization of the Intergovernmental Discussion on Public Administration

The momentum gained by the historic Special Session of the General Assembly should not be

lost and the Secretary-General in 2001 submitted for review of the General Assembly a five-year report on the implementation of resolution 50/225, recommending that the Assembly take up on a regular basis the theme of public administration.

It also submitted a proposal to upgrade the status of the Group of Experts in Public Administration to that of full-fledged subsidiary body of ECOSOC. The latter approved the proposal in its resolution 2001/45 of 20 December 2001, creating the new "Committee of Experts in Public Administration" which along the years would provide to governments, through the ECOSOC, useful policy advice on key and emerging issues of governance and public administration. Comprised of 24 members who meet annually at the UN Headquarters in New York, the Committee is responsible for supporting the work of ECOSOC concerning the promotion and development of public administration and governance among Member States, in connection with the UN Millennium Development Goals (United Nations 2001b).

The first meeting of the Committee in 2002 was devoted to the theme "Enhancing the Capacity of Public Administration to Implement the United Nations Millennium Declaration." This agenda would inspire the work of the Programme for the following 15 years.

## Development of Quality Analytical and Policy Tools

In order to improve its research and analysis capacity, the Programme strengthened the core staff dedicated to this function and availed itself of internationally known experts in the topics under discussion.

### The World Public Sector Report

The first substantive output produced after the General Assembly Session was the publication "Rethinking Public Administration: An Overview," issued in 1998. The publication presented a new model of public administration that recognized the critical role of the state, but at the same time incorporated some of the positive NPM approaches into public sector operations and stressed the importance of strong partnership between state and non-state actor in the context of healthy governance systems.

In 2001 the Programme launched the "World Public Sector Report" (WPSR), a "unique publication that provides policy-makers, scholars and civil society at large with relevant research findings, information and data on emerging questions related to the public sector" (note). The 2001 WPSR was dedicated to the topic "Globalization and the State." The 2003 issue was entitled "E-government at the Crossroads"; the 2005 issue was entitled "Unlocking the human Potential for Public Sector Performance." The 2008 issue was entitled "People Matter: Civic Engagement in Public Governance." The 2010 report was entitled "Reconstructing Public Administration After Conflict"; and the 2015 issue was entitled "Responsive and Accountable Public Governance" (https://publicadministration.un.org/en/Research/World-Public-Sector-Reports).

### The UN e-Government Survey

Given the number of countries embarking in the development of e-government, the Programme launched a project of reviewing the progress made in all United Nations member countries and developed the index of e-government readiness. This index has become the most useful tool utilized by policy makers and researchers around the world. The results of the annual analysis of e-government development at the country level are featured in the biennial issue of the "UN E-Government Survey." The survey, in addition to featuring data and statistics on e-government, reviews an emerging topic related to e-government and offers policy advice to governments on the same.

The 2001 issue of the survey was entitled "Benchmarking E-Government: A Global Perspective." The 2004 issue was dedicated to the topic "Towards Access for Opportunity." The 2005 issue was entitled "From E-Government To E-Inclusion" and the 2008 issue "From E-Government to Connected Governance." In the 2010 issue, the topic of "Leveraging

E-Government at a Time of Financial and Economic Crisis" was discussed. The 2012 issue dealt with the theme of "E-Government for the People" and the 2014 issue with the theme "E-Government for the Future We Want." Finally, the 2016 issue was dedicated to the topic of "E-Government in Support of Sustainable Development" (https://publicadministration.un.org/en/Research/UN-e-Government-Surveys).

## Promotion of Innovation and Best Practices in Governance and Public Administration

Upon recommendation of the Secretary-General, the General Assembly in its resolution 57/277 of 20 December 2002 designated 23 June as the "United Nations Public Service Day" to "celebrate the value and virtue of public service in the community; highlight the contribution of public service in the development process; recognize the work of public servants; and to encourage young people to pursue careers in the public sector."

To encourage and reward innovation in public administration in member countries, the Economic and Social Council in the year 2000 endorsed a recommendation of the Programme to establish the "United Nations Public Service Awards," a competition open to all organizations implementing innovative practices. This is the most prestigious international competition rewarding creativity, responsiveness, and excellence in public service. The awards are bestowed every year during a high-level ceremony held at the United Nations Headquarters or in a country interested in hosting the event.

The practices receiving the awards are subsequently summarized in a "Knowledge Base of UN Public Service Awards" made available on UNPAN (Bertucci 2006).

## Promotion of Knowledge and Information Sharing

The General Assembly resolution highlighted the key role of the United Nations Programme on Public Administration in favoring the access to and exchange of information and documentation on public administration among countries.

To achieve this goal, the Programme created a global Internet platform "The United Nations Public Administration Network (UNPAN)," which links through a powerful research engine international, regional, and national organizations working in the field. Through UNPAN, which receives several million hits a month, public officials and researchers have access not only to documentation and information posted by the United Nations but also to that posted by all of organizations that are members of the network. It is considered a very effective capacity development tool for developing countries (http://www.unpan.org/).

## Building a Common Understanding on Emerging Governance and Public Administration Issues

The Programme has facilitated the meetings of high-level officials responsible for public administration to discuss and reach a common understanding on key issues facing public administration.

As an example, it cooperated in the organization of Conferences of African Ministers of Public Service and promoted the adoption of the *African Charter of Public Service* and of the *Ibero-American Charter of Public Service*.

The Programme was also instrumental in supporting the organization of several meetings of the "Global Forum on Reinventing on Reinventing Government," the largest global meeting for senior government officials and experts to discuss emerging issues in governance and public administration. The first global forum was organized in 1999 by the Office of the Vice-President of the United States of America.

The Programme cooperated in the organization of the second global forum held in Brasilia, Brazil, in 2000 on the theme "Democratic States and Governance in the 21st Century"; of the third forum held in Naples, Italy, in 2001 on the theme "Fostering Democracy and Development through E-Government"; of the fourth forum held in Marrakech, Morocco, in 2002 on the

theme "Citizens, Businesses and Governments: Partnership for Development and Democracy"; of the fifth forum held in Mexico City in 2003 on the topic "Innovation and Quality in 21st Century Government"; and of the sixth forum held in Seoul, Korea, in 2005 on the theme "Towards Participatory and Transparent Governance." I finally organized the seventh global forum in 2007 in Vienna on the theme "Building Trust in Government" (https://publicadministration.un.org/en/globalforum).

Regrettably, after the last edition, the United Nations Programme has discontinued its support to the organization of the global forum.

The legacy of the global forum has been taken up by the Office of the Prime Minister of the United Arab Emirates which has been organizing the annual *World Government Summit* since 2013 (https://worldgovernmentsummit.org).

## Assistance to Interested Governments in Public Sector Capacity Building

The international development assistance scenario changed dramatically in the late 1990s involving a reduction of the resources available and a marked shift toward national execution of projects. Consequently, the Programme needed to adapt its approach to the changed circumstances. Very few field projects remained to be implemented, thus eliminating the need to keep field personnel.

Emphasis was placed on advisory services and on the organization of workshops and seminars for government officials at the country and the regional level. These events exposed the participants to the most recent trends and developments in public administration and served as a means to develop guidelines for developing countries that were disseminated widely as a means to strengthen their capacity. Hundreds of such seminar and workshops have been organized since 1996.

Through UNPAN, the Programme also began to offer online training courses and materials.

In partnership with the International Association of Schools and Institutes of Administration (IASIA), the Programme established a *Joint Task Force on Standards of Excellence for Public Administration Education and Training*. The goal of the task force was to assist development countries in improving the capacity to train their public officials. In 2015, a publication on "Approaches to Enhancing the Quality of Public Administration Education and Training" was issued jointly with the IASIA (United Nations 2015a).

## The Role of Public Administration in the Implementation of the United Nations Millennium Declaration

In the year 2000, the General Assembly adopted at its millennium session a historic declaration (A/RES/55/2) by which "member states and the international community committed themselves to achieve specific development goals by the year 2015" (Millennium Development Goals of MDGs). The entire United Nations system focused its activities in assisting developing countries to achieve such goals, namely, to eradicate extreme poverty and hunger; to achieve universal primary education; to promote gender equality and empower women; to reduce child mortality; to improve maternal health; to combat HIV/AIDS, malaria, and other diseases; to ensure environmental sustainability; and to develop a global partnership for development.

In 2001, the General Assembly specifically requested the Programme to focus its activities on assisting developing countries to achieve the MDGs. The Committee of Experts on Public Administration in the years 2002 and 2003 and subsequent years discussed and made specific recommendations on how to enhance the public administration capacity of developing countries to achieve the MDGs. In particular, it emphasized the importance of developing multi-sectoral programs aimed at addressing several goals at the same time (United Nations 2002).

The Programme, therefore, enhanced its work in the area of human resources development in the public sector, in civic engagement in policy making and service delivery, and in information technology capacity building.

A major publication on the theme "Implementing the Millennium Development

Goals; Challenges and responses for Public Administration" was issued in 2007 (United Nations 2007).

### Participatory Governance and Civic Engagement

The issue of civic engagement in the achievement of the MDGs became a key area of study and of assistance on the part of the Programme. The Committee of Experts in 2007 discussed in depth the theme and stressed the importance of involving citizens in the policy making processes, in budgeting, in the implementation of service delivery, and in auditing the goals achieved. The Programme widely disseminated findings and guidelines emerging from a number of technical seminars it organized. A major publication entitled "Participatory Governance and the Millennium Development Goals (MDGs)" was issued based on a Expert Group Meeting held in 2006. It also organized a major conference on "Engaging Communities" in Brisbane, Australia, in 2005 in cooperation with the Government of Queensland (United Nations 2008).

As mentioned above, the 2008 World Public Sector Report was dedicated to the theme of "Civic Engagement in Public Governance."

## The Role of Public Administration in the Achievement of the Sustainable Development Goals (SDGs)

The United Nations General Assembly on 25 September 2015 convened at the summit level and, having taken note of the progress made in the achievement of the MDGs, adopted the far-reaching agenda "Transforming our World: the 2030 Agenda for Sustainable Development" (*United Nations* 2015b).

The Agenda set 17 Sustainable Development Goals and 169 targets integrating three dimension of sustainable development: the economic, social, and environmental.

### Sustainable Development Goals

Goal 1. End poverty in all its forms everywhere.

Goal 2. End hunger, achieve food security and improved nutrition, and promote sustainable agriculture.

Goal 3. Ensure healthy lives and promote well-being for all at all ages.

Goal 4. Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all.

Goal 5. Achieve gender equality and empower all women and girls.

Goal 6. Ensure availability and sustainable management of water and sanitation for all.

Goal 7. Ensure access to affordable, reliable, sustainable, and modern energy for all.

Goal 8. Promote sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work for all.

Goal 9. Build resilient infrastructure, promote inclusive and sustainable industrialization, and foster innovation.

Goal 10. Reduce inequality within and among countries.

Goal 11. Make cities and human settlements inclusive, safe, resilient, and sustainable.

Goal 12. Ensure sustainable consumption and production patterns.

Goal 13. Take urgent action to combat climate change and its impacts.*

Goal 14. Conserve and sustainably use the oceans, seas, and marine resources for sustainable development.

Goal 15. Protect, restore, and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss.

Goal 16. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all, and build effective, accountable, and inclusive institutions at all levels

Goal 17. Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development

In the same month, the General Assembly adopted resolution 69/327 on "Promoting inclusive and accountable public services for sustainable development," echoing the tenets of goal 16. The resolution "reaffirmed that the United Nations has a central role to play promoting international cooperation in strengthening public institutions and public services for sustainable development." It

also requested the Secretary-General, through the Programme, to provide assistance to public administrations in developing countries to achieve the SDGs (United Nations 2015c).

As a result, the Committee of Experts on Public Administration, at its 2016 session, discussed the issue of "Transforming Public Institutions for the Implementation and Monitoring of the SDGs."

The recommendations of the Committee were endorsed by the Economic and Social Council Assembly in July 2016 in its resolution 216/26 and constitute a working agenda for the Programme for the next decade (United Nations 2016).

Currently therefore all the activities of the Programme under its major operational lines are focused on providing assistance to public administrations in developing countries in the implementation of the SDGs. These include the United Nations Public Service Awards Competition, under the theme: "Accelerating Public Service Innovation for Agenda 2030," the 2017 UN E-Government Survey under the theme "E-Government in Support of Sustainable Development," as well as a number of capacity building workshops and seminars and publications.

In April 2017, the Committee of Experts in Public Administration will discuss the main topic of "Ensuring Effective Implementation of the Sustainable Development Goals: Leadership, Action and Means" and will provide further recommendations for the future activities of the Programme.

## Conclusion

By constantly reinventing itself and adapting its activities to changing global priorities and needs of developing countries, the Programme has been to provide useful assistance to building the public administration capacity of developing countries.

"Public administration in the years to come will continue to be the main instrument of the State to define policies, to implement programmes and to ensure that security, safety and quality services are provided to its citizens. It will also be a key factor in enabling countries to accelerate their economic and social development and to meet their development goals.

In order to maintain its relevance and usefulness to Member States in the next decades, the United Nations Programme on Public Administration needs to advise on and provide solutions to crucial issues facing public administrations around the world, especially those relevant for developing countries. It must also deal with challenges internal to the functioning of the economic and social sector of the United Nations.

Another challenge for the Programme will be to re-emphasize this important role of public administration and to ensure that the study and practice of public administration are given the proper space within the economic and social sector of the United Nations" (United Nations 2009).

# University Governance Models Among Developing and Developed Countries

Habib Allah Ranaei Kordshouli and Seyed Moslem Alavi
Economics, Management, and Social Science School, Management Department, Shiraz University, Shiraz, Iran

## Synonyms

Higher education; University governance; University governance models

## Definitions

One of the most widely accepted definitions of University governance is that provided by Trakman (2008). According to this definition, university governance is a set of decision-making processes in an educational institution through which one can determine its policies and goals, achieve them, and improve its progress.

## Introduction

Higher education has undergone significant changes since the late 1980s. Since university governance is one of the most important structural dimensions of higher education and has important implications for educational and research activities, developments in these areas have been significantly influenced by governance changes (Sporn 1999). In many countries, modifying the governance model of higher education has become a top priority. A significant consequence of this administrative reform is the emergence of a flexible and environmentally friendly organizational structure that can quickly respond to the needs of today's business environment and, in terms of revenue generation, create a competitive advantage for universities, thus promoting their position among other universities (Dill 1999).

Due to these changes and despite the existence of a wide range of governance models in education systems throughout the world, many higher education systems, especially those in Europe and Asia, have adapted themselves to American models, which seem market-oriented and income-generating (Sporn 1999). This tendency is such that Clark (1998) believes universities should be organized and managed like business companies and, thus, become entrepreneurial universities. For this reason, professional management in the university environment has emerged as a key principle. The higher education environment faces increasing competition for the attraction of students and research funds and the recruitment of the best staff. This competitive nature has become more desirable for

governments and funding institutions. Therefore, universities must set priorities for the activities that can make them successful in a competitive environment.

According to the above discussion, the first purpose of this entry is to conduct a comprehensive review of the literature on the concept of governance in universities. Another goal is to identify different models of university governance, examine the strengths and weaknesses of each model, and compare the models as precisely as possible. Finally, the entry seeks to compare the current models of governance at the level of universities in the selected countries and present recommendations in that regard.

## Literature Review

### Concepts of Governance and University Governance

Governance is a way of exercising power and authority in organizations with the aim of allocating and managing organizational resources. This process involves decision-making and adoption of policies and procedures aimed at effective organizational management (Carnegie 2009). According to this definition, Harris and Cunningham (2009) argue that university governance is about oversight, control, disclosure, and transparency. Also, as Considine (2004) states, it affects the university structure, decision-making and delegation, planning, organizational cohesion, and orientation. Trakman (2008) defines university governance as a set of decision-making processes in an educational institution through which one can determine its policies and goals, achieve them, and improve its progress. Finally, in a more comprehensive definition, university governance is intertwined with determining the core values of the university; strengthening decision-making systems and resource allocation; determining the mission and goals of the university; designing power patterns and hierarchy, and paving the way for the university relationships with other educational systems, governments, business markets, and communities.

### Distinctive Models of University Governance

#### State-Oriented Governance

In this model, the governance of the university is in the hands of government officials who are appointed by the government for a certain period of time. These people are the independent and nonexecutive members selected from higher institutions and accredited institutions rather than the university staff. As members of the university governing board, they set the strategic path of the university and its macro-policies; as a result, they make the macro-decisions of the university. As the name of this model of governance suggests, the government plays the most influential role as a superior institution. This role includes determining the method of student enrollment, the courses to be offered and the educational calendar, selecting the faculty members, evaluating the academic quality, and so on. What is of great importance is that the philosophy of establishing a university is to meet the needs of the government, industry, and society based on the government's programs.

#### Academic Governance

The academic model implemented in German, French, and Spanish universities is the one in which the faculty members serve as the university council and the governing body dealing with the affairs related to strategic planning, macro-policies and management. They have control over the finance and the performance of the university. In this model, faculty members are placed at the head of the university as the governing body. Indeed, such important organizational positions as the president of the university, the board of the directors, the university council, the deans of the faculties, and the heads of the departments are chosen among faculty members. These members are elected, not appointed. In addition to the fact that all the university decisions lie within the authority of the faculty members, the representative of the university staff plays a role in making key decisions. It should be noted that, based on the academic experience in the United Kingdom, for example, at the University of Cambridge, and Germany, the representatives of the students,

industries, social and educational institutions, and the like are also relatively involved in making major decisions.

### Market-Oriented Governance

The presentation of a market-oriented model is rooted in the new public management theory, and the emphasis of this management model is on bringing the structure of government organizations closer to business-oriented enterprises (Vigoda-Gadot and Meiri 2008). This model is a kind of translation of the principles of corporate governance at the university level. It emphasizes the importance of the presence of professional managers as a key factor in increasing university productivity (Marinas and Prioteasa 2015).

The market-oriented governance model is based on the idea that universities act as a company; they offer their training services to different buyers in different places, manage complex budgets, and have a variety of profit and loss centers (Trakman 2008). This model of

**University Governance Models Among Developing and Developed Countries, Table 1** Strengths and weaknesses of the three models of university governance

| | | |
|---|---|---|
| **State-oriented model** | **Strength** | Strategic thinking in macro-organizational decisions<br>Spending more time to participate in major organizational decisions<br>Use of communication and trust-based channels in discussing the financing needs of the university<br>Maintaining organizational trust, maintaining university resources, and paying maximum attention to the expectations of higher institutions<br>Lesser conflict of interests<br>Less likely thinking of an island compared to the model of university governance |
| | **Weakness** | Lack of proper knowledge of students' problems, educational calendar, and staff issues<br>Less motivation to promote the university brand<br>Low level of creativity and innovation in the university environment<br>Relying on limited government funding, charities, and NGOs |
| **Academic model** | **Strength** | More knowledge of the governing board members about the mission and vision of the university and how to achieve it<br>Improving the quality of educational programs<br>Promoting the educational and scientific reputation of the university and help the branding process based on the role of eminent professors<br>Establishing better communication with students and student councils |
| | **Weakness** | Paying no attention to the important issue of university income generation, the budget deficit, and the imbalance of accounts<br>Lack of knowledge of faculty members in making managerial decisions, especially governance, finance, human resources, and marketing<br>Spending limited time to participate in major organizational decisions<br>Island thinking as well as collegial and departmental thinking<br>Lack of strategic thinking |
| **Market-oriented model** | **Strength** | Paying attention to the important issue of university income generation, account balancing, and higher efficiency<br>Better response to market needs<br>The more competitive nature of the university against competitors<br>Increasing the level of creativity and innovation in the university service process<br>A stronger connection between industry and university<br>The entry of experts knowledgeable in finance, marketing, and human resources in the governing board of the university<br>Greater transparency and accountability to various university stakeholders<br>Reducing the university's dependence on government budgets |
| | **Weakness** | Insufficient attention to all the stakeholders of the university<br>Commodification of education<br>Moving away from the basic knowledge production process and placing too much emphasis on applied knowledge |

university governance views the university as a service provider whose "output of its activities (i.e. skills, knowledge, and innovation)" should be "sold" to "interested and diverse" buyers in a competitive market. Of course, in this model, university goals are still pursued and the university does not fully operate as a profitable company. According to the model of corporate governance, the budget obtained from the profitable activities of the university is spent to achieve new academic goals and enhance the production of advanced knowledge.

According to the above explanations, the strengths and weaknesses of each model of university governance are presented in Tables 1. Furthermore, based on the findings of Dobbins and Knill (2017), the three aforementioned models are compared.

### Amalgam Model of University Governance

A look at the models presented in this entry shows that, when the basic philosophy of the university emphasizes financial value creation and efficient and effective use of resources, the governance model takes on a market-oriented nature. In this context, the student is seen as a customer and education as a product (Carnegie and Tuck 2010). If the value of accountability and the ensured survival of the university become the bases of affairs, the model begins to be something like public governance. Also, in the case of educational innovation, educational quality, and academic reputation, the model of academic governance gains emphasis. Figure 1 illustrates this classification. The solid lines show the specific functions of the models in the realization of the corresponding goals, while the dotted lines indicate their general functions – which are, of course, just slightly effective in the achievement of specific goals.

To identify the dimensions of university governance, some highly cited studies including Trakman (2008), Carnegie and Tuck (2010), and Dobbins and Knill (2017), were used. In their study conducted in France, Italy, and Germany, Dobbins and Knill (2017) found the comprehensiveness of the dimensions appropriate to compare the models of university governance. In addition, Sari et al. (2018) and Ramírez and Tejada (2018) discussed the dimensions of governance in detail in connection with finance, accountability, stakeholder participation, management structures, and human resources. The indicators presented in these three studies were used as a basis for comparisons. If any other dimension was identified in other studies, it would be added to the mentioned dimensions for comparison.

**University Governance Models Among Developing and Developed Countries, Fig. 2** Governance model of French universities (Dobbins and Knill 2017)

**University Governance Models Among Developing and Developed Countries, Fig. 3** Governance model of Italian universities (Dobbins and Knill 2017)

**University Governance Models Among Developing and Developed Countries, Fig. 4** Governance model of German universities (Dobbins and Knill 2017)

Overall, 12 dimensions of university governance were selected to compare different models of university governance.

As shown in Table 2, after the identification of 12 different dimensions of university governance, the models were compared together in the 4 countries.

Based on the studies of university governance by Dobbins and Knill (2017) in Germany, France, and Italy, the comparative findings for the three countries are presented below (see Figs. 2, 3, and 4). As it has emerged, in terms of evolution, the university governance models in France have become more state-oriented in nature over the past decades, but, in the course of time through the second decade of the twenty-first century, they have become market-oriented.

Contrary to the models of university governance in France, the dominant one in Italy in recent years has largely tended to be an academic model. This trend is more significant in terms of personnel.

Similar to the model of university governance in Italy, the dominant model of university governance in Germany has tended toward being an academic model in recent years. Of course, in the financial dimension, this trend is closer to market-oriented university governance models.

In this dimension of comparison, although there is no accurate information about the transition of university governance models in Iran, it can be predicted according to the probability of the trend of models over the past decades. The prediction is as follows (Fig. 5):

## Conclusion

The findings of this entry show that, over the past 30 years, the governance of higher education systems in some countries, especially the United States, Australia, and most European countries, has undergone a transition from government-

**University Governance Models Among Developing and Developed Countries, Fig. 5** Governance model of Iranian universities (Study Findings)

based to market-based models. In such countries as Germany and the United Kingdom, this trend is slow and the academic model is more common. In Iran, there are signs of the movement of the higher education system into a period of change and the transformation of domestic universities into third-generation universities whose governance is more market-oriented and somewhat hybrid in nature. However, the higher education system has not changed much of its government-centered and, of course, academic-centered nature yet. To achieve this goal, it is necessary to meet the legal prerequisites and make university administrators considerably change their minds in favor of applying business methods and privatizing the field of university management.

# Unplanned Change and Crisis Management

Mahauganee Shaw
Miami University, Oxford, OH, USA

## Definition

Unplanned Change – Organizational changes that are not foreseen prior to the need to change, often made necessary by shifts in the organizational environment.

Crisis Management – The process of preparing for, mitigating, responding to, recovering from, and learning from emergency incidents.

## Introduction

Organizational crises "forward the awkward dimension of 'un-ness': unexpected, unscheduled, unplanned, unprecedented and definitely unpleasant" (Rosenthal and Pijnenburg 1991, p. 1). In both their onset and their impact, crises are inherently unpredictable. Despite the unexpected, unscheduled, and unplanned nature of crises, people in positions of power are expected to respond in a manner that is both scheduled and planned. The general public expects that leaders will have a written response plan to consult, and the ability to offer regular scheduled updates, in the midst of a crisis response. Herein lies a conflict: expectation, scheduling, and planning as a desired response to an event that is unexpected, unscheduled, and unplanned. This conflict – meeting the sudden onset or escalation of a crisis with the general expectation that the crisis will be efficiently managed – requires flexible thinking by those attempting to manage the impact of crises. Essentially, this conflict requires a knowledge of change processes and a willingness to engage in the challenges of unplanned change.

## Managing Unplanned Organizational Change

Organizational change processes are typically planned through the gathering and assessment of current data on organizational operations and using the results of that assessment to construct a vision of how to improve or increase productivity. While it is possible to have an overall crisis management plan, the actual occurrence of a crisis does not allow for this type of planning to guide the response phase. Crisis response – the actions taken in the immediate aftermath of a crisis to mitigate further damage and ensure business continuity – is a largely intuitive process that requires fast-paced decisions and knowledge of available resources. It is in this response phase of crisis management that unplanned changes are most likely to occur. A few change management theories are helpful in understanding how the crisis management process can result in unplanned change.

### Change Management Theories

Organizations experience three stages during the change process: present state, transition state, and future state (Mayhew 2006). Somewhat intuitively, the present state describes the organization as it exists in a current state; the transition state describes "the structure, processes, people, and environment of an organization as it undergoes change" (p. 108); and "the future state is a destination" that describes the organization as it will exist when "most, perhaps all, of the problems

besetting [the] present state are gone" (p. 108). In subsequent change processes, what was once a future state becomes the new present state. A crisis unlocks an organization from the present state and plunges the organization into the transition state. Once the crisis response is complete, organizations can begin to move toward a new future state. These three states suggested by Mayhew may be easily overlaid with a three-stage theory of change proposed by Kurt Lewin.

Lewin (1951) proposes a three-stage change cycle of unfreezing, changing, and refreezing. Although Lewin's theory is classified as a human processual theory and focuses on the process of changing the attitudes and behaviors of group members regarding an impending change, it is applicable to crisis management. Crisis management is as much about managing the human aspect of an emergency as it is about the organizational aspect (Cintrón et al. 2007; Harper et al. 2006; Hemphill and LaBlanc 2010; Pauchant and Mitroff 1992). The change cycle described by Lewin offers an explanation for the process that happens during the transition state described above. Lewin suggests that unfreezing is aided by the presentation of new information that provokes employees to consider the need for change. In the case of organizational crises, the crisis unfreezes (a) the status quo of organizational structure and operations and (b) the perceptions stakeholders have about the organization and its vitality. Upon unfreezing, an organization is ready to undergo the changes that are characteristic of crisis response. When changes have been made, Lewin's theory maintains that employees must refreeze into a mode of acquiescence with the newly implemented organizational changes. If a post-crisis organization fails to refreeze after changes have been implemented, it will continue to operate in the uncertainty and high anxiety that characterizes the crisis response phase.

## Organizational Change as a Result of Disruption

Two theories on change processes within organizations account especially for change that is propelled forward by a sudden disruption. Michael Tushman, William Newman, and Elaine Romanelli (1986) describe this type of change as a pattern of convergence and upheaval, while Connie Gersick (1991) labels it the punctuated equilibrium paradigm. Both of these follow the idea that major change occurs during a temporary period of deep and far-reaching change that is both preceded and followed by extended periods of organizational stability. In convergence/upheaval, an organization is characterized as having long periods of convergence that are interrupted by the need for change. During the periods of convergence, an organization is experiencing incremental change that is aligned with and reinforces existing organizational operations. *Convergence* is disrupted by an *upheaval* or organizational reorientation – a period of discontinuous, frame-breaking change made either in anticipation of changes in the organizational environment or in response to such changes in the environment. This upheaval or need for organizational reorientation can be caused by a crisis (Shaw 2012). Upheaval can be both reactionary and anticipatory, made in response to a recent crisis – either one personally experienced or one that has affected a neighboring or comparable organization – and the anticipation of its recurrence.

Gersick (1991) describes the punctuated equilibrium paradigm as a generalization of the convergence/upheaval theory and others like it that emanate from the scholarship in various fields. Punctuated equilibrium describes the change process that occurs when longer periods of organization stability, known as *equilibrium*, are *punctuated* by short periods of major change. When the organizational equilibrium is punctured, it allows change to occur in an organization's deep structure. Organizations with deep structures are noted to have differentiated parts and contain units that interact with the organizational environment in ways that are based on and maintain this differentiation (1991). For example, higher education institutions are divided into academic and student affairs divisions. Each division is further separated into some combination of schools, departments, programs, functional areas, and offices. The component parts of an institution share information as needed to

continually operate individually and to contribute, both individually and collectively, to the overall operations of the institution. Organizational systems with deep structures, such as institutions of higher education, are susceptible to experience the punctuated equilibrium paradigm. Similar to Tushman et al.'s (1986) convergence, the consistency of the equilibrium period is maintained by making incremental changes that help to sustain organizational operations without disrupting the deep structure. Consistent with what happens during the upheaval process, interactions between an organization's separate units are unpredictable and susceptible to change during punctuation.

Both the convergence/upheaval and punctuated equilibrium models describe processes by which major changes may be made quickly to an organizational structure that has previously been considered stable and sustainable. A crisis can send an organization into a period of upheaval or punctuation; during this period of disruption, change happens to an organizational system. This is different than the convergence or equilibrium states, during which incremental change is occurring *in* an organizational system, rather than to the system itself.

## Organizational Change in the Midst of Crisis Management

Figure 1 provides a visual representation of the interaction between the change theories described above and the crisis management process. There are two layers included in Fig. 1, described here in ascending order. The bottom layer shows the three states of change – present, transition, and future – and how Lewin's three stages of the change interact with the transition state. The top layer is a depiction of the convergence/upheaval theory and the punctuated equilibrium paradigm as applied to crisis response. The lines connecting the convergence/equilibrium periods that precede and follow the occurrence of an organizational crisis represent institutional operations. The dotted lines are representative of the unplanned changes during the upheaval/punctuation period in which an organization is attempting to respond to a crisis and regain a state of convergence/equilibrium. The multiple versions of the dotted lines are indicative of the multiple possible pathways an organization may follow to achieve equilibrium after punctuation; the four pathways depicted were created at random to emphasize the variety of options.

## Leading Major Changes After a Crisis

An understanding of how organizations change can assist with handling the changes that are embedded in the management of a crisis. The change theories described above are those that focus on large-scale change – the types of change that "destabilize the organization and elicit fundamental changes in operations" (Bess and Dee 2008, p. 811). Large-scale change has been called by several names in the research literature: frame breaking (Tushman et al. 1986), radical (Simsek and Louis 2000), comprehensive (Kezar and Eckel 2002), transformational (Bess and Dee 2008), and revolutionary (Gersick 1991; Simsek and Louis 2000). This type of change is defined as discontinuous by several researchers (Gersick 1991; Simsek and Louis 2000; Tushman et al. 1986). It is characterized by "simultaneous and

**Unplanned Change and Crisis Management, Fig. 1** Organizational change models. This map is a visual representation of the interactions between the change theories described above during a crisis management process. (Adapted from Shaw (2012))

sharp shifts in strategy, power, structure, and controls" (Tushman et al. 1986). Working through large-scale changes that are sparked by crisis, and thus unplanned, requires leaders with a willingness to engage in the mental exercise and physical practice of deconstructing organizational norms.

Deconstructing organizational norms is a difficult process for every member of the organization, from the leaders down to the employees on the lowest levels of the organizational chart. Organizational leaders who are typically charged with developing and maintaining norms may have a difficult time unfreezing their vision that guides this process. Depending on the changes required, lower-level employees who are not directly involved in the crisis management process may have a difficult time unfreezing their understanding of either how their positions fit within the organization or how their typical strategies for fulfilling their responsibilities need to shift. For this reason, the process of deconstructing norms is both a mental exercise of envisioning a different pathway toward organizational goals and a physical practice of bringing organizational employees along the pathway to change. In order to guide organizational members through this process, leaders must first be willing to participate in the mental exercises of abandoning norms and considering revised pathways toward achieving organizational mission and goals.

The second step in guiding this process is for leaders to make decisions and take actions that will move the organization from Lewin's unfreezing phase firmly into the change phase. Leadership competencies most used in the crisis response phase are decision-making under pressure, effective communication, and risk taking (Wooten and James 2008). After a crisis, there is often limited information available. Thus, leaders are unlikely to have all of the information desired or needed to make a sound decision; nonetheless, decisions are necessary and integral components of any change process. During crisis management, the need for innovative solutions may more readily lead to decisions that involve some amount of risk. Any decisions that may influence organizational status and processes should be communicated as early as possible to organizational stakeholders, including all employees, constituents, clients, and any others with a vested interest in the organization's viability.

Employees often find it difficult to adapt to changes in organizational processes and strategies (Eckel et al. 1999). Resistance is a typical response to organizational change; however, unplanned change after a crisis may evoke different responses. The uncertainty that exists after a crisis can make it easier for employees to absorb the unplanned changes imposed by organizational leaders during crisis response (Shaw 2012). Adding the element of emergency operations to a change process can encourage organizational commitment and loyalty, resulting in employee support of the crisis response process and thus the changes that are made during that process.

## Conclusion

Crisis events unfreeze an organization's operational and procedural norms, making it necessary for organizational leaders to consider and implement changes that can be refrozen as the organization approaches a new period of equilibrium/convergence. During the period that the operational profile is unfrozen, an organization must implement changes that allow for an effective response to the crisis event and the insurance of organizational viability. Organizational changes made during crisis response are often unplanned and directive, guided by the foresight of organizational leaders. It is after the immediate threat of harm to organizational resources is absolved that planned changes can be made through participative processes.

|---|---|
| UPSC | Union Public Service Commission, the premier recruiting department for civil services in India. |
| Entrance examinations | The examinations undertaken by the aspirants to join the civil services or public administration at the federal and state levels. |

## Introduction

Every year, thousands of young Indians undertake the civil service entrance examinations for admission into the prestigious All India Services or one of the Indian central government's 22 specialized services. Examinees may choose to complete optional tests – called papers – on the subject of public administration. The papers have a significant influence in shaping the academic discipline of public administration in India, and they illustrate the current boundaries of the discipline. Although many organizations such as universities, textbook publishers, and for-profit coaching programs are concerned with preparing students for success in the civil service examinations, their judgments about what matters in the field of

public administration are influenced by what is asked in the Union Public Service Commission's (UPSC) optional papers on that subject.

This research note analyzes the content of these optional papers over the last decade and presents three conclusions. First, there is an unusual and probably excessive focus on American public administration in the theory component of the papers. Second, the papers overlook a substantial amount of important scholarship from the United States and other countries produced over the last 30 years. Third, there is a significant mismatch between the theoretical work covered in the papers and the practical challenges confronting Indian government. Adjustments to the content of the optional public administration papers are desirable but will be difficult because these adjustments will disrupt settled routines among many organizations.

## Background

Civil service examinations have been widely adopted in many nations for recruitment and promotion in their administrative systems. The meritocratic recruitment of public administrators through examination is an important component of civil service reform and has positive implications for economic growth and corruption reduction (Evans and Rauch 1999; Dahlström et al. 2012; Sundell 2014). In the United States, competitive examinations introduced as part of the Pendleton Act of 1883 were effective in significantly reducing patronage as the civil service system expanded across the nation (Sundell 2014). The British Civil Service Commission, established in 1855 following the Northcote–Trevelyan Report, advocated open competitive examinations over patronage in recruiting candidates for civil service positions (Edwards 2011). Such formal procedures are often more prevalent in "closed systems" along with lifelong tenure, special employment regulations, and protection from political pressures (Dahlström et al. 2012). Such mechanisms have been argued to keep bureaucracy more public and prevent the possibility of nepotism in appointments to administrative positions (Dahlström and Lapuente 2012).

In India, the civil service system is classified into two centrally administered categories. The first category comprises the All India Services – the Indian Administrative Service (IAS), the Indian Forest Service (IFS), and the Indian Police Service (IPS) – whose members work in central or state governments. The second category comprises 22 functionally specialized services whose members work only for the central government. In general, all of these services operate on the same two principles: recruiting young people and administrating an examination process. The first is that individuals should be recruited into a service at a young age – generally, between 21 and 32 – and spend their careers advancing through positions of increasing responsibility within it. The second is that admission into the services should be determined by a competitive examination. These principles were set in the 1850s, when the British government established the Indian Civil Service, and they have been continued, albeit with significant modifications, ever since. These two principles are explained in the 1854 Northcote-Trevelyan report (Northcote and Trevelyan 1853, pp. 8–16). While this report made proposals for Britain's home civil service, earlier reforms in the Indian civil service were a model.

The entrance examinations are now administered by the UPSC in two phases: preliminary and main examinations. The four hour preliminary examination is held in June of each year. In 2016, 459,659 people wrote this examination, of whom 15,452 were found to be qualified for the main examination (Union Public Service Commission 2019, Appendix 9). The main examination, held in October, comprises nine papers, each three hour long. Seven are on subjects set by the UPSC. Examinees must also write two papers selected from a list of 26 optional subjects given by the UPSC. Almost all of the people who qualified to write the main examination did so; of these, 2,956 advanced to an interview and 1,209 were recommended by the UPSC for appointment to the civil services (Union Public Service Commission 2019, Appendix 9).

**UPSC Examination Papers on Public Administration in India, Table 1** Number of candidates writing main examination and optional papers in public administration

| Year | Number appearing for CS (M) exam | Number appearing for PA papers | Number recommended | Success rate (%) |
|---|---|---|---|---|
| 2011 | 11,237 | 6,276 | 497 | 7.9 |
| 2012 | 12,190 | 7,077 | 359 | 5.1 |
| 2013 | 14,178 | 2,840 | 176 | 6.2 |
| 2014 | 16,286 | 2,852 | 151 | 5.3 |
| 2015 | 14,642 | 1,795 | 151 | 8.4 |
| 2016 | 15,149 | 1,506 | 160 | 10.6 |

Source: Annual reports of the Union Public Service Commission

Public Administration is one of the 26 optional subjects. It was the most popular optional subject in 2011 and 2012; the second most popular in 2013 and 2014; and the third most popular in 2015 and 2016. In 2016, 1,506 examinees selected this optional subject (Table 1). A summary of topics that may be addressed in the optional papers, referred to as the syllabus, is published in the *Gazette of India* several months before the main examination. The 2019 Syllabus for Public Administration, released in February 2019, is reproduced in Table 2. It has not changed in at least 6 years. The first paper examines "Administration Theory" while the second explores "Indian Administration." Each paper typically has eight questions, and many are divided into subquestions. Examination papers are publicly released following each examination.

This analysis looked at the optional public administration papers for the 10-year period of 2009 to 2018. These 20 papers – two per year – included 492 questions or sub-questions. A spreadsheet containing all the questions is available at http://bit.ly/UPSCexams. Textual analysis of the papers was conducted using NVivo. The study also consulted popular examination preparation books and textbooks on Indian public administration.

## Focus on American Theory

As noted, examinees opting to write on public administration must complete two papers – Paper I on Administration Theory and Paper II on Indian Administration. The separation of themes is not always clear, however. The questions were coded according to our own appraisal of whether they related to theory or practice, and identified 45 questions in Paper II that could be construed as theory questions as well. In some instances, these were theoretical questions that are important in India but neglected in the scholarly literature that forms the basis of Paper I. Examples of such questions are below:

Comment on the view that despite different contexts, administrative maxims of Kautilya's Arthashastra bear considerable similarity with features of Weber's ideal bureaucratic model. (2009 Paper II, Question 1(b))

"Gandhian model of decentralization is similar to the process of reinventing governance." Analyse in the context of good governance. (2013 Paper II, Question 6(a))

"Neighbourhood management provides an appropriate glocal strategy of dealing with social exclusion in the urban development scenario." Comment. (2018 Paper II, Question 7(c).)

Paper I (Administration Theory) draws predominantly on the literature of American Public Administration. This is suggested by the Syllabus (Table 2) and demonstrated by Table 3. The research identified every individual referenced in a question in Paper I and counted the number of references to each individual (variations such as Weberian or Taylorism were included). Of the 58 individuals who are referenced, 41 are American. Many of the non-Americans are politicians

| |
|---|
| The following text is reproduced from the *Gazette of India*, February 19, 2019. Typographical errors have not been corrected |
| Paper I: Administration theory |
| 1. Introduction: meaning, scope, and significance of public administration, Wilson's vision of public administration, evolution of the discipline and its present status. New public administration, public choice approach; challenges of liberalization, privatization, globalization; good governance: concept and application; new public management |
| 2. Administrative thought: scientific management and scientific management movement; classical theory; Weber's bureaucratic model its critique and post-Weberian developments; dynamic administration (Mary Parker Follett); human relations school (Elton Mayo and others); functions of the executive (C.I. Barnard); Simon's decision-making theory; participative management (R. Likert, C. Argyris, D. McGregor) |
| 3. Administrative behavior: process and techniques of decision-making; communication; morale; motivation theories content, process, and contemporary; theories of leadership: traditional and modern |
| 4. Organizations: theories systems, contingency; structure and forms: ministries and departments, corporations, companies; boards and commissions; ad hoc, and advisory bodies; headquarters and field relationships; regulatory authorities; public-private partnerships |
| 5. Accountability and control: concepts of accountability and control; legislative, executive and judicial control over administration; citizen and administration; role of media, interest groups, voluntary organizations; civil society; citizen's charters; right to information; social audit |
| 6. Administrative law: meaning, scope, and significance; dicey on administrative law; delegated legislation; administrative tribunals |
| 7. Comparative public administration: historical and sociological factors affecting administrative systems; administration and politics in different countries; current status of comparative public administration; ecology and administration; Riggsian models and their critique |
| 8. Development dynamics: concept of development; changing profile of development administration; "antidevelopment thesis"; bureaucracy and development; strong state versus the market debate; impact of liberalization on administration in developing countries; women and development the self-help group movement |
| 9. Personnel administration: Importance of human resource development; recruitment, training, career advancement, position classification, discipline, performance appraisal, promotion, pray and service conditions; employer-employee relations, grievance redressal mechanism; code of conduct; administrative ethics |
| 10. Public policy: models of policy-making and their critique; processes of conceptualization, planning, implementation, monitoring, evaluation and review, and their limitations; state theories and public policy formulation |
| 11. Techniques of administrative improvement: organization and methods, work study and work management; e-governance and information technology; management aid tools like network analysis, MIS, PERT, CPM |
| 12. Financial administration: monetary and fiscal policies: public borrowings and public debt budgets types and forms; budgetary process; financial accountability; accounts and audit |
| Paper-II: Indian administration |
| 1. Evolution of Indian administration: Kautilya Arthashastra; Mughal administration; legacy of British rule in politics and administration Indianization of public services, revenue administration, district administration, local self-government |
| 2. Philosophical and constitutional framework of government: salient features and value premises; constitutionalism; political culture; bureaucracy and democracy; bureaucracy and development |
| 3. Public sector undertakings: public sector in modern India; forms of public sector undertakings; problems of autonomy, accountability and control; impact of liberalization and privatization |
| 4. Union government and administration: executive, parliament, judiciary-structure, functions, work processes; recent trends; intra-governmental relations; cabinet secretariat; prime minister's office; central secretariat; ministries and departments; boards; commissions; attached offices; field organizations |
| 5. Plans and priorities: machinery of planning; role, composition, and functions of the Planning Commission and the National Development Council; "Indicative" planning; process of plan formulation at Union and State levels; Constitutional Amendments (1992) and decentralized planning for economic development and social justice |
| 6. State government and administration: union-state administrative, legislative and financial relations; role of the finance commission; governor; chief minister; council of ministers; chief secretary; state secretariat; directorates |
| 7. District administration since independence: changing role of the collector; union-state-local relations; imperatives of development management and law and order administration; district administration and democratic decentralization |

(continued)

**UPSC Examination Papers on Public Administration in India, Table 2** (continued)

| |
|---|
| 8. Civil services: constitutional position; structure, recruitment, training, and capacity building; good governance initiatives; code of conduct and discipline; staff associations; political rights; grievance redressal mechanism; civil service neutrality; civil service activism |
| 9. Financial management: budget as a political instrument; parliamentary control of public expenditure; role of finance ministry in monetary and fiscal area; accounting techniques; audit; role of controller general of accounts and comptroller and auditor general of India |
| 10. Administrative reforms since independence: major concerns; important committees and commissions; reforms in financial management and human resource development; problems of implementation |
| 11. Rural development: institutions and agencies since independence; rural development programs: foci and strategies; decentralization and Panchayati Raj; 73rd constitutional amendment |
| 12. Urban local government: municipal governance: main features, structures, finance and problem areas; 74th constitutional amendment; global-local debate; new localism; development dynamics, politics, and administration with special reference to city management |
| 13. Law and order administration: British legacy; National Police Commission; investigative agencies; role of central and state agencies including para military forces in maintenance of law and order and countering insurgency and terrorism; criminalization of politics and administration; police-public relations; reforms in police |
| 14. Significant issues in Indian administration: values in public service; regulatory commissions; National Human Rights Commission; problems of administration in coalition regimes; citizen administration interface; corruption and administration; disaster management |

such as Nehru, Annan, and Napoleon, or bureaucrats such as Nolan and Whitley, rather than academics.

In fact, one can think of Paper I and Paper II as exercises that relate to two different countries. We coded all of the examination questions where we saw explicit references to laws or practices of specific countries. However, the nationality of individuals was not considered in this analysis. As one may expect, 211 questions, almost all from Paper II (Indian Administration), referred to India. Only two other countries were directly referenced in any examination question in either paper: the United Kingdom in ten questions and France in one. The United States was never explicitly referenced in any question. But Paper I, as we have seen (Table 3), presents a predominately American view of the field of public administration.

## An Outdated View of Theory

The view of American public administration that is suggested by Paper I is also outdated. This is best illustrated by looking at the Syllabus in Table 2, which largely reflects an American public administration curriculum of the late 1960s or

1970s. There is heavy emphasis on overall organization and functions such as personnel and financial administration. The approach to comparative or development administration is guided by the 1960s-era work of Fred Riggs and Ferrel Heady. In fact, Riggs is the most commonly referenced individual in Paper I (see Table 3). Questions that mention policy draw on debates about rationality and incrementalism involving scholars such as Lindblom, Dror, and Vickers, also from the 1960s. Similarly, questions about work processes and administrative behavior focus heavily on concepts such as Taylorism or participative management, and techniques such as PERT, CPM, and MIS, that were most influential up into the 1980s.

The problem of outdatedness also extends to test preparation materials, as evident in the list of American texts recommended in one exam-preparation book (Kalinjar Publications 2016, pp. 9–10):

Heady, Ferrel (2001). *Public Administration: A Comparative Perspective*. New York, Marcel Dekker. 6th edition.

Nigro, Felix A. and Lloyd G. Nigro (1989). *Modern Public Administration*. New York, Harper & Row. 7th edition.

Stahl, O. Glenn (1983). *Public Personnel Administration*. New York, Harper & Row. 8th edition.

White, Leonard D. (1955). *Introduction to the Study of Public Administration*. New York, Macmillan. 4th edition.

The more recent developments in American public administration theory which appear to be neglected but might be relevant to modern India are:

- The substantial shift toward a "public policy" focus by many universities after the mid-1970s. This includes an emphasis on action, techniques of policy analysis, and processes of policy formulation, decision-making, and implementation (Yates 1977; Stokes 1989).
- The rapid growth of literature in the domains of Public Management and Non-Profit Management after the mid-1980s.
- The expanded literature on outsourcing, public-private partnerships, and "networked" forms of service delivery after the 1990s.

It should be noted that outdatedness has some advantages. The UPSC syllabus for Paper I notes the importance of "historical and sociological factors" affecting administration, administrative law, and microlevel questions of motivation and behavior. Contemporary American scholars have criticized their field for neglecting these topics in recent decades and called for renewed emphasis on them (Christensen et al. 2011; Olsen 2015;

Milward et al. 2016). In this sense, the UPSC syllabus may find itself ahead of the curve rather than behind it.

## Mismatch between Theory and Practice

A more fundamental question is whether the heavy emphasis on American public administration in Paper I makes sense, given the distinctive context of Indian public administration and the range of challenges that are emphasized in Paper II.

This question can be approached in several ways. First, we can question the relevance of some of the material canvassed in Paper I. For example, examinees have been asked several times over the last decade to reflect on Woodrow Wilson's views about public administration. In 2017, examinees were invited to comment on the proposition that Wilson's 1887 essay on administration "continues to have great relevance even today." But it is doubtful that Wilson's essay ever had any relevance in India, except as material for examination. In 1887, the administrative systems laid down in India – by the British East India Company, and the British government – may have been more elaborate than those of the American federal government. Appleby (1955) further notes that the administrative experience in India enriched the United Kingdom government in several ways. Moreover, these administrative systems were developed without any reference to American experience. British and Indian writers were engaged in the systematic study of administration well before Wilson entered the field (Stokes 1989). But the extensive British literature on colonial administration is not included in the syllabus for Paper I, although these topics are referenced in the syllabus for Paper II.

Much of the American public administration literature written in the twentieth century took certain facts for granted: that the population was mostly urbanized, middle class, and literate; that the economy was mainly industrialized; that most of the territory was just recently settled; that there was no long history of religious division; that the colonial legacy was long past and (by comparison to India) relatively benign. This may explain why many topics that are emphasized in Paper II are not given much emphasis in Paper I. Unintended as it is, this is a stark example of the age-old lament that theory does not inform practice in public administration.

To appreciate the gaps between Papers I and II, consider Table 4. The text of each question was coded inductively and then aggregated these codes into 37 topics. Table 4 shows the number of references to each of these topics for questions contained in Papers I and II. We can see some areas in which there are clear disparities between the two, notably state and local government, internal security, the Cabinet system, corruption control, and disaster management. These appear to be topics that are important in practice but which are not addressed by the theoretical literature in public administration, as it is currently defined for the purposes of Paper I.

If the aim of Paper I is to survey a scholarly literature that is relevant to the practical problems identified in Paper II, then it would be desirable to draw on a broader array of sources. For example:

- Other Westminster systems such as the United Kingdom, Australia, New Zealand, and Canada deal with similar problems relating to the interaction of senior bureaucrats, ministers, and parliaments. There is an extensive scholarly literature on these problems that could be addressed in the syllabus of Paper I.
- There is also a substantial literature in the field of statebuilding and development studies that addresses problems of state fragility and economic and social development. Much of this literature draws on the experiences of complex polities that have more in common with India than the United States, such as China, Brazil, South Africa, Indonesia, and Nigeria.
- There is also an extensive literature on the problems of federalism, and also a growing European literature on multilevel governance.
- Finally, there is also a growing literature that is relevant to problems of transparency, ethics, corruption control, and the application of new information technologies for improved service delivery.

**UPSC Examination Papers on Public Administration in India, Table 4** Topics in papers I and II

| Topic | Paper I | Paper II |
|---|---|---|
| A: Organization theory | 41 | 4 |
| B: Administrative systems and reform | 17 | 26 |
| C: Local government | 4 | 33 |
| D: Leadership and management | 28 | 3 |
| E: Civil services | 6 | 21 |
| F: Public participation and control | 14 | 13 |
| G: Budgeting, financial administration, and auditing | 14 | 10 |

| AC: Gender and social exclusion | 5 | 5 |
| AD: Parliament and its role | 3 | 5 |
| AE: Disaster management | 0 | 8 |
| AF: Policy analysis and policy process | 8 | 0 |
| AG: Policy implementation | 5 | 3 |
| AH: State government | 0 | 6 |
| AI: Rule of law and human rights | 4 | 1 |
| AJ: Environmental policy and climate change | 0 | 2 |
| AK: Foreign policy and national security | 0 | 2 |

Table 4 also suggests that there may be subjects that deserve more attention in both Papers I and II. For example, little attention is paid to administrative problems associated with climate change and to problems of international relations as well as supranational and transnational administration.

## Reform Opportunities and Challenges

How did twentieth-century American public administration theory find its way into India's civil service exam? Perhaps because the newly formed government of independent India wanted to distance itself from the colonial administration

of the British Raj, beginning with the transformation of the Indian Civil Services (ICS) to the present-day IAS. The government even invited Professor Paul Appleby of Syracuse University to conduct an extensive study of the government's administrative structure. His concluding report recommended significant reform measures in recruitment, training, and daily functioning of administrative personnel. Additionally, the civil service began reorienting towards development administration, along with a focus on professionalization for the efficient management and implementation of development programs (Mathur and Mathur 2017). Administration was seen as a great instrument of change and there was increasing support for comparative administration and development administration, notably the funding from the Ford Foundation to the Comparative Administrative Group of the American Society for Public Administration (ASPA). Furthermore, many of the early administrative development theories in the 1950s were written by Americans. The United States was not perceived as a colonizing power, and American literature might have represented more of a "break" with colonial literatures. The USA, at that time, was also the recognized leader of the West during the Cold War, thus, a need to "learn" about new states to ensure they did not become communist.

These are plausible theories, but they do not explain why the UPSC's syllabi have not kept up to date. Why have new developments in American public administration theory remained stuck in the mid-1970s? This was perhaps a result of the declining interest in comparative administration work in the USA due to the fall in funding for such work after 1973. The study of comparative administration began to diverge from conventional American public administration and increasingly establish itself as a distinct subfield in political science, economics, and related disciplines (Jreisat 2005). Thus, along with the new emphasis on MPA degrees in the early 1970s in the USA, and the concurrent split of public administration from political science, comparative administrative learning effectively stopped (Gulrajani and Moloney 2012). Also, the study of public administration in India remained largely confined to political science departments, and there were few interlinking bridges or professional pathways between the academic and practical domains in the field. Such factors have may resulted in this overwhelming orientation towards American public administration of a certain era. Even though American public administration has moved forward considerably, the Indian civil service papers remain in the past.

In brief, there appear to be opportunities to revise the optional papers in public administration so that they are more relevant to contemporary challenges of administration in India. Adjusting the optional papers would have important consequences. It would require changes in textbooks, coaching programs, and university curricula. Several state public service commissions appear to use UPSC syllabi as templates for their own examinations, and a change at the center might imply changes at the state level as well. But change will also be difficult, precisely because so many different actors have made commitments to the current way of doing things. Added to this is the understandable desire of examinees to know what they will be tested on.

There is a conflict here between the dynamics of scholarly work and the needs of an expansive and highly bureaucratized examination system. On the one hand, the academic literature is always changing, adopting new priorities, inventing new ideas, and abandoning old ones. On the other hand, the examination system depends on predictability and requires coordination of expectations. The problems of adjustment in today's examination system are much more substantial than they were in the nineteenth century, because the system is much larger and more complex. Still, a better compromise between adaptability and predictability seems necessary as a considerable part of the syllabus for public administration is not well suited to India's current conditions and future challenges.

Department of Public Administration, Faculty of Social Sciences, Institute for Regional Studies and Urban Planning, Spatial Development and Regional Studies, Higher School of Economics, Moscow, Russia

## Synonyms

Municipal management; Municipality

## Definition

The administration, organization, and planning performed for cities or towns, particularly the process of converting farmland or undeveloped land into offices, businesses, housing, and other forms of development.

## Introduction

According to the database of the Russian Federal Statistics service from 1 January 2016, there are 1112 cities/towns in Russia. Each of them represents a specific locale differentiated by the peculiarities of their economic and geographical position, structure of economy, development of engineering, transport, and social infrastructure and also the tendencies of the demographical development. The UN estimates that by the year

2050, the mankind life quality will be determined by the quality of the city development, and the entire frame of the municipal economy will be aimed at the sustainable advancement of the cities. The leading factor in this is efficient city administration according to which there are four groups of cities in the Russian Federation:

1. A city as a constituent territory of the Russian Federation divided into districts which are not municipalities. The districts are divided into districts which are municipalities, so-called intracity municipal units of the city with federal status (Moscow).
2. A city as a constituent territory of the Russian Federation divided into municipal districts, intracity municipal units of the city with federal status (St. Petersburg).
3. A city as a municipal unit divided into districts which are not municipalities.
4. A city as a municipality without administrative territorial division.

Due to such division of a city, a lot of local issues are possible to be solved:

- Construction of a scheme to manage the city's property and creation of estate objects
- Functioning of the cadastre and registration of estate property rights
- Budget formation and financing the estate objects from the city's funds
- Distribution of municipal enterprises and establishments
- Pricing formation peculiarities, etc.

The city territorial administrative object is:

- City lands regardless of the property type
- Estate objects (buildings, constructions)
- Utility systems (ground, overground, and underground networks and communications)
- Elements of amenities and landscaping
- Other objects and elements forming a city's infrastructure
- Local budget resources, in particular, the funds flowing into the city budget
- Municipal (city) property – the asset portfolio of a city as a municipal unit

Within a municipality unit, there are the objects significant for fostering and catering the population's needs (running water and electricity, city roads and squares, engineering networks and constructions, fossil fuels) and the objects of cultural and historical heritage (valuable landscapes, monuments of architecture, etc.) and also:

- Local budget funds, municipal extra-budgetary accounts
- Assets of self-governing authorities
- Municipal lands, local natural resources
- Municipal economic entities
- Municipal banks and credit cash companies
- Municipal housing facilities and nonresidential premises
- Municipal sociocultural enterprises
- Other movable and immovable property

Municipal property serves as a base for effective work of local self-government bodies and solution of the key problems of city population well-being; it allows to provide the population with the necessary service, get extra income and decrease the expenses of the local budget, contribute to the creation of a favorable social environment, and tackle the social issues of a city. The local budget resources are significant for a city's efficient territorial administration, especially the money coming to the city budget. Land resources of a city are its territorial, special, and natural ecological and economical basis of the population dwelling. The parts of land matters are:

1. Providing legal rights on land to all the land users
2. Managing the land resources of a city
3. State economical regulations

The following are the objects of land matters in a city.

1. Municipal lands of fixed square within the borders of a municipal unit

2. Territorial zones and areas of special regime of use
3. Land units
4. Parts of land units

The constituent territory of the city territory administration is the population of a municipal settlement and the local self-governing bodies that are legally permitted to sort out economic, financial, social, and other problems at the level of its region. Wealth and administrative rights and responsibilities on behalf of the population can be executed solely by the local self-governing bodies.

The city administration system defines:

- Urban administration structure: its apparatus and managing bodies and their branches and manning table
- Order of the apparatus formation, managing authorities, and municipal (district) services of the city administration
- Order of differentiation of executive and executive and operating functions, distribution of duties among the deputies of the municipality leader, and the apparatus headquarters and managing authorities

The Russian Federation Legislation (Legislative Act from 06.10.2003 N 131-FL "Concerning the General Principles of the Organization of Local Government in the Russian Federation") establishes the following types of municipalities that can be entitled as cities/towns:

- Municipal unit as an urban or rural settlement, municipal district, urban district, urban district with intra-urban division, intra-urban region, or intra-urban town site of federal importance
- Urban county as an urban settlement which is excluded from the municipal district and the bodies of local self-government
- Urban county with intra-urban division as an urban county where according to the law of the constituent territory of the Russian Federation are formed intra-urban districts as intra-urban municipal units
- Intra-urban district as an intra-urban municipal unit on a part of the territory of an urban county with intra-urban division

The division criteria for the urban districts with intra-urban division into intra-urban districts are set by the laws of the constituent territory of the Russian Federation and the regulations of such a county.

The administration of cities as municipalities is executed by the population and/or through the local authorities considering their interests, historical, and other local customs as well as by the federal and regional authorities in the scope of the valid legislation of the Russian Federation regarding the bodies of local self-government.

The majority of cities are, on the one hand, considered to be municipal units but, on the other hand, are elements of the administrative and territorial system of a constituent territory of the Russian Federation. Due to this, the possible problems are solved on the regional level: the laws of constituent territories of the Russian Federation provide the characteristic of a territory; in the laws of administrative and territorial division, there is a description of borders with the procedure of their setting and changing.

The administration of the cities of federal importance in Moscow and St. Petersburg is different in several ways. These cities have the governing authorities of the regional level. Everything is executed complying with the constitution of the Russian Federation, by their citizens – the citizens of the Russian Federation (through elections, referendums, etc.) – or by the public bodies of the government (legislative, executive, judicial). In the cities of federal importance according to the regulations inside these constituent territories of the Russian Federation local self-administration is run by the authorities in the intra-urban areas. In Moscow, there are over 120 of such areas and fewer than 100 in St. Petersburg. The districts are created with regard to the historical, geographical, city-planning peculiarities, the population amount, location of road and traffic network, engineering infrastructure, etc.

Moscow is the only city in the Russian Federation that has three levels of executive power. Along with the municipal districts, there are more than 12 bigger administrative intra-urban districts. On average, these include 12 regions. The districts bear geographical names (Northwest administrative district, East administrative district, and so forth.) Districts – also known as prefectures – are not the elements of local self-government. They are created for managing some certain territories. Formation, change, abolishment of administrative districts, giving them titles, and border alteration are executed by the largest official in Moscow (a constituent territory of the Russian Federation) – the mayor of the city.

The three-level system of the executive power in Moscow includes:

1. Moscow City Council – the highest and only legislative (representative) body of the government
2. Mayor of Moscow – the highest official of the city who heads the largest executive body of the state government of Moscow
3. Moscow Government – the highest executive authority of the state power
4. Moscow government, industries, functional, and territorial executive bodies that perform the executory and regulatory functions in certain industries and administrative spheres of the city are the executive authorities of Moscow

The governing institutions of Moscow has the right to decide the following:

- Passing and changing the law and other statutory acts of the city and controlling the abidance of these
- Territorial organization of the city
- Establishment of the system and order of the governmental bodies and officials of Moscow work
- Regulation of the local self-administration regarding the features of Moscow as a city of federal importance
- Property, funds, and intra-budget funds of Moscow
- Fines, payments, and taxes excluding the federal ones
- Social order and safety control
- Fire safety
- Complex socioeconomic and cultural development of Moscow
- Problems with education, upbringing, science, healthcare, social security, and support of the population
- Development and support of entrepreneurship
- Governmental establishments organization in Moscow and their produce and service price formation
- Support of housing and nonhousing stock, utility provision, and power industry
- Welfare
- City transport and communications
- Trade and catering
- Utilization and recycling of industrial waste and consumption
- Funeral arrangements
- Mass media
- Architecture
- Other constituent territories not contained in the Constitution of the Russian Federation

Each of the governing bodies owns this authority and performs the role due to their forms of organization and methods of work.

The Moscow City Council is comprised of 35 officials elected through the direct vote by the Moscow dwellers – citizens of the Russian Federation according to the main principles of the federal election franchise. It is eligible to pass laws and make other decisions if the number of the elected officials is not less than two thirds of the stated population amount. A council official has a tenure (receives salary from the state budget) and is prohibited from doing any other activity except for teaching, conducting scientific research, or any other creative job. They are free to resign before their term ends. The Council is run by the Head and his deputies that are elected by means of secret voting from the pool of officials. In the Council, there may be created the so-called fractions (unions). Moscow City Council has exceptional authority, i.e., it is a sole decision-maker in some certain matters. For

example, adopting the city's rules, laws, and bills; confirming the budget, intra-budget funds, and reports about their completion; establishment of regional (Moscow) and local (for the local self-government) taxes and charges; approval of the general plan of Moscow's development; gathering of the Council and making changes in its structure, committees, and labor groups; realization of legislation rights in the City Council of the Russian Federal Assembly; election of the Council's member for the Federation Council and appointment of another member from the executive authority in Moscow; law interpretation (except for the Statute of Moscow which is performed by the Charter Court of Moscow); appointment of the head of the Moscow Chamber of Control and Accounts, their deputies, and auditors; appointment of statutory and magistrate judges according to the mayor's will; setting the Council elections date; establishment of the procedure and the date of Moscow's referendum; signing agreements with the governmental bodies of other constituent territories in the Russian Federation and foreign countries; creation, uniting, and abolishment of municipal units in Moscow; setting the order or work and administration of the territory social self-government; and laying administrative responsibility concerning the constituent territory's authority (in this case, Moscow) and other issues.

The Statute of Moscow and its amendments are to be approved by at least two thirds of the votes, the laws by not less than a half of the Council members' number. The bills concerning taxes, changes in the city's financial responsibilities, and other bills about the budget of the city are addressed upon the mayor's order or based on his opinion.

Moscow City Council operates by calling the regular committees, organizing the work of officials, and in other ways. It makes independent decisions on the administration, legal, information, utility, and finance levels.

Moscow City Council can make a decision about its own dismissal. The mayor of Moscow can also do this in case the court has found its statutory act contradicting the Constitution of the Russian Federation, Moscow City regulations, or the federal law, and the Council has neither abolished nor altered such an act within the period of 6 months.

The highest constantly acting collective executive of Moscow is Government of Moscow. It possesses general competence and fosters smooth work of other authorities in the city. The head of the government is the mayor of Moscow who is, at the same time, the head of the constituent territory of the Russian Federation (Moscow City). He is at power just like all other officials in the Russian Federation, which is by entitlement of the City Council according to the will of President of Russia. The mayor directly or through other executive bodies is responsible for solving the issues with social and economic development of the city, representing Moscow and speaking on its behalf, and approving and declining laws passed by the Council (the mayor's decision can be rejected by not less than two third of the Council). He forms the Moscow Government and designates its representative from the executive power of Moscow in the Federal Council as well as his own deputies in Moscow City Council and other authority bodies. He has the right to cancel statutory acts of the executive power and magistrates of Moscow (except for the orders of the Moscow Government). The mayor enacts statutory acts and orders.

Apart from the mayor, the Moscow Government includes the vice mayor, mayor deputies of the Government (including the first deputies), the Mayor and the Moscow Government Apparatus Leader as the first mayor's deputy in the Moscow Government, ministers of the government, and administrative districts' prefects in the rank of ministers of Moscow. The Moscow Government makes rulings if they are voted for by more than a half of the government members.

Also, the Moscow Government operates via industrial and functional bodies of the executive power (administrative departments, directorates, offices, etc.) that perform in varied spheres of urban administration and management (city's property, finance, transport, etc.). The heads of these are designated and dismissed by the Moscow Government.

On sites – in administrative districts and boroughs – territorial bodies of executive power are

created. They are prefectures in the districts and councils in the boroughs. Prefects are appointed by the mayor and the council board by the Moscow Government. Prefectures and councils control, coordinate, and pass orders on the assigned territories according to the legal acts of Moscow. Prefects and council boards are the representatives of the executive power in Moscow. They have their own executive personnel there.

Local self-administration takes place in the districts of Moscow that are considered municipality units. The system of municipalities is regulated by the Statute and a special law. Organization and methods of self-administration in Moscow correspond to the general principles of local self-government in the Russian Federation which are established by the federal law. Apart from the bodies of local self-administration, in Moscow districts, there are also administrative bodies called councils.

The representative self-governing body in each district of Moscow is a municipal assembly elected by the district's residents – Russian citizens (regardless of the time spent in Moscow). The number of its members depends on the district's population amount and usually fluctuates between 10 and 20 officials. A municipality unit's official in Moscow does not get money for their work from the municipality budget. In the municipal assembly's scope of exceptional authority lies the following duties: statute enforcement and its implementation, local budget, management order and usage of municipal property, plans and programs of municipal unit approval, decisions about conducting local referendums, and other tasks typical for self-governing bodies (they are described in detail below). The work of the municipal assembly is regulated by its chairman who is elected by the officials.

The executive-administrative body of a district is the municipality. It is run by the chief of the municipal unit who is elected by citizens for the same term as the municipal assembly (not more than 5 years) simultaneously with the assembly elections but for separate candidacies. The head of the district is in charge of the local self-administration in the district and passes executive-administrative orders. He is entitled to handle all the issues of local importance except for the ones in the exceptional authority of the municipal assembly. He is responsible for the personnel of the municipality. The head of the council issues regulatory decrees and – in case of organization – orders.

As a management tool to control a municipal district, some certain forms of voting are used. These are referendums, territorial community administration, etc. The same ones are implemented by other municipal units as well.

Similar to Moscow, St. Petersburg has its own legislative body (legislative assembly) and the head of this administrative constituent territory of the Russian Federation – the governor. According to the law of St. Petersburg No 411–68 from 25 July 2005 "about the territory organization of St. Petersburg," the territory of the city is divided in 18 districts. There are 111 intra-urban municipal units situated within the district borders: 81 municipalities (some of them were immediately given titles, some got their names later, but some bear only numbers even now; but number 43 is skipped since it used to be assigned to the town called Krasnoye Selo), 9 cities, and 21 rural settlements (intra-urban territories of St. Petersburg).

The head of a municipality unit is elected by the officials of the municipal council from their own staff. He/she creates his/her administration. Unlike Moscow, St. Petersburg does not have any administrative districts.

It should be pointed out that in all the cities including the ones which are the constituent territories of the Russian Federation, along with this or that form of municipal administration, there is also some governmental industrial management represented by territorial bodies of the executive power of the state or, sometimes, of the constituent territory itself such as ministries, offices, departments, and agencies that take care of the issues of the state importance.

Russian cities' development is obstructed by the imperfection of the taxation system, absence of qualified personnel, and interaction of authorities on different levels to achieve goals. To tackle these problems, it is necessary to reconsider the principles used in budget distribution. Firstly, the

municipal level of urban administration should be enforced; the mechanism of social finance must be improved; small- and medium-sized businesses, healthcare, and education are to be helped more actively. Moreover, it is vital to simplify the procedure of interaction between the levels of authority and to establish a unified system of priorities on the joint programs.

The current administration system is built in such a way that the majority of the income is concentrated within the federal level and in regions, whereas the minority stays on the spots. Whereby, it is the municipalities being in charge of the "work on land" having more than 40 kinds of authority (according to 131-FL) that possess the least amount of the budget funds, and due to this, up to 80% of the revenues can be spent on sorting out the current tasks. Budget resources distribution should be performed in proportion to the passed authority. It is sensible to expand the municipalities' tax base and stimulate implementation of the partnership mechanisms between the government and municipality properties. The main directions of reformation are launching mid-term budget planning, program budget, and risk management.

One of the features of the Russian administration is a very common practice of delegating power. Formally, this or that authority remains federal, and its financing comes from the federal budget, but the direct execution is performed by the regional governments. The same is applied to the relationships of the regions and municipalities. The efficiency analysis of the authority delegation instrument for the past 10 years shows that not for every sphere is this method the most optimal one. Underdevelopment of the self-government hinders the interaction of the power and society.

It is necessary to speak about the overall principles of local self-government organization and to develop the financially viable authority in place.

Urban residents have very limited opportunities to influence any kind of administrative decisions. As a result, it appears impossible to use the potential of civilian's volunteer and participation, to lower the rate of avuncular vibes, to fully consider the changes of social priorities, or to determine the division between the duties of the authority and the community. It should also be mentioned that Moscow, St. Petersburg, Samara, and a bunch of other cities are agglomeration centers that define the spatial development of the territory of a certain constituent territory in the Russian Federation. Nowadays, the real Moscow agglomeration encompasses most of the territory of Moscow region and impact on some other constituent territories in the Central Federal District. Worldwide, Moscow is virtually the only global city with no agglomeration administration system of its own. Therefore, when it comes to administration of these cities, it is crucial to take into account the urge to organize some efficient agglomeration administration.

In most constituent territories of the Russian Federation, the executive power is one level. The authority usually consists of the industrial sectors that follow the orders of the State in the cities of the Russian Federation. There is no need to create coordinating and territorial bodies because their role can be played by the head of the municipal unit.

In many small and medium-sized Russian cities, there is a so-called two-headed administration model, i.e., the authority is divided between the mayor and a designated city manager. However, in the present, the system that would cause a lot of conflicts in the cities, their administration will change into a traditional municipality administration system where the city mayor and the main administrative leader are in the same hands. It is mostly applied to "closed" towns whose laws must comply with the demands of the new version of the federal law "about the closed administrative and territorial unit." According to the amendments made, the city mayor and the city manager of a closed settlement as one person are going to be elected by a contest committee that had been formed by the governor, the state corporation "ROSATOM," and the city parliament. As a result, it is the local officials who are to confirm the committee's decision. With the change of the administration model, the structure of the local administration should also be partly reformed. Besides, it is planned to redesign the deputy corps election principles: if in the past, one half

of it was elected by name and the other half by party lists – now that politics is excluded from the procedure and the elections are going to be run only by majority voting – the Parliament will include only the candidates who individually got the largest number of votes in their electoral wards.

It should be mentioned that the continuing reformation of the local self-government organization principles leads to their necessity to function in the conditions of constant instability. The situation is aggravated by the lack of their budget and systematic redistribution of both the powers and tax liabilities.

Along with this, urban settlements created and executed their first programs of development when the main institutional units on the municipal level did not exist yet nor was there any judicial or organizational environment for local self-administration; the mechanisms regulating the land markets, property, and estate were not launched either, as well as legal regulation of interbudgetary relations, etc.

Considering strategic planning of social and economic development, the key mechanism of competitiveness of municipal units and its rise administration, it is worth mentioning that the law passed in June 2014 "about strategic planning of social and economic development of the Russian Federation" promotes the planning at the three levels of administration: federal, regional, and municipal.

The documents reflecting the strategic planning on the level of municipal units are:

1. Strategy of social and economic development of a municipal unit
2. Event plan to implement the strategies of the social and economic development of a municipal unit (road map)
3. Midterm or long-term forecast of the social and economic development of a municipal unit
4. Long-term budget forecast of a municipal unit
5. Municipal program

There is an increase in the interest toward the social and economic strategic development in the municipal sphere. The fast pace of municipal units growth serves as evidence of it. These units participating in preparation of complex programs of varied kinds are trying to develop independently by means of the strategic approach.

Dozens of cities in Russia nowadays live and evolve according to the established complex programs, strategic plans, and projects in the frame of the social and economic development. However, when it comes to execution, all that is done is controlling whether the made decisions have been fulfilled or the planned activities have been run.

# Urban Agriculture and Public Policy

Melissa Patterson, Jerrod Tynes,
Ashleigh Tynes and Noureen Khan
University of North Texas at Dallas, Dallas, TX, USA

## Synonyms

Agricultural regulations; Peri-urban agriculture; Urban farming

## Definitions

Urban agriculture – Agricultural activities that occur within the city limits

Peri-urban agriculture – Agricultural activities that occur within or close to an urban environment

## Introduction

Urban agriculture is not a new practice and has a long history in the United States of helping city dwellers in times of need. Also, urban agriculture is important because it benefits people living in cities in several ways including economic, educational, environmental, health, and social. However, despite the benefits, there are public policy challenges to implementing urban agriculture programs. Many American cities have successfully

overcome public policy challenges and are currently producing food within city limits. All around the world, urban agricultural activities occur in cities with varying government support and success.

In addition to the spatial distribution of countries with varying policies, urban agriculture exists at three different scales, macro, meso, and micro. The macro level is generally government policies and regulations, and the meso level is the economic and social infrastructure that bridges policy to the micro level of producers and consumers. Governments and countries, at the macro level, create policies in response to the meso and micro levels, which in turn can either support or deter urban agricultural activity. It is important to consider the scale when exploring issues of urban agricultural policy. This entry is structured as follows: the history of urban agriculture, the benefits of urban agriculture, regulatory challenges, case studies of cities in the United States, urban agriculture around the world, and future research and issues in urban agriculture.

## The History of Urban Agriculture

The first agricultural revolution made it possible for human beings to give up their nomadic hunter-gatherer lifestyles and create stationary villages, towns, and cities. Yet as cities expanded, their relationship with agriculture has changed over time. Public policy has pushed agriculture out of cities and at times drawn it back into the urban environment in response to difficult circumstances. Few historical works exist on the topic of urban agriculture, but an overview of the literature provides context for current urban agriculture policies (Glasser 2017). This section describes short-lived gardening initiatives in American history that have supported the use of urban agriculture to address societal needs.

### War Gardens

**World War I**. During World War I, farmers became soldiers and could not harvest crops or slaughter livestock. This period of global conflict brought about Liberty War gardens, which were planted within city limits to support the war efforts and alleviate civilian food shortages. Many of these gardens were community gardens in which US citizens worked together in shared gardens to produce fruits, vegetables, and herbs (Ghimire 2008).

**World War II**. Similar to liberty gardens utilized during World War I, during World War II in the 1940s, Americans planted victory gardens to increase the availability of food and stretch household budgets. Some gardeners even produced enough fruits, vegetables, and herbs to feed their families and sell the surplus to donate the profits to war relief efforts. Victory gardens were widespread and productive, and in 1944 20 million gardeners grew 40% of the nation's produce (Brown and Jameton 2000).

### Economic Downturns

**The Great Inflation of the 1970s**. During the 1970s the United States experienced an economic downturn due to losses in the stock market, weak economic growth, and oil prices. At a senate subcommittee hearing of the House of Representatives about a proposed legislation to distribute seeds and plants to combat food inflation, several representatives commented on the need for urban vegetable gardens. State Representative George Brown of California testified that the cost of food had increased 45% from 1972 to 1975 in his state, so home gardens were needed for citizens to be self-sufficient. In addition, State Representative Charles Carney for Ohio spoke in favor of "Inflation Gardens," and Representative James Burke of Massachusetts reported that average gardeners could produce $240 worth of produce from $9 of supplies. However, the legislation did not pass due to pressure from seed companies and agribusiness (Brown and Jameton 2000).

Two years later, in 1977, legislation was passed which created the Urban Gardening Program to support community gardening in six cities in the nation through $1.5 million of funding. Eventually, the program grew to 23 cities and $3.6 million in funding in 1993 (Brown and Jameton 2000). Although the Urban Gardening Program was successful, it was discontinued due to a lack of political support (Brown and Jameton 2000).

**Urban Agriculture in the Twenty-First Century**. Unlike war gardens of the past, during the twenty-first century, there has not been widespread federal government initiatives to increase the number or size of urban gardens in response to events that have impacted American food security. Increased interest in urban gardening originated at the household level out of fear of not being able to afford fresh food or threats to the food supply.

The economic recession in America that began in 2008 when the housing market collapsed created an increased interest in gardening due to economic instability and food insecurity. In 2008, 36 million households participated in food gardening, and by 2013 42 million Americans were producing their own food, an overall increase of 17% in 5 years. The millennial generation (aged 18–34) had the greatest increase in food production participation, increasing 63% in 5 years (National Gardening Association 2014). During the 5 years that followed the start of the economic recession, community garden participation increased by 200% adding an additional two million households. Most of the gardens planted in response to the recession were planted at suburban homes (National Gardening Association 2014).

The Coronavirus Pandemic of 2020 also inspired people to grow their own food due to possible threats to the food supply chain, economic uncertainty, and as a direct result of spending more time sheltering in place at home. People utilized monikers like "Victory over Coronavirus gardens," "Doomsday Garden," and "Stick It to The Virus Garden" to describe their newly planted plots and pots (Higgins 2020). Gardens ranged in size from herbs or sprouts in small planter boxes or jars on an apartment window seal to several acres where space allowed. These gardens provided people with several benefits during a difficult time, including a sense of control over their lives, socially distant outdoor exercise, decreasing the pressure on the national food chain, and fresh food to share with neighbors (Higgins 2020).

The pandemic posed challenges for community gardens in urban environments because social distancing orders prevent volunteers from working closer than six feet apart, and shelter in place orders prohibited Americans from working in community gardens at all. However, providing food in low-income communities to people at high risk for complications from COVID-19 became very important so community gardens increased food production and developed ways to keep their volunteers safe while still serving their community (Wharton 2020).

## Benefits of Urban Agriculture

Urban agriculture has many economic, educational, environmental, health, and social benefits. Globally, urban agriculture complements the food system by increasing access to fresh produce, reducing reliance on the food supply chain supported by traditional production methods, and preventing a strain on natural resources. Locally, urban agriculture builds community networks, promotes healthy lifestyle choices, and provides opportunities for employment and vocational skill development.

### Economic

The economic benefits of urban agriculture are apparent at multiple scales. Individual participants enjoy a reduction in household grocery bills and income generation when supported by the sale of surplus products at local marketplaces. On a larger scale, urban farms supply employment opportunities and provide an expanding consumer population with access to fresh produce. The innovative cultivation techniques associated with urban agriculture often result in larger yields per cubic foot of space when compared to traditional production practices. For example, vertical farming is a practice often used by producers to overcome space limitations in urban environments. This innovative system involves the distribution of plants in stacked layers which results in the production of up to 75 times more crops when compared to an operation that employs traditional practices in the same amount of growing space. Urban agriculture activities eliminate transportation costs associated with product distribution due to the localized nature of such supply chains. This combination

of efficient production methodology and lowered costs associated with decreased distance from farm to fork results in economic growth (Pawlowski 2018).

### Educational

The educational benefits of urban agriculture are twofold. First, a growing body of literature supports the notion that participation in urban agriculture production practices increases proximity between consumer and product. This accessibility to the food chain provides the former with the ability to learn about the nutritional value of different food options apart from the marketing ploys that typically distort this information for profit gain in the business sector. Second, urban agriculture creates opportunities for the development of educational and vocational training programs for adult and youth participants. These programs promote a greater understanding of the food supply chain and provide participants with the means to acquire skills that may enhance personal well-being. Urban agriculture ultimately removes barriers that often prevent individuals from establishing a connection to the food system (Pawlowski 2018).

### Environmental

The use of urban agriculture practices, as opposed to traditional farming methods, contributes to the efficient management of resources and waste at several points of the supply chain. Cultivation is primarily sustained by fewer resources in the urban environment, thereby limiting energy consumption. For example, rooftop gardens established in urbanized areas eliminate the need for conventional heating systems to regulate soil temperature and provide the building with insulation that results in lower energy costs associated with heating and cooling. Additionally, the production and sale of produce in the same area may reduce the need to rely on fossil fuels for transportation purposes, thus reducing the carbon footprint of associated products (Pawlowski 2018).

### Health

The health benefits of urban agriculture are also noteworthy. First, urban agriculture promotes the adoption of positive lifestyle choices concerning food consumption by increasing the availability of fresh produce that constitutes a significant portion of a healthy diet. Second, involvement in urban agriculture activities encourages individuals to engage in physical exercise as opposed to being sedentary. Participation in these projects also positively affects children's health by allowing them to gain a better understanding of the food system and motivating them to spend time outdoors (Brown and Jameton 2000).

### Social

Studies show that urban agriculture builds human and social capital through the formation of supportive networks in local communities. These groups consist of producers that share resources in the form of knowledge, money, and products. For example, the Siyazama Community Allotment Gardening Association (SCAGA) of Cape Town, South Africa, is comprised of residents that utilize their combined assets to facilitate the production of fresh fruits and vegetables. These products are consumed, distributed, or sold based on the perceived needs of the community by members of the group. All funds derived from the sale of these goods at local marketplaces are shared among association affiliates for personal utilization or loaned to external parties. This unique partnership is the epitome of social capital resulting in practices that have benefited the members of the group as well as the localized community by way of engaging in urban agriculture activities. The efficient functioning of social groups that share an apparent set of informal values is also evident in the increasing number of community garden associations established as a result of a localized need that affects a percentage of the region's population in which it exists (Olivier and Heinecken 2017).

## Urban Agriculture and Regulatory Challenges

Urban agriculture has the potential to make a significant positive impact on cities and their

citizens across the globe. However, the application of outdated regulatory practices that directly associated activities has prevented the growth of the industry in affected areas. Municipalities must identify obstacles to urban agriculture practitioners that originate from their regulations and enact amendments to support the implementation and protraction of these activities in their communities.

Here, we summarize examples of animal and land regulatory practices that routinely present barriers to urban agriculturalists. This section is not meant to be exhaustive but, instead, to provide an overview of common regulations that practitioners are likely to encounter when conducting or proposing urban agriculture activities.

### Animal Regulatory Issues

Municipalities have historically overregulated or proscribed animal care and use practices in urbanized areas largely due to pragmatic concerns related to public health and well-being. These regulatory ordinances often include the solicitation of neighbor consent, permit acquisition, restrictions related to the type and quantity of livestock and poultry, and established guidelines concerning the requirements for containment and shelter structures. The vast quantity of regulations concerning animal husbandry practices within cities has substantially impacted the growth of urban agriculture operations by limiting their scope with respect to animal care and use practices (Meenar et al. 2017).

### Land Regulatory Issues

Municipalities are increasingly recognizing the importance of urban agriculture in their communities. However, dated and inequitable zoning regulations often prevent these activities from occurring. For example, such regulations can restrict residents from cultivating crops on certain tracts of land, raising and maintaining livestock and poultry in specific zoning districts, or selling products produced through urban agriculture practices. Thus, the revision of zoning regulations has the potential to promote urban agriculture activities within metropolitan areas for the benefit of its residents (Voigt 2011).

Urban agriculture practitioners require regular access to production sites to maintain their commodities. However, some municipalities view urban agriculture as a temporary activity that can be terminated at any time due to an array of circumstances such as development initiatives and contemporary planning proposals. Short-term access to land limits the lifespan of the operation and minimizes its positive impact on the community (Meenar et al. 2017). Studies show that the elimination of these sites due to matters of land tenure in large metropolitan areas across the United States unequally affects marginalized populations by removing access to fresh produce that is otherwise absent from their communities apart from the existence of urban agriculture operations (Irazábal and Punja 2009; Schmelzkopf 2002).

## Overcoming the Obstacles of Urban Agricultural Policy Challenges

Guidelines and policies over the years have inadvertently placed restrictions on urban agriculture production and development. Some of these barriers include restrictions on gaining access to public land, utilization of municipal facilities, transportation and distribution of products, construction of structures, and the housing of livestock. While there are federal- and state-level guidelines, specifics of urban agriculture often fall under the umbrella of municipal codes as outlined by cities or counties within a state. Some localities have ordinances that are difficult or unclear to understand and interpret. Success stories of urban agriculture within a city can be highly dependent on the unique local ordinances and regulations (Castillo et al. 2013).

### Success Stories

**Chicago, Illinois**. The infrastructure, creation of government programs, and changes to public policy in Chicago has allowed for the development of urban agriculture farms and gardens. NeighborSpace is a city-funded organization created by the Chicago City Council. This organization can purchase land and protect it as a "green

space," which includes community gardens. Growing Home, another Chicago-based organization, has secured long-term land for urban agriculture after working to obtain the land through The McKinney Act (Hagey et al. 2012). In 2003, Chicago's mayor began a city-wide green roof initiative that included rooftop gardens on multiple city and municipal buildings (Ghimire 2008). Regulatory reform in 2011 altered the Chicago permitting process, which allowed for agriculture-related structures such as greenhouses to be more easily built. In 2020 Chicago also saw a zoning change that permitted large-scale multi-use blocks which promotes the blending of commercial and residential land use and has the potential to positively impact urban agriculture production in the city (Castillo et al. 2013).

**Cleveland, Ohio**. Several changes to public policy have increased the ability of Cleveland's residents to participate in urban agriculture. The city of Cleveland recognized that there is a fiscal burden of roughly $1,000 to maintain vacant lots within the city limit. This led the local city government to convert empty lots into urban agriculture sites to offset the cost of vacant lot maintenance. Cleveland has recently worked to alter health and zoning codes to increase land security and allow for things like on-site sales and altered both fencing and livestock hosting requirements. To promote water access for urban agriculture projects within the city of Cleveland, the Water Department has created several strategic programs. The Cleveland Water Department offers low-cost community garden water permits and hydrant permits to provide access to water from fire hydrants to water plants in community gardens. Cleveland's government also offers serval specific grants to promote urban agriculture and help with the cost to start a community garden (Hagey et al. 2012).

**Detroit, Michigan**. Detroit's municipal leaders supported urban agriculture by changing outdated policies to make their city more sustainable. In 2009, the Detroit Food Policy Council, an advisory committee for Detroit's City Council, spearheaded policy reform to promote inner-city urban agriculture in Detroit. The City Planning Commission also oversees the work of the Urban Agriculture Work Group which strives to adjust city policies to make them more "farmer"-friendly (Hagey et al. 2012). In 2013, Detroit saw another move towards city sustainability with a new urban agriculture ordinance that worked to define and regulate the sale of urban agricultural products. This ordinance allowed for the direct selling of harvested produce on location for urban gardens of less than one acre and also allowed urban farms to bring their produce to the local farmers' markets or sale to Whole Foods.

**Dallas, Texas**. While Dallas is not a new large-scale urban city, urban agriculture is a relatively new concept for the municipality. For years strict restrictions limited multiple aspects of urban agriculture in Dallas; however, these restrictions were lightened in 2015 when the Dallas City Council narrowly passed several ordinances that allowed gardeners the privilege to sell what they grow on-site in commercial districts and off-site if grown in residential districts. Limitations on what could be grown and raised in the city were also lifted, allowing for a greater diversity of agricultural products available to citizens. This new ordinance allowed for farmers to raise chicken and fish on-site and clarified the differences between raised beds and other additional structures on a property. Currently, the City of Dallas Code Compliance team and the newly formed focus group known as the Agricultural Stakeholder Group are working to further clarify these ordinances to create more opportunities for inner-city growers. This group is also working to redraft the current ordnance in a language that can be more easily understood by individuals who would be starting urban agriculture projects in the city.

## Marketing of Urban Agricultural Goods

Marketing for urban agriculture produce varies greatly based on food distribution means. Typically marketing chains in urban agriculture production are short, and in some cases, the producer (farmer) is the individual who sells directly to the consumer. Additionally, the producer may sell to a

retailer or a distributor before it reaches the consumer (Hagey et al. 2012).

The Agriculture Marketing Service (AMS) is a branch of the USDA that works to administer programs that ensure the fair marketing of agriculture products produced in the United States such as fiber, food, and other crops (USDA 2020). These programs are often regulatory by design and create standards through the federal rulemaking process. The Fruit and Vegetable Marketing Orders are one set of regulations that greatly impact the marketing of urban agricultural products.

## Urban Agriculture Certifications

### Organic Certifications

The USDA Organic Certification is the most well-known certification that can be obtained by an urban agriculture producer or facility in America. The process of becoming a certified organic operation begins with the organization selecting a USDA-accredited certifying agent and submitting an application. This application outlines the practices used by the agricultural operation and is reviewed by the certifying agent. After this process, an inspector conducts a thorough on-site inspection of the agricultural operation and writes a report that is reviewed along with the initial application. If the agricultural operation complies with the USDA organic regulations, then an organic certificate is issued. At this point, the urban agricultural operation can label their produce and product as USDA Certified Organic (USDA 2020). There are also state and private organic certifications that can be obtained such as the Oregon Tilth Certified Organic and California Certified Organic Farmers.

### Livestock-Related Certifications

The USDA also recognizes several different certifications associated with animal welfare and livestock. These are third-party certifications that have their own strict and rigorous standards for producers to uphold. The United Egg Producers certification and The Food Alliance certification are two examples of certifications that are relevant to urban agriculture. A Greener World, an independent nonprofit certifier, offers both Animal Welfare Approved and Salmon Welfare certifications for sustainable practices and general animal housing conditions (USDA 2020).

## Urban Agriculture around the World

### Asia

Asian countries have the highest urban agriculture participation rates of any region on the globe in part because they have a long tradition of urban agriculture and the highest level of government support. Due to the long-standing culture of urban agriculture in Asian cities, the government allocates land to food production, develop seeds and tools specifically for the urban environment, and provide information and training to urban gardeners. In 1996, the United Nations estimated that 80% of families dwelling in Asian cities were involved in agriculture (Brown and Jameton 2000). In Taiwan, which is mostly urbanized, half of the families participate in farm associations to produce their own food (Lesher 2006).

### Africa

In contrast to Asian Countries, urban agriculture is not supported by the governments or official agencies in African nations despite long-standing agricultural practices (Lesher 2006). European colonization disrupted urban agricultural traditions because farming that had traditionally occurred on community land now required a legal title of land ownership which limited access for many people. In addition, European colonizers envisioned "clean" cities without agricultural activities. After independence, people returned to urban agriculture, but the complicated land title system continues to hinder progress. Today the benefits of urban agriculture are underappreciated by regional development planners which limits people's access to the potentially lifesaving ability to produce food (Lesher 2006).

### Latin America

Latin American countries had long-standing urban agricultural traditions until European

colonization disrupted traditional practices (Lesher 2006). After independence, however, urban agriculture reemerged primarily in the poor communities on the outskirts of former colonial cities. Having lost their own traditions, urban growers in Latin America attempted to adopt European agricultural practices, but these methods were not successful in a different climate. Asian immigrants brought intensive farming to Latin America, and international humanitarian organizations introduced French agricultural practices to successfully increase yields. In 1995, the Latin American Urban Agriculture Network was formed to help people produce food in large cities. However, Latin America is the least sophisticated region in terms of urban agriculture, but many developing nations are exhibiting large amounts of growth (Lesher 2006).

Havana, Cuba, was one of the most successful cities in urban agriculture out of necessity during the United States embargoes in the 1990s. Unlike other countries, Havana's gardeners were men (91%) and spent 3 h gardening a day compared to 3–4 h a week in other countries (Lesher 2006). The Communist Cuban government during this period supported the urban farms; however, they did not educate their citizens, so people learned from relatives who had grown up in rural areas (Lesher 2006).

### Europe

Due to the increased food security in developed nations, urban agricultural policy and gardeners are driven by doing the right thing for the environment and progressing the green movement (Lesher 2006). Throughout European cities, gardeners use allotments of municipal land to grow crops. For example, in Germany, 80,000 farmers tend municipal land, while 16,000 are on a list waiting for an allotment. Former communist countries have great potential for urban agriculture because the cities were planned with densely packed high rises and ample green space (Lesher 2006). In Moscow, Russia, the number of residents participating in urban agriculture increased dramatically from 20% to 65% between 1970 and 1991 (Brown and Jameton 2000).

## Future Issues and Research

The state of urban agricultural policy is growing and changing, so it is fertile ground for further research. There is a current need for future policy and regulation studies regarding diversity inclusion in policy discussions. Additionally, further studies into federal agriculture-related programs such as SNAP need to be ongoing with inputs and ideas from diverse groups and women. Throughout the world, there is a great opportunity for comparative studies between countries with different numbers of regulatory policies.

In addition to future research at the macro level, issues of race, gender, and economic status on the micro level should be explored in greater detail. Both food purchasing and production are impacted by individuals' demographics and economic status within a cultural context. Due to the increasing necessity of urban agriculture to feed humanity, policies and regulations will continue to be a worthy area of study.

## Conclusion

Throughout history, urban agriculture has been an important resource during difficult times, which demonstrates its persistent value to society. Regardless of historical happenings, people benefit from urban agriculture beyond food production. A reoccurring challenge that urban food producers, city planners, and policymakers face is finding space for agricultural activities in crowded cities. Public policy can either hinder or help the development of urban agriculture within city limits. The USDA has certifications that regulate the production of plants and animals for consumption in the United States that apply to both rural and urban farmers. Urban agriculture is an important part of city life across space and time and will continue to be. Policymakers and city planners should pass regulations that allow for agricultural activities in and around cities to improve the quality of life for their residents.

# Urban Agriculture as an Opportunity for Local and Regional Governance

Russell J. Fricano
Urban & Regional Studies Institute, Minnesota State University Mankato, Mankato, MN, USA

## Synonyms

Community gardens; Cultivation; Institutional farming; Local agriculture; Urban farming

## Definition

Urban agriculture can be defined as the cultivation of crops, ornamental plants, and raising livestock within urban and peri-urban areas primarily intended for local consumption. Urban agriculture

U

can be practiced on private or publicly owned land under a lease holding or on land dedicated for that purpose through a trust.

## Introduction

Urban agriculture is the cultivation of land for crops, ornamental plants, and raising livestock within a municipal jurisdiction and adjacent areas. The scope of urban agricultural practices is broad enough to include the location for conducting agricultural activity in cities and sometimes suburban areas; the stage of production, including harvesting, processing, marketing, and distribution; and the purpose of production, for personal consumption or consumption by others (Kaufman and Bailkey 2000). Urban agriculture is practiced in three capacities: (a) community-oriented crops grown for neighborhood consumption and community-supported agriculture; (b) entrepreneurial farming: cultivating crops or raising livestock for small business development and job training; and (c) institutional farming taking place in public parks, municipally owned land, public housing, and educational institutions (Hodgson et al. 2011).

With a focus on government oversight in these activities, it is important to define urban agriculture more narrowly, putting it in the public domain and making it commensurate with community food security planning. Priority is given to food production over growing ornamental plants. In this fashion urban agriculture is "organized" cultivation of land for production of crops or raising livestock within a municipal jurisdiction and adjacent areas. The term "organized" distinguishes these activities, which are community-oriented in nature, from households growing produce for personal consumption in private backyard or apartment patio planter boxes, which are normally permitted accessory uses. Organized activities also include government, non-profit and entrepreneurial farming. Within this scope, urban agriculture also includes legally permissible gardening, but not activities of "guerilla gardeners" or squatters. Further, it does not include demonstration or "one-shot" projects. The scope of urban agriculture is also extended to suburban areas immediately adjacent to the jurisdictions and still close enough to be accessible to inner-city residents.

Urban planning literature is generally favorable to urban agriculture for promoting food security as well as environmental, social, and economic benefits; these benefits include recreational activities, removal of blight, entrepreneurial opportunities, and environmental benefits associated with green open space. For all these reasons, urban agriculture is valued as a sustainable land use practice. However, it can also be controversial, mainly due to land tenure, disjointed and restrictive policies, and regulation and competing land uses. This entry will explore these issues by examining the historical foundations of urban agriculture, factors in its success, barriers, and governmental solutions.

## Historical Foundations of Urban Agriculture Practices

Farming land within cities is not a new concept. In the United States, urban agriculture was practiced in different forms and for different purposes throughout the nineteenth and twentieth centuries. Urban agriculture was first practiced as a form of charity for the unemployed during the Depression of 1893. Later, as a form of social reform, school gardens provided a means of introducing nature into congested urban areas. Urban gardening was also consistent with the City Beautiful movement of the late nineteenth and early twentieth centuries, with its emphasis on aesthetic standards and landscaping. During the 1920s, community gardens were promoted as a form of civic improvement, and during the Great Depression, state and national governments implemented gardening for both food consumption and work relief. Perhaps the best known historic urban agriculture programs were the "War Gardens" of World War I, revived in the "Victory Gardens" of World War II. Both provided civilians with food supplements in the face of wartime food rationing (Lawson 2005).

The stage for more contemporary urban agriculture was set in the 1970s through activism to counteract urban decline. The suburbanization

movement following World War II left the urban poor abandoned in the central cities. As the middle-class population migrated to the suburbs after the war and left the poor behind, city governments faced declines in economic activity, revenue, and services. Abandonment led to deterioration and blight. Urban agriculture became a means of revitalizing abandoned neighborhoods (Lawson 2005).

The concept of sustainability also provided further support for urban agriculture practices in general and specific ways. Sustainable development recognizes the interdependence of environmental, social, and economic systems and promotes equality and justice through citizen empowerment and a sense of global citizenship (Beatley and Manning 1997). Urban agriculture fits snugly into this paradigm in a number of ways. In an environmental sense, agricultural use promotes green open space, which enhances carbon sequestration and the reduction of greenhouse gases associated with climate change. It also reduces impermeable surfaces, which contribute to storm water runoff.

From an equity standpoint, urban agriculture supplements the urban food supply with nutritional produce and provides social benefits to inner-city areas. Devoting urban land to agricultural use also reduces urban blight and provides recreational opportunities (Kaufman and Bailkey 2000; Schukoske 2000).

Economically, a growing market demand exists for locally grown produce, especially for Direct to Consumer (DTC) farmers' markets, community-supported agriculture, and restaurants; this demand offers an entrepreneurial opportunity for low-income urban farmers. According to the US Department of Agriculture, farms with gross cash farm income below $75,000 accounted for 85% of local food farms. Local food farms that distribute their products through DTC marketing channels were also more likely to remain in business (Low et al. 2015).

Studies conducted at state-wide levels found that consumers of local grown foods were generally better educated and more affluent (Carpio and Isengildina-Massa 2009; Martinez et al. 2010). In their study of consumers of locally grown products in South Carolina, Carpio and Isengildina-Massa (2009) also found that consumers of state-grown foods were willing to pay a premium for produce and animal products. Higher profitability enhances the long-term viability of farm operations and food system sustainability (Conner et al. 2010).

Urban agriculture also implements sustainable practices in more specific ways. First, urban agriculture corresponds to a number of smart-growth practices that implement sustainable principles. These include neighborhood revitalization, provision of landscaping and open space, and community-oriented recreation.

Second, sustainability applies to an adequate food supply, with poverty as the main factor in food insecurity. Households with income near or below the poverty level also reported higher rates of food insecurity (Coleman-Jenson et al. 2018). As food supply issues have great relevance to urban areas, there has been a call for policies that enhance food security (Pothukuchi and Kaufman 2000).

Urban Agriculture practices are classified in Table 1. Urban agriculture is a complex topic because of the diversity of projects and supporting organizations.

As shown in Table 1, the extent of urban agriculture practices ranges from cultivation of a small portion of a school lot to a climate-controlled vertical farming tower that utilizes hydroponic systems. Urban agriculture programs can also overlap. For example, a neighborhood park may have land allocated to urban agriculture use for local residents, with special plots assigned to senior citizens.

Changing economic and environmental priorities provide greater opportunities for urban farming. Recently, the stagnancy of the housing market slowed construction activity and lessened pressures to develop vacant land. As the United States shifted to a post-industrial economy, cities in the Rust Belt experienced population declines. Consequently, footprints of Rust Belt cities outgrew the development needs of existing populations, leaving a wake of abandoned buildings and vacant lots. Green building practices that prioritize reducing the carbon footprint of cities and enhancing local food production provide further justification for urban agriculture.

**Urban Agriculture as an Opportunity for Local and Regional Governance, Table 1** Functional definitions of urban agriculture (Based on Hodgson et al. (2011); American Community Gardening Association (1998)

| Project | Description |
|---|---|
| Community garden (neighborhood-serving) | Agriculture conducted by neighborhood residents on vacant neighborhood land or in a local park |
| Community-supported agriculture | Community sharing of interest and risks in an agricultural project. Community shareholders serve as growers and consumers of produce. |
| Experimental research projects | Innovative agricultural projects conducted on an experimental basis (i.e., vertical agriculture towers) |
| Job training | Agriculture conducted for the purpose of developing farming and entrepreneurial skills |
| Livestock husbandry | Raising of animals for their byproducts. This includes chickens, beekeeping. And aquaculture |
| Mental health centers and group home projects | Cultivation of land as a therapeutic activity for mental health patients and group home residents |
| Peri-urban agriculture | Cultivation of land adjacent to urbanized areas on the urban fringe |
| Public housing gardens | Farming of land within a public housing project (e.g., rooftop or courtyard) |
| School gardens | Cultivation of land on a school campus for educational purposes |
| Small business development (commercial farm sites) | Production of crops and livestock within an urban setting for distribution and sale |
| Youth enterprises | Developing of farming and entrepreneurial skills of inner-city youth |

## What Makes Urban Agriculture Successful?

As a suitable beginning for discussing factors behind successful urban agriculture, public officials must consider what a community needs to establish and maintain it. The American Planning Association listed various prerequisites to urban agriculture. Prerequisites relate to site conditions, entrepreneurial/agricultural expertise, and ownership and include not only physical and environmental characteristics but also land, labor, capital, consumer demand, and distribution channels (Hodgson et al. 2011).

### Available Land

Urban agriculture needs sufficient vacant land for growing crops and raising livestock. This is especially evident in former industrial cities that have outgrown their footprint. Former industrial cities, all located within the "Rust Belt," serve as prime examples of how industrial land can be converted to urban agricultural use on a wider scale (Colasanti et al. 2012). This process also includes remediation of contaminated sites or cultivating crops on raised beds (Kaufman and Bailkey 2000). Arable land also needs the proper delivery of services, including water delivery for irrigation and trash collection.

### Regional Coordination

Urban agriculture serves as a component of a food system. A food system consists of networks of farmers, food processors, distributors, consumers, and waste disposal. The extent of food production is delineated by a foodshed, an area in which agriculture and other components of the food system serve a city. Foodsheds can extend to adjacent counties that provide agricultural products to the city, up to a 100-mile radius. If land for urban agriculture is lost, cities could rely more on farms in peri-urban areas, which fits within the geographic context of a foodshed. Planning at the scope of a foodshed requires forms of intergovernmental coordination.

Figure 1 depicts a schematic of regional and local government coordination of urban agriculture policies and programs. There are three ways to extend regional coordination of urban agriculture: Traditional Regional Governance, Multi-jurisdictional Commissions, and Joint Powers Agreements.

**Traditional Regional Governance.** Urban agriculture can be coordinated at a regional level

**Urban Agriculture as an Opportunity for Local and Regional Governance, Fig. 1** Regional and local government coordination of urban agriculture

through agencies that conduct environmental planning at this scale through county government or a Council of Government (COG). County governments traditionally implement functions such as public health on a regional scale. A stronger form of regional governance could potentially integrate environmental, economic, and social policies on a metropolitan scale. This is useful in resolving issues requiring a regional perspective such as interjurisdictional land use issues and locally unwanted land uses. With a new focus on sustainability, especially planning for the reduction of greenhouse gas emissions, coordination by regional governance has become crucial (Bollens 1997).

**Multi-Jurisdictional Commission.** Multi-jurisdictional commissions such as the Pinelands Commission in New Jersey or the Tahoe Regional Planning Agency in California were established to address resource conservation issues. Similar entities can be formed for the purpose of identifying and conserving urban and peri-urban agricultural land.

**Joint Powers Agreement.** The sharing of decision-making authority between two or more local jurisdictions. Joint Powers agreements focus on urban agriculture issues and provide a forum for stakeholders. This arrangement designates agricultural areas in land adjacent to two or more jurisdictions which mutually serve residents in each.

## Community Participation, Education, and Training

Extensive urban agriculture programs have come to fruition through major collaborative programs formed by urban agriculture stakeholders.

Detroit's Garden Resource Program Initiative coordinates a wide range of city, state, and individual initiatives. It provides resources necessary to extend community gardening opportunities. In a similar manner, Baltimore's Community Greening Resource Network coordinates the efforts of a variety of stakeholders, including environmental protection and greening groups, schools, city agencies, charitable foundations, and volunteer organizations. The network converts vacant lots to community garden sites and provides gardening supplies and education programs to prospective urban farmers (Krones and Edelson 2011).

Community participation also provides an opportunity for public education, which shapes perceptions of urban agriculture and provides training to prospective urban farmers. Public education can inform the community of advantages and opportunities provided by urban agriculture. It also provides counter-arguments to Not in My Backyard (NIMBY) perceptions of those who question the legitimacy of urban agriculture and associate its practice with lawless behavior and farm-related nuisances such as pesticide contamination, odors, and truck transport (Covert and Morales 2014).

### Appropriate Land Use Regulation

Properly handled, regulation of urban agriculture can provide guidance to urban farming operations. Cities such as Detroit have standalone urban agriculture ordinances. Aside from a specific ordinance, zoning districts could be modified to make vacant parcels conducive to multifunctional agricultural use (Lovell 2010). Planners may also want to promote more intensive agriculture as permitted uses but limit the extent of the uses through a conditional use permit process to avoid nuisances (Mukherji and Morales 2010).

### Inclusion in the Comprehensive Plan

Cities can also promote urban agriculture through comprehensive planning policies. Urban agriculture policies normally are used as a means to fulfill broader goals such as open space preservation and food access. These policies can also be in sync with regional planning approaches. Noted examples include the cities of Richmond, California; Madison, Wisconsin; and Waterloo, Ontario (Hodgson et al. 2011; Mazereeuw 2005).

### Land Management

Vacant land results from the relocation of industry and residents from the central city. Municipal governments can effectively manage vacant land through land inventory systems, acquisition and disposition, land banking, eminent domain, and comprehensive neighborhood planning.

Integrated land records databases or an inventory that is easy to access can be created. To avoid fragmentation, one central authority should create and maintain it. Cities that identify an inventory urban land for potential agricultural use also integrate urban agriculture into planning policy. In their study of the land inventory process in Portland's "Diggable City" program, the Vancouver Urban Agriculture Inventory found that these programs were instrumental in linking urban agriculture to sustainability programs and policy directions (Mendes et al. 2008).

Cities also acquire and dispose of vacant lots. Acquired lots can include abandoned and tax delinquent lots. However, the process can be complex and inefficient due to lack of interagency coordination, indiscriminate sale of city-owned lots and the inability to acquire properties quickly because of legal and regulatory restrictions. If cities sell property to the highest bidder, nonprofits cannot compete. It is advised that cities should exercise more discretion by sending RFPs instead.

Tax delinquent properties can also be landbanked for redevelopment. As an example, the city of Cleveland aggressively seized tax delinquent properties, shortening the term in which owners could redeem their land, and streamlined the foreclosure procedure. Municipalities can also acquire land through eminent domain, though it may not be feasible in every state due to constitutional issues. The banking of vacant land also raises issues of the cost of maintaining it (Bonham et al. 2002).

The allocation of vacant land works best in a systematic manner, through comprehensive neighborhood planning. Using this approach,

vacant land is treated as a resource in the context of a larger community revitalization strategy. This would also avoid issues concerning competing uses of vacant land spurred by lack of interagency coordination.

## What Impedes Urban Agriculture?

Despite these opportunities the practice of urban agriculture has encountered various barriers throughout its history. Barriers in urban agriculture fall into six main categories: site-related, restrictive policies and regulations; lack of entrepreneurial/agricultural expertise; ownership-related; Organizational/Institutional Coordination; and perceptual.

### Site-Related Obstacles

Site-related obstacles pertain to physical characteristics of the site; barriers include scarcity of land, soil contamination, irrigation, and vandalism (Hodgson et al. 2011; Kaufman and Bailkey 2000; American Community Gardening Association 1998).

### Restrictive Policies and Regulations

Restrictive policies and regulations can be imposed on urban agriculture by zoning and policies of the comprehensive plan. Restrictive regulations impede urban agriculture practices or fail to consider them altogether. Comprehensive planning policies can also promote sustainable development, including redevelopment, urban forestry, and other forms of land use that compete with urban agriculture practices (Lovell 2010).

### Lack of Entrepreneurial/Agricultural Expertise

Urban agriculture operations can also fail due to lack of entrepreneurial/agricultural expertise. This limitation arises from the inability of urban farmers to make urban agriculture a productive and profitable enterprise, due to shortcomings in agricultural expertise and business acumen, as well as waning interest of the urban farmer. This can stem from lack of qualified and experienced staff, educational programs, and training (Bleasedale et al. 2011).

Considering entrepreneurial activity and economic viability, the ability of urban farmers to live off the revenue of their operation is a related concern: In a survey conducted by Oberholtzer et al. (2016), 60% of the farms were sustained with off-farm income, and approximately 33% of the primary farmers derived their income from the farm; most urban farmers reported income of less than US$10,000. The small size of sites precluded large-volume operations. Further areas of concern reported by stakeholders included policy differences, profitability, financing, and farm labor. Respondents also expressed needs for business education and technical assistance (Oberholtzer et al. 2016).

### Ownership Related

Urban agriculture operations often exist precariously on public and private land, as owners commonly lease out urban agriculture sites intended as placeholders for vacant lots until opportunities for further development emerge. The purchase and acquisition of vacant land through local governments, land trusts, and other nonprofit or private organizations specifically dedicated to urban agriculture remains the most effective means of preserving urban farming sites. In the absence of these programs, the urban farmer leases land from a public or private entity on a temporary basis (Kaufman and Bailkey 2000). Under these circumstances, the urban farmer has no assurance of the continued use of the site for urban cultivation. Even in cases where replacement sites are available, the costs of moving from one site to another after lease expiration can be prohibitive (Castillo et al. 2013).

### Organizational/Institutional Coordination

Organizational/Institutional obstacles include competing priorities with other projects, jurisdictional issues over which governmental organization regulates community gardens (i.e., parks, planning), and independent urban agriculture programs that conduct operations without strong institutional support and coordination (Lovell 2010).

### Perceptual

Urban agriculture can face resistance due to perceptions of negative agricultural impacts and

questions over the legitimacy of agricultural use within city boundaries as a non-formalized process. American urban agriculture emerged for different reasons throughout its history. However, perceptions concerning the legitimacy of urban food production changed after World War II.

First, the same policies that discouraged open-air markets and food production in cities after World War II can also defeat urban agriculture. Planners eager to develop inner-city areas considered outdoor food markets and related uses unhealthy, inefficient, and underperforming types of real estate. Redevelopment was intended to enhance property values and espouse the middle-class values of the time. Cities relegated food processing and related uses to industrial zones, with food markets shifting to the retail supermarket chains (Donofrio 2014).

These perceptions have persisted to contemporary times regarding potential nuisances and lawless activities. As urban agriculture advocates propose projects or implement projects, residents develop a NIMBY attitude toward urban agriculture, which can obstruct project approval or the adoption of urban agriculture ordinances (Covert and Morales 2014).

## Facilitating Urban Agriculture Through Local and Regional Government Strategies

### Institutional Arrangements

Institutional arrangements serve important local and regional roles in community food linkages. This includes functions of central intelligence, pulse-taking, policy clarification, strategic planning, and feedback review.

Local government planning agencies have the advantage of direct interaction with constituents. In this sense, they are in the best position to coordinate the efforts of NGOs and assist these organizations. Planners offer expertise in data collection and organization, community participation, conflict resolution, land use planning and economic development, and identification of agricultural opportunity areas.

### Integration of Planning Functions

Planning departments can also integrate planning functions into a framework of existing municipal responsibilities. For example, the planning department can provide direction to a housing authority or social services department in identifying ways their projects can promote urban agriculture practices (Pothukuchi and Kaufman 2000).

### Interagency Coordination

Another strategy extending the role of local government participation in urban agriculture involves interagency coordination, including cooperation of housing authorities, school districts, and other city departments (e.g., public works, parks, and recreation). The Seattle P-Patch program accomplished these objectives. P-Patch started as a private loaning of farmland to a community gardening program. In 1973, the city of Seattle purchased land from an owner and allocated it for agricultural production. First housed in the Department of Health and Human Services, the program was transferred to the Department of Neighborhoods. In this fashion community gardening was implemented by a department which strengthens community development. P-Patch later changed its articles of incorporation and transitioned to a community gardens land trust (Schukoske 2000) (Fig. 2).

### Food Security Element

A fourth strategy incorporates a food security element in the comprehensive plan. This ensures that food planning issues are directly addressed in the planning process, and that goals and policies are set implying commitment from local government. The comprehensive plan identifies agricultural preservation areas in cities where urban agricultural activity is established on a more permanent basis by land trusts and other organizations. The introduction of a food security element attracts urban agriculture stakeholders to the planning process. Lacking such an element, local governments can address food security issues in related comprehensive plan elements such as social services and open space. Food planning can also take the form of a functional plan focused on food security and urban agriculture issues.

## Conflict Resolution

As urban agriculture poses controversy as a land use that competes with other "green" uses, planners strive to establish a common middle ground. They are suited to follow procedural paths, which include conflict resolution, land use and design and bioregionalism. These strategies, outlined below, are based on Campbell (1996).

Conflict resolution can be conducted through an inclusive community outreach process and strategies that redefine the language of conflict and provide mediation. Outreach must include all stakeholders in the urban agriculture process: landowners, parties interested in cultivation, and supporters of alternative forms of land use.

Sustainability issues are not bounded by city limits. Stakeholders may not be limited to those residing or owning property within city jurisdictions. The boundary is not fixed but rather a dynamic and contested boundary between mutually dependent forces. Sustainable planning policies that address issues such as climate change and land conservation lend themselves to interjurisdictional and regional approaches.

Redefining the language of conflict and bridging the divide between economics, environmentalism, and social justice require planners' skills in communication and mediation. In this fashion, planners translate community values between divergent groups and interests. The multidisciplinary skills and perspectives of planners are conducive to this process. Further, mediation involves arrangement of procedures for making decisions. This involves the arrangement of forums and facilitated meetings to engender collaborative solutions.

Land use planning and design practices balance building needs with the natural environment. For example, cluster development, compact design, higher densities, and conservation easements are methods which conserve arable land resources with a more efficient arrangement of land use.

Bioregionalism integrates two phenomena, natural and social. Planners integrate

environmental phenomena by defining planning scale to reflect the natural environment. This involves planning at a regional level. Planners consider social phenomena such as neighborhood and jurisdictional boundaries and market areas. As urban agriculture sometimes requires interjurisdictional coordination, tools such as Geographic Information Systems (GIS) can also integrate planning on these different scales.

### Promotion of Peri-Urban Agriculture

Peri-urban agriculture is discussed in literature focusing on developing countries but rarely in literature involving American urban agriculture. This may be due to perceptions of urban agriculture as strictly a neighborhood activity within a radius of one-quarter to one-half mile. As stated earlier, the environmental, economic, and equity issues of sustainable practices do not recognize boundaries. These include not only neighborhoods but city limits. If agriculture in metropolitan areas is discussed, it is more from the perspective of urban encroachment and farmland conservation.

Another reason may include a NIMBY attitude toward agricultural projects in the suburbs due to odors, chemical spraying, or other impacts (Heimlich and Barnard 1992). Regardless, the problems of land tenure and limitation in land supply call for a review of potential agricultural opportunities in adjacent suburban jurisdictions.

Agriculture on the urban fringe should not be considered a marginal activity but rather as part of an urban area's expanding food production system. As an urban area grows, agriculture can grow concurrently as the urban periphery expands and new development takes in agricultural sites. Peri-urban agriculture can improve prospects for urban agriculture in three ways.

First, increased availability of land leads to greater participation and opens more farming opportunities. While not immediately located in inner-city neighborhoods, suburban farming opportunities still lie close enough for access through public transit, paratransit programs, and automobiles.

Second, suburban farming makes sense from the standpoint of placing agricultural uses in appropriate locations. High-value crops such as vegetables and fruits are perishable and need to be grown in locations closer to urban clients, including restaurants and farmers' markets (Heimlich and Barnard 1992). Proximity to urban areas can provide access to a larger pool of seasonal or part-time labor needed to cultivate and harvest these types of crops. While crop production poses nuisances, these impacts are less intensive than nuisances associated with raising livestock. With the exception of aquaculture, chickens and other forms of livestock generate objectionable odors and vermin. Animal waste creates problems with storm-water runoff contamination and sewerage systems. These sorts of uses are best conducted on larger lots, which are more readily available in suburban rather than urban areas.

Third, peri-urban agricultural products also meet increasing demand for locally grown food for DTC and food service establishments. Locally grown food is perceived as higher quality and fresher. Proximity also allows a better working relationship with the producer and an opportunity to purchase a specialty product (Food Processing Center 2003).

Finally, suburban farming can help prevent sprawl. If enough land is allocated in a given region, the potential exists for an agricultural greenbelt, reminiscent of Ebenezer Howard's Garden City, extending around the suburban area. One of the purposes of the greenbelt design was to prevent the encroachment of development into the hinterland.

## Conclusion

While the planning literature supports urban agriculture as a sustainable activity, it is implemented in a fragmented and sometimes impermanent fashion and competes with other forms of urban use. This is due to conflicts with related sustainable "Smart Growth" land use practices, generally weak government coordination, and perceptions that limit urban agriculture as a practice to be conducted solely within neighborhoods or city boundaries.

Planning practices and programs are only as effective as the policy guiding them. A comparison of successes and shortcomings of urban agriculture indicates that urban agriculture occurs most successfully when coordinated by government and conducted deliberately, with a well-defined purpose, mainly for food production. It follows that the success of urban agriculture depends upon the extent to which food security and urban agriculture are placed on the planning agenda. This requires better specification in the comprehensive planning process, accompanied by augmentation of programs, which focus more attention on urban agriculture implementation. By giving urban agriculture greater stature on the planning agenda, it can benefit from knowledge and skills that planners bring to the table, primarily in outreach, problem definition, and conflict resolution.

Extending the role of government planning for urban agriculture also means extending the scope of planning beyond a neighborhood or city. While urban agriculture is mostly practiced at the neighborhood level, its implementation should not be treated parochially. First, cities differ in land available for agricultural production. Rust Belt cities may offer more land for this activity than New York or Boston. For cities with land constraints, this extends the search for arable land beyond city limits. Further, as sustainable planning considers issues such as agricultural resource conservation, these problems are not limited to neighborhood and municipal boundaries.

Further research should explore ways that the government planning function can be extended and strengthened. This includes surveying and interviewing local and regional government planning agencies to assess how they implement food security and urban agriculture policies. Attention should be devoted to models of successful implementation and how they may be adapted to the specific needs of a community. Planners can benefit from lessons learned from environmental conservation programs and the experiences of developing countries, where more acute food shortages foster greater resourcefulness.

# Urban Community College's Role in Addressing Income Disparity, The

Anthony Cruz[1], Franklyn Taylor[2] and Kaley Buck[2]
[1]Miami Dade College, USA, Miami, Florida, USA
[2]St. Louis Community College, St. Louis, MO, USA

## Synonyms

Earnings differentials; Economic equality; Income gap; Income inequality; Wage gap

## Definition

Income disparity is the degree to which total income is distributed unevenly throughout the population.

## Legacy of the Urban Crisis

More than 50 years have passed since the Johnson Administration's Great Society programs were instituted, and the income disparity between the rich and poor in US urban areas has continued to grow. Income disparity has been exacerbated by the 2020 pandemic and economic turbulence. Civil unrest in many major US cities and the social justice movement have highlighted how differences in economic opportunity and working conditions are having a detrimental impact on the lives and well-being of urban residents.

Despite the best efforts of school districts and higher education institutions, income gaps have intensified because of higher levels of educational inequity for people of color in most of our urban centers. Community colleges have been at the center of the struggle to provide educational access to these communities. Community colleges have consistently been at the forefront of creating innovative transfer- and career-focused programs that create economic mobility for its graduates. This paper will explore the efforts community colleges have made to decrease urban income disparity and what their role will be in the future as the economy and the needs of the urban workforce continue to evolve.

## Mission of Community Colleges

Higher education has numerous missions. These missions include producing graduates to serve the community's needs. Bowen et al. (2005) state that a central purpose of higher education is preparing students to live productive lives in their communities, create human capital, and prepare students for a career.

Bailey et al. (2013) state that community colleges are responsible for educating over ten million students in the United States. They suggest that because of their open- door nature, they serve anyone who is seeking an opportunity to attend college. Their mission is to provide postsecondary education, and this serves as the foundation for economic growth and upward mobility in American society. These colleges serve minorities, recent immigrants, and students from lower socioeconomic backgrounds (Bailey et al. 2013).

The need for community colleges emerged during the early twentieth century due to the access challenges faced by 4-year colleges and universities. They lacked the adequate resources and capacities to face the growing need for access and equity (Sydow and Alfred 2013).

## The Urban College Student

Urban-serving institutions are often also minority-serving institutions, with minority populations ranging from 45% to 98%. A sample population provided here allows a glimpse of the diverse student population: 26.8% African American, 25.1% Hispanic, 11.7% Asian, and 23.2% White students with the remainder of the population being categorized as other, two or more races, or unknown (Cruz and Taylor 2019, p. 39). A discussion must also take place about the struggles of minority populations in higher education. At urban-serving institutions, 30% to 40% of students are first-generation with limited knowledge of the cost of attendance, necessary college preparation, and income support (Cruz and Taylor 2019). With this basic knowledge, the description of an urban college student is complex, each with unique and varied personal histories (Cruz and Taylor 2019).

When thinking about this complex population of students, we must also consider Maslow's (1943) hierarchy of needs. Urban-serving community colleges must consider all the needs of a student. From food insecurity to campus involvement, the urban community college must provide all services for all students to ensure academic success and decrease the achievement gap.

## The Achievement Gap

The achievement gap, defined here as the persistent disparity or inequality of academic performance, is present in all levels of education. If students struggle academically before they enter high school, catching up to grade-level performance will be a constant challenge. A report titled "Advance Illinois" (2016) displays key milestones for k-16 students. The report highlights these milestones and provides statistical evidence of low-SES students performing at lower rates than higher-SES students ("Advance Illinois," 2016). The milestones included in the report are kindergarten readiness, fourth grade reading, eighth grade math, college readiness (based on ACT scores), postsecondary enrollment, and postsecondary completion ("Advance Illinois," 2016). While the goal for the state of Illinois is to reach 60% of working adults holding a minimum of an associate degree by 2025, attaining that goal may

be more difficult than it appears. Current percentages per milestone indicate that 35% of fourth graders reading at grade level, 32% of eighth graders doing math at grade level, 38% of high school seniors scoring college ready (SAT/ACT scores), 64% enrollment in postsecondary education, and 28% completion of a postsecondary program ("Advance Illinois," 2016). To reach the state's degree attainment goal, Illinois must increase the number of students meeting key milestones which would mean increasing resources to all students and at-risk populations.

Students who struggle academically before entering college, including urban community college students, will likely have halted academic momentum. According to Davidson and Blankenship (2017), academic momentum can be used to describe the rate of completion of attempted credit hours by a student. The authors studied a single cohort, 2005–2012, of first-time in college, full-time (enrolled in 12 or more credit hours) first-year college students (Davidson and Blankenship 2017). Through the study, the relationship between enrolled and completed hours became directly correlated to a student's length of time in college (Davidson and Blankenship 2017). Students of low socioeconomic status (SES) are less likely to gain academic momentum as they enroll in and complete fewer credit hours per semester than their higher-SES counterparts (Davidson and Blankenship 2017). In addition, students attending a community college are also less likely to gain academic momentum, also enrolling and completing fewer credit hours than students attending a 4-year institution (Davidson and Blankenship 2017). With this collection of data, the authors can, within a reasonable doubt, infer that students attending a community college and of low SES have the least amount of academic momentum of all students attending college.

## Sense of Belonging as It Relates to Access and Equity

Sense of belonging has always been at the center of the student college experience, and that includes the urban institutions. Income, access, and equity have played a role and impact in this regard. Kuh (1995) focused on quantifiable student engagement and involvement, while Astin (1984) suggests that what matters is quality involvement. These writings lead us to Vincent Tinto's (1975, 1993) work on student departure from college, suggesting that if students are not engaged or involved in some activity outside the classroom, they will have a much more difficult chance at succeeding and hence will leave college. These writings shed light on the income disparity of students who attend urban colleges. Often, these students who are on the lower end of the income scale cannot afford the luxury of time and money to be involved and engaged in college. Most of these students have multiple and complex identities that do not allow such involvement. In some cases, money and time are the ingredients for participation and engagement in college activities. Many times, urban students are not offered these luxuries.

Creating a sense of belonging and engagement in this environment should be done with direction. Realizing that not all urban students are in the low socioeconomic status, in regard to providing academic equity and addressing income disparity, institutions should make sure engagement and belonging opportunities are planned purposefully and intentionally. Faculty, staff, families, and the community should be involved in creating programs which are well planned and cost-effective and are available at times when the most students are able to attend. Institutions should develop strategies to meet the needs of urban students.

## Equity and Access to College

Only 30% of children from families in the bottom income quartile are expected to attend college, while 80% from the top income quartile (Bailey and Dynarski 2011). This difference in access and opportunity results in an acceleration of disadvantages for those at the lower-income levels. Those disadvantages are further amplified as individuals grow older and lose out on better-paying jobs and promotions because they lack the necessary credentials. Fortunately, community colleges are

open-access higher education institutions that do not require SAT/ACT scores or superior high school grades. They educate students of all ages and backgrounds while providing comprehensive student support services. Community colleges also offer a variety of credit and noncredit academic programs of different lengths to meet the unique needs of students. These community college programs offer many urban adults an opportunity to greatly reduce the educational disparities that they inherited from the socioeconomic status of their parents.

## Challenges and Opportunities

Income disparity at community colleges has a direct impact on access. Although community colleges are open-access and reasonably priced, students primarily from lower socioeconomic backgrounds struggle to fund their education despite the funding from the federal government and scholarships provided by the urban institutions. The increase in population of low-income students creates a challenge, but also an opportunity for colleges and urban governments to assist and increase the skills and capacity of its citizenry.

As previously mentioned, low-income students are challenged to be involved and engaged in activities at their institutions. Most have families with dependents and some leading single-income households while working multiple jobs. This renders itself a challenge to involvement. As such urban students have limited time and opportunity to participate in activities. An increase in the opportunity for students to participate in these programs allows for students to thrive and succeed. Community colleges need to provide more student programming activities in the evenings and in virtual formats. Another aspect of income disparity and challenge that many urban students face has to do with food insecurities. The income disparity has compounded this problem in all institutions across the board, particularly low-income students. Urban institutions are constantly dealing with this challenge.

There is a great opportunity for urban communities to work with community colleges to close the income disparity gap. In the areas of subsidies, grants and cooperation with these community colleges can alleviate this challenge. This can also come in the form of direct assistance to the students in these urban areas. This may be currently occurring, but a more coordinated effort is needed.

Community colleges are working hard to face the challenges that are associated with poverty and the income disparity. Higher levels of student success will be achieved and realized when the barriers of low income are removed. Across the country, community colleges are aware of these barriers and make every effort to eradicate them by being intentional in programming, policies, and procedures. The income and equity gaps impact the student success rates because they increase the time it takes students to complete their degrees, which ultimately leads to more students dropping out. The goal of community colleges is to increase graduation rates.

Although community college tuition rates are the lowest in American higher education and students receive tuition assistance and federal financial aid, some students still cannot afford college because of the hidden costs associated with food, shelter, childcare, and unpaid debts. Some states, namely, Tennessee, are experimenting with the concept of free college. This is a novel concept that other states are contemplating to alleviate the income gap and equity challenge.

## Community Colleges' Response and Role in Addressing Income Disparity

Urban community colleges play a vital role in responding to the income disparity challenge. Several community college services and initiatives need to be expanded including expanding college transfer pathways, closing the skills gap, empowering low-income and first-generation students, strengthening partnerships with k-12 schools, and increasing virtual learning opportunities.

### Expand College Transfer Pathways

Community colleges have historically served a critical role in providing accessible and affordable

transfer pathways to 4-year colleges and universities. Approximately 40% of all US college students begin their higher education journey at community colleges (Shapiro et al. 2015). These transfer pathways have resulted in millions of graduates who have ultimately received professional undergraduate and graduate degrees. Community colleges continue to develop new and innovative approaches to increase the transfer pipeline. In Maryland, Prince George's County Public Schools, Prince George's Community College, and University of Maryland University College have developed a transfer initiative that provides a more affordable accelerated pathway that results in a bachelor's of science degree. Students pay less than $10,000 to earn a Bachelor's of Science in criminal justice, computer networks and cybersecurity, or business administration (AACC 2018).

While many institutions have collaborated to advance transfer pathways, an unintended consequence has been a loss of credits after undergraduate students transfer from a community college to a 4-year college or university. Monaghan and Attewell (2015) determined that the greater the loss of credits, the lower the chances of completing the 4-year degree. The loss of transfer credits can be greatly diminished by establishing more formal transfer agreements between institutions. These transfer or articulation agreements protect students by detailing transfer policies and specifying which courses will transfer to the senior institution. States like Massachusetts, California, and Florida have created strong statewide articulation agreements to provide a seamless process that guarantees university admission and the acceptance of transfer credits for those students who complete associate of arts degrees at their community colleges.

## Close the Skills Gap

There are over 5,000,000 jobs that go unfilled because people do not have the appropriate skills or training to fill those jobs (U.S. Department of Labor 2020). Income disparities are increasing not because there are not enough good-paying jobs, but because urban communities do not have enough people with the skills to fill these positions. Urban community colleges are poised to address this skills gap because they are nimble enough to start new programs that meet the needs of employers. There are many community colleges in urban areas who are partnering with local industry to deliver the specific training that is needed.

Many times, the skills gap can be reduced by providing short-term technical noncredit programs that lead to living wage jobs. Since 2007, St. Louis Community College has been collaborating with Boeing to provide short-term training to residents of St. Louis County. These 4- and 8-week noncredit accelerated programs prepare participants to work for Boeing as Sheet Metal Assemblers or Composites Mechanics. Those who complete one of the programs are guaranteed an interview with Boeing for a full-time position. Those who are hired have the opportunity to continue their education and receive promotions along the way. In addition, Miami Dade College has partnered with Tesla Corporation to offer a Tesla Technician Career Technical Certificate. The 15-week electric vehicle service training program is designed to provide students with the skills necessary for a successful career with Tesla. Both examples demonstrate the importance of urban community colleges partnering with industry to increase skills and provide good-paying jobs to residents in their communities.

## Empower Low-Income and First-Generation Students

Since the inception of federal financial aid programs in the late 1960s, urban colleges and universities have had an influx of low-income and first-generation students. Community colleges in particular with their open admission policies disproportionately serve more first-generation and students of color than 4-year colleges and universities (CCRC 2020). As a result, urban community colleges have a long history of providing the student support services necessary to help underserved students succeed. Now more than ever, community colleges must empower its students to overcome the economic challenges they and

their families face. Community colleges need to connect their lower-income and first-generation students to college organizations and services where they can receive support from peers and institutional allies. Empowering students will increase degree completion and thus increase their ability to earn a living wage and decrease the income disparity.

### Strengthen Partnerships with K-12

Most urban community college students come from underfunded public school systems that are overcrowded and lack the support services needed by their students (The Education Trust 2015). Many of these students arrive on the community college campuses lacking the academic preparation and social skills to be successful (U.S. Department of Education 2016). Unfortunately, many of these students will not graduate from college and will lack the education and training to get high-paying jobs. The partnerships between community colleges and public primary and secondary schools need to be strengthened. Too often, the first connection is made in 11th or 12th grade. In the last several years, community colleges have steadily increased their presence at high schools by providing dual enrollment classes. These dual enrollment classes count both toward high school and college credits. While dual enrollment classes are undoubtedly valuable, the relationship between these students and the community colleges needs to start at the elementary school level. Community colleges can help students identify career interests earlier and set them on a path to take the necessary classes in math and science to adequately prepare them for educational programs. This type of early guidance and planning will help urban students enter the workforce sooner in higher-paying jobs that will decrease the income disparity.

Career-technical education (CTE) partnerships between community colleges and high schools have been encouraged through federal and state funding. "Since 1990, federal funds have been set aside for Tech Prep programs as part of the Carl D. Perkins Vocational and Applied Technology Education Act and its re-authorizations" (Barnett and Hughes 2010, p. 5). These Tech Prep programs aim to improve the link between the last 2 years of high school and the first 2 years of college. According to Barnett and Hughes (2010), over 900 Tech Prep partnerships have been created throughout the country. Sinclair Community College, in Dayton, Ohio, and the Miami Valley Tech Prep Consortium are nationally recognized as a leading Tech Prep program. Students pursuing the pathway in engineering technology eventually earn an A.S. degree in engineering science from Sinclair Community College. This type of career-technical partnership puts high school graduates on a fast track to earn a credential in a technical area that does not require a bachelor's degree. More public funding is needed to expand these career-technical education partnerships in our urban communities.

### Increase Virtual Learning Opportunities

According to a 2016 national distance education survey, "eLearning enrollments have accounted for nearly all student enrollment growth at community colleges during the past eleven years" (Lokken 2007, p. 31). One of the biggest equalizers in higher education could be the increased use of virtual learning modalities. Virtual or online learning allows lower-income students who need to work multiple jobs and have childcare needs the opportunity to earn a credential irrespective of class time frames or college campus location. The COVID-19 pandemic has forced community colleges to reexamine their technical capabilities and instructor training to effectively deliver more classes virtually. This reexamination also includes surveying the technical needs of its students and making sure they have the appropriate access to online platforms. The digital divide continues to be a challenge for urban citizens. According to the Census Bureau, three times as many households in urban areas remain unconnected as in rural areas (Levin and Downes 2019). Community colleges need to make sure that they are offering the right mix of online short-term training opportunities. In addition, the digital divide is exacerbated by the cost of electronic textbooks and other materials.

Maricopa Community Colleges, in Phoenix, is working on ways to leverage digital resources for their students. They are using open educational resources (OER), through the Maricopa Millions OER Project, to reduce the cost of virtual learning (Kater et al. 2016).

## Summary

Despite the best efforts of school districts and higher education institutions, income gaps have been exacerbated by higher levels of educational inequity for people of color in most US urban centers. Through discussion of the mission of community colleges, the urban college student, and overall access and equitable education, this chapter outlined the urban income disparity crisis as it pertains to education. Community colleges have made efforts to decrease income disparity by attempting to combat educational inequity. These efforts include expanding college transfer pathways, closing the skills gap, empowering low-income and first-generation college students, strengthening K-12 partnerships, and increasing virtual learning opportunities. The future of urban college students lies with community colleges. The role of community colleges will continue to evolve with the changing student needs. Community colleges have served their students and will continue to be at the center of the struggle to provide educational access to their communities.

## Operational Definitions of Key Concept

**Food insecurity:** a household-level economic and social condition of limited or uncertain access to adequate food (USDA 2020).

**Socioeconomic status (SES):** the social standing or class of an individual or group... measured as a combination of education, income, and occupation (American Psychological Association 2020).

**Food deserts:** regions of the country (featuring) large proportions of households with low incomes, inadequate access to transportation, and a limited number of food retailers providing fresh produce and healthy groceries for affordable prices (Deener 2017).

**Food swamps:** a spatial metaphor to describe neighborhoods where fast food and junk food inundate healthy alternatives (Cooksey-Stowers et al. 2017).

**Morbidity:** the state of being symptomatic or unhealthy for a disease or condition... usually represented or estimated using prevalence or incidence (Hernandez and Kim 2020).

**Chronic diseases:** conditions that last 1 year or more and require ongoing medical attention or limit activities of daily living or both... such as heart disease, cancer, and diabetes (Centers for Disease Control and Prevention 2020).

**Cardiometabolic disease (or cardiometabolic syndrome):** a combination of metabolic dysfunctions mainly characterized by insulin resistance, impaired glucose tolerance, dyslipidemia, hypertension, and central adiposity (Saljoughian 2017).

**Stigma:** stereotypes or negative views attributed to a person or groups of people when their characteristics or behaviors are viewed as different from or inferior to societal norms (Ahmedani 2011).

**Food system:** an interconnected web of activities, resources, and people that extends across all domains involved in providing human nourishment and sustaining health, including production, processing, packaging, distribution, marketing, consumption, and disposal of food (Grubinger et al. 2010).

**Food justice:** seeks to ensure that the benefits and risks of where, what, and how food is grown, produced, transported, distributed, accessed, and eaten are shared fairly... represent a transformation of the current food system, including but not limited to eliminating disparities and inequities (Food Secure Canada 2020).

## Introduction

It is projected that nearly two-thirds of the world's population will be considered urban dwelling by 2050, a near 15% increase beyond the already four billion people currently inhabiting urban areas (Ritchie 2018). Yet in the face of rapid, confined population growth, the term "urban" remains rather ambiguous within the literature. This ambiguity begets a need for understanding how the urban environment is demarcated (spatially and temporally), what current resources are available, and how allocation of said resources will meet an ever-growing demand and landscape (Bloom et al. 2008). While the link between urbanization and economic growth appears to be well-documented (Dutt and Ros 2008; Henderson 2003), micro- versus macro-assessment of urban amalgamation requires a deeper assessment. Importantly, as urban context is tightly interwoven within neighborhoods, community members, and residential well-being, it is essential to clarify how socio-dynamics may lead to the development and sustainability of the urban environment.

Misunderstanding urbanity is an emerging crisis concerning the public health sector, medical communities, and those of lower socioeconomic status (SES). Particularly worrisome is the impact of food insecurity on the urban populace. Defined in the literature as a lack of economic and social well-being leading to uncertainty around food access, food insecurity is often associated in the urban core and characterized by higher racial and economic inequality (USDA 2020; Dutko et al. 2012). Food-insecure communities are often further categorized into "food deserts," which are based upon a poverty rate exceeding 20% and inhabitants experiencing a consistent lack of access (measured by distance: 1 mile in urban communities versus 10 miles in rural communities) and utilization of affordable healthy or nutritious foods (USDA 2019, 2020). In the most recent report of *Food Insecurity by the Numbers*, the USDA claims that nearly 35.3% of households that fell below the federal poverty line were food insecure, including those with low and very low food security (USDA 2019). Food insecurity, however, does *not* explicitly denote the lack of access to food. Unhealthy fast or cheap foods are instead the typical alternative. This reliance on less healthy, energy-dense foods is why urban food insecurity is symptomatic to a plethora of morbidities, particularly obesity.

Unhealthy eating in the United States currently accounts for one of the largest obesity epidemics to date, with average Americans eating a more than 20% higher caloric intake over the past 17 years (Public Health 2020). Furthermore, research by the World Health Organization found that fast-food sales correlate with rising BMIs – a marker for obesity in adults (De Vogli et al. 2014). These unhealthy eating behaviors are compounded by the fact that adults are not consuming the appropriate daily amount of fruits and vegetables, leading to poor diet and an increase in preventable nutrition-related diseases such as heart attack, stroke, and type II diabetes (Moore et al. 2015). Along this line, research has shown that Blacks and Hispanics are more likely than Whites to be obese with poverty compounding to significantly increase this likelihood (Ogden et al. 2010). Moreover, food insecurity and poverty are heavily associated with contributing to higher psychological stress in racially and ethnically diverse populations (Allen et al. 2018; Becerra et al. 2015). Thus, understanding the complex, multidimensional intersection between poverty, food insecurity, and access to healthy food and nutrition presents a unique and daunting challenge that is not readily understood under the current context of public health.

At present, COVID-19 has deeply intensified this problem. Consistent reporting shows that under-resourced groups and Black and Hispanic neighborhoods are some of the hardest hit by the pandemic (Thebault et al. 2020). Collectively, these groups suffer from higher rates of illnesses typically associated with COVID-19 complications or have limited access to quality health care (Shadmi et al. 2020). This point was highlighted by research revealing that of all COVID-19-associated deaths within the first ten weeks of the pandemic, most were largely associated with poorer and urban communities (Finch and Hernandez-Finch Finch and Hernández Finch 2020). Moreover, this burden is compounded by school and childcare closures, whose feeding programs provided children in poverty access to healthy eating (Van Lancker and Parolin 2020). Since its onset, COVID-19 has accelerated food insecurity's status as a social crisis within the United States. Forecasting models predict that more than 54 million people (of which 18 million are children) will experience COVID-19-related food insecurity by the end of 2020 (Feeding America 2020).

Thus, how does triage of food insecurity begin, and how quickly will resources be provided for those who need it most? Regardless of economic stimulus programs like Supplemental Nutrition Assistance Program (SNAP) and Electronic Benefits Transfer (EBT) programs (Bauer 2020), food insecurity remains a multidimensional problem unique to each community it affects. Therefore, each community needs an appropriate response. Here, the aim is to provide a high-level overview of how food insecurity is traditionally reported, consideration of missed metrics and stigma associated with food insecurity, and finally how now, more than ever, is the time to reinvent community empowerment.

## Factors Contributing to and Exacerbated by Food Insecurity

### Food Deserts

Measurements of food insecurity and subsequent food deserts frequently fail to consider the ambiguous factors that perpetuate urban food insecurity beyond the traditional metrics (Fitzpatrick et al. 2015; Jiao et al. 2012; Shannon 2016; Wright et al. 2016). First, fresh-produce-selling grocers are often present within food deserts; however, they are routinely ignored or discredited by residents due to having poor produce quality or being more expensive than nonlocal supermarkets (Wright et al. 2016). These perceptions push residents to shop at more middle-class or ethnically White stores further away, which both inhibits the profitability of local stores and stimulates the growth of corporate competitors (Ragulina and Rogovskaya 2018; Shannon 2016). Residents' racialized meta-narratives and negative place comparisons likewise stigmatize the ownership of ethnic-serving stores (Howerton and Trauger 2017), thus encouraging locals' avoidance of poor- or minority-associated businesses. This can ultimately force stores to adopt whitewashing and gentrification in order to re-attract local clientele or close indefinitely (Howerton and Trauger 2017).

Second, measures of food access (availability and usage) are extensively criticized as being misleading. Critics state that assessment metrics do not fully account for the various factors that lead to food insecurity, such as concentrations of low SES groups or the failure of structuralized governance (Ver Ploeg et al. 2015). Although noncontentious food desert origins have yet to be readily identified, a recurring and controversial finding is that low-income residents usually do have access to healthier foods but choose *not* to purchase them. This may be due to factors such as rising food prices, familiarity with unhealthier foods, or backgrounds prioritizing a less healthy diet (Wright et al. 2016). Interestingly, some reporting has discredited the correlation between living in a food desert and the presence of food insecurity. For example, one study's sample proclaimed stable access to groceries and transportation via their social networks yet admitted to mainly eating canned or frozen meals (Lewis et al. 2018). As residential self-perception impedes upon the academic categorization of food deserts, critics have suggested switching from impersonal, area-level measurements to more personalized individual- and household-level aggregations of data (Ver Ploeg et al. 2015). Additional suggestions include tracking supermarket affordability, proximity to groceries (via walking or transit), median household income, and the costs of grocery stores divided by tier (Jiao et al. 2012).

### Life Span

Individual and neighborhood-associated SES is a key indicator for measuring mortality within a given area (Hussein et al. 2016; Signorello et al. 2014). Since food security and poverty are closely intersected, investigating how food access and life expectancy translate into social mobility within the urban environment is necessary. Recent findings indicate that neonatal and gestational health can be compromised by inadequate nutrient consumption (Augusto et al. 2020), resulting particularly in adverse health effects for young children (i.e., emotional or psychological distress; Cook et al. 2004). Furthermore, biologically chronic psychosocial stress experienced in childhood is linked to higher rates of disease burden and mortality via a cellular process known as telomere length (TL) shortening. In summary, telomeres are an important genetic mechanism which protects DNA during cellular division in adulthood but are highly susceptible to accelerated shortening under conditions of high cellular stress and inflammation (Blackburn 2000; Blackburn 2005; von Zglinicki 2002). Of note, the largest associations of TL shortening in adults were between childhood SES and early life adversity events (such as exposure to conflict or violence, family instability, and traumatic life events; Rentscher et al. 2020). Beyond childhood, midlife or "middle-age" (between 40 and 45 through 60–65 years of age) appears to be a timeframe of increased vulnerability to food insecurity (Coleman-Jensen et al. 2013; Ory et al. 2014), which also exacerbates premature aging (Miller et al. 2020). Taken collectively, research in this

area is continuously needed to understand how the cumulative effects of lifelong hardships associated with food insecurity might equate to mortality.

### Chronic Diseases

Food insecurity and chronic disease development are bidirectional, with each experience interchangeably influencing the other's progress or termination. For instance, rates of cardiometabolic diseases (e.g., diabetes, coronary heart disease, congestive heart failure) and food insecurity in the United States have simultaneously doubled since the Great Recession in 2007 (Berkowitz et al. 2017). This rise has seen a positive correlation between food insecurity and the onset of cardiometabolic disease, obesity, and hypertension (Berkowitz et al. 2017; Jih et al. 2018), a trend even reflected among other high-income nations (Essien et al. 2016).

Along this line, food insecurity has been shown to drive lower-income individuals to prioritize cheap fast-food and high-energy meals. Moreover, "food swamps" (concentrations of fast food associated with area-based chronic disease development) are more clustered in blighted, low-income, and racially diverse urban areas than in homogenous suburban areas (Balcaen and Storie 2018). As race can compound overall health risks, Black and Hispanic people are disproportionately more likely to develop cardiometabolic disease than White and Asian people (Mangini et al. 2018; Mendy et al. 2016; Ro and Orbison 2018). Furthermore, chronic allostatic stress, as experienced by those enduring extensive hunger, exacerbates allostatic overload. This can heighten vulnerability to respiratory illnesses like lung cancer and asthma (Hill et al. 2019). Also, kindergarten- to elementary-age children of food-insecure and depressed parents are 55% more likely to sustain asthma well into the 8th grade (Mangini et al. 2018), indicating how paramount early intervention is.

Although food insecurity is repeatedly emphasized as being a key contributor to cardiometabolic disease and obesity, the etiology of obesity is quite complicated. Overweight and obesity can result from easier-access to ready-made food in urban areas and a cultural transition from physical labor to sedentary service work, but these factors are not wholly responsible. Surprisingly, little research has found a correlation between the urban-built environment, soft drink-promoting policies, or genes that potentially predispose weight gain and obesity (Alston et al. 2016; Alviola et al. 2013). Behaviors like sedentariness, non-produce consumption, and minimally preprogrammed epigenetics are conducive to obesity within an obesogenic environment, but defining such an environment remains elusive (Ulijaszek and Lofink 2006). Regardless, food swamps are considered a major link between diet-related diseases among urban populations, as high positive correlation exists between regional obesity and a lack of local grocery stores (Cooksey-Stowers et al. 2017). Blaming obesity on fast food, however, minimizes the many other contributing factors, such as low SES and neoliberal agricultural standards (Headey and Martin 2016).

### Mental Illness

Lack of proper nutrition combined with severe hunger can generate toxic stress resulting in poor cognitive development, learning and self-regulation difficulties, and aggression (especially among children; McEwan and McEwan 2017). The literature supports a strong association between food insecurity and the development of mental illness, especially depression and depressive disorders (Becerra and Becerra 2020; Compton 2014). Through this nutritional deprivation, an individual's mental state might be primed for vulnerability later in life. Elevated expressions of mania symptoms were present among food-insecure adults with mood disorders (possibly due to lower intakes of essential micronutrients, vitamin C, and protein; Davison and Kaplan 2015).

Food insecurity is shown to be particularly injurious to adolescent girls' and women's mental health. National data indicates a higher incidence of food insecurity (17%) among women-led households (Coleman-Jensen et al. 2016), which is linked to increased women's morbidity, stress, and depression (National Research Council 2006; Weiser et al. 2011). Other findings report a

heighted link between domestic violence and women who are at risk of or living with HIV during periods of food insecurity (Conroy et al. 2019) and a potential association between food insecurity and obesity in HIV-positive women (Sirotin et al. 2014). Multiple studies spanning India, Canada, and the United States have also found that urban conditions (such as cramped or slum-like residency, work stress, menial labor, and an early abandonment of schooling) can contribute to expressions of depression, anxiety, and psychological distress among teenage girls and young adult women (Muldoon et al. 2013; Maynard et al. 2018; Rani et al. 2018).

Research has shown that maintenance of a strong social network can improve mental stability. Elderly people who lived with a spouse, close to a child, or in a retirement community were much less inclined to develop depression or anxiety (Mesbah et al. 2020). In support of this, observed strong Black networks regularly pooled resources, cooked together, and helped one another grocery shop, while weak Black networks exhibited greater levels of stress, anxiety, and shame about using food assistance (Myers et al. 2019). Taken collectively, understanding how context-specific culture-, gender-, and sex-based policies may relate to food insecurity vulnerability among urban communities is needed.

### Stigma

Lastly, social stigma and the projected damage feelings of shame, helplessness, and social isolation play a major role in food insecurity. According to sociologist Ervin Goffman, stigma is the result of "status incongruity" or when specific individuals violate the status quo and are therefore shamed, harassed, or isolated by the community (Weaver and Trainer 2017). Under this logic, individuals who are viewed as obese or food insecure (impoverished) are perceived as being unequal with society's standards and may suffer internalized stigma (feeling ashamed of themselves) and/or externalized stigma (being shamed by others). Weaver and Trainer's (2017) work in rural Brazil and urban United Arab Emirates (UAE) found that food insecurity – while negatively viewed – could be relatively hidden from others. However, obese individuals were not able to hide their weight and were readily exposed to humiliation or reproach. Makowski et al. (2019) add that stigma against overweight and obese people may even reinforce preexisting inequalities due to low SES and/or sex, possibly worsening weight gain or depressive symptoms and discouraging future adoption of exercise or produce consumption. Stigma can also increase the risk of developing opportunistic infections or fungal mycoses among food-insecure immunodeficient or HIV-positive people, particularly women (Shin et al. 2018). Even food-insecure, low-income Australians would only sign up for food assistance as a last resort due to the shame perceived by using it (Booth and Pollard 2020).

Of particular importance is the stigmatization of those who use federal food assistance, such as Women, Infants, and Children (WIC) or SNAP. SNAP is the largest food safety net available in the United States (with more than 40 million Americans using it each month; Bleich et al. 2020). Shame associated with SNAP intervention is a common misconception and seen as a governmental "handout" for failures. This type of social morality has expanded over the years due to negative political rhetoric and mixed research over SNAP's alleged inefficacy and suggested link with higher rates of obesity (Howlett et al. 2016). SNAP participation is often an arduous, bureaucratic, and highly time-consuming process to navigate. From backlash via public officials and burned-out caseworkers to impatient grocers and opinionated shoppers, stigma can be exhausting and lead to executive functioning overload among already stressed-out individuals (Gaines-Turner et al. 2019). Along this line, SNAP participation fails to account for stagnated wages or provide sick leave options and can be seen as invasive in its automatic dropout policy if participants lose a job or make too much money (Gaines-Turner et al. 2019). Suggestions to alleviate stigma and encourage participation have included universal basic income and stigma-targeted training of community health-care workers, social workers, and public health servants (Barnidge et al. 2017; Gottlieb et al. 2017; Stenmark et al. 2018). Bleich et al. (2020) have created a list of initiatives to strengthen

SNAP's policies, such as restricting soft drink purchases, incentivizing the purchase of fruits and vegetables, promoting healthier consumption in all stores, and increasing the allotment and its disbursement frequency. Interestingly, an association has been found between using SNAP and elevated obesity, especially when participants shopped at more expensive supermarkets (Howlett et al. 2016), yet the authors admitted to participants possibly being unaware of which stores accepted SNAP. While SNAP can provide positive short-term effects, long-term results involving micronutrient deficiency or susceptibility to stigma are still ambiguous (Bitler and Seifoddini 2019). Finally, it needs to be emphasized that SNAP does not lift a family from food insecurity; instead, it helps people endure it until they can secure a sustainable income.

Alternatively, there are observed positive effects of SNAP (and other food assistance programs) in alleviating food insecurity. Research has shown that participation can be associated with improved childhood health, testing, and life adjustment, reducing maternal stress, low birth weight, and children's susceptibility to attention-deficit/hyperactivity disorders (Bitler and Seifoddini 2019). Additionally, it has shown to decrease financial burdens among families (Bitler and Seifoddini 2019). SNAP use may also effectively improve health in all age groups, especially in birth outcomes, child health, allowing the elderly to pay for needed medications or avoid hospitalizations, and incurring an average of $1400 per year less in health-care expenditures compared to nonparticipants (Seligman and Berkowitz 2019). Thus, the stigma and associated hurdles of SNAP are daunting challenges, but a comprehensive review of the literature reveals that SNAP benefits are more reliable than food banks or church pantries at regularly providing fresh food due to their haphazard operations and lack of produce options (Seligman and Berkowitz 2019).

## Urban Food Systems and Urban Food Justice

Urbanization itself seems to be a monolithic contributor to food insecurity. This is not a phenomenon localized to the United States. In Tanzania, Cockx et al. (2018) marked a distinguishable switch from healthier foods to high-sugar fast foods among residents who newly transitioned to urban life from suburban or exurban locations. The authors conclude that this might be because healthy foods that were once cheap in nonurban areas (e.g., nuts, fruits, vegetables, and fish) were considerably more expensive in urban areas. This coincides with the common belief that over time, globalization has increased urban food prices, which prevents the urban poor from affording fresh produce (Robinson 2018). However, research of these claims has provided mixed results. One review posited that higher global food prices actually provided a long-term benefit by decreasing the wage gap between the rural and urban populations (Headey and Martin 2016). In contrast, Parker and Johnson (2019) noted how globalization decreased the diversification of crop yields and incentivized hyper-neoliberal food distribution policies. One such policy is the galvanization of "big box" stores in crowding out the smaller competitors in urban neighborhoods. Because of this, urban areas have seen a gradual phasing out of independently owned grocers. This transition has mostly eliminated the diverse ecosystem of local grocers, abandoned people dependent on singular food institutions, and inhibited new small grocers from reoccupying the huge spaces left by the former superstores (Parker and Johnson 2019).

As urbanization continues to expand, it seems imperative to consider how urban planning will incorporate the urban food system. An approach to address food insecurity beyond the traditional brick-and-mortar grocery is the installment of urban agriculture and urban food production systems. Aside from direct urban access, urban agriculture gives the potential for food justice. Food justice is the local- and community-led response to food inadequacy and economic hardship influencing the lack of access to healthy, nutritious, and culturally important foods (Alkon and Agyeman 2011). Community engagement focusing on locally sourced urban agriculture and planning can help foster food justice by generating societal benefits (Horst et al. 2017). Results of

this type of planning include increased healthy food consumption per neighborhood (Barnes et al. 2019) and participation in community-supported agriculture (CSA) programs that expand vegetable exposure and intake (Hanson et al. 2017; Quandt et al. 2013; Wilkins et al. 2015). While these studies potentially justify urban food system planning, proper assessment of whether or not urban agriculture correlates to food justice in food-insecure or socioeconomically disadvantaged communities still proves challenging.

Alternatively, food *injustice* can occur through a multitude of overlooked parameters including ongoing marginalization, perpetuated systemic inequalities, and gentrification (Horst et al. 2017). In her book *Feeding the Other* (2019), Rebecca de Souza expands upon the aspects of neoliberal stigma and food insecurity associated with donation-based feeding, such as food pantries. Her research attempts to understand how anti-hunger programs (i.e., food pantries, food banks, hunger coalitions) and large-scale donation-based advocacy (e.g., Feeding America) commodify the poor by exacerbating the "up by bootstraps" mentality. As pointed out by public health researchers, the USDA, for decades, has collected and published yearly data regarding national food insecurity statuses, yet food insecurity continues to rise (Chilton and Rose 2009). Thus, food injustice is just as critical to consider. Ease of access to basic human rights, increased wages, and community-championed neighborhood-specific policies are a few entitlements that food desert communities should be privy to (De Souza 2019). Additionally, factors of strategy, money, time, and resources need to be included in the collective conversation when considering urban planning and agriculture in local food movements (Alkon and Agyeman 2011; Allen 1999).

## Community Intervention, and Reinvention

As urbanization continues to expand, urban planning will need to closely consider what works best for the communities it aims to serve. Because of this, the path from food insecurity to food security (and subsequently social mobility) needs to provide an array of personalized and community-led solutions. Seligman and Berkowitz (2019) have generated a broad overview of coping strategies that are implemented at the individual, household, and community level as a resource of potential intervention. In brief, individual-level mitigation can include shifts in diet (i.e. eating cheap caloric-dense foods and trans fats; Darmon and Drewnowski 2015), severe dietary restriction, end-of-the-month financial triage (Bhattacharya et al. 2003), and even drastic measures including engagement in risky behaviors such as transactional sex for money or food (many of the above are also witnessed at the household-level; Conroy et al. 2019; Ivers et al. 2009; Weiser et al. 2011). At the community level, resources can include friends, family, and faith-based organizations (Connell et al. 2005). Food donations from local food banks, pantries, and meal programs through community centers, local schools, and shelters are likewise prized resources (An et al. 2019). These outlets can also be platforms introducing programs about safe sex practices, alleviating joblessness, and household concerns with food insecurity. However, not all community members seek out or even have local access to these outlets. Thus, the community has the opportunity to provide a two-way, stopgap measure between the individual and policy implementation in providing access to wraparound services.

A promising community alternative is the mobile farmer's market model (Zepeda et al. 2014; Zepeda and Reznickova 2017). This resource offers an immediate response to challenges associated with the urban environment, including transportation and supply to fresh, local fruits and vegetables (Blondin et al. 2016; Rose and Richards 2004; Walker et al. 2010). Moreover, dollar match programs and health-care-supplemented prescriptions (or "veggie-scripts") demonstrate sizable community support and increased participation (Cavanagh et al. 2017; Lindsay et al. 2013; Saxe-Custack et al. 2020; Ylitalo et al. 2019). Research indicates that positive community engagement like the interventions

above in collaboration with support of local businesses is important for community buy-in to mobile produce units (Ylitalo et al. 2019). This point suggests that hyper-local response efforts need to be perceived as *by* and *with* the community *for* the community.

Another invaluable resource could come from local university engagement in personalizing the urban response effort. As more than half of universities are located in and around the urban environment (Ehlenz 2015), they are perfectly positioned to research, serve, and foster neighborhood interventions (Hodges and Dubs 2012; Silverman et al. 2015; Yamamura and Koth 2018). Viewed in the light of its intellectual capital, partnership between universities and neighborhoods can provide great potential in advancing urban innovation. Furthermore, engaging students with "real-world" problems firsthand via mentored research, capstone projects, experiential learning, or volunteering could manifest opportunities by which urban students (who might have personalized experiences with food insecurity) can actualize revitalization and social justice within their own communities (Checkoway 1997; Harkavy 2006). Because current research cites lack of education, cooking familiarity, and knowledge of basic public health principles as preventing community members from obtaining or maintaining healthy diets or lifestyles (Walker et al. 2010; Ylitalo et al. 2019; Zepeda et al. 2014; Zepeda and Reznickova 2017), universities could provide student-coordinated solutions suited to these barriers. Furthermore, community and participant/respondent evaluation of mitigation efforts encourages local voices to be heard while providing a foundation of community trust and participation (Huckfeldt 1979; Nikolaus et al. 2019), thus creating a more holistic move toward food justice.

## COVID-19's Impact on Urban Food Insecurity

At the time of this reporting, COVID-19 has incurred dramatic social and economic implications, including school closures, substantial job loss, and economic downturn (Bauer 2020; Fitzpatrick et al. 2020; Niles et al. 2020). Early reporting suggests that household food insecurity has risen to dire levels in just a few months (2018 reporting: 11%–38% in March 2020) with indicators pointing to continued rises (Bauer 2020; Fitzpatrick et al. 2020). Recent reporting has identified that households who are food insecure at the time of economic drop experience a greater magnitude of food insecurity even after economic recovery – in other words, food insecurity is more severe and longer-lasting (Balistreri 2016). Moreover, Black and Hispanic communities in the United States are disproportionately experiencing food insecurity in the wake of COVID-19 (Wolfson and Leung 2020). More importantly, consideration needs to be given to the fact that food is often politically charged (Seligman and Berkowitz 2019; Souza 2019; Walker et al. 2010) and that current societal pressures unknowingly tie class identity to food access. This is especially relevant in the current state of pandemic as families (including those in the middle class) are potentially trying to manage class slippage or even new class location. Federally, the CARES (passed on March 27, 2020) and Families First Coronavirus Response (passed on March 18, 2020) acts were passed with intention of providing unemployment expansion benefits and as a temporary stopgap measure (CARES Act 2020; Families First Coronavirus Response Act 2020). Long-term solutions, however, are imperative as urban structure is drastically changing during this time. Given that some communities are already experiencing lag in emergency food response systems (school feeding programs, local food banks, etc.; Kulish 2020), the time for personalized, urban response is more pressing now than ever.

## Closing Remarks

Food insecurity in the wake of growing urbanization is of grave concern. As population expansion continues and the demarcations of rural and suburban become less distinct, how urban space and planning will adapt is paramount. As

individuals in food-insecure household face a myriad of unique hurdles, close attention to polices which embrace compassion, create opportunity, consider essential needs, and promote knowledge and empathy can help provide community-led intervention (Taylor et al. 2018) generating and leading to holistic sustainability. Finally, investment into the use of social capital could help to inform policy maker, public health officials, and community leaders about the current state of their local urban landscape (Martin et al. 2004) and, ultimately, foster the flourishment of urban food security.

# Urban Hispanic Pre-service Teachers' Science Self-Efficacy: Science Museum-University Partnership Impact

Ratna Narayan[1], Lori L. Petty[2] and Thomas Close[3]
[1]School of Education, University of North Texas at Dallas, Dallas, TX, USA
[2]Amarillo College, Amarillo, TX, USA
[3]CVS Health, Irving, TX, USA

## Synonyms

Aplomb; Confidence; Self-assurance; Self-belief; Self-efficacy; Self-motivation

## Definition

Self-efficacy is defined as one's belief in one's ability to succeed in specific situations or accomplish tasks (Bandura 1989).

Dallas is an urban metropolis in North Texas and a commercial and cultural hub of the region. While there are several institutes of higher education in the Dallas-Fort Worth (DFW) area, the University of North Texas at Dallas (UNTD) is the only public university based within Dallas city limits. With over 48% of the student body being Hispanic, UNTD was designated as a Hispanic-serving institution (HSI) in 2019. The School of Education at UNTD partners with local school districts in certifying teachers, offering both undergraduate and graduate programs through the teacher education program. Students enrolled in the pre-service teacher education program hail primarily from the surrounding urban communities.

This qualitative, empirical case study explores how participating in a novel science museum-university partnership impacted the science self-efficacy of four urban, Hispanic pre-service teachers. The article is written to appeal to practitioners and informal science educators, as well as educational researchers.

## Overview of Relevant Literature

The literature review explores some of the issues in urban school systems before delving specifically into problems elementary pre-service science teachers exhibit and encounter while in teacher education programs. At the outset, it must be stated that not all urban school systems face the same challenges. Urban school districts are frequently characterized by high poverty and greater rates of racial and ethnic diversity (Kincheloe 2004). Ahram et al. (2011) report that urban school systems have both structural and cultural challenges to contend with. They describe structural challenges as school policies and practices impeding student success such as low student achievement, lack of instructional coherence, inexperienced teaching staff, low expectations of students, and a poorly functioning business plan. The authors examine cultural challenges as predominant cultural beliefs that contribute to low performance and academic achievement. When these cultural beliefs are harbored by low-income and racial/ethnic minorities, it may result in those students feeling a sense of stereotype threat and vulnerability to failure.

Science education research has consistently shown that elementary teachers have low science teaching self-efficacy (Erik 2009) and often avoid teaching science altogether (Appleton 2007). Several reasons have been posited to explain this phenomenon, including having naïve views about science (Abd-El-Khalick and BouJaoude 1997), science anxiety (Ramey-Gassert et al. 1996), and a lack of formal reasoning skills (Anderson and Mitchener 1994). According to Butts et al. (1997), inadequate science knowledge is a key factor leading to negative attitudes about science. Inadequate preparation coupled with a lack of interest in teaching science, especially among elementary teachers, has negative implications both for their own students and the pre-service teachers assigned to those teachers as mentees. Jarrett (1999) reports that pre-service teachers' confidence to teach science depends on the number of science courses they have taken in college and on their own elementary school science experiences. Atwater et al. (1991) suggest that poor content preparation could contribute to the development of low science teaching self-efficacy. Low self-efficacy toward teaching elementary sciences may result in avoidance of teaching science and a reduced quality of science instruction by those teaching science (Riggs and Enochs 1990). These issues are further compounded by the problems encountered in urban schools described earlier.

While the importance of practicum in learning to teach science has been well-established (Cannon 1999) interactive, inquiry-based science or the use of culturally relevant pedagogy is not often evident, especially in urban schools. Wilson (1996) promoted the notion of improving the teaching of science with inquiry-based, hands-on activities early in pre-service field experiences, allowing pre-service teachers to practice presenting science information, to use science materials, and to learn to manage equipment, as well as to observe educators who model these teaching practices and reflect on their own practices. Lederman (1999) posits that pre-service teachers need to actually "see" science at work to internalize science and understand the extent to which it is a part of our everyday lives. Wilson and Berne (1999) caution that the structure of pre-service teachers' coursework and preparation impacts their future science teaching efficacy once in the classroom. Toward this end, we propose a need to incorporate well-designed out-of-school practicum experiences that meet the needs of pre-service teachers as part of the teacher education program.

Alternative informal sites such as natural history/science museums and nature centers show promise (Jung and Tonso 2006) as venues for these out-of-school practicum experiences. It is widely assumed that field-based experiences are necessary and useful components in pre-service teacher preparation programs. There is a growing support for the use of out-of-school and informal science settings for educating prospective teachers – most often in conjunction with elementary science methods courses. In a small study in Taiwan, researchers found that including museum resources in science methods courses helped pre-service teachers learn to teach science

and that such resources were later incorporated into their own teaching (Chin 2004). A small-scale pre-service teacher preparation program partnership between a university and a field study (nature) center revealed the program benefited the participants, increasing their science knowledge and confidence in their science teaching ability, even after working only 8 h there (Ferry 1995).

Urban school districts face a number of challenges related to poverty and diversity. Some of these urban schools have inexperienced teaching staff and low expectations from their students (Ahram et al. 2011). As a result, minority students can harbor feelings of being "less than" and are more vulnerable to failure. When students who are products of such urban schools enroll in teacher education courses to be certified as elementary teachers, they carry these perceptions with them. Science is a subject many elementary teachers struggle with. It is well documented that elementary pre-service teachers have low self-efficacy in teaching science due to their prior science learning experiences in urban schools. Sending elementary pre-service teachers with low science content knowledge and low confidence in their science teaching ability back into the urban school environment is less than ideal and has the potential to perpetuate the cycle of failure. We know that teachers' attitudes toward teaching science are important as these attitudes influence their teaching, which in turn affects student achievement and interest in science (Crooks et al. 2008). The problem can be further compounded when minority pre-service teachers have not had the preparation that helps them overcome their low science efficacy.

Based on the need to provide pre-service teachers with positive science experiences that will increase their science teaching self-efficacy, the instructor of the science methods course required for all elementary pre-service teachers at UNTD designed a 20-h hands-on, interactive, novel field experience at the Perot Museum of Nature and Science. The rationale for the incorporation of the Perot Museum field experience component was based on observed inadequacies in the elementary classroom assignments students participated in. For example, the science lesson observations completed at local urban schools were often uneventful with the pre-service teacher passively watching the lesson progress from the back of the room with little or no interaction with the teacher or students. The methods course instructor could not be sure that all students enrolled in the science methods class were able to observe or experience good science teaching at the urban schools to which they were assigned.

Toward this end, the research question investigated was:

- What effect did participating in the novel science museum-university field experience have on the science self-efficacy of four urban, Hispanic pre-service elementary teachers?

## Theoretical Framework

For this project Bandura's notion of perceived self-efficacy was used as the theoretical framework. According to Bandura (1989), self-efficacy is "beliefs in one's capabilities to organize and execute the courses of action required to produce given attainments" (p. 3). The principles of self-efficacy operate on human behavior through cognitive, affective, and motivational mediating processes (Bandura 1989). Two central constructs with regard to his theory are self-efficacy and outcome expectancy. Bandura (1977) believes that the construct of self-efficacy has more to do with the perceived capability than the actual capability and is situation specific. Outcome expectancies are behavior related and are judgments about the likelihood of outcomes (Bandura 1977, 1986).

Bandura identifies four factors that influence self-efficacy: (1) experience or enactive mastery where success raises self-efficacy and failure lowers it; (2) modeling or vicarious experience where seeing others' success raises our own self-efficacy and witnessing others' failure leads to self-doubt setting in and lowers self-efficacy; (3) social persuasion where direct encouragement from another person increases one's self-efficacy and direct discouragement lowers it; and (4) physiological factors such as exhibiting symptoms of having butterflies in one's stomach before

speaking in public, fear, fatigue, or nausea which are interpreted by a person with low self-efficacy as an inability to complete a given task (Bandura 1977, 1986). Palmer (2006) identified three additional factors impacting an individual's self-efficacy in a science curriculum course for elementary pre-service teachers: cognitive content mastery, cognitive pedagogical mastery, and simulated modeling. According to Palmer, cognitive content mastery "involves success in understanding something rather than doing something" (Palmer 2006, p. 6). Cognitive pedagogical mastery refers to the understanding and mastery of how to teach science effectively. Simulated modeling involves a type of vicarious experience where the professor and the students simulate conditions in an elementary class through role-playing. In his research study with 193 pre-service teachers, Palmer found that the main source to enhance self-efficacy was cognitive pedagogical mastery.

It was hoped that the Perot Museum field experience would provide the opportunities that would improve content mastery while, at the same time, allowing scenarios that exposed the participants to social interactions and role-playing that reduced anxiety about teaching science.

## Context of the Study

This study was set at a small, urban, 4-year university located in a high needs, low socioeconomic status area in Dallas, Texas. The university is the first public university within Dallas city limits. Participants were four Hispanic pre-service elementary teachers enrolled in a science methods class EDEE 4330, "Teaching Science EC-6 Grades" in the Fa11 2018 semester for pre-service teachers seeking an EC-6 generalist certification. The science methods course was one of the four methods courses students enroll in for the semester prior to student teaching. The science methods course had a 20-h field experience requirement at the Perot Museum of Nature and Science and 5 h of field experience at a local urban school.

The Perot Museum of Nature and Science is located in downtown Dallas, 11.2 miles from the University of North Texas at Dallas campus. The massive six-story institution opened its doors to the public on December 1, 2012, and is a tourist mainstay with cutting-edge technology that allows visitors to feel the shaking grounds of an earthquake or try to outrun a dinosaur. It has 5 floors which are accessible to the public and houses 6 learning labs as well as 11 permanent exhibit halls: Children's Museum, Sports Hall, Discovering Life, Being Human, Engineering and Innovation, Dynamic Earth, Gems and Minerals, Energy, Life Then and Now, Expanding Universe, and the Birds Hall. The building was conceived as a large cube floating over a landscaped base and is designed to inspire awareness of science through an immersive and interactive environment. It has a stone plinth roof which features a landscape of drought-tolerant greenery inspired by Dallas surroundings.

## Participants

**Participant Profiles** At the start of the fall 2018 semester, volunteers were asked to participate in the project. Five pre-service teachers volunteered; however, one dropped the class due to a medical emergency. Two participants, Maria and Ana, were enrolled in the morning section of the science methods class, and Louisa and Nellie were in the evening section of the class. Pseudonyms have been used to protect participant identities. Participant profiles are in their own words from their introductory reflection papers:

> My name is Maria, I am in the EC-6 Program, I am also getting a bilingual certification. I am the first in my family to go to college. I am married and have two children. Being bilingual I do not think It will be difficult to get a job. I am worried about the science portion of the certification test. I don't like science. I have science-phobia. I have never liked it, for a second language learner like me it is full of difficult terms. I take care of my kids and go to school. I have been to the Perot museum as a chaperon with my son's class.
>
> I am Ana, EC-6, ESL. I am expecting my first child and I live with my partner and my parents. My parents never completed their schooling and cannot speak English. I used to like science in elementary school, then in middle school it became more boring and harder and in high school I hated the dissections. I would like to teach Kindergarten to second grade at the oldest. I used to work at a local eatery. I have been to the Perot Museum once.

> My name is Louisa. I tried to transfer to the other section of the course so I would not have to go to the Perot, but that did not work. I am an aide at a local school and am bilingual. Science and social studies are the hardest subjects, all the laws and formulas in science and all the dates in social studies. I just never seemed to be good in science and always dreaded the subject. My mother is also a teacher, but she teaches high school math.
> Nellie here, I live by myself and have 3 cats and a dog. I work at a packaging company. I started school as a nursing major, but the upper level biology and chemistry courses were too much for me, so I am getting certified EC-6 and special education. I don't see much point to the field experience at the museum because I don't think there will be any special needs children there.

### Study Design

The field experience at the Perot Museum was well integrated into the science methods course and structured and divided into several phases over a 13-week period. Each pre-service teacher was assigned specific exhibit halls where all their museum assignments were based. After completing each phase, participants had to respond to open-ended reflection questions regarding their experience. Three major hands-on, interactive, differentiated assignments had to be designed, implemented, reflected on, and improved during the field experience. The three assignments included a vocabulary activity, a discovery cart activity, and a science game. The vocabulary activities and the game were performed individually, while the cart activity was a group endeavor. Materials for the discovery cart activities were provided by the museum.

Participants signed up to go to the museum at dates and times as per their convenience and always with a partner. Participants were treated as volunteers and were provided free entry and parking at the museum. Like other volunteers, participants adhered to the dress code and donned the Perot Museum apron and name badge prior to going to their exhibit halls. Bilingual participants able to communicate effectively in other languages could wear a special badge indicating their ability to speak in that language. Bilingual participants were encouraged to create a Spanish version of the games and activities they created.

As part of the field experience, participants had to shadow a Gallery Experience Presenter (GEP), the museum's science educators in the exhibit halls they were assigned to, and communicate with them. Several of the GEPs assigned to participants were from varying ethnic minorities, and several did not have a degree in science. The GEP assigned to the energy hall was a high school student who had achieved docent status.

All activities were first field tested in class at the university before they were used at the museum. Timely feedback was provided by peers, the course instructor, and the museum's educators. The games and cart activities could be improved upon at the museum. All participants attended an orientation at the museum during which they were introduced to the museum and its practices and were guided on how to respond to museum guests and what to do if they did not know the answer to a question. Grades were based on the game and cart activity documents and reflections and not the actual enactment, making the Perot Museum field experience truly experiential.

The 20-h field experience was divided into four phases.

Phase 1 was the orientation at the museum. During this session, participants were encouraged to explore the exhibit halls of the museum. They were also informed about procedures with regard to entering and exiting the museum, parking, dress code, and signing in and signing out after their shift. Former students demonstrated games they had created in the previous semesters, and participants had the opportunity to interact with Gallery Experience Presenters (GEP) from various exhibit halls who demonstrated their cart activities.

Phase 2 involved shadowing a GEP in the cart activity hall and designing a vocabulary activity for the hall and interacting with the museum visitors using the vocabulary activity.

Phase 3 was the game phase and had two subphases. During the first P3 subphase, participants shadowed a GEP in the game hall to which they were assigned and individually designed a hands-on, interactive game differentiated according to age/grade levels. Participants had the opportunity to test out their games in a university showcase

event, get feedback from their peers and the GEPs, and make changes prior to taking them to the museum and using them to interact with the visitors there. Participants were partnered with their peers from the same exhibit hall. During the second P3 subphase, participants were paired up with a peer from a different game hall than theirs. Prior to P3 subphase 2, participants worked with their partners to learn about their game. Participants split their time between two exhibit halls and jointly presented both games in each hall.

Phase 4 was the discovery cart activity phase. The design and implementation of the cart activity were a group endeavor. Each group had to submit a budget to the museum who provided the materials for their activities. Once the materials were purchased, the activities were assembled and tested at the university prior to presenting them at the museum. Like phase 3, phase 4 also had two subphases. In P4, subphase 1 participants presented their cart activities to the museum visitors partnering with a peer from the same exhibit hall. Prior to P4, subphase 2, participants were paired up with a peer from a different cart activity hall. They worked with their partners in class to learn about the cart activities prior to presenting the cart activities in two different exhibit halls.

## Data Collection and Analysis

A qualitative narrative approach was selected because narratives are how we make sense of the world. The narrative-telling approach not only enabled participants in monitoring the development of their own self-efficacy but also helped them understand and appreciate it.

Data consisted of pre- and postqualitative surveys using SurveyMonkey that contained questions about participants' experiences with science teaching and learning in both formal and informal settings. Course assignments and the corresponding reflections constituted a major part of the data. Focus groups were conducted after every phase and also at the end of the semester. The final focus group interview used a semi-structured interview protocol during which participants discussed their experiences with science and science teaching in the museum setting as well as identified factors that impacted those experiences.

All interviews were transcribed and reflections coded. During this process, data underwent constant comparison (Glaser and Strauss 1967) and "theoretical questioning" (Charmaz 2005, p. 511), for assuring trustworthiness and rigor. Patterns in the data were classified and catalogued into themes that were further developed. Themes were identified by "bringing together components or fragments of ideas or experiences, which often are meaningless when viewed alone" (Leininger 1985, p. 60). According to Seale (1999), "trustworthiness of a research report lies at the heart of issues conventionally discussed as validity and reliability" (p. 266). Credibility and trustworthiness in our research study were achieved through methodological triangulation of the data (Denzin and Lincoln 1998).

## Results and Discussion

In the first reflection, written after the phase 1 orientation, all the participants expressed they were worried about the field experience. Louisa inquired if she could be moved to another section of the class, if possible, to avoid the Museum field experience. The participants did not comprehend how the museum field experience tasks related to teaching science at an elementary school. Louisa remarked she was training to be an elementary teacher, not a volunteer at the museum. In a focus group interview soon after their orientation, participants created a "Fears List" about the museum field experience in order of importance:

(a) Being Hispanic in what they perceived as a "white" area, participants mentioned in their initial visit to the museum that the only people who looked like them were the janitorial staff.
(b) Feelings of being out of place because of their notions as to who did science at such sites. "The people who work here are probably doctors from China or Japan or somewhere. They must all have degrees in science." Ana

(c) Participants expressed they felt no one would listen to them because of who they were. Nellie shared, "Look at me, I am short, and I am fat. I don't think anyone is going to listen to me. They might ask me where the restroom is."
(d) Lack of familiarity with the museum, Maria said "I have never been to a museum. We never go to museums. If we are on holiday we go to a beach or a park, not to a museum."
(e) Fear of saying the wrong thing or not knowing the answer to someone's question.

As the semester progressed, and participants became more involved with their tasks at the museum, the researchers discussed the Fears List with each of the participants individually. It became very quickly evident to participants that many of their fears were unfounded. In a focus group interview, the researcher broached the issue of being Hispanic in what they perceived as a "white" area. Participants responded with the following:

> Nellie: "I had driven past the building many times, it has a weird shape and with the sun falling on it, it glows white and knowing it was a science museum, I didn't think it was for me."
> Louisa: "It was different for me, all my teachers in school were Anglo, all the scientists we studied about were white, to me science was white and so a place like a science museum would also be white."
> Researcher: And now that you have been to the museum several times?
> Maria: "I don't think it's got anything to do with Hispanic or white or black, Science is science. It's got nothing to do with race."
> Ana: "It's about whether you know your content or not, not your ethnicity."
> Louisa: "Initially I didn't want to be here. But I am finding I really like it. There should be more Hispanics here, there are not. . .."
> Ana: "I counted 17 Hispanics during my Phase 2."
> Louisa: "They are not here, but I AM, and I can do this just as well as anyone else can!"

During their field experience, participants experienced all four factors that Bandura (1977) described that impacted self-efficacy: (a) enactive mastery, (b) vicarious experience, (c) social persuasion, and (d) physiological factors. The Museum field experience tasks were deliberately designed to challenge yet scaffold participants' efforts. They were not penalized for errors made and had the opportunity to improve on their ideas through feedback and reflection. Participants had to present their activities to their peers and the GEPs prior to presenting it to the museum visitors. Observing other students just like themselves achieve success with their activities was a strong indicator that they could be successful, too. Participants specifically highlighted examples of how social persuasion impacted their self-efficacy.

Nellie explained: "The game I designed for the Engineering Hall consisted of building and testing catapults, and I had all kinds of materials for the kids and they loved it. Even though my session ended at 3:30 pm, I stayed till the museum closed at 5 pm because it seemed everyone wanted to do the activity."

Louisa relayed that a teacher had stopped by her table and played her game, took a lot of photographs, and mentioned she would use Louisa's activity in her class. The greatest social persuasion came from the children and adults who flocked to their stations to do the activities. Initially all the participants were nervous about their activities and presenting them at the museum. As the field experience progressed, they grew more confident and their positive physiological state impacted their self-efficacy.

Interestingly, participants also described social persuasion that started at the orientation in which they were welcomed to the "Museum family" and received the same benefits as other volunteers did (free parking and entry, discounts at the café and store). Ana said "I felt so official putting on the apron and talking to the visitors in my exhibit hall. Everyone was so supportive and friendly. I thought I would stand out like a sore thumb, but I didn't. I felt very much a part of the museum and am proud of it."

Maria, a bilingual participant, also described her experiences in talking in Spanish with a visitor. "The first time I communicated in Spanish with a visitor I was so thrilled I was able to help them, they kept coming back and asking me questions and I loved it though I realized I needed to practice my Spanish delivery so I went home and practiced."

Achieving success in their field experience helped participants confront their perceptions with regard to science teaching in three broad categories: cultural, pedagogical, and personal. Before the field experience, several participants revealed they were intimidated and apprehensive because they believed volunteer opportunities came only to a group of very knowledgeable individuals in a largely "white domain." Nellie's reflection with regard to what she learned about the cultural aspect was most telling. She notes:

> I am a young Hispanic female, and I did not see anyone that looked like me upon arrival. I did feel a sense of being out of my element. However, throughout the day, even though I still did not see a majority of people that looked like me, there was also so much else there to experience that I lost sight of being out of place. . .. I learned that there is no 'museum-type' person. I learned that I fit in this environment just as much as an old Caucasian man with glasses on his nose, wearing a cardigan, and penny loafers. Nellie (P4 reflection)

Pedagogically, participants reported gains through their assignments (games and cart activities). Learning through their interactions with children was a big theme that emerged. All participants reported shock and amazement at how much the children knew, "The children know more about the exhibits than I did. Many of the children came up to the activity cart telling the volunteers information they already know. I was in Life Then and Now for P3 and this little five-year-old was naming all the dinosaurs in the hall and others that I had never heard of" (Maria). Through trial and error, participants learned what to do and say pedagogically to achieve success with the games and hands-on activities they designed while interacting with the museum visitors.

With respect to science content, participants described the informal teaching experiences at the museum as opportunities to relearn the science content relevant to their certification in a manner that was engaging and an environment that was stress-free. Initially participants identified lack of science content knowledge as one of the biggest hurdles preventing them from being effective science teachers. However, in postinterviews, participants unanimously reported an increase in their science teaching self-efficacy, identifying an enhanced understanding of relevant pedagogical issues as the cause.

On a personal level, participants reported that they learned much about themselves and their abilities to teach science. All participants indicated on the pre-survey and/or the orientation reflection that to teach science, you must know everything about science. They were terrified at not being able to answer someone's questions. Through interaction and experiences with the visitors, volunteers, and GEPs, participants began to realize that no one knew everything about science, but that one has to be willing to learn. Having the ability to say "I don't know, but let's find about it together" is of vital importance to these pre-service teachers and is a critical self-efficacy builder that goes a long way in changing participants' perception about teaching science.

## Summary

In this qualitative case study, we explored the impact that participating in a novel university-science museum partnership had on four Hispanic elementary teachers' science self-efficacy. Initially, all four participants reported negative attitudes about science teaching and learning, associating them with descriptors such as "boring," "difficult," "abstract," and "memorization." However, after the field experiences, participants described positive experiences with science teaching and displayed greater science self-efficacy. Participants offered several reasons for this including knowing the science content they were presenting very well; designing interactive, hands-on activities that attracted children and adult participation; the practice sessions and the feedback obtained from their peers and GEPs, and that it was an unsupervised and truly experiential, where there performance was not graded.

From initially wondering what elementary science teaching had to do with a museum full of "old stuff," participants were able to appreciate that each exhibit at the museum was not only TEKS (Texas Essential Knowledge and Skills)

mapped but also served as an individual science teaching-learning opportunity. Participants also gained a better understanding of how an informal science site such as a museum could serve as a valuable resource to bridge and facilitate student learning at both formal and informal settings, building on the strengths and resources of both.

The greatest impact of the museum experience was on participants' self-efficacy. Initially none of the participants believed they would be successful with the Museum field experience because of their ethnicity and lack of science content and pedagogical knowledge. Participants not only successfully completed the Museum field experience but have completed the teacher education program at UNTD and are currently employed as elementary teachers in local urban schools. Maria teaches fifth grade science at the elementary school she attended as a child. Ana and Louisa teach fourth grade science and math, and Nellie teaches in a self-contained second grade classroom. Maria, Nellie, and Louisa attended the STEM summer Institute for in-service teachers held at the Perot Museum. Ana gave birth to her child and plans to attend the Institute in the near future.

## Implications

Though this small case study has its own limitations, the findings have implications for elementary science teacher preparation. More teacher education programs should include introductions and collaborations with informal learning institutions in their vicinity and have access to their resources, pedagogies, and expertise, enabling transfer of practice and content learning. Informal science settings offer an array of resources usually unavailable in schools (Neathery 1998). In their official position statement on informal science education, the National Science Teachers Association states: "Informal science learning experiences offer teachers a powerful means to enhance both professional and personal development in science content knowledge and accessibility to unique resources" (National Science Teachers Association 1998, p. 17). Urban schools are rife with problems, and often new teachers do not receive the support they need to succeed. Teacher attitudes and actions can leave an indelible impression on students, impacting their lives and career paths. Appropriate changes, such as community partnerships with informal learning institutions, must be made to teacher education programs to improve the content and pedagogical knowledge of pre-service teachers so that they can develop into effective science teachers and hence "Science for All Americans" will not be a pipe dream but a reality.

# Urban Innovation

Albert Meijer
School of Governance, Utrecht University, Utrecht, Netherlands

## Synonyms

Collaborative innovation; Public innovation; Smart city

## Definition

Urban innovation is a dynamic process through which public problems and challenges in urban environments are defined, new and creative ideas are developed, and new solutions are selected and implemented. It entails the collaborations between local governments, companies, NGOs, citizens, research institutes, and various other actors.

## Introduction

More than half the world's population lives in cities and these concentrate both problems and innovative capacity. Due to technological, economic, and demographic development, cities around the world face a broad set of challenges that are related, among others, to economic growth, sustainability, safety, mobility, and welfare. These problems are often "wicked" and require creative approaches. For these reasons, innovation in cities is high on the public, political, and administrative agenda: "everybody" talks about smart cities (Townsend 2014).

At the start top-down approaches based upon strong corporate involvement were presented, but now participatory bottom-up approaches to urban innovation have been proposed. These approaches build upon notions such as public innovation (Borins 2014), collaborative innovation (Sørensen and Torfing 2011), and user innovation (Von Hippel 2005). While "urban innovation" is a hot topic in academic research and administrative practice, the governance of urban innovation is hardly explored (for an exception, Dente et al. 2005).

This paper enhances our understanding of urban innovation by building upon theories about innovation systems. Innovation systems should be understood as all the different actors that engage in urban innovation, the relations between them, the tools and instruments they use, and the institutional rules that guide their actions and decisions. On the basis of a review of the literature, five key functions for the governance of urban innovation are identified: mobilizing, experimenting, institutionalizing, balancing, and coordinating. This model can form the basis for urban policies aiming at strengthening the climate for public innovation in cities.

## Theoretical Building Blocks

### Public Innovation

Public innovation is linked to the challenging policy agendas of governments who try to find answers to wicked problems in the domains of security, climate change, and the global financial crisis. While the study of private innovation focuses on artifacts and technologies, the domain of public innovation is broad and encompasses process, product, services, governance, and conceptual innovations. Borins (2014) distinguishes innovations that entail new collaborations in government and external collaborations, information technology, process improvement, new forms of citizen empowerment and innovative uses of volunteers and market incentives, and change of public attitudes.

A key theme in the study of public innovation is the tension between the dynamics of entrepreneurial activity on the one hand and the stability – or inertia – of democratic and administrative institutions on the other. This entrepreneurial activity is praised by some but criticized by others. Borins (2000), however, emphasizes that public innovators combine initiative and creativity with respect to the law and due process. This observation is now widely accepted, and innovation in government is largely regarded as a desirable way to enhance the production of public value.

Sørensen and Torfing (2011) highlight that public innovation increasingly takes the form of collaborative innovation. In line with the governance perspective, the outcomes of public innovation should not be attributed to single actors but rather to collaborations between a variety of public and private actors. Most work on collaborative innovation, however, focuses on specific collaborations and not on the boarder ecosystem. This paper aims to contribute to our understanding of public innovation by bringing in a theoretical perspective that helps to position public and collaborative innovation within a broader innovation system.

### Innovation Systems

The perspective of the innovation system has been developed by historians to account for different approaches to and trajectories of innovation in different countries. Freeman (1995) defines an innovation system as the network of institutions in the public and private sectors whose activities and interactions initiate, import, modify, and diffuse new technologies. This system approach challenges the assumption that differences between countries should be understood on the basis of quantitative R&D comparisons and proposes that institutional differences are crucial to understand these differences.

Hekkert et al. (2007) build upon Freeman's work but put an emphasis on processes or functions in innovation systems rather than on the structural features. He stresses that these functions are highly important to the performance of innovation systems: "If we knew what kind of activities foster or hamper innovation – thus, how innovation systems 'function' – we would

be able to intentionally shape innovation processes." These activities can be labeled as functions when they contribute to the goal of innovation systems which is to generate and diffuse innovations.

## Model of Urban Innovation

On the basis of these different bodies of literature, we can identify the following components for a model of governance of urban innovation:

- Local government engages in processes of collaborative innovation with various actors, and the outcomes of urban innovation should be understood as network outcomes. For this reason, assessing the contribution of local government to urban innovation should focus on the way local government governs the urban innovation system.
- The governance of an urban innovation system can be modeled as a functional activity: several key functions can be identified that are crucial to the flourishing of the urban innovation system. Mobilizing, experimenting, institutionalizing, balancing, and coordinating were identified as core functions.

A generic perspective on the evolution of innovations forms our starting point for identifying the functions. Based on the main principles of evolutionary economics – variety, selection, and retention – we can develop a general overview of three functions: generation of novelty leading to diversity, selection among alternatives, and retention and transmission of information. Translated to the public sector, these functions can be labeled as mobilizing, experimenting, and institutionalizing. Two other functions need to be added to cover the normative issues involved in innovation (balancing) and the coordination between the different functions in the urban innovation system (coordinating). Our model thus stresses that local governments need to fulfill five functions – mobilizing, experimenting, institutionalizing, balancing, and coordinating – to govern the urban innovation system (see Fig. 1).

It is important to realize that the different functions can interact and generate feedback loops. Successful test situations (experimenting) or demonstrated uptake in work routines (institutionalizing) may, for example, result in easier mobilization of new stakeholders. Or lack of sound coordination may result in a disconnect between experimenting and institutionalizing and, consequently, a decline in engagement of stakeholders (mobilizing).

## Zooming in on the Functions

*Mobilization*. The first function, mobilization, means stimulating other actors to engage in innovation processes as the starting point for processes of collaborative innovation. The most obvious group of actors to mobilize are civil servants. Bason (2010, p. 118) highlights that innovative organizations must leverage the innovation capacity of all civil servants and not just dedicated project teams or R&D departments. The urban innovation system, however, entails much more than just the government organization, and mobilization of external actors is a key difference between collaborative and single-organization innovation processes. Dente et al. (2005) stress that the mobilization of a variety of actors contributes to the innovation potential since more

**Urban Innovation, Fig. 1** Functional model of urban innovation

complex innovation networks result in a better performance of the local innovation system. This means that mobilizing the ideas, knowledge, (financial) support, and operational capacity of other actors is a crucial requirement for successful urban innovation systems. Mobilizing can consist of stimulating action, contracting actors for specific activities, building new networks, etc.

*Experimenting.* Innovation is a challenge to urban governments and other bureaucratic organizations such as certain large companies since it challenges the stability that is a key feature of these organizations. This means that another approach is needed than normally applied in bureaucratic organizations: experimenting instead of planned implementation. Bason (2010, p. 121) emphasizes that setting up safe space and environments where experimentation and learning is encouraged is crucial to innovation. The elaborate literature on strategic niche management emphasizes the need to develop innovation in friendly "incubation rooms" or "niches" before they are implemented in the "real world" (Hoogma et al. 2002). Creating robust and fertile conditions that allow for experimentation is crucial to success. There is a growing body of literature on urban experimentation. This literature acknowledges the importance of citizen-centric living labs to facilitate social learning. Sengers et al. (2015) indicate that urban experiments involve a broad coalition of actors that engage in social learning related to a socio-technical configuration to generate both proprietary and public knowledge.

*Institutionalizing.* While the niches or incubation rooms create opportunities for developing and testing new ideas, their large-scale value can only be established if these experiments are translated into organizational practices. The notion of institutionalizing highlights that innovation is not only about doing something new but also about connecting these new practices to established practices with the aim of improving – institutionalizing – these practices. The literature on strategic niche management highlights that niches should follow the dynamics of the surrounding environment to be adopted in a larger network. As Kemp (2010, p. 293) stated: "New technologies may remain stuck in these niches for a long time (decades) when they face a mismatch with the existing regime or landscape". Public innovation means that in the end the practices need to become institutionalized. This may happen at the specific site of the experiment (longitudinal diffusion) but also – after a process of horizontal diffusion – at other sites. Finally, institutionalization can also occur at a higher level of government after a process of vertical diffusion. Institutionalizing entails a set of activities that start with evaluating experiments and "packaging" the innovation for dissemination, upscaling, embedding, and institutionalization. Securing long-term collaboration with partners is also a key challenge for this function.

*Balancing.* Balancing means deliberately weighing the different interests and values involved in the process of urban innovation and choosing the option that contributes most to societal desirable outcomes. Balancing is different from the other functions in the sense that balancing does not seem to be a necessary condition for advancing the innovation process. Balancing might even halt or slow down the processes by bringing in extra considerations and difficult issues. At the same time, balancing is crucial to realizing responsible innovation in the sense that the innovation does not harm stakeholders or neglect key interests and to ensure desirable and acceptable research outcomes (Stahl 2013). Responsible innovation can be defined as "a transparent, interactive process by which societal actors and innovators become mutually responsive to each other with a view to the (ethical) acceptability, sustainability and societal desirability of the innovation process and its marketable products in order to allow a proper embedding of scientific and technological advances in our society" (Von Schomberg 2013, p. 19). Balancing entails identifying risks, disadvantages, and tensions and discussing these to make deliberate choices. A public debate about sensitive issues is important, and ethical leadership is needed to generate fruitful interactions and support for choices. Finally, the capacity to mediate conflict is important to deal with the tensions that may emerge around urban innovations.

*Coordinating.* Coordinating is about managing the connections, interfaces, and relations between

the various functions in the innovation system. Important are, for example, the connection between experimenting interesting experiments and using these to strengthen existing systems. Coordinating the innovation system also entails the provision of certain generic functions. For one thing, not only creatives and "tinkerers" are needed but also sponsors and champions are crucial to innovation (Bason 2010, p. 203). At a more general level, innovation leadership is crucial to stimulating a climate of innovation in the city. The culture of innovation needs to be nurtured to provide support for civil servants, citizens, and other actors who take risks in their attempt to develop new and promising approaches to wicked problems. In addition, framing the general innovation process, specific experiments, and outcomes of experiments is crucial to the process of innovation (Bason 2010, p. 175). This framing is also important for obtaining support from the institutional environment – legal, politics, administrative, and societal – for the innovations. Bason (2010, p. 254) stresses that an organization – or an innovation system – needs to have a "license to innovate": the (institutional) environment needs to be supportive to innovation.

## Conclusions

While urban public innovation is increasingly regarded as collaborative innovation, the role of local government in innovation is still crucial since local government is the only actor who can assume responsibility for the innovation ecosystem. Not all public innovation needs to be developed by local government, but local government has a key task for governing the local system of innovation by mobilizing actors, by stimulating and facilitating the testing of new practices, by ensuring that the lessons from successful tests are applied in "normal practice," and by weighing the different (weak) interests and public values. In the model of governance of urban innovation, these functions have been labeled as mobilizing, experimenting, institutionalizing, balancing, and coordinating.

The key theoretical contribution of the paper to the literature is the model of urban innovation. This model integrates the literature on innovation ecosystems, smart cities, and public innovation and presents a functional perspective on the governance of urban innovation. The functional perspective helps to analyze why urban governments are or are not successful in stimulating public innovation in their cities. More specific contributions include the identification of specific activities such as managing the institutional environment, managing internal connections, and managing the technological infrastructure as important activities in the governance of urban innovation systems.

The model that we developed has direct value for urban governance. The first value lies in benchmarking and comparative learning. Hekkert et al. (2007, p. 420) highlight that the innovation systems perspective facilitates a comparison in terms of performance between innovation systems with different institutional setups. Differences between cities can be measured, and these differences can form a starting point for mutual learning. The second value is reflexive learning: the model can be embedded in a learning process in a city and help the authors to make better choices for optimizing the performance of the urban innovation system. Hekkert et al. (2007, p. 420) stress that the functional perspective has the potential to deliver a clear set of policy targets as well as instruments to meet these targets.

# Urban Local Government Finance in Bangladesh

Tahmina Ferdous Tanny
Department of Public Administration, Jagannath University, Dhaka, Bangladesh

## Synonyms

Financial system of City Corporation; Local government fiscal system; Revenue structure of urban bodies

## Definition

Urban local government finance is the income and expenditure pattern in Paurashava and City Corporation areas of Bangladesh.

## Introduction

Local government is a representative institution which serves the local community in a particular geographical area. As a government organization in proximity to masses, local government provides essential services to its citizens on behalf of central government that requires sufficient sum of finances. Urban local government finance is integral in countries like Bangladesh where high population growth and increasing rate of urbanization simultaneously putting pressure on urban authorities make the task daunting to fulfill multifarious functions in urban area. To ensure proper arrangement of basic amenities followed by the better discharge of utility services, the urban authorities put in charge of utilizing their resources to collect funds. Besides, they accrue money from government projects and international donors. However, the process is not as smooth as it looks, as a developing country, the urban local government in Bangladesh intensely needs bulk of revenues to meet the expenditures on local service delivery.

Hence, the local government responsibility implies making the living better: physically, economically, socially, and culturally through the rendered services (Siddique 2005); the efficiency of actions is determined by the level and nature of finance (Bhattacharya et al. 2013). The urban local bodies in Bangladesh lag in resource mobilization despite prospectus sources of earning, while inadequate tax and other fees collection from existing sources result in dependency toward government and international grants. Although measures have been taken from time to time to reforming municipal finances, it emerged as a challenge for political economy concerns. Unlike many developing countries, the efforts have been dismissed for absence of political commitment to decentralize tax structure and the negation of the local political authorities to utilize the revenue sources for loss of popular support.

## Structure of Urban Local Government

In Bangladesh, the local government operates under the Ministry of Local Government, Rural Development, and Cooperatives (LGRD & C), continuing its operation in rural and urban local government. The urban local government splits into Paurashava/municipalities and City

Corporation. At present, there are 12 City Corporations in large cities, while the number of Paurashavas are 328 in small towns/urban centers. The Paurashavas classify into three categories based on their financial capability from own source income in the last three years: category A denotes having an annual average revenue income above 6 million BDT (Bangladeshi Taka); category B denotes income above 2.5 million to 6 million BDT; and category C denotes income above 1 million to 2.5 million BDT.

## Urban Local Government Finance: Background and Legal Framework

The local government system dates back from British period when the formal structure planted to collect revenue and maintain law and order in Indian subcontinent. Nevertheless, it was the Local Self-government Act which allowed the urban local government bodies power to impose house tax so that it may serve basic civic amenities. Afterward, the act of 1919 expanded the taxation opportunity to have more financial autonomy in urban local units. During Pakistan period under the Basic Democracies Order, 1959, the promulgation of Municipal Ordinance 1960 specified 26 types of taxes, rates, and fees that the municipalities could collect. After independence, the Local Government Ordinance of 1976 specified the financial management of local bodies into three sections: construction of local fund, division between tax and nontax revenue, and the expenditure. A notable endeavor was the Paurashava Ordinance 1977, which first permitted that all City Corporations could sanction their own budget prepared by themselves (Siddique 2005:194–199). Although Paurashava Ordinance 1977 has been abolished, at present the financial and other administrative functions in Paurashavas and the City Corporations operate under the Local Government (Paurashava) Act 2009 (amended in 2010); and Local Government (City Corporation) Act, 2009 (amended in 2011) accordingly. The municipal (Paurashava) authorities can charge on 28 items to collect revenue as per the Paurashava Standard Tax Schedule 2014. Similarly, in terms of City Corporation the items are 26 as per City Corporation Ideal Tax Schedule 2016 (Pramanik et al. 2018).

## Urban Local Government Income and Areas of Expenditure

A sustainable fiscal structure at the local level bodies is the key to financial freedom; maximum collection of funds through user charges and fees let the municipalities undertake innovate projects through self-budget for urban development. The adequacy of own revenues not only addresses a city's improved capacity to deliver goods and services but also shows that the local officials are accountable to their constituents (UN-HABITAT 2015). Article 60 of the constitution of Bangladesh empowers the local bodies to impose taxes using local resources, plan budget, and implement effectively to pursue local needs. So, the local government organs in the urban areas of Bangladesh get mandates to practice the constitutional directions for greater autonomy and better service assurance to its citizens.

The major resources of Paurashavas and City Corporations accumulated from two sectors: from own sources and from other sources, for instance government grants, development funds, and loans. Income from self-source are two types: nontax revenue and tax revenue. The nontax revenue implies fees tolls, collected from specific purposes, and rents, profits received from market, and other places. The tax revenue includes different taxes imposed and gathered from citizens. Although revenue sources in the tax schedules contain a broad list, the significant elements from which colossal sum of money is collected put here (Fig. 1).

## Nontax Revenue

### Fees and Tolls

1. **Issuing certificates:** City Corporations and municipalities issue certificates based on the applications to register birth, death, marriage, and adoptions; citizens under the jurisdiction

**Urban Local Government Finance in Bangladesh, Fig. 1** Income sources in urban local government. Source: Author

of any Paurashava or City Corporation need to pay an amount of fee fixed by the government. The fees vary according to the subject of registration or increase with time.

2. **Property transfer fees:** It imposes when any sale or other transfer of immovable property (land, building, etc.) takes place within the City Corporation at 2% of the value of the property, which is collected by the agencies under the Ministry of Land and after deduction of collection charges passed on to the corporation concerned. This is not a local tax. It is levied and collected along with a variety of stamp duties. The government has cut the IPTT (Immovable Property Transfer Tax) to 1 % from previous 2 % for companies in three City Corporations of Dhaka (Dhaka North City Corporation and Dhaka South City Corporation) and Chattogram, amending the City Corporation Model Tax Schedule 2016 (The Financial Express 2020).
3. **Trade license fees:** Trade license fees are one of the nonproperty taxes levied on various trades (shopkeepers, businesses, and companies) to legalize their business.
4. **Rickshaw license fees:** Although rickshaws contain the prime sector among widely used transports in cities for many people, most of those rickshaws running on the streets are unlicensed. The statistics of two City Corporations suggest there are only 79,554 licensed rickshaws and rickshaw vans in the capital, while the actual number is over one million (The Daily Bangladesh 2020). After 32 years of suspension in rickshaw license issuance of Dhaka City Corporation, Dhaka South City Corporation in 2020 has restarted to issue and renew licenses for nonmotorized rickshaws with nonrefundable BDT 100, while Dhaka North City Corporation is yet to decide (The Daily Bangladesh 2020). Some argue syndicates of police, ruling party, and union

leader's men take advantage of illegal rickshaws taking tolls, piled on the street (The New Age 2020).

5. **Road cutting fees:** An important fee in many municipalities/City Corporations is charged to institutions that provide utility services who cut roads for purposes like laying the pipelines and setting pillar for electricity or cable lines. Such revenues, however, compensate for the costs of repairing the roads and, therefore, we cannot regard it as a major net revenue source.
6. **Tolls collected from bridges and flyovers:** Tolls impose as a road pricing like whoever uses the road will have to pay fees except authorities with exemption. Tolls serve two purposes: to recoup the expenses over the construction of bridges or flyovers and to surge the City Corporations' earnings.

### Rents and Profits from Property

Rental income generates particularly from shops and markets owned by the City Corporations, also through leases of government properties under its jurisdiction (Samad 2009; Rahman 2019). To avail profits municipal bodies require physical assets such as landed property, community halls, marketplaces, rent houses etc. coupled with the commercial schemes like construction of new markets and community halls, to increase incomes (Siddique 2005).

## Tax Revenue

1. **Holding tax**: Holding tax defines a kind of property tax that is levied based on the value of the buildings followed by the location of the land where the buildings are located. It comprises the house tax, lighting rate, water, and conservancy rate. Since the emergence by the District Municipal Improvement Act, 1884, the holding tax keeps the most significant and stable source of municipal revenue, with maximum potential for growth (Samad 2009). Two-third of total tax revenue in municipalities attained from holding tax (Huda and Hasan 2009). According to Ideal Tax Schedule, 2016, the City Corporations can collect up to 30% of tax that includes 7% holding tax for building, 7% for waste removal, 5% for street lighting, 3% for water supply, and 8% for health. As the City Corporations exercise considerable freedom to fix holding tax, there is glaring disparity in 12 City Corporations irrespective of income, residents, and value of buildings, resulting in approximately a 15% gap in payment of holding tax from one City Corporation to another commented by local government expert Dr. Tofail Ahmed. Consequently, Dhaka City Corporation being in the capital of Bangladesh determines the holding tax at only 12% while it is 27% for Rajshahi and Barishal City Corporations (Rahman 2017).
2. **On professions, trades, and callings:** The local government bodies impose taxes on professions, trades, and callings on professional persons engaged in trades or vocations within this jurisdiction. It has fixed different rates for different professions through government notifications.
3. **Amusement tax:** This kind of tax is crucial, as it allows both central and local governments charge simultaneously. The central government is responsible to collect entertainment tax on cinema, theatrical shows. However, the municipalities are authorized to collect 15% surcharge on the admission fees (Siddique 2005, p. 208).
4. **Taxes on nonmotorized vehicles:** The vehicles including cycles, rickshaws, bullock carts, handcrafts, and carriages, etc. are taxable sources in urban locality for City Corporation income. The tax is initiated to reduce congestion in busy roads and restrict the use of these vehicles in the municipal areas.

## Government Grants

1. **Salary compensation grant:** This grant assists the municipalities provide their staffs and officials salaries when the local authorities are in deficiency of budget. The local bodies would put in risk unless they get financial aid for salary compensation.

2. **Octroi grant**: Octroi tax applied to those goods entering a particular urban area (Paurashava/City Corporation) for consumption or sale, collected at terminal points (Siddique 2005). Such tax has been repealed from 1981–1982 since a grant as a compensation equivalent to estimated annual income renders to the City Corporation by Local Government Engineering Department (LGED), that is quite nominal (Samad 2009).
3. **Normal development grant**: Every year City Corporation applies to the government for funds related to infrastructural development projects such as construction of roads, flood protection, sewerage, and drainage system while government allocates budget under Annual Development Program (ADP) to finance these projects upon the sanction. Frequent donor assistance also covers the finance of different projects under national government ministries/agencies. Local bodies in Bangladesh extensively depend on government aids due to their limited resource availability to pursue any plan.
4. **Special grant:** Special grant from government includes dearness allowance for local government bodies financial security, public importance scheme like antimosquito eradication program, environmental cleaning program to lessen infectious disease, and president's special grant (Bhuiyan 2017).

**Development Fund** Bangladesh Municipal Development Fund **(**BMDF**),** a government owned company established in 2002, provides financial support to urban local bodies (ULBs), channeled through IDA, World Bank, to improve urban environment, strengthen the institutional capacity of selected municipalities and City Corporations as well as improve resource allocation and fiscal discipline (Rahaman et al. 2014). Municipal Service Project (MSP) is also a World Bank initiative that finance in environmental and service delivery affairs in urban areas.

**Loan** The urban local government can take loan from internal financial institutions such as commercial banks and international organizations such as ADB (Asian Development Bank), JICA (Japan International Cooperation Agency), and UNDP (United Nations Development Program) so that it may ensure proper investment in several agenda implementation.

## Urban Local Government Expenditure

The spending of City Corporation and Paurashava is determined by the annual revenue earned. After allocating the recurrent expenditure the development and maintenance programs are undertaken (Samad 2009), and expenditure charged on the salaries of government employees excluding the ones who are posted on deputation. An important task is to bear the expenses on maintenance and services of the properties of City Corporation while perform acquisition and purchase of lands. The surplus revenue remaining after all these tasks assigned is transferred to the development fund of concerned authority. The City Corporation also uses their fund for the repayment of loans, meeting establishment charges, cost of credit, or any other establishment charges maintained by government on account of their works (Bhuiyan 2017, p. 7).

## Challenges in Urban Local Government Finance

***Avoidance in Holding Tax Reassessment*** The most valuable source of income in City Corporation and Paurashava the holding tax's general assessment abstained frequently despite the legal obligation to revise the tax at five years interval keeping pace with existing market rate. The revision of holding tax had been carried out last in 1989, whereas the assessment does not reflect the market condition (Samad 2009). Besides, regular assessment is also seldom carried out, to check new constructions, additions, and alterations to identify taxable payments. Such an information gap makes adversity in charging additional tax on someone even though the amount has turned due to him (Huda and Hasan 2009).

***Tax Evasion*** Holding tax: A major source of revenue for urban local bodies is hardly facilitating to administer. A significant portion of city dwellers intend to underassess the valuation of the holdings that consequently increases evasion. It is common practice that rich and influential people mostly evade taxes while entitled as defaulters in paying holding taxes. However, building illicit collusion with the assessor the taxpayers also get the rental value per unit of building arbitrarily instead of jurisdictional application (Huda and Hasan 2009). On the contrary, the implicit tax system results resentment and reluctancy to taxpayers while the canon of certainty principle of taxation is totally infringed for tax evasion causes in Bangladesh local government.

***Negligence in Resource Utilization*** Unlike the property assessment, rates and fees collected as nontax revenue are not clearly stated while these fees not even grow according to the property values or business transactions growth, resulting in potential revenue loss in City Corporation and municipal area. Sometimes the local government officials and few brokers take benefit from this situation, charging arbitrarily to the low educated, poor segment of the city population.

***Unresponsive Political Intervention*** The local representatives owe to motivate people regularly to pay taxes and also identify potential revenue sources. The scenario is opposite in Bangladesh, where elected representatives play neutral role in tax collection to retain excellent reputation in the constituencies. As regular reassessment would certainly increase tax burden on the Paurashava holdings, exerting pressure for the collection of arrears from influential people would lose their support in future elections and popularity will be at stake if tax rate is increased.

***Untimely and Unrevised Budget*** Dependency of the local government on central government ministries make it complex to perform shared responsibilities which also cause delay in public functions. City Corporation shows reluctancy to submit budget to the ministry on time, does not take actual income and expenditure patterns into account while projecting the budget, and instead follow a 10% increase over the previous year. Consequently, local authorities fail to implement citizens expectations of public services that could better improve cities for a better living condition.

## Conclusion

The increasing role of local government in urban places puts the municipalities and City Corporation in financial difficulties to construct infrastructure; ensure smooth civil utilities, arrange accommodation for poor. The probable solution is to make the best potential use of the resources for maximization of revenue, directed towards city's development, so that a win-win situation prevails between city authorities and the citizens. As the local government fiscal system in Bangladesh rounds around changes and reforms since British era till date, in line with political promises it does not pace with emerging urbanization challenges. Thus, it is left with the policymakers to formulate legislative acts and their subsequent amendments to ensure political and financial autonomy of local government institutions.

# Urban Local Government Service Delivery in Post-Mugabe Zimbabwe

Sylvester Marumahoko
Department of Politics and International Relations, University of Johannesburg, Johannesburg, South Africa

## Synonyms

Local authorities; Local councils; Local public service delivery; Service provision; Urban councils; Urban government; Urban local government

## Definitions

**Urban local government** – It is the lowest tier of government responsible for the administration of local affairs and service provision in cities, towns, and smaller urban settings. Above it is provincial and metropolitan councils and national government.

**Service delivery** – It is the statutory duty of urban councils to provide services such as road construction and maintenance, primary health care, water supply, and waste management. The process of making these services available to urban dwellers is called service delivery.

**Post-Mugabe Zimbabwe** – President Robert Mugabe, a man who ruled Zimbabwe since 18 April 1980 was removed from office on 17 November 2017 in a process involving the military, members of the ruling ZANU-PF party, the opposition, and ordinary Zimbabweans. The period following Mugabe's ouster from the office is referred to as post-Mugabe Zimbabwe.

## Introduction

After more than three decades of socioeconomic and political upheavals characterized by economic instabilities, isolation, diminishing international capital arrivals (including transmittals), and infrastructure blockages and transnational company closures, Zimbabwe is undergoing a renewal as it seeks to reengage fully with the international community, attract foreign direct investments (FDI), and restore confidence in the economy (African Development Bank Group 2019). On the political front, President Robert Mugabe, a nationalist who led Zimbabwe since 18 April 1980 stepped down on 18 November 2017 after bruising factional fighting in which he lost control of the governing Zimbabwe African National Union-Patriotic Front (ZANU-PF) party and government. Thereafter, Emmerson Dambudzo Mnangagwa (ED) became the second President of Zimbabwe and consolidated his grip on power by winning the presidential election held on 30 July 2018.

Committing toward reinvigorating the Zimbabwean economy, with the "Zimbabwe is open for

business" and "Vision 2030" narrative, the ED-led ZANU-PF governing party signaled its intention to address fiscal excesses, corruption, and uneven implementation of reforms and hyperinflation. In adopting "Vision 2030" which seeks to transform Zimbabwe into a middle-income country by year 2030 and the "Ease of Doing Business policy," the ED-led government signaled that it appreciated the central role played by developmental states in realizing national development, industrialization, and economic growth. Despite envisioning a capable state as the only viable response to deteriorating socioeconomic and political fundamentals, it is, however, unclear how the government that promised to break with an ugly past in which its policies are blamed for Zimbabwe's decline intends to address the service delivery challenges facing the country.

The entry seeks to understand urban service delivery inefficiencies in post-Mugabe Zimbabwe and propose possible solutions to diminishing devolved urban service delivery at a time of great need and expectation. Given that a major effort is required to rebuild Zimbabwe after almost four decades of Mugabe's ruinous policies, detailed and up-to-date diagnoses of service delivery challenges and their possible solutions are essential for effective planning, development, and exploitation of scarce financial resources, as well as effective management of local public service delivery. By focusing on the contribution of urban local authorities in service infrastructure development, the entry recognizes the important role played by urban government in Zimbabwe in facilitating socioeconomic recovery, efficient service provision, and human development. Through bottom-up strategies, mass community involvement in public affairs and infrastructure investments inspired by public consultation, democratic principles, norms, and values, urban councils are silently contributing toward socioeconomic development, national economic recovery, employment generation, and efficient devolved public service delivery.

The remainder of the entry is structured as follows: a brief discussion of the history of urban service delivery is presented to demonstrate the need for revitalization, general issues around inefficiencies, and problems surrounding local service provision. Thereafter, the entry discusses the legislative provisions for service delivery. This is followed by a discussion of the possible strategies for overcoming urban government service delivery inefficiencies. In this regard, the entry focuses on four service delivery areas of particular interest: water supply, road construction and maintenance, primary health care, and solid waste management. It wraps the discussion with concluding remarks.

## Urban Service Delivery History in Brief

In Zimbabwe, the urban local authorities are divided into the following 30 administrative units: (a) 2 metropolitan cities, (b) 10 municipalities, (c) 8 town councils, (d) 6 city councils, and (e) 4 local boards. They are classified hierarchically in ascending order as follows: local boards, town councils, municipalities, and cities (Marumahoko and Fessha 2011). All urban councils, including local boards and town councils which are inferior councils in the hierarchy of urban local governments, have a statutory requirement to deliver the 54 service functions outlined in the Second Schedule of the Zimbabwe Urban Councils Act (Chapter 29:15). The functions include key urban service delivery responsibilities such as water supply, road construction and maintenance, primary health care, and solid waste management.

Before independence the success of urban local authority systems in Zimbabwe was most evident in the effective capacity demonstrated by the cities and towns in supplying, operating, and maintaining infrastructure services over the years. The absorption of the large shifts in population to the urban areas, and the steady performance of the industrial sector, which was able to rely on dependable and efficient urban services, is attributable to the independence and self-sufficiency of the urban local councils.

Furthermore, the impressive performance of the local governments could be traced to a resource-rich period for the urban sector, when public investments favored the cities at the

expense of the rural areas. Substantial depth in bulk infrastructure capacity and in standards and levels of supply was established. As a result, the urban population enjoyed satisfactory access to water supply, sanitation, road networks and public transportation facilities, drainage, and solid waste management. With the postindependence period of emphasis on redressing imbalances in the rural areas, investment in real terms in urban infrastructure suffered deterioration. At risk was an erosion of the depth in infrastructure capacity as intractable service deficiencies emerged. Mugabe's obsession with centralized planning and top-down deconcentrated models of development facilitated urban government inadequacies characterized by discernible regression in local public service. There was a marked decline in the provision of basic services such as water provision, road construction and maintenance, and primary health care. The reasons for the degeneration include waning public sector investment, shrinking government investment in urban service delivery, development asymmetries, and policy lapses.

## Legislative Provisions for Local Service Delivery in Zimbabwe

The deterioration in service delivery was attributed to the fact that subnational urban councils were deconcentrated entities of central government that derived their authority from the Ministry of Local Government. They operated within the framework of the mandate entrusted to them by national government, and their autonomy was restricted by government action, public policy, and the law (Marumahoko and Fessha 2011). In 2013, however, this setup changed when the country adopted a new Constitution providing for a three-tier cooperative government structure made up of national government, provincial and metropolitan councils, and local authorities broken down into urban councils and rural district councils (Section 264 of Zimbabwe's 2013 Constitution).

Composed of cabinet ministers appointed by the president, national government as the first tier of government provides public services of a national character and also sets service delivery standards. Provincial and metropolitan councils as the second tier of government (they are still to be established 7 years after adoption of the Constitution) are responsible for service delivery implementation at provincial and metropolitan city levels (Section 268 of the 2013 Zimbabwe Constitution). They are composed of a mixture of directly elected representatives and those that are chosen based on the party-list system of proportional representation. Directly elected by local voters, ward councilors are responsible for policy-making functions relating to the management of decentralized local public service delivery (Section 277 of the 2013 Zimbabwe Constitution). Urban councils (together with rural district councils) form the third tier of government commonly referred to as local councils.

The Constitution imagines the three devolved tiers of government, through strategic intergovernmental relations and collaboration, working together to facilitate public service delivery. A key feature of the intergovernmental system in devolved service provision is that the tiers of government "inform, consult, harmonise and co-ordinate" (Moyo and Ncube 2014). Through full council resolutions, urban local governments represent and manage the service delivery functions and other affairs of the urban dwellers (Section 277 of the Constitution as read with Section 274 of the Urban Councils Act). As mentioned earlier, the Second Schedule to Zimbabwe's Urban Councils Act (Chapter 29:15) outlines 54 service delivery functions of decentralized urban local councils.

With only one authority responsible for the affairs of each area, the primary concern of the urban councils is the provision of water supplies, sewerage systems, road and transport-related infrastructure, low-cost housing, and street lighting, as well as health, educational, and welfare services. Each authority is autonomous in directing its own affairs and virtually all service delivery programs are the responsibilities of the local authorities which they finance mostly out of local revenues generated from utility and service tariffs, fees, and property taxes in the form of rates. Through the subnational structures, it is

imagined that the voices of local citizens will be heard in the decision-making processes that affect not only local service delivery but community development as well.

## Addressing Zimbabwe's Urban Local Service Delivery Challenges

For almost four decades into majority independence, the decline of Zimbabwe politically, economically, socially, and even constitutionally is a sad phenomenon associated mostly with perceived misrule under Mugabe's government. At the time Mugabe resigned public office (or was ousted in a military coup as some would say), the country once considered in many ways an example for the rest of Africa was in the full grip of unprecedented socioeconomic and political challenges. It was suffering through populist policies, policy misalignment, political conflict, international isolation, disease, poverty, near economic collapse, and underdeveloped public service delivery.

With Mugabe's resignation from office toward the end of 2017, a window of opportunity for change tentatively opened. Mnangagwa (ED) succeeded Mugabe amid euphoria and the optimism that things may change for the better. There was great expectation that the inbound self-styled reformist president would bring back ailing urban service delivery from the brink; reform the bloated bureaucracy to make it more effective, efficient, and responsive; accelerate the reconfiguration of the governance system from centralization to devolution; champion local development needs; and prevent the complete erosion of local public service delivery.

Three years after Mugabe unceremoniously departed office with some of the reasons for his departure including inefficient governance, backsliding state capacity, ruinous policies, and unproductive implementation strategies, decentralized urban service delivery has not improved significantly but instead suffered unprecedented regression. Even though Mugabe is no longer in office, the service delivery challenges associated with his legacy refuse to go away. In fact, if anything, the failures of local government are increasingly mirroring those in national government decline, reflecting a much bigger problem underlying public sector inefficiencies across all three tiers of government. The service delivery situation under the Second Republic led by ED is as undesirable as it was during the First Republic led by Mugabe. The question then arises what needs to be done to turnaround the undesirable situation.

The entry suggests how, through cooperative management, local government can work together with provincial and metropolitan councils and national government to improve public service delivery. Specifically, the entry, in the context of facilitating good policy formulation, implementation, monitoring, and evaluation of devolved government, recommends what can be done to restore key elements of effective urban service delivery. In this regard, the entry focuses on water supply, road construction and maintenance, primary health care, and solid waste management as the key service delivery functions of urban government. In doing so, the entry assesses the scale and scope of the challenges, opportunities, and needs in Zimbabwe's devolved urban service delivery systems.

## Water Supply

It goes without saying that water is life. The improved sources of water that urban local authorities are unable to deliver satisfactorily comprise (a) piped water, (b) public taps, (c) stand pipes, (d) tube wells, (e) boreholes, (f) protected dug wells and springs, (g) rainwater, and (h) bottled water (AFDB 2019). As a result of inadequate supplies of safe drinking water, urban dwellers now face a situation where there may be a serious public health risk from people drawing water from substitute supplies that are unsafe such as polluted river water and unprotected wells. In fact, the severity of the problem is evident. In 2018, 2019, and early 2020, the neglect of the water infrastructure was a major factor in the outbreak of cholera and other waterborne diseases reported in Harare, Chitungwiza, and Gweru, among other

major cities and towns. Sustainability of human urban settlements through water supply is undermined by the country's domestic inflation rate; standard water prices set by government and meager investment into this area remain a primary concern as there is a big gap between the demand for water and its supply. Currently, urban councils' cost of supplying water vastly supersedes the revenue they generate from its customers (AFDB 2019).

Urban councils also have to contend with erratic, inefficient, and at times chaotic national government review of water supply policies. A case in point is when the Mugabe-led ZANU-PF government transferred in 2004, without consultation, rigorous policy review, and comparative analysis, the water supply function from opposition-run cities and towns and bequeathed it to the Zimbabwe National Water Authority (ZINWA), an inefficient, corruption-ridden, and bureaucratic state enterprise. After 4 years of infrequent water supply, stagnated capital development, and declining service, water supply reverted back to urban local government in a process characterized by chaos, confusion, and lack of accountability. In both instances, the transitions were "carried out without adequate preparatory work that led to both loss of more production capacity and a further deterioration of the services" (Mapfumo and Madesha 2014). Even after water supply returned to urban councils, there is still overlapping responsibility and lack of clarity between the ZINWA and local boards (the lowest classification of urban councils in Zimbabwe) over who is responsible for water service provision at this level. Eight ministries are also involved in the issue of water supply at this level.

The other problem is that national government encroachment and politicization of urban water supply is making an already bad situation desperate. At the height of elections campaign in 2013, former ZANU-PF Local Government minister Ignatius Chombo issued a directive ordering local councils to write off water bills and other charges amounting to US$2 billion in revenue owed by city dwellers for the period between February 2009 and June 2013 (Zaba 2013). This negatively affected scheduled expansion of water supply and sewer reticulation, and urban councils are still hurting from the consequences of that impromptu policy. Worsening the situation is that national government forbids local councils to apply efficient water pricing policies (Marumahoko and Fessha 2011).

It helps that urban water supply is guided by the neoliberal values of cost recovery, liberalization, and deregulation as good bases for ensuring that water services can be provided to all citizens at an affordable price and that there is water quality protection. It is also important that water pricing is increasingly seen as an acceptable and viable instrument of public policy underpinned by good governance, the rule of law, and accountability. In particular, the main objectives of water pricing should include the following: (a) creation of incentives for efficient water use, (b) cost recovery in the water sector, and (c) financial sustainability for urban water supply systems (Rosegrant and Cline 2002). The overall objective is to enable cash-strapped urban councils to raise sufficient funds for necessary infrastructure development and expansion of services to meet intergenerational demand for efficient water supply.

## Road Construction and Maintenance

It is the function of a good road network to facilitate mobility; reduce the cost of transportation; develop trade; promote economic linkages; assist in the integration of various regions within a city; accelerate growth; reduce poverty; and contribute to economic development. The substandard poor state of urban road network is characterized by potholed roads, a lack of maintenance, and a dire shortage of financial resources to build new roads. As a result of the sorry state of the road infrastructure, transporters are losing a lot of money through vehicle maintenance, cars are depreciating at a faster rate, and goods meant for production are being delayed (Zikhali 2017).

Up until 2009, using vehicle license fees, urban councils supported efficient, reliable, and safe transport services. After vehicle licensing was

removed from local councils and given to the Zimbabwe National Roads Administration (ZINARA), a state-owned enterprise created by national government, the capacity of urban councils to invest in the urban road network system suffered decline. The ZINARA has turned out to be an inefficient state-owned enterprise in which huge amounts of money meant for road projects have been lost to inefficiency, corruption, and sleaze. A common complaint is that the ZINARA is not remitting enough money to urban councils for the planning, development, construction, and maintenance of the road network (Nyakudya 2016). Without vehicle license fees and in the face of limited financial resources, local authorities have been struggling in road construction and maintenance. It is important that the collection of vehicle license fees reverts to urban councils to facilitate transparency, accountability, efficiency, and effectiveness in devolved road infrastructure construction and maintenance as was the case before 2009. It is also worthwhile exploring public-private partnerships for urban road construction, rehabilitation, and maintenance.

## Primary Health Care

As the tier of government closest to the people, urban local authorities run health clinics as part of their responsibility to provide essential services and projects for the people and communities at the grassroots level. This is a concurrent function that local government performs in collaboration with national government. Primary health care is encountering many challenges. The difficulties range from health fees that are not cost-reflective to declining spending on the maintenance and refurbishment of infrastructure that is below the required levels.

The deterioration in the primary health-care infrastructure over the past three decades stems from the lack of maintenance of these assets, the review of fiscal policy, and a reduction of government support which saw grants reduced to a trickle and eventually dry up. In the same vein, policy differences, a deterioration of relations with countries from the West, and ill-advised policies saw development partners and non-governmental organizations withhold funding for expanding local health services. Urban councils that were historically reliant on grants supporting devolved health care suddenly found themselves grappling with huge unfunded mandates. An unfunded mandate refers to national legislation that imposes a requirement on state or local governments and fails to provide funding for the cost of implementation or compliance. National government should not offload responsibilities to another tier of government without providing the funding.

The implication is that urban local authorities will need to increase the price charged for health services to cover operating costs that include realistic levels of maintenance spending on health-care infrastructure while at the same time continuing to generate financial surpluses that cover some of the capital costs of these programs. It helps to encourage urban local councils to apply the cost recoverability method used in business to local health-care delivery. A major risk and uncertainty associated with this method despite its potential to reduce the decline in devolved health investment is that the setting of local health fees is subject to regulation by central government.

Even as urban councils provide services at subeconomic levels, national government's thinking seems to be that it is protecting the poor from being excluded in the health-care system (Marumahoko and Fessha 2011). The provision of health services to city dwellers at heavily subsidized rates has serious consequences for the financial position of the utilities, given that national government does not compensate urban local authorities for the subsidized prices. Through financial support from national government, urban local authorities can complement funds from own source revenue so as to guarantee sustainability of service delivery.

## Urban Solid Waste Management

The failure of urban councils in solid waste management is on full display for all citizens to see across the country. It manifests, among other

things, in overspilling public bins, heaps of uncollected rubbish in street corners, clogged drainage systems, infrequent refuse collection, and chronic shortages of refuse collection equipment. This has created an environment where disease-causing vectors thrive, contributing to soil, water, and air pollution and emitting greenhouse gases that cause global warming (Gogo 2018). The problem was evident during Mugabe's rein but appears to have gotten worse under ED's rule.

In general, the capacity of all local authorities, including rural councils, to deliver sustainable service provision has suffered additional decline. The reasons for the sharp degeneration seemingly include worsening economic woes, inflation, depreciation of the Zimbabwe dollar against major foreign currencies, and the rampant closure of companies and associated loss of jobs worsening the unemployment situation. Furthermore, an increase in urban population and solid waste generation has not been matched with sound waste management systems, posing environmental and health hazards particularly to the urban population (Gogo 2018).

The situation is compounded by the fact that both national government and local government are slow in introducing effective policies to address the constraints facing the urban sector in solid waste management The adoption of an inverted pyramid type of management that prioritizes waste reduction, reuse and composting, recycling, and disposal would go a long way in addressing the challenge. Key elements of the strategy could include (a) partnering with non-governmental organizations to increase public awareness of new innovations to engage the challenge such as reuse and recycling; (b) strengthening the capacity of urban local authorities without adequate financial resources by procuring them refuse equipment; and possibly, (c) outsourcing.

Going forward, it is also important that three particular concerns are addressed if devolved service provision is to return to the state it was before independence and, possibly, the early years of majority rule. The first is fixing the weak financial position of urban local authorities through making them more accountable for their own fiscal autonomy, revenue-raising powers, expenditure responsibilities, and borrowing powers, among other measures. In addition, it helps to restore intergovernmental fiscal transfers, unconditional grants, and conditional financial support. Alongside this intervention is the need for the renewal of obsolete equipment and infrastructure to spur service provision. Secondly, policy and institutional initiatives will require support for capacity building. Currently, many service delivery projects and related policies and programs are poorly integrated and not well coordinated and failed in their implementation. It helps to improve the capacities for planning, monitoring, and oversight of all service provisions. Thirdly, there is a need to implement all the constitutional provisions on local government in the 2013 Constitution of Zimbabwe, the objective being to strengthen capacities for service delivery, prioritization, and management.

## Conclusion

Urban local authorities (along with rural councils) are the tier of government closest to the people in the context of decentralized management of local public service delivery. In that vantage position, they are better placed to respond to urban service delivery challenges; design and deliver service provision policies that respond to the needs and interests of people under their jurisdiction; harness localized knowledge to address local challenges; and increase public accountability for the management of urban government public service delivery initiatives. In post-Mugabe Zimbabwe, reforming sluggish urban service delivery is an issue that requires intergovernmental cooperation, support, and solidarity among the three tiers of government following three decades of ruinous local government policies pursued by the former president Mugabe.

Several "dividends" accrue from strengthening the capacity of urban councils to respond to the challenges posed by declining service delivery in cities and towns. First, it increases the image of government as an institution that is

working again following four decades of service erosion and decay. Secondly, through investment in service infrastructure such as roads, primary health-care, water supply, and sewer reticulation systems, urban local councils increase the possibility of the realization of the national policy goals to reduce poverty and increase the quality of life set in the "Vision 2030" policy document. Thirdly, national government support for subnational entities including urban councils is in line with the 2013 Constitution which imagines the three tiers of devolved government working together in collaboration, harmony, solidarity, and cooperation to realize decentralized service delivery, national unity, and economic development.

# Urban Nonprofit Strategy, Understanding a Mission- and a Market-Based Perspective for

Umar Ghuman
Department of Political Science, Public Administration and Leadership Studies, California State University, Stanislaus, Turlock, CA, USA

## Synonyms

Communities of color; Neoliberalism; Non-governmental organizations (NGO); Third sector organization; Urbanization

## Definitions

Nonprofit organization: A tax-exempt organization that utilizes its revenue and funds towards furthering a social cause and providing a public benefit

Organizational mission: A composed and widely distributed organizational statement by which the organization communicates its purpose to external and internal stakeholders

Marketization: A set of principles and narratives that promote a business and entrepreneurial approach to an organization's strategy

## Introduction

This essay examines the divergent strategic orientations for nonprofit organizations and argues for an equal emphasis on a market-based strategy, rather than just a primary focus on a mission- and values-based strategic perspective for nonprofits that function in diverse, competitive environments with limited resources. Past scholarly research on traditional nonprofit strategy has proposed that strategy should be focused primarily on the mission, vision, and values of the organization, especially since nonprofit organizations

(NPO) are seen as the preservers of society's cultural norms and value systems. Such scholars have argued against recent strategic trends in which nonprofits have increasingly conformed to the requirements of a neoliberal agenda, i.e., they have adapted a market-based business orientation. However, in an increasingly competitive environment for scarcer resources, new research demonstrates the need for a strategic incorporation towards a market-based perspective in which the nonprofit operates in and responds to a multiplicity of environmental pressures, especially for those nonprofits that serve diverse, urban populations and communities of color. Nonprofit organizations in such settings must continually examine their organization's strategies of growth, mission creep, and a shifting external environment to better position themselves from short- and long-term strategic perspectives such that the organizations maintain their strategic advantage and position. Recent research and articles on the topic have begun to emphasize the growing importance of integrating a market-based perspective, one that adopts a more business-oriented strategy while trying to remain aligned with the mission, vision, and values of the organization. This essay will examine both perspectives and argue that, for urban nonprofits working within communities of color, a reconciled approach may be the best option.

## A Mission/Vision/Values-Based Perspective

Nonprofits exist when individuals seek to make a difference in their community. Pandey et al. (2017) cite passion as a crucial component of why leaders seek to start a nonprofit; passion around a particular cause motivates leaders to create an organization that is centered around and promotes the causes associated with that passion (Pandey 2017). The mission of the organization helps in the articulation of this passion. The mission statement thus becomes the means by which the nonprofit communicates its passion to external and internal stakeholders. It is the organization's call to action, its *raison d'etre*. Worth (2012) states:

> Nonprofit organizations are driven by their missions, and those that work in them, as staff or volunteers, are often motivated primarily by their passion for the social purpose that the organization serves. (Worth 2012, p. 167)

Phills (2005) adds emotional and psychological components to the mission. He states "it is the reason why people get up in the morning and go to work in a nonprofit" (Phills 2005, p. 22). Phills (2005) mentions how the mission is instrumental in creating and propagating the social value that in inherent in the mission of the organization and that social value "– whether it is spiritual, moral, societal or aesthetic, intellectual or environmental – is that it transcends economic value. Thus, it is inextricably linked to fundamental human values, which are the basis for intrinsic worth and importance" (Phills 2005, p. 22).

This concept of mission, as the essence of the organization, is different from an organization mandate. Mandates are what the organization is required to perform in order to fulfil its mission or its purpose (Worth 2012). The mission of an organization also forms the basis for the organization's values and vision (Frumkin and Andre-Clark 2000).

Values and vision are initial phases of the strategic planning process and allow the organization to shape future strategy. The vision of an organization is a statement of an idealized, future end state. While this end state may or may not be fully achievable, the vision allows the organization to work towards and plan for a strategic means by which they will accomplish the mission (Frumkin and Andre-Clark 2000). Along with the vision, an organization also makes explicit the concept of a "values system." Values can be considered the "guiding principle" and the "fundamental assumptions" that the organization will have while striving towards its vision (Allison and Kaye 2005). For example, a community arts center and a national symphony may have the same vision and mission, i.e., promoting the performing arts, artistic excellence, and education, but one may value a greater emphasis on local community outreach and development than the other (Worth 2012).

These three key components, mission, vision, and values, establish the prelude to the

organization's long-term strategy and assist the organization in clarifying and cementing organizational mandates, goals, and future milestones (Bryson 2004). This values perspective and the concepts of the values and the mission that the organization ascribes to and informs all aspects of the nonprofit: from leadership development; to employee recruitment; to board development, marketing, and communications; and to capacity and collaboration.

In short, the mission allows leaders to develop aligned short- and long-term strategies that address issues critical to the organization's survival and promotion of its goals. It allows the nonprofit board and the members of the organizations to structure their motivations, their actions, and their strategic interventions such that they support mission-related organizational development. The mission also allows external stakeholders recognize, evaluate and endorse the organization and the causes for which it stands, and provide support (Eikenberry and Kluver 2004).

This values-based outlook is the traditional, de facto strategic position for nonprofit organizations. Nonprofits exist to provide mission-based service/products that market-based for-profit or government organizations either cannot fulfil or do not completely address. They tend to operate in an environment of market failure, i.e., providing goods and services that have either been deemed economically unfeasible from a profitable standpoint. They may also provide necessary goods and services that government entities do not have the expertise, resources, or political will to properly provide.

This above perspective also fuels the argument that nonprofits are more than just organizations that provide much needed advocacy and services to their clientele and the community at large. Eikenberry (2009) argues that nonprofits have become the arbitrators of the values and norms of the society in which they operate. Utilizing resource dependency theory and institutional theory, Eikenberry and Kluver (2004) argue that nonprofit organizations are embedded in "multi-layered and interactive dependencies or the blurring of boundaries among the nonprofit, government and market sectors" (Eikenberry and Kluver 2004, p. 133; Ostrander and Langton 1987). This embeddedness implies that nonprofits continuously interact and coordinate with the political-legal and societal value systems in which they operate (Ostrander and Langton 1987). The relationship is an interdependent one, in which the nonprofits uphold cherished societal norms and value systems and society provides support and legitimacy to the actions of the organization. Due to this reciprocal, interactive, and dynamic relationship, nonprofit organizations affect their internal and external stakeholders in ways more significant than just being organizations that provide care and advocacy. Nonprofits are considered progenitors of cultural values and norms: that their influence is instrumental in society maintaining its cultural norms and values systems (Eikenberry 2009). Nonprofits provide expression to the "social, philosophical, moral or religious values of their founders and supporters" (Jeavons 1992, p. 403; Eikenberry and Kluver 2004). As a result, nonprofits become "guardians and promoters of values that are esteemed in the societies in which they exist and operate" (Eikenberry and Kluver 2004). Their service and their advocacy are responsible for upholding such values and their interactions with the systems in which they operate make them more than just service organizations (Jeavons 1992).

Scholars that advocate for the above-described mission/vision/values-based perspectives feel that the perspective that will be discussed next in this essay, the marketization-based perspective, is at odds with and diminishes the societal values impact that nonprofits create and maintain. Additionally, scholars aligned with such an approach have assumed that a marketization approach may actually decrease philanthropic spending and philanthropic contributions, as they continually move away from mission (mission creep) and focus on building market share and enhancing performance. However recent data about the state of philanthropic giving suggest that giving has consistently increased over the years (Giving Statistics 2018). In fact, according to the website philapthropyroundtable.org, charitable giving in the USA is seven times larger in 2016 than it

was in the in1950s. Even after adjusting for inflation, per capita, the average American household gives twice as much in charity now than it did in the 1950s. During this time the onus has been on nonprofits to adopt pro-market strategies and engage in higher levels of social enterprise (Rainey 2014; Kesler 2011; Drucker 1990). This implies that there may be some value to examine the marketization perspective of the nonprofit sector.

## Nonprofit Marketization

Eikenberry (2009) and Simpson and Cheney (2007) define marketization as a set of principles and narratives that promote a business and entrepreneurial approach to an organization's strategy; marketization encourages organizations to adopt capitalist, for-profit-like strategies in order to create funding and revenue streams that allow the organization to fulfill its mission-based strategic objectives. According to some, marketization may be a necessary "evil"; public and nonprofit organizations operating in highly marketized environments must react to prevailing "market" forces by adapting their strategies, frameworks, and structures to environmental pressures in order to survive and thrive. Such an approach implies that the organization adapts and responds to normative and mimetic isomorphic pressures, i.e., the pressure on organizations to conform to the current organizational "standard of success" (Dimaggio and Powell 1983). Consequently in a capitalist, pro-market environment, organizations may implement business-based strategic approaches (marketization practices) that legitimize their actions, and legitimize the organization (Eikenberry and Kluver 2004; Stivers 2000; Deephouse 1996, 1999; Meyer 1991).

Stivers (2000) argues that the prevailing belief and faith in capitalism is governed by a neoliberal agenda that is becoming increasingly prevalent in the current public and nonprofit environment, an agenda in which a capitalist, free market emphasis on organizational activity and strategy is endorsed and promoted. Nonprofits that embed themselves in a neoliberal ideology become focused on demonstrating their business acumen and business-like growth strategies and engage in funding activities that encourage transactional behaviors with their donors, so that donors receive goods or services in exchange for donations; in other words revenue is generated that is not just a one-sided donation by a benefactor but implies an economic transaction. In this neoliberal environment, nonprofits are being encouraged to engage in greater levels of social entrepreneurship, i.e., the creation of goods and services that allow nonprofits to create additional revenue streams from the sale of the aforementioned goods and services and to use those revenue towards their operational and strategic mission activities.

The theoretical underpinning of why nonprofits become more market-like in their actions, structures, and philosophies can also be attributed to resource dependency theory where organizations react to prevailing market forces by adapting their strategy, structure, and processes to reduce environmental uncertainty and dependance on the external environment (Hillman et al. 2009). Thus, when faced with increased competition for scarce resources (such as donors), organizations take actions to manage these resources as best as they can. In a neoliberal environment, where business like practices are seen as positive and emulative, nonprofits organizations may have little choice but to adopt them to survive.

Scholars argue that a normative agenda of neoliberalism has pervaded both the public and nonprofit sectors, such that the adoption of "business-like" practices has become a requirement; thus, the institutionalization of the business environment necessitates conformity so as to receive support and legitimacy. This is an important issue to recognize because it lays bare the inherent tension that nonprofit organizations must face: to remain true towards their internal mission and vision constraints and yet respond to external normative pressures of conformity and required institutional isomorphism.

Eikenberry 2009, Stivers (2000) urges nonprofits not give in to such a perspective. Past scholarship on marketization of the public and nonprofit sector has theorized the following negative consequences:

- Since marketization emphasizes a neoliberal agenda, it is detrimental to democratic values. Marketization places a focus on entrepreneurialism, and the individual self-interest, which is incompatible with democratic citizenship and collective action for public interest.
- Marketization and commercialization trends compromise the civil society roles of the nonprofit sector as guardians of values as service advocates and as builders of social capital.
- It is also detrimental to the collaborative relationship that nonprofits build between the citizen and public administration. Nonprofits serve as a training ground for citizenship and promote the idea of the collective good. Adopting a market-based perspective compromises this view of citizenship and does not build the values of citizenship and collective goodwill that are inherent to nonprofits and the public sector.
- Marketization would blur the boundaries of the public, private, and governmental sectors, further obscuring nonprofit missions and values.

## The Necessity of a Market-Based Perspective

Current trends of increased competition and scarcity of resources indicate that nonprofits seeking to maintain viability may actually benefit from adapting to these new realities in which increasing competition for market share and resources and a focus on demonstrating organizational survival and success drives resultant strategy (Drummond et al. 2000). Nonprofits face a quandary in which they must stay focused on the values and norms they seek to share and propagate and at the same time have the strategic ability to adapt to shifting external environment, and changing funding and resourcing trends that require faster strategic reconceptualization, and also possess a focus on responding to a market-normed environment (Hwang and Powell 2009; Cooney 2006). As Sanders (2015) and Weisbrod (1998) point out, nonprofits tend to operate in an environment of competing responsibilities that are at odds with each other, i.e., "maintaining and unprofitable social mission alongside the constant and often stringent imperatives or operating within a market economy" (Sanders 2015, p. 205). Sanders (2012, 2015) goes far enough to add that such a tension is an integral feature of the nonprofit and that resolution of such a tension may only occur if the sector either compromises its nature or breaks with the requirement to be financially solvent. Sanders (2015) frames this dilemma as a "mission-market tension" and emphasizes that it is a salient issue that nonprofits grapple with on a constant, almost daily basis.

In addition to the mission-market tension, there are a number of reasons why nonprofits are increasingly adopting organizational strategies that require both higher levels of professionalization of practices (also known as rationalization) and more of a business-like approach. One of the main reasons is that nonprofits exist and operate *within* a for-profit market environment, i.e., in environments which require regular transactions with for-profit enterprises (Drummond et al. 2000). In such an environment, "images of successful organization are based on enterprise and corporate practice" (Sanders 2012; p. 207), and these images, attitudes, and practices become the normative understanding of what constitutes a successful organization. In order to practice within an environment that values such corporate customs, nonprofits adopt a strategic orientation and mode of professionalism that imitate the normative standard. Dimaggio and Powell (1983) term such behavior as "mimetic isomorphism," i.e., when an organization imitates another's structure/strategy paradigm because of the assumption that such imitation of the latter organization is beneficial to the former's survival.

Maier et al. (2016) mention the tension in the nonprofit sector between the two positions of the values orientation and the marketization perspective:

> Scholarly attitudes towards these changes diverge. On one hand management and organization studies play a decisive role in promoting the adoption of business-like practices. On the other hand, researchers criticize the mission drift and the loss of idealism. Literature on this topic is fragmented, because research is conducted under a multitude of similar, yet distinct concepts (e.g. commercialization,

> managerialization, professionalization). The range and complexity of these concurrent notions make it challenging for scholars to position their work in a larger context, to build on previous findings, and to identify research gaps. (Maier et al. 2014, pp. 64–65)

Another main reason is that the distinctions between private, nonprofit, and governmental organizations continue to become increasingly blurred and vague, i.e., a blurring of the sectors (Rainey 2014; Weisbrod 1998; Weisbrod 1997). An increasing number of nonprofit organizations perform functions that were previously performed by government entities, and conversely a number of for-profit organizations have entered into arenas that were previously held by either government or nonprofit organizations, or a combination of the two (Rainey 2014). The implications of these increasingly blurred boundaries between the sectors are that nonprofits cannot rely on certain markets exclusively being their operational domain and thus not have the ability to establish dominant norms and values of normative practice, procedure, and strategy. In this blurred environment, nonprofits must compete with each other and with for-profit enterprises for government or private funding, i.e., an increased competition for scarcer resources. Additionally, as Rainey (2014) points out:

> Like government agencies, many nonprofits obviously have no profit indicators and often pursue social or public service missions, often under contract with the government (Weisbrod 1997). To further complicate the picture, however, experts on nonprofit organizations observe a trend towards commercialization of nonprofits, by which they try to make money in businesslike ways that may jeopardize their public service missions (Weisbrod 1998). (Rainey 2014, p. 59)

## Dilemma of Nonprofit Organizations in Urban Environments

The role of the nonprofit in urban environments, i.e., cities with large, highly diverse populations, requires that nonprofits address the needs of the urban center within which they operate while competing for limited resources with other organizations such as other nonprofits as well as private organizations (Barman 2002; Frumkin and Andre-Clark 2000). For nonprofit organizations navigating mission, strategy, and increased competition for resources can be especially challenging. Hula and Jackson-Elmoore (2000) consider the case of the cities of Baltimore, Detroit, and Los Angeles. All three cities are large urban centers with significant African-American populations. African-Americans make up the majority race demographic in Baltimore and Detroit and are over 20% of the population in Los Angeles. Hula et al. (1997) showcase that nonprofits in these communities had to strategize in a multiplicity of methods, moving away from just defining and promoting social value and social missions, but also incorporating a broad policy and economic strategy agenda that involved working with public and business agencies to define values, promote urban and economic development, and provide advocacy to both social issues and issues of urban and economic development. These organizations had to be more than just nonprofits. They had to navigate and straddle not just their immediate operating environments but encompass the understanding that they were now working in those "blurred sectors" that Rainey (2014) points towards. They could no longer just operate on their core mission and core competencies but had to incorporate political and economic contexts. Hula et al. (1997) and other scholars have pointed to a "shrinking of the public sector": that the lack of urban and economic development, the lack of economic opportunities, and the reduction of services provided by the public sector in urban communities of color have required that nonprofits that serve these communities work to address gaps caused as a result of the failure of the private and public sector. Nonprofits in such urban environments become more than just entities fulfilling societal needs and promoting values that result from market failure. They also have to do more than promote and uphold the communities' social norms and values. They are responsible for the urban and economic development of these communities. Such a responsibility implies that they approach their core mission and competencies for both a values-based and a market-based perspective.

Thus, Hula et al. (1997) were able to demonstrate that nonprofits in complex urban environments need to respond to dynamic environmental markers such that the nonprofit shifts away from its traditional roles as an organization that endorses and promotes societal values and shifts towards a more encompassing role that includes urban development, including the development of local businesses and promoting policy change. Hula et al. (1997), Salamon (1987), and Salamon and Anheier (1992) point out that the role of nonprofits have evolved in societal development as a response to market and governmental failure. They (Hula et al. 1997) state:

> It is hardly surprising that there appears and increasing interest in having the nonprofit sector engage long term and short-term economic problems, given widespread capacity cynicism about the capacity of government. Such cynicism is particularly strong in our nation's large cities, which are viewed by many cities as citizens as essentially ungovernable.

Additionally, McKinley-Floyd and Shrestha (2008) mention that philanthropy for communities of color is sophisticated and segmented. African-Americans tend to engage philanthropy in four key strategic avenues: education, sociopolitical empowerment, racial equality, and socioeconomic empowerment. The goals while promoting societal values also demonstrate that engaging philanthropy in communities of color focuses on developing education infrastructure, promoting civil rights, and also stimulating increased business and economic development. Nonprofits that seek to engage communities of color in urban environments need to be cognizant of such segmentation and engage in persuasive and marketization strategies that demonstrate their ability to positively affect such goals: through the strategic involvement of their organizations in such causes. Thus this paper proposes a multipronged approach that includes both an emphasis of values but also one where market-based strategy and outcomes may be better options for nonprofits working with communities of color in urban environments.

The above implies that the nonprofits in urban communities of color need to have more sophisticated messages and strategies. Messages that encompass a values-based outlook, and a strategic orientation that is able to respond to the needs of the community, especially as they relate to economic development. As mentioned earlier in this paper, such dynamic environments require an equally dynamic conceptualization of nonprofit strategies. Strategies that maintain a focus on the social mission but concurrently operate within the requirements of the market economy. As this paper has noted, scarcity of resources and dynamic environments require attention on responding to marketization (Hwang and Powell 2009; Cooney 2006). Sanders' (2015) "mission-market tension" is a salient issue in these environments and one that such nonprofits must continually address.

## A Reconciled, Multipronged Approach for Urban Nonprofits

Urban nonprofits need a strategic response that encompasses both a values-based and a market-based perspective. Recently scholars have been proposing that nonprofit leadership move past a mission-versus-marketization approach, but instead appreciate the value of both perspectives. Some have called for the recognition of other factors that may unavoidably steer the organization towards a more marketized perspective. For example, Hwang and Powell (2009)'s study on the professionalization practices in nonprofit organizations demonstrated that if an nonprofit has a mission that requires higher levels of expertise and professionalization (such as a large hospital), it may then be that the organization has to work within a market-based environment and as a result be more driven towards business-like practices. Similarly, larger organizations that may require highly levels of bureaucracy and professional practice tend to adopt greater levels of managerial professionalism and rationalization of practice (i.e., act in a more corporate manner). A quote that Hwang and Powell (2009) use from their interview with the director of a large art museum reveals the need for a marketized perspective:

> I had to surround myself with people who came from business. I have a deputy who has a very strong business background. He used to be a banker. And then the younger people I have been hiring come from the new wave of MBAs that are getting into the nonprofit sector and are very strategic in terms of how you set your mission, your vision, your goal. (Hwang and Powell 2009, p. 285)

Hwang and Powell (2009) also point out that organizations that receive funding from foundations also face institutional and normative pressures of isomorphism. Funding from such organizations (a number of which receive substantive funding from or are linked with private organizations) comes with sets of structural and reporting requirements. These requirements may necessitate a more business-like, market-forward strategic approach to demonstrate viability such as long- and short-term strategic planning, market outreach, fundraising portfolio, and other means of measuring if the nonprofit will utilize funds granted in an efficient and effective way, in other words a measure of the ROI (return on investment) for the foundation.

The above issues elaborated in this and past sections of this essay necessitate the understanding that nonprofits need to reconcile both their mission-based and market-based strategies. Recent scholarly research has begun to point towards such a perspective. Maier et al. (2016) review 599 articles on the issue of nonprofits becoming "business-like," and they find that there is an increasing prevalence of business-like strategic orientations in nonprofits. They advocate for a measured approach: one where each nonprofit examines its external and internal environments, its internal structure, and processes and adapts its strategic mix of mission- and market-driven approaches to a combination that best suits it. A reconciled approach in which the nonprofit recognizes the positive as well as the tradeoffs of each of the two strategic orientations (mission and market based) and creates a more nuanced, resultant strategy. Current trends of rapidly increasing competition and environmental change in the nonprofit sector have created the sense that in order to survive, nonprofits have had to focus on values that were more aligned with the private, for-profit sector, i.e., competition for scarce resources, a "customer-centric" responsiveness, market capitalization, and a streamlined, lean, and pro-efficiency perspective. This new landscape implies that nonprofits must continually reexamine their strategy, their environments, and their organizational structure such that they are congruent with the evolving needs and expectations of their stakeholders. Nonprofits should be able to critically examine their mission, vision, and value statements, as well as other critical competencies and align them with current and anticipated needs. Additionally, the increased use of social entrepreneurship strategies among nonprofits and their increased relationships with for-profit organizations imply that nonprofits have had to proactively implement marketization strategies that include increased commercial revenue generation and results-oriented economic ROI (return on investment)-oriented patterns of behavior. As the above demonstrates, recent research and data trends tend to no longer support that marketization is a negative strategy that ought to be avoided, but one that is strategically utilized towards the organization's mission and long-term survival. It needs to be noted that the reconciled approach that this essay advocates for does not imply that nonprofits abandon their mission orientation, their vision, or the set of values that make them unique and essential to societal impact and the preservers of cultural norms. Instead, it calls for a measured, relativistic approach, where nonprofits recognize the value of both perspectives.

## A Reconciled Approach to Training for Minority Nonprofit Leadership

One of the implications of a reconciled approach for nonprofit strategy is the issue of developing training programs for minority employees interested in leadership positions. There is a large area of research that demonstrates that minorities and POC (people of color) working at nonprofit organizations have encountered differences in the amounts of training they receive and as a result are at a disadvantage when they try to move into

leadership and top management team positions. The Race to Lead project (Project 2019) states that there is a substantive racial gap in leadership in nonprofit organizations. The project research demonstrates that the percentage of people of color (POC) in executive leadership has remained at under 20% for the past 15 years, even though the USA continues to become an increasingly diverse nation. Past research has shown that nonprofit staff that self-identify as people of color (POC) and ethnic minorities have consistently rated that they receive less training than their white counterparts. Thomas-Breitfeld and Kunreuther (2017) point out that compared to staff that are white, minority staff regularly report receiving less levels of training especially in leadership and development. According to the authors, the same staff report that they feel that the largest gaps in training are in fundraising, staff development, and board development such that the board was able to connect the organization to greater sources of revenue (Yung et al. 2008). Yung et al. (2008) also point out a similar issue. In their assessment of 659 organizations that served ethnic minority groups, the authors found that the most substantive need was in "revenue-generating activities, marketing and public relations, information technology training, program evaluation, and board leadership development. The limited ability of these organizations to pay for the needed assistance creates challenges for planning approaches to meet these vital needs" (Yung et al. 2008, p. 382). Such results suggest that leadership training and development for minorities not only address racial gaps but that the training include both a values-based and a market-based approach that allows trainees to recognize the importance of fundraising, revenue generation, and board development.

Contextualizing the above arguments for leadership training in an urban context is furthered by research that demonstrates that nonprofits in communities of color are already beset by less access to financial and other resources. As Adetimirin (2008) points out:

> With public funding cuts, minority-led nonprofits face the additional challenge of serving a population that has fewer financial resources to contribute to organizations that serve them. Moreover, recent studies show that foundation grantmaking for ethnic minorities is low and is not growing at the same rate as overall giving. (Adetimirin 2008)

Thus a lack of adequate leadership training and training in a market-based growth and sustenance approach for minority nonprofit leaders has severe implications for communities of color and urban environments where nonprofits tend to have leaders that reflect the ethnic diversity of the populations they serve. Providing minority leaders with training in both mission-based and market-based approaches would be beneficial for the communities they serve as well as promoting greater diversity among nonprofit leaderships and nonprofit boards.

## Conclusion

This essay proposes a reconciled model of the strategic process for nonprofit organizations. It examines past critical literature on strategic orientations and evaluates the works of past scholars who have dissected and critically analyzed the process from either a pro-marketization or a pro values perspective. It recommends a reconciled model allowing organizations to critically assess both sides of the proverbial coin. Thus, this paper explores the examination of marketization issues such as the relevance of current MVVs (mission/vision/values), core competencies, and efficiencies and yet also recognizes value and social advocacy factors that need to be synchronously studied during the strategic process. The paper acknowledges the inherent structural tension within current nonprofit organizations: as to whether to become entities of marketization and examine issues of reinvention and strategic adaptation on a continual basis (Durst and Newell 2001; Akingbola 2006) or maintain their traditional and lauded role of being "value guardians," generators of social capital, and proponents of service and advocacy (Eikenberry 2009). The author posits that by examining both such conceptualizations, organizations can exploit this inherent tension for their own benefit in formulating a model and an ensuing strategy that allows

for the absorption of the key elements of both approaches. Such an approach is especially salient in urban environments that are affected by dwindling resources and a crisis in trained leadership. Based on the reconciled model, the paper also proposes how to adjust and advance leadership training for minority employees in the nonprofit sector.

## Synonyms

City planning/town planning; Expansion; Growth; Haiti; Improvement; Urban design; Urban development; Urban planning

**Urban Planning**, also referred to as, **urban and regional planning**, **regional planning**, **town planning**, **city planning**, **rural planning**, **urban development**, **physical planning**, **urban management** or a similar combination in various areas worldwide, is a technical and political process that is focused on the development and design of land use and the built environment, including air, water, and the infrastructure passing into and out of urban areas, such as transportation, communications, and distribution networks.

Typically, there are three actors that have main roles in urban planning, namely the decision-makers/policy makers, the technician/planners, and the users/community stakeholders.

**Planned city/community** is any community that was carefully planned from its inception and is typically constructed on previously undeveloped land. Some examples include Gaborone, Botswana, Wolfsburg, Germany, Sparta, Greece, and Saint Augustine, FL.

## Introduction

Haiti is a densely populated island nation located in the Caribbean, and unequivocally Haiti is the first Caribbean island planned community/country created and developed by freed slaves beginning in the late 1700s to the present day.

It took over a decade for the Haitian people to obtain their independence after the slave revolt and soon after what begin was a movement toward country unification. This process, movement, collaboration among the almost slaves can be identified as planning, although not in the traditional sense but nonetheless it was a form of planning with intent. What begin was over 215 years of what I would coin as passive/intentional conscious planning. The collective acceptance of the Haitian people to create a nation that possess all the required survival apparatuses at that that time. In Haiti, Planning had been analogous to top-down and centralized. It was not until the forced 19-years invasion and subsequent occupations of the United States from July 28, 1915, to August 1, 1934, did the Haitian people lose their autonomous decisions on where land uses, such as housing, road, and other infrastructure will be built. The invasion embodied the complete control and decision-making of international forces of planning in the island. Planning for the next 17 years will then become multicultural with the American forces selecting and appropriating public policies of development and to some extent zoning. When the American invasion ended, numerous rules, statues, orders, decrees, and mandates that were passed remained that were completely ineffectual to the masses and benefited the affluent and the Haitian citizens. There were also public policies embodied in the Haitian constitution that prohibited foreign land ownership. Under the United States invasion, permitted without the mass consent of the Haitian people, foreigners became able to purchase both residential as well as commercial properties.

In as much as American, European, and other nation's commercial industries were located, dominated, and prevailed in Haiti, planning was not bottom-up process and remained an international and centralized activity throughout the nineteenth and part of the twentieth centuries.

The effect of the invasion was specifically impactful to the growth and urbanization of the capital city, Port-au-Prince. Haiti was primally rural with its major economic activities distributed among several seaports where commerce during that time flourished. After the 1915 invasion by the United States, the Americans facilitated the centralization of trade activities to/in Port-au-Prince. A move which has economic and developmentally affected the country due to rapid urbanization of the capital and economic and social reconcentration of rural regions. According to World Bank, today, more than half of Haiti's population lives in the country's cities and towns, a major shift from the 1950s, when approximately 90% of Haitians lived in the countryside/rural regions (Taylor 2018).

Haitian institutions whose mandate relates to planning exist and have changed over time. Physical and territorial planning tools have been developed over the past three decades. Some have been applied, and others have become outdated and ought to be updated and better adapted. Haiti needs to change the paradigm it uses for planning if it is to tackle new urban challenges and confront the issues facing it in the twenty-first century. The entry aims to highlight the most important experiences in the field of town planning and urban development in Haiti before and after the earthquake of January 12, 2010. It discusses traditional thinking and studies on town planning and urban development, before moving on to look at some achievements and success stories as well as presenting the flaws and limits to the existing planning system in Haiti.

## Procedural Theories/Conceptual Framework of Urban Planning Approaches

Urban planning theories/approaches are typically considered procedural since they generally concern itself with the process of planning that occurs and whether the processes are valid. Urban planning processes are either top-down, bottom-up, or sustainable approach. There are nine topmost procedural theories of modern urban planning today consisting of the Rational-Comprehensive approach, the Incremental approach, the Transformative Incremental approach, the Transactive approach, the Communicative approach, the Advocacy approach, the Equity approach, the Radical approach, and the Humanist or Phenomenological approach.

Rational-Comprehensive Planning- The reference framework of urban planning as an approach was consolidated and applied to various disciplines, among them regional and urban development and the so-called Rational-Systemic approach of knowledge being dominated by economists, architects, and planners. The rational planning model is a model of the planning process involving several rational actions or steps. According to Taylor (1998), five steps involve in the rational model, as follows:

- Definition of the problems and/or goals
- Identification of alternative plans/policies
- Evaluation of alternative plans/policies
- Implementation of plans/policies
- Monitoring of effects of plans/policies

The rational planning model has been central in the development of modern urban planning and transportation planning. One key limitation of this model is particularly the lack of guidance on involving stakeholders and the community affected by planning, and other models of planning, such as collaborative planning.

Also referred as the Blueprint model, the Rational Planning movement (1890–1960) emphasized the improvement of the built environment based on key spatial factors. Examples of these factors include exposure to direct sunlight, movement of vehicular traffic, standardized housing units, and proximity to green space. To identify and design for these spatial factors, rational planning relied on a small group of highly specialized technicians, including architects, urban designers, and engineers. Other, less common, but nonetheless influential groups included governmental officials, private developers, and landscape architects. Through the strategies associated with these professions, the rational planning movement developed a collection of techniques for quantitative assessment, predictive modeling, and design. Due to the high level of training required to grasp these methods, however, rational planning fails to provide an avenue for public participation. In both theory and practice, this shortcoming opened rational planning to claims of elitism and social insensitivity.

**Synoptic theory** of planning followed rational comprehensive planning, Lane (2005) describes synoptic planning as having four central elements:

> (1) an enhanced emphasis on the specification of goals and targets; (2) an emphasis on quantitative analysis and predication of the environment; (3) a concern to identify and evaluate alternative policy options; and (4) the evaluation of means against ends. (page 289)

Public participation was first introduced into this model. However, the problem was that the idea of a single public interest still dominated attitudes, effectively devaluing the importance of participation because it suggests the idea that the public interest is relatively easy to find and only requires the most minimal form of participation.

**Participatory planning**- Conscious Participation in planning/participatory planning is an urban planning paradigm that emphasizes involving the entire community in the strategic and management processes of urban planning; or, community-level planning processes, urban or rural. It is often considered as part of community development (Lefevre et al. 2000). Participatory planning aims to harmonize views among all its participants as well as prevent conflict between opposing parties. In addition, marginalized groups have an opportunity to participate in the planning process.

**Incrementalism**- Beginning in the late 1950s and early 1960s, critiques of the rational paradigm began to emerge and formed into several different schools of planning thought. The first of these schools is Lindblom's incrementalism. Lindblom describes planning as "muddling through" and thought that practical planning required decisions to be made incrementally. This incremental approach meant choosing from small number of policy approaches that can only have a small number of consequences and are firmly bounded by reality, constantly adjusting the objectives of the planning process, and using multiple analyses and evaluations.

**Transactive planning**- Friedman (1973) identifies transactive planning as a radical break from previous models. Instead of considering public participation as a method that would be used in addition to the normal training planning process, participation was a central goal. For the first time, the public was encouraged to take on an active role in the policy-setting process, while the planner took on the role of a distributor of information and a feedback source. Transactive planning focuses on interpersonal dialogue that develops ideas, which will be turned into action. One of the central goals is mutual learning where the planner gets more information on the community and citizens to become more educated about planning issues.

**Advocacy planning**-Formulated in the 1960s by lawyer and planning scholar Paul Davidoff (1965), the advocacy planning model takes the perspective that there are large inequalities in the political system and in the bargaining process between groups that result in large numbers of people unorganized and unrepresented in the process. It concerns itself with ensuring that all people are equally represented in the planning process by advocating for the interests of the underprivileged and seeking social change. Again, public participation is a central tenet of this model. A plurality of public interests is assumed, and the role of the planner is essentially the one as a facilitator who either advocates directly for underrepresented groups directly or encourages them to become part of the process.

**Radical planning**-Grabow and Heskin (1973) provided a critique of planning as elitist, centralizing and change-resistant, and proposed a new paradigm based upon systems change, decentralization, communal society, facilitation of human development and consideration of ecology. John Friedmann, in 1987, entered the fray with *Planning in the Public Domain: From Knowledge to Action*, promoting a radical planning model based on "decolonization," "democratization," "self-empowerment," and "reaching out." Friedmann described this model as an "Agropolitan development" paradigm. In "Toward a Non-Euclidian Mode of Planning" (1993) Friedmann further promoted the urgency of decentralizing planning, advocating a planning paradigm that is normative, innovative, political, transactive, and based on a social learning approach to knowledge and policy. Radical planning is a stream of urban planning which seeks to manage development in an equitable and community-based manner.

**Bargaining model**- The bargaining model views planning as the result of giving and taking on the part of a few interests who are all involved in the process. It argues that this bargaining is the best way to conduct planning within the bounds of legal and political institutions. The most interesting part of this theory of planning is that it makes public participation the central dynamic in the decision-making process (McDonald 1989). In the bargaining approach to urban planning, decisions are made first and foremost by the public, and the planner plays a more minor role.

**Communicative Approach**-The communicative approach to planning focuses on using communication to help different interests in the process to understand each other. The idea is that everyone will approach a conversation with his or her own subjective experience in mind and that from that conversation shared goals and possibilities will emerge. Again, participation plays a central role in this model. The model seeks to include a broad range of voice to enhance the debate and negotiation that is supposed to form the core of actual plan making. In this model, participation is fundamental to the planning process happening. Without the involvement of

concerned interests, there is no planning. Bent Flyvbjerg and Tim Richardson developed a critique of the communicative approach. Lane (2005) argues that public participation is largely influenced by how planning is defined, how planning problems are defined, the kinds of knowledge that planners choose to employ, and how the planning context is set.

These primary theories of planning approaches to urban planning are tools that have been used for good practice. However, arguably they may be predominately western based. In Haiti, urban planning processes are highly subjected to central political influences and institutional structures. The process of planning involving many stakeholders, akin to the participatory or communicative approaches, is minimal. Urban planning remains highly central, and the Haitian government including government planners does produce plans while not as publicly available. Development planning in Haiti remain top-down Rational-Systemic approach, where planning is concentrated/centralized and participation by international funding agencies, such United States Agency for International Development (USAID) for project development. The results of the process were directed to the selection of an optimal proposal that would show lower costs and cover the outlined purposes, where the decision was centralized, and the participation of the population was practically null.

## Urban Planning in Haiti Between 1975 and 2005

The institutions in charge of economic and social planning in Haiti are the Ministry of Planning and External Cooperation (MPCE), together with other planning bodies and local government authorities. Under Article 61 of the 1987 Constitution, Haiti's units of local government are defined as the communal section, the commune, and the department.

Planning the physical development of urban areas is the responsibility of the Ministry of the Interior and Local Government (MICT), the Ministry of Public Works, Transport and Communications (MTPTC), the Urban Planning Service (SPU), and local authorities.

The first attempts at formal, deliberate planning by the Haitian authorities responsible for town planning and urban development began during the period from 1975 to 2005. With funding from UNDP and the Haitian state, high-quality urban planning studies made it possible to highlight urban dynamics and the way Haiti's capital and the rest of the country operated. During that period, the Haitian state prioritized urban development of the Port-au-Prince region. The town in Haiti: a concept yet to be defined. It is a paradox that while the town in Haiti has a physical and spatial reality which differentiates it from rural settlements, it is not recognized in law. Nonetheless, it is worth noting that according to official statistical estimates, 52% of the population lived in urban areas in 2015 (IHSI, Population Estimates: 2015). Based on an analysis of satellite images that included identification of the urban foot printing built-up areas, Haiti had an urban population of more than six million people in 2018, equivalent to approximately 64% of its total population (WB: 2018). Hence, the urgency of setting criteria to define towns in the country of Haiti to ensure better control over urbanization. **Town planning and urban development documents**- The key studies marking the beginning of urban development and land use planning in Haiti date back to the *Port-au-Prince Development Plan* (1975–1977, CONADEP-PNUD), the *Land Use Outline* (MPCE-PNUD: 1981), and the 1988 *Port-au-Prince Development Plan* (MPCE – Lavalin).

These urban development and national planning documents were funded by bilateral donors. The quality of the work arises from the fact that they contain the first urban assessments of Port-au-Prince and its metropolitan region, along with strategic recommendations and ways forward for the development of Port-au-Prince and surrounding areas. The 1981 *Land Use Outline* (MPCE-PNUD: 1981), which was drawn up on the basis of urban surveys and an assessment of the use of physical space, was the first review of local assets, development potential and constraints, and of the way urban and rural land is used, carried out at a national level.

This period was therefore one of growing interest at the national level in conducting studies on urban development and land use planning in Haiti which as aimed primarily at highlighting the importance of spatial planning in promoting the coherent and integrated development of Haiti's territory.

In addition to this interest in regional planning promoted by the MPCE, the Ministry of Public Works, Transport and Communications (MTPTC) and the Urban Planning Service (SPU) produced plans for the development and expansion of major Haitian cities such as Cap-Haitian and Gonaïves in the period between 1982 and 1994. In the metropolitan area of Port-au-Prince, development and infrastructure plans were drawn up for the urban areas of Carrefour, Delmas, and Frères. However, it is important to stress that these studies only provided outlines.

Haiti's cities, the administrative centers of each department and several medium-sized towns have, since 1996, benefited from development and expansion plans drawn up during projects supporting municipalities or decentralized cooperation between twin towns. From 1996 to 1998, the *Priority Support to Municipalities project, HAI/94/003* of the United Nations Development Program (UNDP)/United Nations Centre for Human Settlements (UN-Habitat) oversaw the development of urban plans for a number of towns and cities such as Cap-Haitian, Fort-Liberté, Port-de-Paix, Gonaïves, Saint-Marc, Hinche, Miragoâne, Jacmel, Cayes, and Jérémie, although some of the plans, specifically those in Gonaïves, in 2005–2007, and Jacmel, in 2007, were revised a few years later.

Between 2001 and 2003, the *Port-au-Prince Metropolitan Area Development Plan and Program/Urban Initiatives Program for Port-au-Prince* prepared by the Haitian Government and the Interdevelopment Bank (IDB) made it possible to draw up a master plan for the Development of the Metropolitan Area of Port-au-Prince and a Strategic Development Plan.

Between 2005 and 2007, following the flooding of Gonaives brought about by Hurricane Jeanne in September 2004, the town's government drew up the Local Urban Development Plan for the Town of Gonaïves in partnership with the Ile de France Region and CRESFED.

## Town Planning and Urban Intervention After the January 12, 2010, Earthquake

The January 12, 2010, earthquake in Haiti drew attention to the country's extreme vulnerability in the Caribbean region. Following the extensive damage caused by the earthquake, urban planning in Haiti focused on land-use planning for the whole country and post- disaster development plans for the affected towns and areas. A new approach to urban planning in Haiti was developed. Greater importance was attributed to taking natural risks into account as well as to exercising control over land use through the involvement of local communities in the process of planning and local development. Regulatory frameworks were also developed to ensure sustainable and up to standard interventions in the affected neighborhoods. National planning documents were drawn up over this period, including the *PSDH –Haiti Strategic Development Plan/Emerging Country 2030.* (MPCE, IBIDAA: 2015). After the January 12, 2010, earthquake, the national government designed a new framework for urban development and land use management in Haiti. This vision for an emerging country by 2030 and the strategic development guidelines were presented in the Haiti Strategic Development Plan (PSDH). Its objective was to guide public action over the course of 20 years based on four major fields of operation: territorial, economic, social, and institutional reform.

As a follow-up to this, the Ministry of Planning and External Cooperation (MPCE) drew up a *National Land Use* Plan-SNAT (MPCE: 2016). After carrying out a land use assessment and highlighting development challenges, the document presents strategic priorities, each broken down into several objectives. The SNAT serves as a reference document for all planning interventions after the earthquake.

Another report, *"Haiti tomorrow"* (World Bank/ST-CIAT:), is the outcome of strategic thinking about the development of regional plans

for the country. It offers a frame of reference for regional planning and development interventions in Haiti.

These general and strategic documents all point to the importance of Port-au-Prince at the national level, and the role it is envisaged to have in years to come. They also propose decentralization away from the city of Port-au-Prince and moving toward the development and strengthening of regional capitals and medium-sized towns.

*Outline for the Urban Development of the Metropolitan Area of Port-au-Prince* (MPCE/IBIDAA, 2013) is a conventional urban planning document, including an action plan with strategic priorities and projects that should be carried out. It proposes local development actions aimed at ensuring the coherence of urban planning initiatives in Port-au-Prince and its metropolitan area.

**Reconstruction of the administrative center of Port-au-Prince.-**The 2010 earthquake affected downtown Port-au-Prince very seriously, with the destruction of the presidential palace, among other important buildings. The downtown area, which had been the economic, commercial, and administrative heart of the city, was emptied of activity, which moved instead to more peripheral areas.

Though the country is still recovering from the 2010 earthquake, many of Haiti's landmarks dating back to the early nineteenth century remain intact. To address planning, since 2010, a number of studies have been carried out. They include *The Downtown Port-au-Prince Reconstruction Plan* produced by the Prince's Foundation for the Built Environment with technical support from the architectural firm Duany-Plater-Zyberk (DPZ), the outlines of urban plans for 18 towns and plans for 6 development poles produced by the firm IBI/DAA, as well as various proposals for the development of neighborhoods in the Port-au-Prince metropolitan area, the City of Jacmel-Marigot area, and the regions of Les Palmes (Léogane, Petit-Goâve, and Grand-Goâve).

The Unit for the Construction of Housing and Public Buildings (UCLBP), a body which reports to Haiti's Prime Minister, was set up after the earthquake to take charge of the reconstruction of government buildings that were destroyed during the earthquake as well as the construction of new, up to standard housing in Port-au-Prince. As the designated contracting authority, UCLBP has been assigned responsibility for planning, coordinating, and implementing the Port-au-Prince "Administrative City" project.

The Administrative City will once again house the buildings of the vast majority of Haitian government and state institutions in areas declared to be of public utility (DUP of May 20, 2012) in downtown Port-au-Prince – *La Cité Administrative of Port-au-Prince – MPCE-UCLBP-IBIDAA planning guidelines*, 2012.

To assist with implementation of the Port-au-Prince Administrative City project, CIAT's technical secretariat, together with the UCLBP, the MTPTC and Port-au-Prince City Hall have developed regulatory guidelines called a *Minimal Framework for the Development of the Old City Center of Port-au-Prince, Haiti to Protect its Architectural, Urban and Landscape Heritage. (Old center of the city of Port-au-Prince/Regulatory guidelines – CIAT- Port-au-Prince City Hall-MTPTC-UCLBP, 2012/Annotated and illustrated regulatory guidelines, 2013).* These guidelines, issued by Port-au-Prince City Hall, were drawn up to provide a framework for planning and construction projects in the old city center of Port-au-Prince.

The main components of the regulatory guidelines for the old Port-au-Prince city center include regulations to ensure preservation of land that is of national interest. It serves as a reference point for planning the physical reconstruction of the historic center of Port-au-Prince. It represents a considerable step forward in the field of regulation of the reconstruction process that is of interest to the whole nation. As to urban planning at the level of Port-au-Prince district, after the January 12, 2010, earthquake, the main concern was to draw up detailed development plans for certain neighborhoods in the Port-au-Prince area. Post-earthquake development plans for these districts were drawn up jointly by the Haitian state, nongovernmental organizations (NGOs), and bilateral financial institutions. Many studies were carried out with community participation, emphasizing integrated

planning and implementation of priority ad hoc projects.

The *Canaan Upgrading and Community Development Program (CUCD) – Urban renewal for the center of Canaan and its outlying districts/ Project Identification* managed by USAID, the American Red Cross, *Global Communities* and SODADE with the town halls of Varreux and Croix des Bouquets (2016–2017)**,** made it possible to carry out a post-disaster technical assessment of land in the Canaan study area, located on the northern road out of Port-au-Prince. A participatory social assessment, which included strategic planning workshops involving the communities of Canaan, Jerusalem, Onaville, and Saint Christophe opted for the development of a joint urban restructuring plan for the center of Canaan. Priority projects designed in accordance with community expectations were identified and implemented over a 2-year period.

The City of *Delmas 32 Post-Disaster Redevelopment and Restructuring Initiative, Urban Project for Participatory Development – Operational Urban Planning Plan for the City of Delmas 32 (PRODEPUR)* is another program managed by the Ministry of Economy and Finance and the Bureau of Monetization of Development Aid Programs (BMPAD), with the initial study carried out by SODADE (2010–2011). The project made a post-disaster assessment of the Delmas 32 district and put forward a development model based on residents' participation in the planning and urban restructuring process for their neighborhood. Projects for the provision of local services were identified and implemented with the intention of revitalizing the economy and boosting the resilience of the community in Delmas 32.

*The Town of Léogane Communal Development Plan* coordinated by the Economic and Social Assistance Fund (FAES: 2011) provided a post-disaster assessment and detailed review of the social needs of the population of the town and its communal sections, and included strategic guidelines for the relevant communes. Some basic local services were introduced as a result.

Between 2010 and 2018, neighborhood planning studies were carried out, presenting detailed urban assessments of various neighborhoods in the commune of Port-au-Prince: Desprez, Quartier Ti Savann, Christ Roi, Zone Fort National, Grand Ravine, Martissant, Haut de Turgeau, Bas Canapé Vert, Villa Rosa and Sainte Marie, Haut de Turgeau, and Debussy. It is worth noting that these neighborhood development plans cover a significant proportion of the municipality (almost 60%) (UrbAyiti- Expertise France, MICT: 2018). The process of drawing up these neighborhood plans required the support of local community associations, and trust had to be built with the local population while they were being conducted.

One of the most important neighborhood development plans is the *Martissant Development Plan,* produced by the firm ACT-LGL (2012) as part of an AFD project aimed at restructuring Martissant and Baillergeau. Another, the *Carrefour Feuilles Participatory Urban Planning Project*, is an example of a participatory urban development project, which was drawn up in 2012 by UN-Habitat with funding from the Haiti Reconstruction Fund (FRH).

Analysis shows that these neighborhood plans were developed with physical and spatial restructuring and urban planning needs in mind. However, given the level of poverty in some of the neighborhoods studied, implementation became a cosmetic exercise, papering over other serious issues. It is also worth pointing to the fact that the interventions contained in the neighborhood plans were sometimes developed in isolation, without any links to the city of Port-au-Prince. Some of the projects in these local plans have been carried out, while others have not moved beyond the design phase.

## Conclusions: A Change Paradigm to Move into the Twenty-First Century

It is essential that the institutions responsible for urban planning and development define public policies in this field over the medium term, to ensure that the physical development of Haiti's towns and cities becomes more resilient and is up to standard. Moreover, the concept of towns and

their boundaries in Haiti, as well as that of urban space, are based on extremely vague criteria. As a result, it is essential for them to be defined in law as to be able to cope with new urban challenges. Given the extreme vulnerability of the Haitian capital and the hazards to which the country's cities are widely exposed, the Haitian state should, over the short and medium term, continue to plan and implement the urban improvements laid out in the reconstruction plan for Port-au-Prince's Administrative City.

Indeed, the largest reconstruction project in Haiti after the earthquake, the reconstruction of Haiti's National Palace, is due to be carried out at the heart of the capital's Administrative City. To ensure better control of urban management, Haitian municipalities should be provided with an operational planning tool for use in urban settings. In the case of Port-au-Prince, this will involve integrating the new social and land-use challenges facing the city, taking into consideration the studies, and thinking already carried out. The objective of such an approach is to ensure, on the one hand, a coherent, integrated, and operational urban development for the city of Port-au-Prince over the medium and long term; and, on the other, to consolidate the authority of the Port-au-Prince municipality, and of municipal governments in general, over the long-term in matters of urban development.

The competent bodies in the field of urban development should, over the medium and long term, define a framework and procedures to supervise implementation of the new building construction code, which was renewed and consolidated by the MTPTC after 2010. It is also essential to capitalize on social gains made in the practice of participatory urban development in Haiti since 2010. Community participation and involvement in urban and land-use planning processes facilitates greater ownership of urban projects by local people in the medium and long term.

There was legislation on urban development and town planning in Haiti which dates back to June 6, 1963. It is important to highlight the relevant legislation on urban development and town planning establishing special regulations relating to housing and town and country planning with a view to promoting urban development. The law provides a framework allowing for the expansion and development of Haiti's towns. It also proposes a structure for establishing zoning. Although it was passed in 1963, it still provides the legal reference point that is used today in urban planning and development in Haiti. It has become obsolete. It may be of significance if it is updated and adapted to fit the new issues that have emerged and current challenges in the field of planning in urban regions of Haiti.

## Recommendations to Move into the Twenty-First Century

Haiti needs to change the paradigm it uses for planning if it is to tackle new urban challenges and confront the issues the urban areas are facing in the twenty-first century which worsened after the 2010 earthquake due to overpopulation and rapid urbanization.

It may be of significance if it is updated and adapted to fit the new issues that have emerged and current challenges in the field of planning in urban regions of Haiti. Haiti needs to change its urban planning approach. Top-down external funding focus if it is to tackle these urban challenges, namely, the urban planning efforts potential to confront infrastructure gaps and investing in basic services.

- Government planners should involve the residents, citizens, and other stakeholders the decision-making of projects and development of urban plans.
- Determine opportunities and urban planning initiatives post-Covid-19 pandemic era. While to date few cases have been reported for the island nation, urban planners should consider the future development approaches to prepare adequate facilities to handle a potential or similar outbreak.
- Develop and establish governmental, commercial/commerce centers, and mixed-use

development in peripheral areas where there are opportunities and available land.
- Promote/establish an indicative planning approach between government and private sector.
- Adjust the traditional top-down planning towards a bottom-up proposal.
- Decentralize the capital city to provide infrastructure and development along the outer peripheries.
- Haiti has a major and available labor pool. Government should capitalize on that benefit by working to promote, internationally, products such as Haitian art, knowledge, the unique skills, and talent from the populace.

# Urban Policy

Jing Wang
Department of Political Science, California State Polytechnic University, Pomona, CA, USA

## Synonyms

Social policy; Urban governance; Urban management; Urban politics; Urban program

## Definition

Urban policy refers to the cluster of policies that are aimed at influencing the development of urban areas and urban lives. It could be fragmented and diverse in practice due to the fragility of social needs and political institution.

## Introduction

Urban policy is a broad category of policies tackling public problems in urban areas. In the USA, the understanding of "urban area" has been evolving as being reflected in the US Census Bureau's definitions in decennial censuses. For the 2010 Census, "urban(ized) area" is defined as "a statistical geographic entity consisting of a densely settled core" and "contiguous qualifying territory that together have a minimum population of at least 50,000 persons" (p. 15). However, the US Census also gives a more general identification of "urban" as the "densely developed territory, encompassing residential, commercial, and other nonresidential urban land uses within which social and economic interactions occur" (US Census 2010, p. 15). Today, more than half of the world's population are living in urban areas. With the rapid development of urban settlements around the world, it is projected that 70% of the world population will be living in cities by 2050 (UN-Habitat 2014).

The global process of urbanization, which is about the spatial concentration and growth of the

urban population, has presented important opportunities as well as major challenges to many countries. We could list a series of urban problems ranging from distressed public housing to poor transportation, from public health crises to inequitable urban education, and from high crime rate to concentration of poverty; and the list continues. To address these problems, governments of different levels have developed policies and programs to accommodate and manage the process of urbanization in their respective countries. Due to its urban context, history, culture, and other features, each country's urbanization process is different, with varying goals and unique challenges.

There is little shared understanding about what constitute urban policy. The discussion of urban policy has been covering numerous initiatives and programs to create opportunities and welfare outcomes in urban setting (Cochrane 2007a). Because of the complex nature of the urban problems to which urban policies are expected be applied, there is hardly one urban policy that fits all scenarios. However, these ambiguities and inconsistencies give urban policy its importance, as well as reflect the critical role of the cities in social and economic development (Cochrane 2007b). This article explores the definitions and scopes of urban policy, outlines typology of urban policy, and addresses its current trend and challenges, as well as discusses its future development.

## A Coherent Urban Policy?

Urban policy evolves along with the urban development process around the globe. The definition of urban policy is elusive in part because it appears so self-explanatory. It is a cluster of policies that are aimed at influencing the development of urban areas and the lives of those living in urban areas (Cochrane 2007b). Many public and social policies directly affect urban areas (such as housing, transportation, and education), but not all of them are labeled as "urban." What is missing is a clear cut or simple definition that helps determine what makes urban policy "urban" or the nature of urban policy that distinguishes it from other policies.

There is hardly a widely adopted definition of urban policy, "at least in Western society, a chaotic conception" (Atkinson and Moon 1994, p. 20). The content and scope of urban policy vary across the countries at different developmental stages. In the Western world, the birth of urban policy has been located in Johnson's declaration of "War on Poverty" and his promise of a "Great Society" (Cochrane 2007a; Ross and Levine 2012). It marks the first time in American history that large-scale federal policies are created specifically for urban areas. Followed by that was Carter's proposal of "New Partnership to Preserve America's Communities" which targeted local communities with financial assistance and job creation. Carter was the first, and the last, president to propose a coherent, explicit national urban policy in the USA. His pledge has smashed against a constituent-protectionist congress (Ross and Levine 2012).

Unfortunately, the development of urban policy from these early attempts did not take a continuing learning process with a clear and consistent set of aims and practices. If we define urban policy as nation-state's self-conscious intervention into urban lives and spaces, it could be fragmented and diverse in practice due to the fragility of social needs and political institution. While postindustrial countries, such as in the USA and UK, are searching for approaches of coherent national urban policy, decision-makers in China are dealing with social equity issues in the rapid process of urbanization. Meanwhile, much attention has been paid on lifting peoples up from slums in many regions in Africa and South Asia.

The complexity of existing social and political arrangement makes it almost impossible to find a universal definition of a coherent urban policy. It makes more sense to understand "the process by which the urban policy develops and defines itself in practice" (Cochrane 2007a, p. 2). In essence, discussions should start with identifying the urban problems and issues that deserve resource inputs and policy interventions.

The social construction of "urban deprivation" is important for understanding these urban

problems and issues. "Urban deprivation" refers to a social problem in urban area which requires policy intervention. Scholars have criticized the "muddling thinking" with regard to "urban deprivation" which in decision-makers' ideas is an umbrella of causally related social issues and problems (Cochrane 2007a; Edwards and Batley 1978). In practice, the urban policy could be any policy intervention for those problems with "urban label", such as delinquency, poverty, and unemployment.

Another distinctive feature shared by various urban policies is that they have had "a territorial or area focus" (Cochrane 2007a, p. 3). Urban policy has been and will continue to be preoccupied with "spatial targeting" (Burton 1997, p. 430). By spatial targeting, an urban policy focuses on spatially delimited (urban) areas or the groups of people associated with these areas. For policy makers, the value of the spatial identification of urban policy is that it can be used to isolate and symbolize particular clusters of problems and to apply specific interventions to these clusters. However, this approach of urban policy identification has also been criticized for its simplicity. Cox (2001) warns that we need to use the term "urban" with great caution. It can be just another spatial category (similar to "region," "rural," "local," and "global") being used to "carve up the world" without substantial distinctions (Cox 2001, p. 761).

The questions remain, are we able to define a coherent urban policy? And is it necessary to have a coherent urban policy? There are no simple answers to these questions. Just as Downs (1999) criticizes, there is not a single formal strategic decision-maker in US urban policy. Instead, current practice of urban policy has resulted almost entirely from "a combination of market forces plus political policies aimed at goals other than how metropolitan economies ought to develop" (p. 15). No matter what scale and emphasis a particular urban policy initiative has, we define it as "urban" as its purpose is primarily improving physical and economic conditions within specific areas and therefore ameliorating the quality of life and opportunities of advancement (Burton 1997).

## Types of Urban Policy

Regardless of the controversy of defining a coherent urban policy, most discussions of urban policy seem to have no problem to go from there and identify the major types of urban policy. Over the years, urban experts have suggested a number of typologies based on the normative ideas by which urban policies are initially designed. They may take a variety of perspectives and criteria, but most of the typologies suggest the distinction between policies focusing on economic development and those for others.

Urban policy is usually a collaboration of national and urban governments. In terms of economic development, the national and urban interests are not always consistent (Hanson 1983). The tension intensifies when the growth rates are low or negative. In particular, when some regions are growing and others are declining, urban interests may be conflicting with one another, as well as with the national interests. In this case, Hanson (1983) believes national urban policy should encourage the adjustments in economic structure and meanwhile stabilize the most adversely impacted urban economies and societies. Therefore, most of the urban policies are located in these two categories: (1) those that encourage economic development and (2) those that provide stable environment for those areas and people left behind (Hanson 1983).

A spectrum of economic development models, from pure free market to heavy central planning, has been applied to urban places round the globe. Leaving the future of urban areas entirely to the market will jeopardize social equity and other profound values of urban society, while the centrally planned economy tends to ignore the principle of market as a device to allocate resources efficiently. Therefore, the best approach is to craft urban policy in a way to understand and reinforce the market. Policies should be able to "provide reasonable options for dealing with economic transformation" (Hanson 1983, p. 172).

Many have criticized the economic dominance of urban policy (Hanson 1983; Lake 2005). According to Lake (2005), the predominant influence of the historical context to current US

national urban policy is the subordination of urban and social policy to the needs of economy. The economic dominance is an ideological position with far-reaching consequences for urban policy. The government's commitment to urban policy subordinates to its concern with economic development, as being reflected in its obsession with tracking economic indicators such as the unemployment rate. Instead of defining policy goals based on the social needs of urban populations and places, government's attention is limited to those urban priorities that are compatible with the needs of growing and stabilizing the economy. The most recent manifestation of the economic dominance, as Lake (2005) argues, is the financialization of urban policy. The financialization of urban policy entails the redesign and implementation of urban policy as a financial instrument which is governed by the needs of a finance-based economy, rather than the social or urban problems that need to be addressed.

Despite the critiques of economic dominance, studies have noticed the shifting of urban policy strategies and patterns within the economic focus and beyond. Ward (2014) observes that the strategies of urban policy have been transformed from collective consumption to economic development. Collective consumption strategies tend to emphasize inward investment, physical regeneration, and residential gentrification in urban places (Cox and Jonas 1993). Economic development strategies are more about holistic programs and initiatives to promote urban development, including those of education, health, social services, and transportation (Ward 2014). By examining the political logic and evolutionary path of US urban policies, Kantor (2013) illustrates that urban policy has "two faces": social and developmental. Each of them follows quite different political dynamics within specific policy boundaries, and developmental face does not necessarily overshadow the social face (Kantor 2013). The social face refers to the urban initiatives and programs that are perceived as essentially redistributive in its social impact and are addressing social inequalities associated with the urban system. In contrast, the developmental face of urban policy largely concerns policies and programs that impact the growth and economic competitiveness of business and population comprising the urban system. It is highly pragmatic and politically stable and is firmly rooted in sustained public sector intervention. Kantor (2013) believes this dual reality fundamentally shapes the context of initiating new directions in urban policy. Although in history the support to the developmental face appeared more resilient, significant shifts in urban policy are now at play.

While the economic versus social dimension has received most of the research attentions on urban policy typology, even more systematic approach has been taken to include other significant dimensions of urban policy, including public versus private and people versus place (Holland 2015). Drawn from American context, Holland (2015) uses these dimensions as the key criteria that categorize the strategies behind national urban policy development. The measurements of these criteria are the intended outcomes and the historical results of implementing an urban initiative or program.

The first dimension of criteria echoes the previous works on economic versus social in the design of urban policy. In Holland's (2015) definitions, an urban policy is "economic driven" if it generates or reduces income; and it is "social driven" if it reflects the creation or destruction of community institutions. However, one should also recognize the hybrid nature of this parameter. In his illustration, the expansion of childcare for working parents creates both economic (generating income for the parents) and social (creating a new community institution) outcomes.

For the public versus private dimension, the criteria can be generally defined as to whether it is a public or private initiative. In the public initiative, the government uses public resources to initiate a proposed set of programs to stimulate and leverage private investment. In contrast, in the private initiative, the private sector makes the first move to intervene in the urban places with the expectation of profit maximization in the proposed action (Savas 1983). However, due to the mixed economy in the USA, there is hardly any "pure" free market or government action in urban investments.

The last dimension is the people versus place which is likely the most traditional contention in urban policy. People-oriented strategies include those initiatives that seek to develop human capital, increase household resources, or support entrepreneurial activities and self-employment. Rather than targeting directly urban population, place-oriented policies include those programs which have a fixed or location-centric focus. The focuses of these programs can be to improve the level and quality of public infrastructure, to enlarge the supply and availability of affordable housing, or to build new community facilities (Holland 2015). Despite of its wide adoption, the "people versus place" is a false dichotomy, as being clarifies by Holland (2015). In practice, the outcomes of urban policies inevitably affect both people and places.

With these three dimensions (economic vs. social, public vs. private, and people vs. place) concurrently at play, Holland (2015) suggests urban policies fall into eight categories:

1. Public led, place based, and social
2. Public led, people based, and social
3. Public led, place based, and economic
4. Public led, people based, and economic
5. Private led, place based, and social
6. Private led, people based, and social
7. Private led, place based, and economic
8. Private led, people based, and economic

Holland's (2015) another contribution is to depict the typology visually in a geometric form (see Fig. 1). By illustrating the range of options within these policy spheres, this typology helps to identify the elements that a comprehensive urban policy might potentially consider.

## Challenges to Urban Policy

In the current global process of urbanization, the concentration of vast numbers of people into densely packed areas creates enormous policy challenges. Urbanization potentially generates substantial benefits of economic development, social improvement, and effective use of resources. However, high density also exposes cities to greater risks of social disorder and environmental degradation. Urbanization also affects domestic and international migrations, the

**Urban Policy, Fig. 1** The map of urban policy continua. (Source: Holland 2015, p. 128)

stability of the international society, and the resilience and sustainability of the global ecosystems. In the context of climate change and resource scarcity, there is little doubt that urban growth over the next few decades will have a major bearing on the well-being of several billion people (UN-Habitat 2014). There are ongoing global debates on the proper policy responses to the urban challenges. Among these debates, Glaeser (2012) believes the most expressing tasks of urban policy making include the optimal degree of centralization, private versus public provision of urban services, optimal land use regulation, appropriate spatial policies, and the use of engineering and economics approaches to reducing the negative consequences of density.

None of these challenges are close to being addressed, but researchers have generated a number of useful insights on them. For example, Peck and Tickell (2002) have summarized the "global common sense" of "neoliberal competitiveness" approaches to address the challenges, which include but not limited to "a 'growth first' approach to urban development," "a commitment to 'lean government, privatization, and deregulation,'" and a "naturalization" of the market as the model for decision-making and distribution (pp. 394–395). Learning from previous urban policy failures, Imbroscio (2016) suggests a paradigm shift of urban policy from "meritocratic paradigm" to "community paradigm." The former paradigm leads to liberal policy approaches to lessen the barriers in the social environment that prevents meritocratic outcomes from being realized. In the community paradigm, social equity must be woven more tightly and more harmoniously into the very fabric of the paradigm itself (Imbroscio 2016). The establishing of good governance and the removal of bureaucratic barriers are also at the center of the discussion (Kellar 2015). While national governments obtain more resources to address urban problem, local governments have a greater sense of urgency to make better communities for their people. Will cities become the new centers of power around the world to develop more strategic approaches to these challenges? And will national governments give them the authority and resources to tackle the problems? Many questions remain to be answered. The next section focuses on the controversial role of national urban policy and the current trend of global urban policy.

## From National to Global Urban Policy

A national urban policy refers to a coherent set of urban policies made from a deliberate government-led process of coordinating and rallying various actors for a national vision and goal (UN-Habitat 2014). The vision and goal is usually about to "promote more transformative, productive, inclusive and resilient urban development for the long term" (UN-Habitat 2014, p. III). The urban problems and opportunities across different nations are very contextually different. As a result, the policy strategies need to vary accordingly. A nation's urban policy strategy is determined by many factors, including whether it is in rapid process of urbanization, the resources it has to invest in urban infrastructure and services, and its social, economic, and institutional capabilities. While the last attempts of explicit national urban policy during Carter's administration in the USA have been unsuccessful within its fragmented federal system, many other national governments are taking aggressive top-down approaches to steer the urbanization process.

The demand of coherent national urban policy has been intensified in the global process of urbanization. National governments are more interested in urban policies today due to both negative and positive effects of urbanization. On one hand, large-scale urbanization causes all kinds of problems and pressure to urban spaces that requests the guidance and resources from higher-level governments. On the other hand, the "agglomeration economies" of urbanization is attracting increasing attention from the government (Cochrane 2007a; Turok and Parnell 2009; World Bank 2009; Jha et al. 2013). "Agglomeration economies" of urbanization refer to the economic gains from improved productivity, job creation, and higher living standards because of the geographical concentration of population and

economic activities (Buck et al. 2005; Glaeser and Joshi-Ghani 2013; Duranton and Puga 2004).

A nation's urban policy is an interactive and contested process with its own institutional dynamics and historical path. UN-Habitat (2014) summarizes the broad trajectory of urban policy evolution shared by many countries. It starts with simple reaction to urban problems by providing essential public services and infrastructure, followed by efforts to control and manage growth due to the challenges of congestion and overcrowding. Social and environmental programs are then made to ameliorate the effects of urban decline and poverty. These programs are usually the starting points of the efforts of renewal, reinvestment, and regeneration; there follows a new cycle of urban growth and development.

Nevertheless, the levels of urban development and the approaches of urban policy are contextually specific in each country. There is no universal model with a standard approaches and outcome that can be replicated in different scenario. A national urban policy must be tailored to fit the specific situations of the country. While considering the unique features of their own urban challenges, countries can definitely learn from lessons of other countries and societies. Based on the best practices of urban policies worldwide, several principles of urban policy are presented by UN-Habitat (2014) for many countries to follow. Firstly, the national urban policy should have "a forward-looking developmental agenda"; second, cross-cutting policies are needed to support each city and town which is on the frontline of urbanization; third, local institutions should be strengthened to plan and manage urban growth; and fourth, robust legal and financial instruments should be provided for the effective implementation of the urban policies.

While governments across the countries are devoted to addressing urban issues of their own, the globalization of urban policy has become a phenomenon. In the global age, the significance of national and local borders is eroding. Cities exist in a global system of interconnections. They may be impacted, both socially and economically, by forces originating from abroad out of their controls (Ross and Levine 2012). "Global cities" emerge as large cities from Pacific Asia to Oceania and from the USA to Western Europe become important nodes in the global economic system. These cities have a concentration of corporate headquarters and international financial institutions which control the networks of the global economic output and growth. In this sense, urban policy is no longer an aggregation of nationally or locally distinctive urban programs and initiative. Instead, there are active learning processes and elements of urban policy that are shared between different regions and nations (Cochrane 2007a).

The learning processes have accelerated the emergence of a global urban policy. A global urban policy emphasizes the economic importance of cities and urban places as "engines" of economic growth and social capacity building. In this sense, instead of being concentrations of social problems, entrepreneurial and competitive cities "become the basis on which prosperity and well-being may be constructed" (Cochrane 2007b, p. 665). There has been a major shift away from a vision of the state as regulator of the market to one in which the state is defined as agent of the market who provides the infrastructure for efficient production rather than welfare support to those left behind by the market. Many transnational organizations, such as World Bank, UN-Habitat, and OECD, have promoted programs and initiatives to create models of urban policy that can be applied across national borders. The basic approach has been creating "innovative" models for urban areas' economic and social regeneration. A specific example would be the World Bank's vision of "sustainable cities." In this vision, four policy themes are highlighted for countries to follow: livability, competitiveness, good governance and management, and financial sustainability (World Bank 2000, pp. 46–52). These are all key components of a successful "global city" which builds its capacity based on its economic advancement. However, it is not an easy job to achieve all of them especially when the country is facing economic turbulence, social transition, and resource scarcity. What's more questionable is the extent to which these global common sense have been able to build up

global template of effective urban policy (Cochrane 2007a). As mentioned earlier, the nationally distinctive urban situation is always an important consideration of urban policy making. Therefore, the "localized" expression of the global urban policy will be a challenging but crucial step for states to take.

## Conclusion

Although different countries may take various paths of urban transition and economic development, it is evident that urbanization is an inevitable company of the global-wide development process (UN-Habitat 2008). Urban policy is a broad category of social policy that tackles specific issues and challenges. Living in an increasingly urbanized society, it is difficult for us to identify urban policy among other social policies. Urban policy is pervasive in our daily lives and will continue to be so.

National or local urban policies have transformed driven by the rapid process of globalization. Meanwhile, the process and dynamics of globalization are also impacted by the progresses of urban policy. Today, the nature of the urban problems has been interpreted differently. Instead of a catalog of "social deprivation," which urban policy needs to address, urban places have become centers of growth, innovations and entrepreneurialism (Cochrane 2007a). As a result, the urban "welfare" has been redefined as it stresses the economic success of cities and the access to employment and other resources for urban residents. The major challenge for the government becomes how to get the most out of the growth, innovations, and entrepreneurialism and bring social and economic benefits for those who are living in urban places.

As nations and places respond to their challenges and opportunities in novel ways, new urban policies are constructed with the emphasis of urban comparativeness. The new generation of urban policy is more aware of "the gravity of the issues at stake, more ambitious in scope, and more integrated in approach" than earlier generations (UN-Habitat 2014, pp. 4–5). The approaches are twofolded. One involves achieving the political and institutional support for collective efforts to shape the path of urban growth, and the other is about developing legal frameworks, financial resources, and technical capabilities of instruments to implement the policies consistently. The substantial tools include but not limited to mining of big data for mega projects, the re-imagination of cities as green and sustainable, and the restructure of political institution for better governance, as being marked in urban places from Asia to Americas and to Europe.

The complexity of urban policy transformation means it cannot be accomplished by one single organization or system. The management of change and transformation is best achieved through "networks" of organizations and individuals working with each other, pooling resources and tackling the same problems (Stoker and Young 1993). This has been reflected by the emergence of various partnerships among public, private, and voluntary organizations, especially networks of global agencies (such as the Word Bank and UN-Habitat) seeking to build models for urban initiatives and programs. Moreover, as well as focusing on current needs, the policy making must also anticipate future changes. Social and economic changes need to be monitored and met by developing specific strategies for future needs (UN-Habitat 2014).

The complexity and ever-evolving nature of urban society also highlight the importance of research on urban policy. We cannot assume that urban policy necessarily increases urban well-being. Urban policies and programs should always be monitored, and their outcomes should be analyzed critically, with the benefits and costs evaluated. Moreover, urban policy cannot be studied without consider politics and "the whole question of who wins and who loses as a result of policy decisions" (Wolman and Goldsmith 1992). While researchers have discovered important facts about urban policy, the knowledge of this field is incomplete and keeps evolving. These under addressed concerns in the context of urbanization will keep challenging the researchers as long as there is a demand of services and policies for the urban society.

## Synonyms

City management; City policy; Urban management

## Definition

A course of action adopted and pursued by government, business, or some other organization,

which seeks to improve or develop cities or towns through land use planning, water resource management, central city development, policing and criminal justice, or pollution control.

## Introduction

Urban population was 73.7% of the total population in the Russian Federation in 2016. The highest urban population rates occur in the North-Western Federal Okrug (83.5%); very similar rates were recorded in the Central Federal Okrug (81.3%), with the lowest rates found in the North Caucasus Federal Okrug (49.1%). The most urbanized constituents of the Russian Federation are Magadan and Murmansk Oblasts (regions) with respective rates of 95.4% and 92.8%.

At one point, the industrial revolution and industrialization prompted establishment of new industrial cities in Russia. Even today, all major cities, including Moscow, are also large industrial centers. Production efficiency is achieved through exogenous economies of scale in major cities. Innovation diffusion, however, may move the production facilities to peripheral areas, where labor costs are lower. Easier transport and communication links facilitate fragmentation of production but remain insufficient for making access to the markets from remote areas easier.

Another driver of big cities further growth is the availability of a large range of public services, absent for residents of smaller settlements. Dense and efficient transportation and communication networks play a decisive role, because better connectivity is the main urban function. Social infrastructure facilities may serve a big number of users, while a larger local tax base facilitates their funding. In other words, cities in general may be considered as a local public good, attracting users as magnets.

**Forms of Settlement** Usually one distinguishes between urban and rural settlements. The main criterion of telling an urban settlement from a rural one is the number of residents, employed primarily outside the agricultural sector. The current definitions of a city integrate functional and legal properties. Federal Law #131-FZ *On General Principles of Organization of Local Self-Governance in the Russian Federation* defines a concept of a city (urban settlement) as a city or a town where the population executes local self-governance itself and/or through elected and other local authorities. Regardless of a city category, its economy is a unity of city-forming and city-servicing entities.

Cities are broken down into categories by the number of functions (*poly- or monofunctional*) and by the character of special functions: industrial, transportation, research, historic, and multisectoral). City's functions may change over time because of geopolitical reasons, the city's role, and importance in the national economy.

Rural settlements in the Russian Federation have mostly retained their traditional forms, determined by the natural and climatic, historic and cultural, as well as ethnic properties of the Russian regions. The Central European parts of Russia have mostly crop and livestock farming rural settlements, while villages in Northern Europe are mostly dependent on fishing and forestry, and Urals townships are traditionally dependent on mining sectors. The rural settlements are going through a transitional stage now.

The Russian Federation is traditionally favoring large urban developments. More than half of the RF population lives in 130 cities with more than 100,000 residents each. The Russian Statistics Agency registered 12 cities with 1 million + inhabitants in 2010: Moscow, Saint Petersburg, Nizhny Novgorod, Novosibirsk, Yekaterinburg, Samara, Omsk, Ufa, Chelyabinsk, Kazan, Rostov-on-Don, and Volgograd. In 2011, Perm recovered its status of a city with 1 million + inhabitants, and in 2012, Voronezh and Krasnoyarsk joined the list. As of 2016, Russia has 15 cities with 1 million + inhabitants.

Development of cities with one million + inhabitants is known to result in agglomerations involving all settlements around big cities into the area of its economic activities through better connectivity. Strengthening of various links facilitates rural agglomerations. The latter are more sophisticated forms of population concentration, dominating the landscape of developed countries and the modern world in general.

***Agglomeration*** is a territorial and spatial formation including constellations of human settlements connected by transport, economic, and cultural links. Urban agglomerations concentrate large number of people and industries (e.g., Moscow and Saint Petersburg agglomerations).

Experts and managers use a number of approaches to define an agglomeration. According to V. Glazychev, the Russian research community has not worked out a well-defined agglomeration term yet and still operates its Soviet interpretation. The Soviet tradition understood an agglomeration as a "clustering of settlements, mostly urban ones, sometimes merging with each other, united by intensive economic, labor and cultural links."

Given the current trend in regulation of this area at the federal level, it would be appropriate to give an official definition of the term used in the Russian Federation:

**Urban agglomeration** is a set of municipalities (townships and urban districts) with a number of settlements, mostly urban ones, situated within the boundaries of a set of municipalities, united into a complex dynamic developing system with intensive production, infrastructure, social, and economic links, sharing the use of adjacent areas and development resources. (Recommendations on selection of pilot projects for pilot testing and improvement of governance mechanisms of urban agglomeration development in the Russian Federation. They were approved by Decision No.1 of the Interagency Working Group on Socioeconomic Development of Urban Agglomerations on March 21, 2014. Link: http://www.minregion.ru/uploads/attachment/a5ee9fc5-6dd4-4ec9-a712-02635c77a469.pdf).

In Russia, Moscow agglomeration is followed by Saint Petersburg one, while Samara-Togliatti agglomeration ranks the third. There are 936 cities in Russia (out of total 1100) with less than 100,000 residents, but the prevailing majority of the urban Russian population (67%) lives in the cities with 100,000 people or more. The number of people in such cities in 2010 was almost two million more than in 2002. (Preliminary outcomes of the Russian Census of 2010: Statistical Digest/Rosstat. M.: Statistics of Russia, 2011. – 87 p.)

Concept for Long-Term Socio-Economic Development of the Russian Federation until 2020 (Concept for Long-Term Socio-Economic Development of the Russian Federation until 2020, approved by Instruction #1662-r of the RF Government of November 17, 2008. (version of 08.08.2009). Link: http://www.economy.gov.ru/wps/wcm/connect/e150a080409c1cf38861e92c73e16b99/rp_1662_p.doc?MOD=AJPERES&CACHEID=e150a080409c1cf38861e92c73e16b99) treats agglomerations as centers for socio-economic development of the RF constituents, federal mega-regions, and the country as a whole.

There are 22 most populated urban agglomerations in Russia, with about 200 cities where almost 45 million people live: Moscow, Saint Petersburg, Rostov, Samara-Togliatti, Nizhny Novgorod, Novosibirsk, Yekaterinburg, Kazan, Chelyabinsk, Volgograd, Ufa, Krasnodar, Omsk, Vladivostok, Voronezh, Krasnoyarsk, Perm, Novokuznetsk, Saratov, Naberezhnye Chelny (Nizhnekamsk), Irkutsk, and Tula-Novomoskovsk.

Urban agglomerations are rightfully seen as a policy tool for comprehensive territorial development to benefit both the core city of an agglomeration and its periphery. Moving manufacturing facilities outside the city boundaries, unification of transport and communications infrastructure, and improvement of sociocultural space promote the life quality and comfort and attract qualified labor resources to support high economic growth rate in the agglomeration. These developments boost the peripheral capacity building and involvement.

Notwithstanding all the benefits of large city agglomerations, there are some issues and limitations to their development, on the one hand, and some types of growth do not depend on the city size and number of its residents, on the other. High technology sectors require knowledge, creativity, innovations, and favorable business environment.

Agglomeration governance processes play a key role. Some attempts to build agglomeration management systems took place in the later part of the twentieth century, but the conceptualization and practical implementation of them still do not meet the current requirements. In 2013, the

Ministry of Regional Development of the Russian Federation prepared a roadmap of agglomeration development in Russia and specified conditions for selection of agglomerations for pilot project implementation.

Draft roadmap of agglomeration development in Russia includes the following milestones:

- Development of proposals on government regulatory and support measures for urban agglomerations.
- Development of mechanisms for urban agglomeration governance.
- Development of proposals on draft regulations to address the urban agglomeration challenges.
- Preparation of analytical information materials and promotion of best practices to improve urban agglomeration development.

The roadmap under review contains its mission: "to initiate and merge organizational, regulatory and institutional measures to streamline and accelerate agglomeration development as a basic condition for postindustrial economy development in Russia in the mid-term (6 years)," and "to remove restrictions and smooth out disproportions in the development of existing agglomerations, to develop urban communities and real self-governance". (Draft action plan (roadmap) Development of Agglomerations in the Russian Federation, para. 1// Link: http://www.minregion.ru/uploads/attachment/445f2dd6-dc64-49be-b4ee-118ae5abce04.docx).

The main purpose of this roadmap is to attach the status of agent (Draft action plan (roadmap) Development of Agglomerations in the Russian Federation, para 2, p.2 // link: http://www.minregion.ru/uploads/attachment/445f2dd6-dc64-49be-b4ee-118ae5abce04.docx) of development to agglomerations, including definition of the concept of urban agglomeration, its place in the system of government policy and territorial planning, incorporation of agglomeration in the Master Plan for Population Distribution in the Territory of the Russian Federation, and update of the regulations to facilitate agglomeration formation.

The roadmap calls for the development of a conceptual government program *Agglomeration Development in the Russian Federation*. It should result in the alignment of government regulatory and support measures related to agglomeration development.

The Ministry of Regional Development selected 14 pilot projects in 2014 to test and improve the agglomeration governance mechanisms.

While focusing on mechanisms of governance, it is important to remember that they relate mostly to the infrastructure development of territories and institutional frameworks of the main markets. Three priority areas of such development are as follows:

- Development of economic advantages of agglomerations, growth of labor productivity.
- Development of transport infrastructure to support the territorial connectivity.
- Development of public utilities and social infrastructure, to support higher living standards and comfort.

Concentration of spatial economic activities would drive further development of agglomerations. At the same time, concentrated development of agglomerations would result in higher interregional differentiation.

Experiences from most countries reveal considerable spatial variations resulting from development of regional agglomerations. The Russian Federation is no exclusion from the rule: Moscow, occupying 0.1% of the total area of Russia, produces more than 21% of the gross regional product (as of 2015), having less than 8.4% of the total population and leading among all other RF constituents. Saint Petersburg ranks second with its 4.6% share in GRP and 3.2% of the RF population.

In line with its long-term plans, the Russian Federation needs to strengthen the exoskeleton of settlement and distribution of productivity factors based on major urban agglomerations where innovative and investment activities are concentrated. Agglomerations combined with transport communications and border areas of Russia promote the establishment and development of backbone regions that may save the growth points (zones)

even in the situation of economic crisis, depopulation, and lack of labor resources. Functions of backbone regions should be defined depending on the international market situation, national and regional development priorities, production capacity, and territorial specialization.

## Urban Sanitation: Optimizing Private Sector Involvement

### Synonyms

Local government; Public-private partnership; Sanitation; Service delivery; Urban governance; Waste management

### Definitions

**Urban sanitation:** It entails institutional arrangements and policies by city authorities aimed at the provision of facilities and services for safe collection, disposal, and management of all forms of waste: both solid and liquid. Poor measures and facilities for managing waste have been a cause of disease worldwide, and improving sanitation is regarded to have significant health impacts.

**Private sector involvement:** Entails ceding the responsibility for sanitation service delivery from city authorities to a nonstate actor or a partnership/contractual arrangement between city authorities or local government and a waste management contractor (s) for the purpose of urban sanitation service delivery. It also connotes the opening up of public monopoly to allow nonstate actors to intervene in the collection, disposal, and general management of urban waste.

**Optimization:** Making the best of private waste contractors under the agreed terms of contract in terms sanitation service delivery. In contemporary times, most city authorities have partnerships with private actors to facilitate sanitation service delivery. Optimization refers to the processes, mechanisms, and interventions to ensure private engagement yields appreciable outcomes in terms of efficiency, effectiveness, and economy.

### Introduction

Sanitation remains a pressing issue across the globe and more pronounced in the developing world (Faniran et al. 2017). Developing countries face greater challenge owing to rapid increase in solid waste generation triggered by uncontrolled urbanization, proliferation of manufacturing, and speedy population growth [United Nations Department of Economic and Social Affairs (UNDESA) 2014]. For instance, Africa is estimated to be about 56% urban by 2050 (Ibid). Compounding this problem is the fact that Africa witnesses only 54% access to improved sanitation (AfDB Group 2012). In the sub-Saharan Africa, there is a very slow improvement in sanitation as the 30% coverage does reflect only a 5% point increase from the year 1990 (Yeboah-Assiamah 2015). About 44% of the region's population uses either communal or unwholesome facilities, and 26% are estimated to be practicing open defecation (UNDESA 2014). Like other developing countries, Ghana experiences sanitation challenge in its cities. In Accra, for instance, the Environmental Protection Agency (EPA) reports that about 2800 metric tons of solid waste is generated, out of which only about 2200 metric tons (78%) is collected and disposed, leaving a backlog of about 600 tons (21%) in open drains and water bodies (EPA 2014). According to World Bank's Water and Sanitation Programme, the existing poor sanitation situation costs the Ghana Government about US$ 290 million every year (WSP 2015).

Considering the impact of environmental sanitation, the role of local government authorities

cannot be over emphasized as they provide services from *cradle* to *grave*. Developing countries actively involve local governments in the provision of sanitation service (Chong et al. 2016; Faniran et al. 2017). For instance, local governments in Indonesia have had primary responsibility for delivering various services, including sanitation (Chong et al. 2016). Similarly, in Nigeria, local governments have been actively involved in ensuring proper sanitary practices among their respective citizens. For instance, Ibadan municipality in the Oyo State of Nigeria enforces monthly environmental sanitation exercise during which citizens are enjoined to participate in activities such as storing, collection, and disposal of solid waste (Faniran et al. 2017).

This situation is not different from the Ghana case where local governments are tasked to provide inter alia environmental services (Nsarkoh 1964). Section 10 (3e) of Ghana's Local Government Act 1993 (Act 462) provides that the local government is responsible for the development, improvement, and management of human settlements and the environment (including sanitation) in the district. This study focuses mainly on sanitation aspect of environmental services provided by local governments. In order to realize sustainable sanitation, sanitation system needs not only be socially acceptable, economically viable, as well as technically and institutionally appropriate, but should also safeguard the environment and the natural resources within it. Goal six (6) of the Sustainable Development Goals (SDGs) is to ensure the sustainable management and availability of water and sanitation for all. Among other targets, the goal seeks to assist and strengthen the involvement of local communities in improving sanitation management, which Ghana seems to struggle with (G-MDGs Report 2015). In spite of the tremendous progress made during the past years regarding environmental laws, policies and programs such as Environmental Protection Agency (EPA) Act 1994 (Act 490) and the National Environmental Sanitation Policy (NESP) of 1999, reports, and studies show that waste management process in Ghana continues to experience a number of obstacles (Oteng-Ababio et al. 2013; WaterAid 2015). For instance, although Ghana was on track to meeting the MDGs target of halving the proportion of population using improved drinking water source, same could not be said for sanitation (G-MDGs Report 2015; WaterAid 2015). Thus, while the MDGs target for improved sanitation coverage was to be 53%, the national coverage for improved sanitation, nonetheless, only marginally increased from 4% to 13% between the 1990 and 2015 periods, respectively, which suggests a huge deficit (WaterAid 2015). High levels of rural-urban migration have triggered poor sanitation in cities, especially in Accra, Ghana's capital. This is against the backdrop that wherever people gather, waste is produced. More than 15,000 children die in Ghana annually of sanitation-related diseases before attaining the age of five (5) (UNDP 2014). Such sanitation-related diseases include Malaria, Typhoid, Cholera, and Diarrhoea. Other common diseases related to poor sanitation but not often mentioned in hospitals include bilharzias, ascariasis, hookworm, and fungal infections (Prüss-Üstün et al. 2004). The Ghana Millennium Development Goals Report highlights that although the country observed a decline in under five mortality (from 108 in 1998 to 80 in 2008 per 1000 live births), its progress was 60 deaths per 1000 live births as at 2014. This progress was still halfway behind the MDG target of 39.9 per 1000 live births (G-MDGs Report 2015). The report, among other things, links the high prevalence of under-five mortality to diseases and complications that are traceable to poor sanitation practices as listed above (Ibid).

The foregoing suggests that local governments who are primarily charged with waste management are faced with myriads of challenges, which overwhelm their capacity to contain the amounts of waste generated posing a greatest health risk in Ghana. For instance, WaterAid (2015) reports that 80% of all diseases in Ghana are caused by unsafe water and poor sanitation. In the latter part of 2014, the country experienced its worst cholera outbreak hitting a record of about 17,000 cases with 150 deaths (http://www.myjoyonline.com/news/2014/October-1st/ghanas-cholera-outbreak-worse-in-30-years.php). The crises informed the launch of a National Sanitation Day in November

2015 by the Ministry for Local Government and Rural Development, to create awareness. With this, first Saturday of every month is set aside for general cleaning, which seeks participation of community members, *albeit*, poorly patronized. This chapter discusses the sanitation experience of one peculiar local government [La Dade-Kotopon Municipal Assembly (LaDMA)] in Ghana with a view to unpacking how the local authority addresses sanitation situation in its jurisdiction. A critical review of the Ghanaian Times Newspaper from August to October of 2014 [sanitation crisis period] reveals that the La Dade-Kotopon Municipality was tagged the hardest hit local government in terms of cholera outbreak which suggests greater laxities in its sanitation management systems. LaDMA alone recorded 1726 cholera cases with 16 deaths compared to the national 17,000 cases and 150 deaths for the same period (Ghanaian Times 2014). Paradoxically, this local government has in place various private actors and contractual arrangements for waste management. A main question underpinning this study is: *to what extent does the involvement of private actors shape urban sanitation service delivery? What interventions are required of city authorities to optimize gains from private sector involvement in urban sanitation management?* The rest of this chapter has been organized into the following sections: brief review of relevant literature; the research approach; data results and presentation; and it ends with conclusion and policy implication.

## Literature Review

Copious studies have attempted to address the urban sanitation phenomenon. Some of such studies include satisfaction of public service delivery in the Sedibeng district of South Africa (Akinboade et al. 2012), a global review of solid waste management (Hoornweg and Bhada-Tata 2012), and private actors involvement in urban sanitation services provision (Domfeh 2002; Yeboah-Assiamah 2015). These studies acknowledge that sanitation service space in most developing and developed nations is opened up for other actors towards promoting efficiency and effectiveness in public service delivery. In many jurisdictions including Ghana, sanitation service delivery is principally the task of the local authorities (albeit try to involve private actors through various arrangements) who have been given such mandate through decentralization and local governance. Local government provides services such as basic health care and education, social welfare, internal transport, maintaining laws and order, local works and housing, firefighting and other emergency services, traffic regulation, streetlight maintenance, water supply, environmental services, and garbage collection/waste management among others (Akinboade et al. 2012). Regarding waste management, Hoornweg and Bhada-Tata (2012), in their global review of solid waste management, identified landfills, damp, compost, recycling, and incineration as some solid waste disposal methods. They also noted solid waste collection methods as house-to-house, community bins, curbside pick-up, self-delivered, and contracted or delegated service. Table 1 briefly explains each of these waste collection methods.

Hoornweg and Bhada-Tata (2012) observe that municipalities often license private operators and may designate collection areas to encourage collection efficiencies, an arrangement which is termed by scholars as public private partnership or privatization of public service (Yeboah-Asiamah 2015; Hoornweg and Bhada-Tata 2012).

## Research Approach

The case study design within qualitative research approach was employed for analyzing and discussing the study findings. With this approach, the study presents in-depth insight into the participants upon understanding the context of the social phenomenon and the subjective meanings assigned to them by local actors (Klein and Myers 1999). The case of La Dade-Kotopon Municipality was adopted, as it was the most affected municipality by the 2014 cholera outbreak in Ghana (Ghanaian Times newspaper 2014). The Municipality was created in 2012 with an

**Urban Sanitation: Optimizing Private Sector Involvement, Table 1** Waste collection methods.

| Waste collection method | Description |
|---|---|
| House-to-house | Waste collectors visit each individual house to collect garbage and the user generally pays a fee for the service. |
| Community bins | Users bring their garbage to community bins that are placed at fixed points in a neighborhood or locality and the waste is picked up by the municipality, or its designate, according to a set schedule. |
| Curbside pick-up | Users leave their garbage directly outside their homes according to a garbage pick-up schedule set with the local authorities (secondary house-to-house collectors not typical). |
| Self-delivered | Generators deliver the waste directly to disposal sites or transfer stations, or hire third-party operators (or the municipality). |
| Contracted or delegated service | Businesses hire firms (or municipality with municipal facilities) who arrange collection schedules and charges with customers. |

Source: Adapted from Hoornweg and Bhada-Tata (2012 p. 13)

estimated population of about 465,620 (GOG 2013). It has 10,372 houses and 30,925 households. As shown in Fig. 1, the municipality covers an area of 360sq km and is located on Longitude $05^0$ 35'N and on Latitude $00^0$ 06 W. The study used both primary and secondary data for purposes of validity and reliability. Primary data involved 11 in-depth interviews from administrative officials and private operators involved in the municipal waste management service. This includes a purposive sample of the three biggest private waste management operators working within the municipality and 8 officials of the LaDMA whose positions and roles are relevant to sanitation management: the head of Environmental Health and Sanitation Department (EHSD), the Director of Health Services, 4 Environmental Health Officers, and 2 Health Promotion Officers.

In addition, 93 semi-structured questionnaires were administered to residents who were randomly selected from strata of household heads, teachers, market women, traders, hawkers, and restaurant operators. The stratified sampling method was adopted to capture the different perspectives of community members in their waste management and disposal practices.

Primary data were complemented with secondary data from peer-reviewed journal articles, government publications, and periodic reports on urban sanitation and waste management. All interviews were transcribed and analyzed thematically, and in the course of discussions, direct narratives are used to support the arguments. Questionnaires were coded using the Statistical Package for Social Sciences (SPSS) to generate frequencies and generate bar and pie charts to ascertain general experiences of citizens on sanitation in LaDMA.

## Results and Data Presentation

### Biodata

It was observed that out of the 93 respondents, a majority representing 36.5% were within the ages of 21–30 years, indicating a comparatively youthful population in the municipality. In addition, 19.8% each was recorded for respondents of 31–40 and 41–50 years, while the 51–60 years composed of 17.7%. Same data also showed 3.1% of the respondents being below 21 and above 60 age groups.

Data on gender distribution reveal a wide gap: 67 representing 69.8% of female respondents and 30.2% for male respondents (see Fig. 2). It is plausible to suggest that during the time of data collection, majority of females were available and agreed to respond to questions. Regarding occupational distribution of respondents, market women recorded the highest participants constituting 20.8%, followed by traders (15%) and teachers (10.4%). The rest were restaurant operators, students, artisans, civil servants, drivers, fishermen/fishmongers, hawkers, security personnel, cleaners, and pensioners. The unemployed constituted the least, in a descending order.

## Local Government Partnership with Private Actors

### Lessons from an Old Burdensome System

Previously, solid waste contractors used to convey solid waste on behalf of the Assembly for subsequent payment by the latter through its internally generated fund (IGF). However, with this system, huge sums of money were owed to the waste collectors. An official who has been working with the Assembly for the past ten years when it was a submetro and later gaining a municipal status in 2012 explained:

> . . . Solid waste contractors used to collect the refuse to their final disposal sites on behalf of the Assembly and the Assembly paid them per ton. This got to a time the Assembly owed the contractors billions of cedis. This was so much of a burden to the Assembly.

Another informant added:

> we ran to Local Government Service and Central Government for support. About 80% of the population in Accra or La community were not paying for refuse except the developed communities like Labone and Cantonment.

He further explained:

This necessitated a franchise system that came with different payment arrangements.

With a feeling of relief, another official provided support to the point:

> A rethinking of the whole situation brought about this franchise system. Now the current system compels anybody who generates waste to pay for its disposal. This is called the polluter pay system.

It has been explained that the old sanitation system resulted in huge debts owed to the waste collectors by the Assembly. This made the system

**Urban Sanitation: Optimizing Private Sector Involvement, Fig. 2** Age and Gender Distribution (Source: Field data 2016)

clearly problematic and unsustainable. It therefore became plausible to resort to an alternative system. Meanwhile, it is advanced by scholars that sanitation service provision by local authorities is faced with dissatisfaction of service and that inclusion of private companies becomes helpful notably for the sake of efficiency and quality service delivery (Domfeh 2002; Yeboah-Assiamah 2015). A new sanitation system, the Polluter Pay System, was introduced to fill the loopholes in the previous system. The Polluter Pay System is an arrangement that enjoins households to pay for sanitation service or waste collection based on the extent of service or the volume of waste generation. This is a strategy for effective cost recovery and a candid means of imposing charges accepted by most countries, both developed and developing (Lindhout and Van den Broek 2014). This means that the citizens in the Assembly pay based on the volume of waste they generate and dispose. The Polluter Pay System identified in the study comprises the Door-to-Door System (DDS) and Central Container System (CCS), an arrangement that involves private actors in the sanitation service.

### Door-to-Door System

With the DDS, waste management companies are contracted by the Assembly to transport waste from the households of residents and even corporate organizations to final disposal sites at a fee. The fee currently ranges between $6 and $13 per month. A waste management official explained:

> The Assembly has franchised waste management to some private companies including Daben Cleansing Company Ltd, the official door-to-door waste contractor. This involves charging of monthly fees by contractors because of high cost of transporting the refuse or containers from the communities to the final disposal sites at the landfills

Another official added:

> . . . such cost includes fuel, trucks as well as dumping fee which is now about $3.7 per ton. Because of these costs, they need to be charging fees otherwise the Assembly would have to be paying the contractors. Due to the franchise with the DDS, we have enough time to concentrate on the CCS.

This finding however confirms the curbside pick-up and contracted or delegated service method noted by Hoornweg and Bhada-Tata (2012) and Oduro-Kwarteng (2011).

### Central Container System (CCS)

The CCS on the other hand involves the stationing of large containers at convenient places where residents dump their refuse at a token. This again is aligned with the community bins or self-delivered method identified in the global study of Hoornweg and Bhada-Tata (2012). An official from LaDMA explained the rational for the CCS:

> Due to inaccessibility, central containers are placed at vantage points into which residents can reach and dispose their refuse

With the CCS, people are hired to sit at the container to receive payment from citizens for dumping the waste into the container, and out of the

**Urban Sanitation: Optimizing Private Sector Involvement, Fig. 3** A Pie Chart of Solid Waste Collection at LaDMA (Source: Field data 2016)

amount earned, payment is made to the private contractor who transfers the refuse to the disposal site.

### Community Members' Engagement with Private Waste Collectors

Figure 3 indicates that almost half (45.83%) of the respondents dispose their waste through other means (drains, sea, gutters, etc.), which serves as evidence for the indiscriminate disposal of waste in the municipality. Approximately 20% identified Daben Cleansing Company Ltd. as their private waste management company, while 7.29% and 2.08% noted Zoomlion Ghana Ltd. and Asadu Royal, respectively. This corroborates data from the Municipal management that waste collection has been outsourced.

The study found that almost all the residents from Green Court and Kojo Sardine areas including the elite communities dispose their solid waste in dustbins (64%), while the rest (36%) from other suburbs dispose solid waste by burning, CCS, sacks/cartons, recycling, at beaches and on compound. The choice for these alternative forms of solid waste disposal may be due to high collection fees charged by waste collectors. Only a few individuals collect and sell their plastic waste to rubber manufacturing companies for recycling.

Also, 25% of the respondents majority of whom confirmed collection of their solid waste by "Bɔɔla Taxis" also use Central Containers (CC) and informal waste collectors (most of whom are junkies), at a fee. Figures 4, 5, and 6, respectively, present pictures of a "*Bɔɔla*" Taxi, Tricycle, and a Central Container site. The operations of the informal waste collectors replicate the house-to-house method noted by Hoornweg and Bhada-Tata (2012).

**Urban Sanitation: Optimizing Private Sector Involvement, Fig. 4** "Bɔɔla" Taxi (Source: Field data 2016)

### Factors for the Poor State of Sanitation

According to the Composite Budget of LaDMA for the 2013 Fiscal Year, total solid waste generated in the Municipality in a month is 2045.45 tons out of which the Assembly, through private contractors, was able to collect only about 1200 tons. The waste generated by the municipality was largely constituted by organic substances, which can easily decompose. Other solid waste included inert material comprising of plastics, rubbles, and debris generated within the municipality and

along the beaches. Most of this waste is dumped at the Tema and Abokobi landfill sites. This suggests that private sector engagement in solid waste management in the municipality has not necessarily solved the sanitation crisis. This subsection discusses the lingering challenges militating against effective sanitation service delivery.

### Indiscriminate Dumping of Waste

The study identified indiscriminate dumping of waste as a major challenge confronting the municipality's sanitation department. Indiscriminate dumping of refuse comprised those disposed in open spaces, which later enter the drains as well as open defecation along the beach and into some of the big drains.

**Urban Sanitation: Optimizing Private Sector Involvement, Fig. 5** Tricycle (Source: Field data 2016)

A principal officer informed with grief:

> People dump waste and openly defecate along the beaches and into some of the big drains like the Cemetery drains, Wangara drains, the Roman School drains and around the Central Containers. These sites are used as transfer stations because these are places where containers are sited

Another added:

> . . . we thought this could be a result of inadequate number of public toilets, I recommended to the Assembly to provide public toilets at such places. Since the Assembly is very sensitive to such things, it has provided two public toilets aside the Ghana at 50 public toilets which have not been commissioned yet

However, the indiscriminate dumping of waste by citizens thwarts the effort of the local government. It also leads to the spread of diseases like malaria. This creates major burden. It was remarked by a key officer at the local government premises:

> The dumping of refuse and open defecation are inimical to our effort as an assembly and these contribute to the outbreak of diseases like malaria. It is a real issue of concern.

### Uncollected Waste by Private Waste Collectors

A key factor for the poor sanitation situation in LaDMA is the fact that in some circumstances the private waste contractors leave some of the waste uncollected. On some occasions, some of the waste containers are left full, contributing to the bad state of sanitation. However, the study

**Urban Sanitation: Optimizing Private Sector Involvement, Fig. 6** A Central Container site for some communities along the sea (Source: Field data 2016)

observed that this anomaly was attributable to the fact that the dumping site was distant, coupled with the challenge that the waste contractors are not permitted to dump waste during the nights and on Sundays, which often experience less traffic on the roads. Meanwhile, the charge at the dumping site is often high. A staff at a private waste company hinted:

> The dumping sites are at Tema and Abokobi, and they are a bit far. Even the Abokobi site is full. Apart from that, the charge is high-it has been increased from UD$3.00 to US$3.75 per ton. Meanwhile, over there, night and Sundays dumping when there are less traffic in town is not allowed. These also affect our schedule for collecting waste sometimes. So at times, we are not able to collect some waste in time.

The observation above was given support by sections of citizens who bemoaned why at times their waste containers at home get full up yet the private waste contractors fail to empty these on time. One female put forward:

> . . .. there are times the waste container gets full but they will not be coming for it until vultures and other animals scatter the waste around the compound.

This was given support by another respondent who explained:

> . . ..When the bin gets full, we have no place to put rubbish, so we put in polythene and lean it to the waste bin thinking the contractors will come for them on time, but at times no, dogs and birds will scatter these waste all over the area.

### Limited Work Force/Labor

Another factor responsible for the poor sanitation state in LaDMA is limited staff. The sanitation department is challenged with limited number of skilled personnel. At the time of the study, the sanitation unit of the Assembly had only 49 laborers and the Ghana Youth Employment and Entrepreneurial Development Agency (GYEEDA) program had 190 of the laborers. These numbers are insignificant especially considering the fact that the Assembly has graduated from submetro to the status of municipality, which comes with improved services, increased population, and economic activities. The result is that the limited sanitation staff are unable to contain the increasing volumes of waste generated, leaving some of the waste in the municipality uncollected.

An official unequivocally voiced:

> We also don't have enough laborers. The GYEEDA programme has almost 190 of the laborers while my section in the Assembly has 49. But you know because we have moved from a sub-metro to a municipal assembly, there are certain areas that we have had to acquire. AMA was formerly claiming some part (public space) and now that we are collecting revenues from those parts, it implies we should also be responsible for sanitation in those areas. However, because our staff are limited, we are unable to collect some of the waste.

This clearly impedes the department's efforts at providing improved sanitation condition in the municipality.

### Inadequate Logistical Support

Inadequate logistical support and equipment is another key factor for the poor state of sanitation in the municipality. The study revealed that LaDMA is challenged with logistical constraint such as compaction trucks, shovels, rakes making the sanitation exercise an onerous task.

> We don't have enough equipment like shovels, rakes, "Bɔɔla taxis" and compaction trucks which would have helped us a lot during weekends when most assembly men wish to organize clean up exercise for their communities

Since very few containers are stationed at central points, people who have not subscribed with private waste collectors have to move several meters with wheelbarrows to dump their refuse. Raising these wheelbarrows to dump refuse into the container sometimes becomes daunting. In their frustration, these people are tempted to throw waste away indiscriminately and at times in the drains.

### Informal Waste Collectors

Although waste pickers/scavengers do help to clear the homes of refuse, they sometimes dump it illicitly within the town, adding up to the poor sanitation state. It was remarked that:

> These boys are a 'necessary evil' because they contribute to refuse collection in the third class communities but some of them dump this rubbish at wrong places during the night. In the fullness of time, this act results in improper waste management and poor state of sanitation.

It could clearly be observed that about 10% of the respondents, a considerable section indicated that their waste is collected by informal waste collectors (see Fig. 3). This observation may explain why the indiscriminate waste dumping attitude of these collectors contributes to poor sanitation in the municipality.

### Laxity in Sanitary Inspection (SI)

In the municipality, Environmental Health Officers randomly embark on door-to-door inspection of households to ensure safe and proper sanitary practices. These officers have power to caution and serve households with fines and notices meant to improve their sanitary conditions. However, the study observes that sanitary inspection is rare in the municipality. Figure 7 presents a bar graph of frequency of sanitary inspection of households. It was evident that 40.6% of respondents recorded no SI visits, while 6.3% of the total respondents were uncertain about the frequency of sanitary inspection by the Municipal Assembly's environmental health officers. Infrequent visits by the sanitary inspectors trigger households to relax over issues of sanitation leading to improper sanitary practices by residents and the poor sanitation state.

## Enhancing Private Collection of Waste

To ensure proper waste collection to improve the sanitation situation in LaDMA, the municipality has resorted to inspecting the tour schedules and is planning to register the informal waste collectors.

### Inspection of Tour Schedules

The sanitation department inspects waste collection by waste management contractors. The Assembly supervises tour schedules of waste management contractors for adherence. The staff at the sanitation department of the local government drive within the communities to find out whether or not the private waste collectors have performed their function of collecting the waste from households that have subscribed to the service. They inspect the households and the containers situated at vantage points to be sure the waste contractors have collected the refuse. With this, they are able to find out any lapses for themselves and interrogate the waste collectors accordingly.

A staff at the sanitation department illustrated:

> If the contractors go to Labone and Cantonment on Mondays, we go there late Monday afternoon or on Tuesday morning to see what they have been able to do. Normally, every household knows collection days, so they wheel out the 240 letter bins and put them at the gate, lock the doors and go out or a security man may be left behind to see to it that they are emptied. Since the bins are seated in front of the house, contractors just empty them on their arrival and go away

She added:

> During monitoring, if we drive within the community and see so many containers standing at the gate not emptied, it means that they (the contractors) have not been able to work

Based on the observations of the sanitation department, a monitoring form is filled. The Assembly further interrogates the private waste contractors should they default in adhering to their schedule.

**Urban Sanitation: Optimizing Private Sector Involvement, Fig. 7** Sanitary Inspection of Household (Source: Field data 2016)

The contractors may have developed mechanical fault or just could not complete collection in that area on a specific day, in which case the landfill site might have been closed or they were distracted by rains. The use of this inspection instrument or model is to help to provide quality service by regularly picking up the waste to ensure cleanliness of the vicinity as espoused by Schulte, Gellenbeck, and Nelles (2017) who conducted a study on operationalizing service quality in waste collection.

### Registration of Individual Solid Waste Contractors

Informal solid waste contractors, in their attempt to help collect the waste, end up contributing to the poor sanitation state in the municipality largely because their activities are not regularized or recognized by the Assembly. However, should they get registered, given recognition and as well as monitoring, they would be very helpful in enhancing the sanitation state in the municipality. They are useful in moving from door to door to collect waste. Studies on solid waste management have revealed that informal waste collectors play a key role in collecting solid waste from households particularly the poorer segments of the population (Katusiimeh et al. 2013; Oteng-Ababio and Amankwa 2014). The municipality, having identified this potential, has deliberated on ways to register these individuals and link them to specific waste management contractors (with consideration of location), who would then receive the waste collected and send it to designated disposal sites. An official of the sanitation department vividly demystified:

> . . .we are planning to meet and register all the individual solid waste collectors within the communities so we could channel each of them to solid waste contractor with considerations to their various local areas. This would mean placing central containers, not too large at certain points within the town where they can collect their money and dump there for the contractor to also transfer to final disposal sites when they are full. With this, they will be controlled from dumping outside their outskirt and be tracked as well. They would also police themselves in the case of unregistered individual solid waste collectors.

By this approach, these individual waste collectors would serve as a check on each other against indiscriminate dumping of waste to ensure enhanced sanitation within the municipality.

### Institutional Strengthening (by-Laws)

Another way by which the municipality intends to enhance waste collection is to step up the implementation of sanitation-related by-laws and introduction of regulations that will levy fines on persons who illicitly dispose waste. The Assembly also intends to provide a regularized system for the operation of informal waste collectors and to register such individuals. A key official at the sanitation department hinted:

> . . . My colleague and I have been working on some documents to be considered as by-laws by the Assembly. When approved and endorsed, the by-laws will facilitate the incorporation of informal waste collectors into waste collection by registering them. The laws intend to look at the punitive measures for people who dump waste into sea, drains and other unwarranted places. In fact, we intend to dedicate one court to handle such cases in case of default

The decision to assign a court to deal with sanitation cases has been mandated by Section 10 (3 g) of the Local Government Act 1993 (Act 462) which provides that the "District assembly shall ensure ready access to Courts in the district for the promotion of justice." In addition, concerning the making of by-laws to tackle waste collection and sanitation challenges, Section 79 (1) states, "A District Assembly may make by-laws for the purpose of a function conferred on it by or under this Act or any other enactment." In this context, the proposed by-laws and special courts are set to enhance sanitation in the municipality.

## Discussion

This chapter unpacked how LaDMA addresses its sanitation challenges. Previously, the system in place was such that private waste contractors collected the waste on behalf of the assembly for subsequent payment. This system proved unsustainable, as the assembly was heavily indebted to the waste contractors. That regard, upon reaching a "crises point" of indebtedness, the Assembly had to alter its sanitation institutional arrangement towards one that adequately collaborates with other private stakeholders

towards effective and sustainable waste management (Yeboah-Assiamah et al. 2017). This problem with the old system triggered a new sanitation system, the Polluter Pay System, which was introduced to fill the loophole in the previous system. The Polluter Pay System is an arrangement that enjoins persons to pay for sanitation service or waste collection based on the extent of service or the volume of waste generation (Mauerhofer et al. 2013). This means that the citizens in the Assembly pay based on the volume of waste they generate and dispose. Oduro-Kwarteng (2011) argues that monthly flat fee charge per household may not be appropriate for all communities especially those with low incomes and high illiteracy rate. Hence, the classification of communities into first, second and third class for effective implementation of the new payment policy. Additionally, Domfeh (2002) is of the view that such franchise system of waste collection will only be feasible in communities where the entire household can be educated to understand its need for public health and sanitation.

On the part of informal waste collectors, this study found that this category is very instrumental and helpful in clearing households of refuse generated although in some instances, yet they appear to be problematic. In other words, the informal waste collectors serve as "two-edged sword"; they contribute significantly to effective waste collection, yet this chapter observes that informal actors could also be a nuisance to effective waste management. The first part of the finding affirms an earlier study by Oteng-Ababio et al. (2013) that informal waste collectors are very useful in collection waste from households. The second part of this present study finding reiterates a need to regularize activities of informal waste collectors and to merge them with formal waste collectors to optimize comprehensive waste management system especially in terms of wider waste collection coverage and proper final disposal. Realizing this benefit, India as at 2010 made a resolution that saw formalization of informal sector waste collection to effectively regulate their operations (see Oteng-Ababio and Amankwa 2014).

Notwithstanding the partnership with the private sector, there remained challenges in the sanitation situation where waste may be left unattended to which exacerbated the poor sanitation situation. This observation provides empirical support to a postulation by Yeboah-Assiamah (2015) that it is not the merely involving private actors that helps improve sanitation but the nature of their engagement. He puts it "the processes before, during and after engagement of the private sector in service provision are imperative for the efficiency and effectiveness of the process... if city authorities after engaging private sector coil back in their shelves and sit on the fence may render privatized services poorly provided" (ibid, p. 284). Yeboah-Assiamah further admonishes urban administrators that "private sector involvement in urban waste services should be effectively monitored through appropriate institutional arrangements so that the private entities do not engage in activities or actions that reduce effectiveness and efficiency" (p. 284). What appears problematic is that most local governments engage private actors but fail to monitor them well which has been a major challenge why in spite of many public-private partnerships in sanitation service delivery yet the sanitation challenges seems to be lingering around in many jurisdictions (see also Yeboah-Assiamah et al. 2017). Although private actors have been incorporated in the waste collection in the municipality, there appears to be lapses in the waste collection, which the municipal authorities are endeavoring to tackle.

## Conclusion and Policy Implication

The study observes that private sector participation is essential to effective sanitation service delivery as this brings about a renewal in how waste is collected and finally disposed. Observations and discussions in this study highlight that without strengthening the monitoring and supervision mechanisms, private sector engagement for urban sanitation service delivery will not yield any significant improvement in waste management. In other words, it is not just about private involvement in sanitation services, but the "how," and "what" goes into the contract agreement and

more importantly "how" and "what" occurs after the involvement of private actors. The study contends that putting private actors to task or making private involvement worthwhile requires a formidable monitoring system as well as a performance appraisal mechanism that reviews activities of private actors periodically. A policy implication is that city authorities need to be very meticulous in their engagement with private actors and should provide active monitoring mechanisms and regular checks to ensure these are on track per the contract.

The study also concludes that informal solid waste collectors serve as "facilitators for" and "detractors of" effective sanitation service delivery. Although they help in waste collection and disposal, they nonetheless pose a major challenge to the efforts of local government sanitation service delivery if their activities are left unregulated. In that regard, the study maintains that to optimize the role of informal waste collectors, the assembly should register them and assign specific places to them where they would be responsible for collection of waste generated by the households.

For effective compliance to details, coordination and effectiveness in waste collection, the study recommends increase in the frequency of sanitary inspection to deal with insanitary practices in households and communities, especially in urban slums. The Assembly should also develop periodic educational programs on public health and environmental sanitation to sensitize residents. Again, there should be increased distribution and placements of waste bins and stringent punishments meted to culprits of indiscriminate waste disposal. It is also expedient for the assembly to intensify its supervisory role on the private waste collectors in order to keep up with their regularity and punctuality in collecting refuse to ensure quality service delivery.

# US Foster Care Administration

Rebecca H. Padot
PRRUCS, University of Pennsylvania, Philadelphia, PA, USA
Department of Government and History, Misericordia University, Dallas, PA, USA

## Synonyms

Child welfare administration; Child welfare policy; Foster care implementation; Foster care policy; Foster care public administration

## Definition

| | |
|---|---|
| Foster Care | The US Department of Health and Human Services defines foster care as "24-hour substitute care for all children placed away from their parents or guardians and for whom the title IV-E agency has placement and care responsibility. This includes but is not limited to placements in foster family homes, foster homes of relatives, group homes, emergency shelters, residential facilities, child care institutions, and preadoptive homes" (Code 2018). |
| Administration | Public administration, bureaucracy, public organizations, public policy implementation, public management. |

## The Foster Care Children

In FY2017, 691,000 children were served by the foster care system in the United States with 443,000 children in care on the last day of FY2017 (U.S. Dept., Trends, 1). The number of children served declined consistently from 750,000 in 2008 to 635,000 in 2012 but then steadily increased again through 2017 with 691,000 children (U.S. Dept., Trends, 1). This increase is partially attributable to the opioid epidemic (Radel et al. 2018, Substance Use, 1).

The median amount of time a child spends in foster care is 14.3 months as of FY2017 (U.S. Dept., Foster Care, 7). In FY2017, approximately one-third of children reside in foster care homes with relatives (U.S. Dept., Foster Care, 2), which is termed kinship care. An additional 45% of foster children are placed in nonrelative foster family homes, 7% in institutional care, 6% in group homes, and the rest are in various other categories (U.S. Dept., Foster Care, 4). Between FY2008 and FY2017, the number of adoptions has hovered between approximately 50,000 and

60,000 annually (U.S. Dept of Health and Human Services n.d.).

The Fostering Connections to Success and Increasing Adoptions Act of 2008 raised the age states are permitted to seek Title IV-E funding (reimbursement from the federal government) from age 18 up to age 21 (The National Conference of State Legislatures 2017). Half the states have chosen to extend foster care through this Act (The National Conference of State Legislatures 2017).

## The Foster Care System

Akin to some government by proxy systems (Kettl 1988) in the United States, foster care involves funding from both the federal government and state and local governments. The primary vehicle by which foster care is funded federally is Title IV-E. The federal government provides approximately $5 billion in federal spending via this vehicle (U.S. Dept, Fiscal Year 2016, 7) along with another at least $4.1 billion in annual state and local spending (Radel, personal communication, August 25, 2009) (Note: The $4.1 billion mentioned here only refers to the HHS reported amount of state spending (including local spending) on foster care. State and local spending is significantly higher when including foster care expenses for non-Title IV-E eligible claims. HHS does not report overall data for state/local funded foster care, which is non-Title IV-E eligible.). However, state and local spending is higher when including foster care expenses from non-Title IV-E eligible claims. Less than half of all foster care cases receive partial funding from the federal government because they are not eligible for Title IV-E (Padot 2015, 9). In these cases, the states become financially responsible and, in some cases, shift the costs to their sub-governments (Padot 2015).

In addition to funding foster care, the federal government requires reporting via the Adoption and Foster Care Analysis and Reporting System (AFCARS) (U.S. Department of Health and Human Services 2012) from states such as reducing abuse, reducing time to reunification, and reducing placements of young children in group homes. The author (2015, 146) found the federal government had increased its focus on measuring the performance of state programs, thereby acting as a monitor of state agencies.

The states operate as grantees who receive some of their foster care funding from the federal government. Each state oversees the foster care program in their state, and some states sub-grant authority to regions in their state. As part of this government by proxy system, some states will administer the foster care programs themselves, and others will sub-grant out to counties or regions and/or nonprofits to conduct the foster care placements themselves. For instance, in Delaware the state oversees foster care and licenses the foster homes, but nonprofits also produce matches to connect foster children with foster parents (Padot 2015, 46). Whereas, in New York, foster care is state administered, but county implemented in that the counties manage their own foster care programs. New York City, which includes five boroughs, has approximately two-thirds of the foster care caseload for the state (Padot 2015, 68). In general, the bulk of the foster care work is produced at the state level or by its sub-governments, and there is a significant on-the-ground involvement by the nonprofit sector (Padot 2019) including obtaining foster parents for foster children.

## The Effectiveness of the Foster Care System

There has been one well-known self-assessment of a foster care program, the Casey Young Adult Survey, conducted by a foundation affiliated with their own foster care programs (Havalchak et al. 2008). In addition, there have been three major foster care effectiveness initiatives launched, including two produced by academics and one by the federal government.

The US Department of Health and Human Services started measuring foster care outcomes via their Child Welfare Outcomes Reports (U.S. Dept., Child Welfare 2006). This federal department collects data from the states on foster care outcomes via AFCARS and via the Child and Family Services Review (CFSR). An example of outcome measure 1.1 is the following: "Of all the

children who were victims of substantiated or indicated child abuse and/or neglect during the first 6 months of the reporting period, what percentage had another substantiated or indicated report within a 6-month period?" (U.S. Dept., Child Welfare 2006). Whereas, outcome measure 4.1 reads, "Of all children who were reunified with their parents or caretakers at the time of discharge from foster care, what percentage was reunified in less than 12 months from the time of entry into foster care?" (U.S. Dept., Child Welfare 2006). This data shows how each state has performed on each of several outcomes and then allows states to track themselves against the national median and to potentially increase their performance on foster care outcomes over time. This report measures foster care effectiveness while children are in the foster care system and tracks their reentry within 1 year thereafter.

The Chapin Hall Center for Children at the University of Chicago produced the Midwest Evaluation of the Adult Functioning of Former Foster Youth study that tracked 700 foster care youth after they exited from foster care from 2002 to 2011 (Courtney et al. 2011). This study found that approximately 20% of these former foster youth did not have a GED/high school diploma versus 6% of the control group. Nearly one-third of these former foster youth reported being homeless or couch surfing. 28% noted they did not have enough money for rent versus 6% of the control group. 38% reported they were worried about running out of food. Two-thirds of the young men and nearly half of the young women had been involved in some way with the juvenile or criminal justice system although some of this likely occurred while in the foster care system (Courtney et al. 2004). In other words, the study looked at how the foster system was preparing foster youth for long-term success, and the result showed the system needs improvement.

The author (2015) released a study on what variables are producing foster care administration effectiveness in the stronger performing foster care states. This four-state public administration study looked at two top-performing and two bottom-performing foster care states that were selected by the author based on their performance on a variety of foster care outcomes in the Child Welfare Outcomes Reports, as well as, other variables. The goal of the study was to understand the variables that might be associated with positive foster care practices and performance. The study found that "better foster care administration is produced by public managers who operate as principled agents to develop networks, partnerships, and strategies within and outside their states" (Padot 2015). The study offers case examples of the practices these public managers performed to produce better foster care results that can be replicated by other foster care systems.

However, another finding (Padot 2015) was that the foster care system is largely measuring the progress of foster children while in care via the Child Welfare Outcomes Reports, but not tracking the former foster youth to see how they are performing once they transition to adulthood post-care. Even the top-performing foster care states had weaker long-term outcomes for former foster youth. In other words, effective foster care administration which means lower abuse rates in care, more placement stability, etc. does not equate to long-term success for these former foster youth. Many former foster youth, even in the stronger performing states, end up homeless, incarcerated, or with food and/or financial insecurity. The author encourages (1) more support for these foster children for a longer period and (2) more government, nonprofit, faith-based, community, and individual involvement to support these foster youth as they make the permanent transition to adulthood.

# US Office of Government Ethics

Robert N. Roberts
James Madison University, Harrisonburg, VA, USA

## Synonyms

Administrative ethics program; Compliance-based ethics management; Public integrity management

## Definition

US Executive Branch agency responsible for the oversight of the federal executive branch administrative ethics program including the confidential, public financial disclosure and standards of conduct programs.

## Introduction

In the aftermath of the Watergate scandal (1972–1974), which led directly to the resignation of President Richard Nixon and the criminal convictions of a number of his closest White House aides, Congress passed the Ethics in Government Act of 1978 in an effort to restore public trust in the federal government (Gilman 1995; Roberts 1988; Walter 1981). The Ethics Act embraced much stricter compliance-based ethics regulation as the solution for the restoration of public trust in government. Advocates of compliance-based or rule-driven ethics argue that providing government employee with clear rules governing their

conduct is the most effective way to deter official misconduct and to maintain public trust in government.

Due to growing concerns over the impact of financial conflicts of interest on public trust of the federal government, between 1961 and 1968, Congress and the presidential administrations John F. Kennedy and Lyndon Johnson put in place much stricter criminal public corruption and conflict of interest restrictions as well as new administrative standards of conduct directed at regulations for federal executive branch employees. In 1965, President Lyndon Johnson issued Executive Order 11222 that established new standard of conduct regulations for federal executive branch employees and officials and requiring tens of thousands of executive branch officials to file annual confidential financial disclosure statements. The new ethics directives dealt with issues such as acceptance of gifts and other non-criminal conflict of interest issues. Subsequently, each federal agency and department adopted their own standard of conduct rule patterned on the guidelines established by Executive Order 11222. However, these reforms did not prevent the Watergate scandal and an explosion in serious conflict of ethics controversies involving high-level executive branch employees and officials. Elected to the presidency in 1976, Jimmy Carter had pledged to restore trust in the federal government. The Ethics in Government Act of 1978 (Ethics Act) passed Congress with strong support from President Carter. With the goal of increasing the financial transparency of high-level executive branch officials, members of Congress, and federal judges, the Ethics Act required high-level officials in all three branches of the federal government to file annual public financial disclosure statements and also to restore trust in criminal investigations of high-level executive branch officials, including the President of the United States.

In 1989, President George H. W. Bush signed Executive Order 12674 that replaced individual agency standards of conduct with a single set of ethical standards applicable to federal executive branch employees. On August 7, 1992, the USOGE issued the first set of comprehensive executive branch standard of conduct regulations. These were codified in 5 C.F.R. Part 2635.

## The Responsibilities of the US Office of Government Ethics

The Ethics Act of 1978 and subsequent executive orders gave the USOGE responsibility for (1) the oversight of the existing confidential financial disclosure program, (2) the oversight of the new public financial disclosure program for high-level executive branch officials, (3) providing interpretations of presidential standard of conduct executive orders, (4) the issuance of advisory opinions regarding the application of standard of conduct rules and regulations, (5) the approval of blind trust to resolve potential financial conflicts of interest issues, and (6) the oversight of agency ethics programs. Of particular importance, Congress did not give the USOGE any authority to investigate or prosecute possible violations of criminal public corruption or conflict of interest laws.

A presidential appointee subject to Senate confirmation serves as the Director of the USOGE. The Director of USOGE serves a 5-year term. One hundred and thirty federal organizations appoint their own designated agency ethics officials (DAEOs) to assist some 2.7 million executive branch employees in identifying and resolving potential conflicts of interests. Presently, some 5,600 full-time and part-time ethics officials work to educate employees regarding ethics rules and regulations and help employees to recognize and resolve actual and potential conflicts of interest. The USOGE has a staff of 80 full-time equivalent employees and a budget of $15 million. In comparison to other executive branch public integrity units, the USOGE is a small organization. As a result, the USOGE relies heavily upon agency DAEOs to handle the day-to-day management of agency ethics programs. Even though the USOGE provides extensive training for agency DAEOs, the USOGE lacks the authority to appoint or remove agency ethics officials.

The USOGE devotes much of its resources on the oversight of the executive branch confidential

and public financial disclosure systems. In 1965, President Lyndon Johnson issued Executive Order 11122, prescribing standards of ethical conduct for government officers and employees. Besides establishing new standards of conduct for executive branch employees, the executive order put in place a confidential financial reporting program for tens of thousands of federal employees. The order delegated to each federal agency or organization responsibility for collecting and reviewing confidential disclosure statements. Pursuant to the requirements of the 1978 Ethics Act, agency ethics officials annually collect and review some 384,000 confidential financial disclosure statements and 26,000 public financial disclosure statements. Of these forms, the USOGE only has responsibility for reviewing public financial disclosure statements filled by presidential appointees subject to Senate confirmation.

## The Resolution of Financial Conflicts of Interest and the Presidential Nominee

Prior to the passage of the Ethics Act of 1978, the Senate system for reviewing the financial affairs of presidential appointees for financial conflicts of interest effectively broke down. Senate committees responsible for reviewing the qualifications of presidential nominees lacked uniform standards for identifying and resolving actual or potential financial conflicts of interests the resolution of financial conflict of interest. This situation seriously complicated efforts by presidential administrations to recruit individuals to serve in crucial policy-making positions. Rules regarding the establishment of blind trusts did not exist. Presidential nominees needed to negotiate recusal or divestiture agreements with individual committees.

To speed up the review of the financial affairs of presidential appointees subject to Senate confirmation, Ethics Act of 1978 assigned to the USOGE the responsibility for reviewing the public financial disclosure statements of presidential appointees subject to Senate confirmation and to make sure that nominees took appropriate steps to resolve and financial conflict of interest issues. Subsequently, Senate committees adopted a policy of not proceeding with the confirmation of presidential nominees until the USOGE informed the committee that it had reviewed their public financial statements and the nominee had agreed to resolve any actual or potential financial conflict of interest involving the nominee and the spouse and or minor children of the nominee. The system has proven remarkably successfully in the resolution of financial conflicts of interest which might otherwise derail a nominee's effort to obtain Senate confirmation.

Under the present system, a presidential nominee submits their public financial form to the DAEO of the agency or department they will serve. The DAEO then conducts an independent review of the financial affairs of the nominee for any actual or potential financial conflicts of interest and negotiates with the nominee how to resolve any conflicts. The agency DAEO then forwards the nominee' financial disclosure statement to the USOGE for a second review. In consultation with the nominee and the appropriate agency ethics officials, the USOGE works to resolve any financial conflict of interest not taken care of satisfactorily at the agency level. Historically, the USOGE has relied upon a number of different remedies. Some nominees agree to recuse or disqualify themselves from participating in certain matters in which the nominee or immediate family member has a financial conflict of interest. Recusal agreements, however, have a major disadvantage of making it more difficult for a nominee efficiently perform their official duties. To deal with this problem, some nominees decide a blind trust to resolve financial conflict of interest issues without having to sell off any financial holdings. Blind trusts must meet strict statutory requirements.

Between the enactment of the Ethics Act of 1978 and the late 1980s, complaints increased that it worked an undue financial hardship to force nominees to sell of certain financial holdings or carry the expense of setting up and managing a blind trust which might subject them to substantial capital gains taxes. To lessen the burden on nominees and other executive branch employees and

officials required to sell off certain financial assets, the Ethics Reform Act of 1989 granted the Director of the USOGE the authority to issue a so-called certificate of divestitures which permits officials to defer capital gains taxes on assets sold to comply with financial conflict of interest rules and regulations.

During a presidential transition, not surprisingly, the role of the USOGE in the review of the financial affairs of presidential nominees becomes much more important. A new administration wants to get their nominees through the confirmation process as quickly as possible. To accomplish this objective, the USOGE must process hundreds of public financial disclosure forms and negotiate often complex ethics agreements over a particularly short period of time. The USOGE has proven remarkably successful in meeting these extremely tight timetables. From Republican to Democratic administrations or Democratic to Republican administrations, the USOGE established a reputation of professionalism in the resolution of complex financial conflict of interest issues.

## Employee Standards of Conduct Oversight and the USOGE

The management of the executive branch standards of conduct program constitutes the second major responsibility of the USOGE. During the 1990s, the USOGE took the important step of issues detailed regulations dealing with a number of important standards of conduct issues covered by a series of executive branch standard of conduct executive orders (5 C.F.R. Part 2635). The USOGE issued the new regulations with the goal of establishing a uniform set of administrative ethics rules for all executive branch employees. Executive branch employees found responsible for violating these rules face disciplinary action but do not face criminal sanctions. Some of the topics dealt with by these standard of conduct regulations include (1) gifts to executive branch employees from outside sources, (2) gifts between executive branch employee, (3) conflicting financial interests involving executive branch employees, a spouse or minor child, (4) impartiality in performing official duties, (5) executive branch employees seeking outside employment, (6) misuse of position by executive branch employees and officials, and (7) outside activities by executive branch employees. Significantly, the USOGE has limited authority to enforce these standards of conduct regulations or order corrective action by federal executive branch employees. The Ethics Act of 1978, the Ethics Reform Act of 1989, and a series of executive orders place responsibility for the enforcement of standards of conduct regulations on individual agencies and departments.

The regulation of the acceptance of gifts and private hospitality by executive branch employees constitutes one of the most difficult standards of conduct issue dealt with by federal agencies and departments and the USOGE. Regulations issued by the USOGE prohibit executive branch employees and officials from accepting most gifts or private hospitality from prohibited sources. Gift acceptance regulations prohibit all executive branch employees and officials from accepting most types of gifts and private hospitality from a "prohibited source." A "prohibited source" includes anyone seeking business with or official action by an employee's agency and anyone substantially affected by the performance of the employee's duties. Exceptions to the gift acceptance prohibition include unsolicited gifts worth less than $20 per occasion, gifts motivated by a personal or family relationship and entertainment, and food and refreshments at certain widely attended gatherings.

Federal agency ethics officials also devote considerable time to the management of financial conflicts of interest. Standards of conduct ethics regulations prohibit executive branch employees "from participating in an official government capacity in a matter in which he has a financial interest or in which his spouse, minor, child, employer, or any one of several other specified persons has a financial interest." Regulations issued by the USOGE give agency DAEO's broad authority to resolve financial conflicts of interest including requiring employees and officials to sell certain financial interests or to acquire

certain types of financial interests. Again, the USOGE does not have a direct role in the resolution of the vast majority of financial conflict of interests involving executive branch employees. This responsibility rests with individual agencies and federal departments.

The regulation of the outside activities of executive branch employees has also proven a difficult public ethics issue for federal agencies and departments and the USOGE. The Hatch Act, for instance, places limits on the on political activities by off and on duty federal executive branch employees. Also, standards of conduct regulations permit federal agencies to require employees to obtain prior approval from their agency before engaging in outside activities that may create a financial conflict of interest (5 C.F.R. 2635.801). An employee of the Environmental Protection Administration, for example, receives a promotion. The employee's new position will require the employee to write new hazardous waste disposal regulation. The employee also serves as a president of a nonprofit environmental organization that routinely submits comments on such regulations. Federal standards of conduct regulations would prohibit the EPA officials from continuing to serve as the president or officer of the nonprofit environmental organization (5 C.F.R. 2635.802).

Executive branch standards of conduct regulations also prohibit federal employees from misusing their public positions for private gain. This includes misuse of nonpublic information, misuse of government property and equipment, and making use of work hours to engage in activities unrelated to the employee's official responsibilities and a range of other activities (5 CFR Part 2635).

## The USOGE and the Restoration of Public Trust in Government

When one looks at the size of the USOGE, one might assume that it has a minor role in protecting public trust in the integrity of executive branch employees and officials. This would not be an accurate assessment of the role played by the USOGE since its establishment by the Ethics Act of 1978. In fact, it has emerged as one of the most effective federal public integrity units. First, the USOGE has proven remarkably successful in helping to eliminate financial conflicts of interest as a major barrio to the Senate confirmation of presidential nominees. The USOGE has worked effectively with both Republican and Democratic administrations to remove barriers to Senate confirmation. The USOGE has proven remarkably successful in working effectively with both the White House and Senate committees with respect to the Senate confirmation process. This has proven to be a remarkable achievement in the light of the problems created by financial conflict of interest issues prior to the passage of the Ethics in Government Act and the establishment of the USOGE.

Second, the USOGE has succeeded in putting place a uniform set of ethics guidelines dealing with a number of common conflict of interest issues that has the ability to seriously erode public trust in government. The existence of a uniform set of ethics guidelines has made it much easier for agency ethics officials to put in place ethics training programs directed at helping executive branch employee avoid conflict of interest controversies that have the potential to destroy their government careers and reduce public trust in government. As a result, the adoption of a uniform set of standard of conduct regulations has proven successful in reducing intentional and inadvertent standard of conduct violations.

Third, the USOGE plays a crucial role assuring the every federal agency takes seriously the importance of operating effective government ethics programs. The USOGE constantly monitors and evaluates the effectiveness of agency ethics programs. Even though the USOGE does not have the authority to appoint or remove agency ethics officers, it does have the authority to order federal agencies to make changes to their ethics programs if they do not meet standards established by the USOGE.

Fourth, the USOGE directly and indirectly provides the ethics officials of federal agencies education and training essential to the effective

operations of agency ethics programs. As part of this mission, the USOGE provides agency ethics programs with up-to-date interpretations of standard of conduct regulations. With this information, agency ethics officials have a much higher probability of preventing federal employees from violating ethics rules. As a result, the USOGE places a high priority on the education and training of agency ethics officials in an effort to provide them the tools to work with large numbers of federal executive branch employee to avoid inadvertent violations of standard of conduct regulations.

## Conclusion

Many critics of compliance or rule-driven ethics argue that there is little increase of public trust in government (Huddleston and Sands 1995). Although rule-driven ethics may not be the only way to restore public trust in government, it has a major role to play. The history of the USOGE demonstrates that effective public integrity management has the ability to reduce conduct that seriously undermines public trust in government (Roberts 2007).

# US Trends in Public Corruption Prosecutions

Kristine Artello and Jay S. Albanese
Wilder School of Government and Public Affairs, Virginia Commonwealth University, Richmond, VA, USA

## Synonyms

Bribery; Embezzlement; Fraud; Foreign Corrupt Practices Act (FCPA); Government monopoly; Kickbacks; Misappropriation

## Definition

Public corruption is defined as the misuse or abuse of an individual's public office for private gain. In contrast, commercial corruption is the use of a private or business position of trust for one's personal gain. While both types of corruption involve misuse/abuse of one's position, public corruption affects everyone because it involves public trust and/or money, whereas commercial corruption affects only those doing business with the individual or firm.

## Introduction

Corruption has been broadly defined as "the use of public office for private gain" or "the abuse of entrusted power for private gain" (Rose-Ackerman and Palifka 2016; Transparency International 2017; World Bank 2017). However, broad definitions are not useful to understand the exact behaviors result in liability and public corruption prosecutions. The modern era of US prosecution of public corruption might have started in 1970, when Herbert Stern, US Attorney for New Jersey, convicted on Hugh Addonizio, mayor of Newark, for conspiracy and extortion in exploiting his role as mayor to take money illicitly – a clear quid pro quo exchange of money for awarding public contracts (Stern 2012). In 1976, following Watergate, the US Department of Justice created the Public Integrity Section to oversee public corruption prosecutions across the country. This unit must review and approve prosecutions against judges, governors, and other elected officials. The 94 US Attorneys Offices, distributed across the United States, conduct all federal prosecutions. There has been a rise in prosecutions and convictions for public corruption over the last 30 years.

Most public corruption prosecutions occur at the federal level in the US. Cordis and Milyo (2016) examined all newspaper and newswire coverage from 1986 to 2014 and found a total of 17,362 cases, once they were screened to include only cases involving public employees. The overwhelming majority of cases (n = 16,452) were prosecuted in federal court. In contrast, only 910 convictions involving public corruption were brought in state courts, consisting primarily of local government employees, such as thefts by public school teachers and administrators, local police, and firefighters. The remaining portion involved state employees, most frequently motor vehicle licensing bureau clerks selling licenses, or thefts by university employees, state police, and prison guards (Cordis and Milyo 2016). Therefore, according to these data, approximately 94% of all public corruption convictions in the US occur by federal prosecutions in the federal courts (but a substantial number of those convicted in federal court involved state and local officials).

**US Trends in Public Corruption Prosecutions, Table 1** Corruption convictions in federal court, 1986–2015

| Year | 1986 | 1996 | 2006 | 2015 |
|---|---|---|---|---|
| Prosecutions | 1949 | 2214 | 1541 | 1222 |
| Convictions | 464 | 552 | 590 | 474 |

Source: TRAC

The reporting of cases as public corruption did not occur in a systematic way until 1989. TRAC (Transactional Records Access Clearinghouse) collects information via FOIA (Freedom of Information Act) requests to gather data on the activities of the executive branch of government. The analyses by TRAC have been found to be more accurate than the reports published by individual government agencies themselves (Cordis and Milyo 2016). The last 30 years has seen a steady climb in public corruption convictions from 1986 to 2001, and then dropping somewhat. Table 1 illustrates trends in the number of cases in which at least one defendant was charged and found guilty of corruption. A leveling off follows an upward trend. A sustained high level of convictions is evidenced year-to year; however, as there has been more than 460 federal convictions for public corruption offense every year since 1986.

## Prosecution Charges

When examining the record of prosecutions, four main types of illicit conduct are found: bribery, extortion, fraud, and conspiracy. Bribery, typically recognized as quid pro quo, is a common corruption offense, because it involves a voluntary exchange of a benefit to influence an official act. Both parties, the bribe giver and receiver, are liable under law. In contrast, extortion involves a threat of some kind of future harm to obtain the

property (usually money). Bribery is distinguished from extortion in that bribery occurs when the payer received "better than fair treatment," while extortion occurs when the payer must pay "just to be treated fairly." In both cases, there is a corrupt exchange (Arrieta 2016).

Fraud occurs when either a private citizen or public official obtain government money or property using false representations. The Public Integrity Section of DOJ includes any type of fraud perpetrated against the government or its programs (e.g., false claims for medical procedures). Therefore, some of these cases more closely resemble white-collar crimes of fraud, but they are considered corruption because public funds are involved. Embezzlement of public funds occurs when a public official or public servant misuses their authority to steal money from the government. Conspiracy punishes the planning to commit a crime. It occurs when two or more persons agree to commit a crime, so it can be used for a variety of planned crimes involving multiple people, such as organized crime, corruption, and some white-collar crimes (Albanese 2015). An expansion of conspiracy law to criminal enterprises, the "Racketeer Influenced and Corrupt Organizations," (herein RICO), was enacted in 1970, making it unlawful to acquire, operate, or receive income from an enterprise through a pattern of racketeering activity. An individual or group (an "enterprise") who commits two or more indictable offenses ("racketeering activity") within a 10-year period (a "pattern") is subject to 20 years' imprisonment, fines up to $25,000, and forfeiture of any interest in the enterprise, as well as civil damages and dissolution of the enterprise itself (Urbina and Kreitzer 2004). The RICO law targets the enterprise behind the illicit behavior and was designed to combat organized crime infiltration of legitimate businesses, although it has since been employed to prosecute criminal activities by government agencies and corporations (Blakey 2006).

An examination of all federal prosecutions that resulted in convictions from 1986 to 2015 were analyzed to examine how public corruption was prosecuted in practice. Fifty-eight different statutory charges were brought in these cases, but only ten statutes comprised nearly 60% of all the public corruption cases. The list below summarizes the top 10 federal statutes used to prosecute corruption cases.

18 USC 201 – Bribery of public officials and witnesses
18 USC 666 – Theft or bribery in programs receiving Fed funds
18 USC 1951 – Hobbs Act (extortion)
18 USC 1001 – Fraud/false statements or entries generally
18 USC 641 – Public money, property or records
18 USC 1341 – Mail Fraud – frauds and swindles
18 USC 371 – Conspiracy to commit offense or to defraud US
18 USC 287 – False, fictitious or fraudulent claims
18 USC 1343 – Fraud by wire, radio, or television
18 USC 1962 – RICO – prohibited activities

These 10 statutes reflect the three major types of underlying behavior: bribery, fraud, and extortions, well as a fourth behavior, identified as conspiracy and racketeering, found in larger and more systematic corruption schemes. The relationship between these underlying behavior and corruption is summarized in Table 2.

Therefore, over 30 years of federal prosecutions indicate that these cases rely on a small number underlying forms of misconduct: bribery, fraud, extortion, and conspiracy (Albanese et al. 2018).

## Types of Corrupt Behavior and Governmental Level

Public corruption behaviors appear to vary by level of government. For example, in cases involving federal defendants, the mixture of charges brought differs than for cases involving state and local public corruption defendants. Fraud-related corruption charges underlie most cases overall, as well as in cases involving federal defendants. At the state and local level, however, fraud behaviors were second most common after bribery (in local

**US Trends in Public Corruption Prosecutions, Table 2** Behaviors underlying federal prosecutions

| Offense description | Connection to corruption |
|---|---|
| Bribery is a voluntarily exchange (solicitation or acceptance) of any benefit to influence an official act (18 USC 201, 666) | A corrupt exchange between a public official and a private business or citizens that benefits both parties. It subverts a lawful process (e.g., pay to avoid a ticket, pay to get a permit, pay a kickback to obtain a government contract). |
| Fraud is theft by deception, often funds obtained or misused without authorization for their personal enrichment or benefit (18 USC 1001, 641, 1341, 287, 1343) | The government is deceived in obtaining public funds through false documentation, false statements, or purposeful avoidance of procedures that are required by law. |
| Extortion involves obtaining property, using threats of future harm (18 USC 1951) | The person soliciting the property is liable due to the threats made to extract payment from the victim who has been placed under duress. |
| Conspiracy and racketeering - organized or ongoing efforts to violate the law in systematic fashion (USC 371 and 1962) | Conspiracy punishes the planning to commit a crime by two or more persons. Racketeering targets the enterprise behind ongoing or systematic criminal behavior. |

Source: Developed through authors' analysis

cases) and extortion (in state cases). The lower-levels of fraud-related corruption at the state and local level may be the result of DOJ's Public Integrity Section's inclusion of frauds perpetrated against federal programs, including no public official or employee participated in the fraud. Bribery was the second most common underlying behavior overall but was found to be the most common charge in local cases. At the state level, corruption charges involving extortionate behavior were the most common. Overall, 54% of corruption cases over 30 years cases involved federal defendants, 30% involved local defendants, and 16% involved state-level defendants.

Federal defendants were most often charged with following offenses (in order of most to least): bribery, fraudulent statements/entries, theft of public funds, conspiracy and fraudulent claims. However, state and local defendants were more likely to be charged with a different ordering of offenses: extortion, theft from government programs, mail fraud, and conspiracy for state defendants and theft from government programs, extortion, mail fraud, and bribery for local defendants in the last 30 years.

## Conclusion

Though federal corruption cases have been brought under 58 lead charges over the last 30 years, only 10 of these charges account for nearly 60% of all cases made. These 10 charges target four types of underlying behavior, which, together, form the operational meaning of corruption in practice. At the federal level, fraud is the most common corrupt behavior prosecuted. In contrast, state and local officials more often accept money or gifts for actions either through bribes (offered at the local level) or extorting payments for access (at the state level). The majority of prosecutions are occurring against public officials at the state and local level. In addition the level of the prosecution effort against corruption has been consistent over the years with some drop-off after 2001. The drop may have resulted from a shift in resources to focus on national security after 9/11 attacks, a change in behavior as people are deterred because of high profile cases or a change in behavior to avoid detection. The future of public corruption convictions may be more determinative based on the recent Supreme Court decision of *McDonnell v.* US that exclusively defines public corruption as the quid pro quo in the conduct of official acts which is a limited view on corrupt behaviors (136 S. Ct. 2355, 2016). Court decisions have also curtailed use of the honest service doctrine in the federal mail fraud statute to prosecute state and local officials on public corruption charges. In addition, Congress has been reluctant to enact statutes that provide clear authority to investigate state and local officials for offenses that do not involve a direct quid pro quo (Heilman 2017). It remains to be seen whether the federal prosecution effort will be sustained in the face of

increasing judicial and legislative limitations, or whether corruption prosecutions will occur more often at the state level.

## Synonyms

Debt cancellation; Debt forgiveness; Debt-for-education relief; Government education spending

## Definition

Debt relief granted to a debtor government, such as in the case for the DRC, may result in more public resources available and, through the conditions attached to receiving the debt relief, can lead to increased social sector spending, in general, and higher education sector spending, in particular, and may also, given particular other conditions fulfilled, cause improved effectiveness of this spending in terms of improved outcome and impact indicators for education.

## Introduction

On July 1, 2010, the Executive Boards of the IMF and World Bank jointly announced, under the so-called heavily indebted poor countries (HIPC) and multilateral debt relief initiatives (MDRI), to irrevocably grant the Democratic Republic of the Congo (DRC) external debt relief of about 12.3 billion USD (IMF 2010). Initiated in 1996, these debt relief programs basically aim to act as a mechanism to help eligible countries not only restore debt sustainability but also increase macroeconomic stability, improve governance of public service provision, and reduce poverty. They intend to do so in two ways: first, they increase

the country's available resources. Whereas savings on current and future debt service provide for a direct budget increase, the elimination of "debt overhang" also has an indirect positive effect on both domestic (through higher economic growth) and foreign resource availability (through more aid and foreign private investment). The second and maybe more important channel works through conditionalities attached to the deal, which focus on structural reforms to spur economic growth and reduce poverty, for example, by improving the governance and quality of basic health care, education, or other public services (IMF 2015).

When the debt relief was granted, the IMF considered these aims to be accomplished (IMF 2010: 1). Now, 8 years after the completion point, the IMF's claims on improved governance and service delivery can be reassessed with the benefit of hindsight. We focus on two questions in particular. We first question how and to what extent the HIPC debt relief program increased the availability of resources entering the public budget and how it triggered, reshaped, and sustained budgetary policies and priorities (Cassimon and Essers 2017). The second question asks how and to what extent the HIPC debt relief impacted on education, both in terms of sectoral resources and their allocation to schools and teachers and regarding the educational attainment of Congolese pupils. Our choice for education stems from the priority given to this sector by the Congolese government in the allocation of HIPC resources. Therefore, if any impact is to be expected, then it would become visible *there first*.

## The DRC's History of Debt

The origin of the Congolese debt burden can be traced back to the period between 1973 and 1975. Totalling 544 million USD at the start of this period (representing 25% of the country's GNI and yielding a debt service of around 5% of the country's exports), the overall debt stock rose nearly sixfold, and debt service doubled within only 2 years. This increase can be mainly attributed to four major projects: INGA I, INGA II, and INGA Shaba (800 million USD), the Tenke Fungurume Mining Company (320 million USD), Maluku/SOSIDER (182 million USD), and the Cimenterie Nationale (100 million USD) (Marysse et al. 2012). As none of these projects realized its potential, especially after the nationalization policy introduced by Mobutu in 1973, debt servicing problems emerged very early in the DRC.

In June 1976, Zaire (as the DRC was then called) was the first African country to conclude a deal with the bilateral creditors of the Paris Club. However, as the authorities did not respect the stipulated repayment schedule, new deals followed, and penalty interests kept inflating the debt stock. Although this snowball effect was briefly halted in the early 1980s (when structural adjustment programs prioritized debt repayment over social spending, resulting in severe budget cuts to education and health care), poor economic and fiscal governance soon returned to Zaire, which further eroded the formal economy and did anything but prevent further debt accumulation during the last decades of the twentieth century. When Joseph Kabila took power in 2001, the new president inherited a total external debt of nearly 13 billion USD in nominal terms, nearly three quarters of which were arrears and additional debt service arrears adding 700 million USD per year.

## Did the Process of HIPC Debt Relief Increase Resources?

In the case of the DRC, the process of debt relief was indeed accompanied by "new" resource inflows. These new resource inflows were quite limited, however, and they were only to a limited extent channeled through the Congolese government or state administration. Instead, the indirect resource effect has proved to be much more powerful: through the elimination of debt overhang and by stabilizing the macroeconomic landscape, which was partly a result of the country's pacification, partly triggered by the conditionalities attached to the HIPC deal, the country has managed to substantially broaden its fiscal base.

Furthermore, a part of this increased Congolese budget has been successfully earmarked to social sectors, of which education received the biggest share. Figure 1, which displays the evolution of two key macroeconomic indicators, shows that the adjustment program implemented between June 2001 and March 2002, succeeded in breaking the vicious cycle of hyperinflation. Since 2002, the DRC has further managed to keep inflation at relatively low levels, except for 2009 when the global economic crisis hit Africa. Moreover, the economic reforms resulted in the first positive economic growth rates in 13 years, a trend which continued and was only interrupted again in 2009. As a result of this global crisis, economic growth between 2008 and 2013 was lower than forecasted by the IMF growth models but still positive and resuming its upward trend in 2012. Even if we cannot fully attribute this economic trend shift to the process of debt relief, it is clear that the prospect of debt being cancelled was an important "carrot," which has helped produce this macroeconomic performance and attract attention from the donor community.

The resumption of economic growth and macroeconomic stability, combined with the pacification of the country, also had large effects on the evolution of the Congolese budget and the inflow of new aid. Figure 2 shows that the state budget, including aid resources registered on the budget, witnessed an impressive, almost sixfold increase over the period 2003–2013, from around 1 billion USD to nearly 6 billion USD in 2013. Compared with the additional funding obtained through aid (including the HIPC Initiative), the increase in tax revenues from merely 400 million USD to more than 4000 million USD, partly as a result of higher economic growth, is the most salient.

As such, significantly more resources have become available for public spending in general.

## How Did the Debt Relief Process Impact on Education?

The success story of debt relief in the DRC needs to be curtailed halfway, and here we part ways with the IMF's conclusion: based on the data available for the education sector (where its effect should have been most visible), the debt relief process did *not* result in improved public service delivery. True, at the level of the Ministry of Education, the HIPC initiative and its conditionalities have reversed the downward trend and contributed to a sustained increase in budgetary resources. However, this increase was still insufficient to reach the average level of state expenditures allocated to education in other sub-Saharan

African countries or to regain its pre-structural adjustment level of 1982.

Table 1 documents the sector's performance in the first decade of the twenty-first century. The evolution in gross enrolment rates of children between 5 and 18 years of age indicates a substantial increase in school participation between 2005 and 2012, from 55% to almost 70%. On the flip side, when considering disparities in school enrolment, we observe that they remain important in general, despite being (slightly) reduced in some respects. More specifically, boys still have a higher probability to be enrolled in school compared to girls, the urban sector is doing better than the rural, and richer households continue to outperform the poorer in terms of school participation of their children.

Furthermore, according to a recent World Bank study, three problems of internal efficiency seem to persist. First, most children continue to enter school relatively late: they enter the system around the age of 9. Second, and related to the first problem, the percentage of children abandoning school remains about as high as before. And third, there is practically no change in the repetition rate, which amounts to approximately 10% in primary school (World Bank 2015). Finally, when it comes to the quality of education, there is not much reason for optimism either. Indeed, even though the data do not allow for an accurate comparison of literacy rates over time (the principal reason being the varying methods used by different surveys conducted in the DRC), some systematic but geographically limited studies report alarming figures. A study carried out in a series of primary schools in Katanga in 2011 reported that more than two thirds of the pupils from the second to the fourth grade were unable to read 10 words of text, and of those who could, only less than 10% actually understood what they were reading (Torrente et al. 2011). Another study, carried out in several schools in Bandundu, Orientale, and Equateur in 2010, reported that no less than 23% of the sixth grade children were unable to read a "single" word of French text (RTI International 2010: 2).

## Mind the Political Economy of Debt Relief

In other words, there is quite some contrast between, on the one hand, the substantial increase

of funds geared toward the education sector, and, on the other, the persisting disparities in schooling as well as the sector's poor performance in addressing internal efficiency and quality.

To understand this contrast, we need to disentangle the interests and logics of various stakeholders within the education sector. First and foremost, as the lion's share of overall resources spent on education is still directly provided by the parents through the payment of school fees, the education sector remained very much dominated by a market logic, with schools being accountable to the parents rather than to the education administration. As a result, private income inequalities are translated into disparities in schooling, despite the increase of the state education budget. Apart from this key explanation, the policy leverage to pursue larger degrees of schooling inclusiveness is further jeopardized by tensions within the good governance agenda as well as in relation to short-term political rent-seeking strategies. Whereas myopic reforms and the adoption of generic blueprints might produce some superficial results and maintain donor loyalty in the short run, they will most probably hinder the promotion of a more structural and domestically driven policy process in the longer run.

## Conclusion

Replication of the IMF exercise for the process of debt relief in the DRC connects to a broader debate about whether it is possible to stimulate good governance from the outside, if country ownership is considered to be such a crucial ingredient. Indeed, the HIPC debt relief process builds on an aid architecture that considers country ownership as a basic building block for improved governance, and the Paris Declaration (2005) and Busan Conference (2011) reaffirmed this view. Several scholars remarked, however, that country ownership may be at odds with other commitments, such as managing for results or with good governance in general. First, the institutional weakness in various countries constitutes a chicken-and-egg problem (Gisselquist and Resnick 2014): the final outcome of a sector reform fully owned by a recipient country ultimately depends on the institutional capacity of the sector to conduct such a reform in the first place. In this respect, one should also mention the considerable administrative workload, manifest in the multiple restrictive and implicitly imposed M&E formats that accompany such reforms. Second, the tacit assumption behind

the pursuit of increased country ownership is that political leadership is development-oriented, which is argued to be often in tension with countries' "short-term clientelistic strategies for gaining votes and seeking legitimacy" (Booth 2011: 15).

Given the varying degrees of institutional quality and diverse political incentives, it is thus unclear whether and to what extent foreign aid, in any particular setting, will be able to advance good governance and good policies. To address this issue, the generic answer is often to take context more seriously when designing, implementing, and monitoring reforms (Booth 2011; Gisselquist and Resnick 2014). Put differently, donors should "learn how to play local politics. If they want to be successful, they cannot refuse to be drawn into local events, despite their desire to appear neutral and giving only technical advice" (Marenin 2014: 159).

Now that we can judge with hindsight, our study of the debt relief process in the DRC teaches us what donors risk when they refuse to play local politics. Indeed, it is important to remark that our conclusions diverge from the IMF's assessment of 2010, particularly at the point of engaging in a local political economy analysis. A mere technical analysis of macro-level results and micro-level outcomes, especially in a context with data of debatable quality, clearly does not suffice to make a final judgment of the effectiveness of aid in improving governance. In this respect, we can only concur with Marenin's conclusion that if they want to be successful, donors should have a clearer idea about the intended effects of their actions on the beneficiary country's political economy.

# Utilitarianism

Charles D. Kay
Philosophy Department, Wofford College, Spartanburg, SC, USA

## Synonyms

Cost-benefit analysis; Expected utility; Expected value

## Definition

Utilitarianism is a consequentialist theory of ethics which states that actions are morally right to the degree that they tend to promote the greatest good for the greatest number. Utilitarianism is a consequentialist theory of ethics which states that actions are morally right to the degree that they tend to promote the greatest good for the greatest number.

## Introduction

Utilitarianism is the best-known version of consequentialist ethics. Consequentialist ethical theories evaluate the morality of actions strictly on the basis of their outcomes, setting aside any consideration of the agent's motives or other circumstances. As such utilitarianism is readily distinguished as the opposite of deontology, which evaluates actions solely on the basis of moral duty and the will of the agent. Since it focuses on the morality of individual actions, utilitarianism is also distinct from theories of virtue which are concerned with the moral character of agents rather than actions. Although forms of utilitarianism have been put forward and debated since ancient times, the modern theory is most closely associated with the British philosopher John Stuart Mill *(1806–1873)* who developed the theory from a plain hedonistic version put forward by his mentor Jeremy Bentham *(1748–1832)*.

The basic principle of utilitarianism is deceptively simple: Actions are morally right to the degree that they tend to promote the greatest good for the greatest number. The simplicity is deceptive since the statement suggests several crucial questions: what is "the good"? and who is to be included as a stakeholder in "the greatest number"? The statement also implies that there will be degrees of right and wrong and seems to presuppose that the action that is right to the highest degree is the one that should be performed.

Furthermore, in the classic form of the theory, the utilitarian principle is taken as defining the ethical or moral "right." It is the promotion of such consequences that actually *makes* an action right, rather than merely identifying what is right. That establishes utilitarianism as a theory of ethics. But it is also possible to regard the principle as only a guide to action. In that case, it would help to identify the right course of action, but not explain what it is that makes the action right. Such an approach would then need to be supplemented by both a different theory of the nature of "the right" and an explanation of the necessary connection between consequences and the moral right. (As already indicated, deontology rejects such a connection.) Here, utilitarianism is discussed as a theory of ethics which defines the nature of the right (Darwall 2003).

## What Is "the Good"?

First, it should be indicated that within the utilitarian principle, "the good" is not identical with "the right"; otherwise, the principle would be

nearly tautological. Instead, the moral "right" of an action is determined by the measurable, material "good" it produces. For Bentham, this good was simply hedonistic: pleasure and the absence of pain. For Mill and most later thinkers, however, the good also includes more abstract and intellectual benefits – indeed anything that would contribute to either individual well-being or the general welfare. Mill also insisted on qualitative as well as quantitative differences in the good, famously claiming that "It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied" (Mill 1861). Both Mill and Bentham maintained that utilitarianism provided a more objective and scientific approach to morality than older views that invoked notions of duty, God, or personal motives. The introduction of qualitative assessments of the good raises difficulties for the theory's professed objectivity.

## Who Is Included in "the Greatest Number"?

Consequentialist theories cover the full range of possibilities for the inclusion of stakeholders, from a single individual to everyone. Egoism, for example, defines the right in terms of the greatest good for the self alone. In contrast, utilitarianism is an altruistic theory: it includes others along with the self. As stated by Bentham, "each person is to count as one, and no one as more than one." Clearly, however, it is not possible in any practical way to consider the consequences of an action as it may impact *all* people. Utilitarian considerations are therefore generally confined to those who are identifiably affected in a meaningful or significant degree within the broadly inclusive goal of altruism. Such a limitation is justifiable given the generally quantitative nature of the theory. The good or harm for those who are more distantly affected by an action adds little to the overall calculation, but care must be taken to be sure to include all of those who are affected in a significant way, and this in itself is not a simple matter.

Decisions are made from among a variety of alternatives available, and according to utilitarianism, actions are right to the degree that they tend to promote the greatest good for the greatest number. A means to measure and compare the consequences of possible actions is therefore required if utilitarianism is to be of any practical use in identifying the best course of action. The immediate problem appears to be how to measure the quantity – and perhaps quality – of pleasures, pains, or well-being. Bentham imagined a "hedonistic calculus" which directly compared quantity of pleasure – measured in "hedons" – resulting from different courses of action. But for the application of utilitarianism, the task is in fact far less daunting than it at first appears because all that is required is a comparative, rather than absolute, measure. It is rather more like judging the temperature of a room rather than the quantity of heat it might contain. There is no need to quantify "good" per se, only "better" or "worse."

Without a means of objective determination of "the good," even a comparative determination remains problematic, however. Even if an overwhelming majority of human opinion may be in agreement, there will still be areas of disagreement. This has led to the development of *preference utilitarianism* according to which the "greatest good" can be simply defined by the collective preferences of all parties concerned. This has the distinct advantage of not prejudging any of the different viewpoints involved and is likely to lead to the greatest level of total satisfaction in the outcome. It does, however, have the seemingly counterintuitive feature of admitting *all* preferences – including those of the bigot, the saint, the mass murderer, and the zealot – in the initial calculations.

Given a reasonable definition of the scope of relevant stakeholders, and some applicable definition of the nature of the comparative good, it is possible to evaluate the consequences of a given action in terms of the goal of "the greatest good for the greatest number." The procedure appears to reduce to something approximating a cost-benefit analysis: factoring the benefits of an action by the number of people receiving those benefits and subtracting the costs factored by the number of

people paying those costs. In different language, utilitarianism thus defines morality in terms of the maximization of net expectable utility for all parties affected by a decision or action. As such it has acquired popularity among many economists and seems well suited to matters of public policy. In fact, Bentham presented his ideas under the title *An Introduction to the Principles of Morals and Legislation* (1789), reflecting the great similarity he perceived between the two processes.

According to the utilitarian principle, actions will always possess varying degrees of right (or wrong) depending on their consequences. One of the greatest advantages of the theory is the flexibility this permits. Without moral absolutes, utilitarianism avoids the moral dilemmas that trouble theories like deontology. Within a framework of moral absolutes, the deontologist may be presented with the dilemma of being required to perform two distinct actions (or refrain from both) even if that is not physically possible. In contrast, if two alternatives appear to yield the same expected value, the utilitarian is free to choose either one since both are equally good.

As a guide to action, utilitarianism is not without its own complications, however. This is especially true when seeking guidance for future actions. While it is possible with the given procedure to evaluate a past action in a fairly straightforward way based on present consequences, it is quite a different matter to consider a future action since the outcomes are as yet unknown. In that context, utilitarian calculations take on at best a probabilistic character. Moreover, the work of finding guidance for future action is further compounded by the fact that in order to choose the best course of action, as required by the theory, available alternative future actions would also need to be evaluated and compared. Choosing the right thing to do appears to take on all of the complexities of a feasibility study. In a similar way, even though the evaluation of a past action appears to be rather straightforward, evaluating a past *decision* would require comparison of the action taken with the possible outcomes of alternatives not chosen. Of course the inability to correctly predict the future is not unique to utilitarianism, but deontology, for example, does manage to avoid such problems by disregarding consequences altogether when evaluating the morality of actions.

## Moral Objections

While utilitarianism does encounter several difficulties in implementation, it is not obviously worse off than many other ethical theories in that regard. There are several moral objections raised against it, however, and these are often reflected in the general disapproval of the notion that "the ends justify the means." In particular, the results of utilitarian calculations run contrary to commonly recognized moral intuitions regarding distributive justice, rights, and special duties.

Since the greatest good for the greatest number is described in aggregate terms, that good may be achieved under conditions that are harmful to some, so long as that harm is balanced by a greater good. It is not hard to imagine a distribution where the benefits accruing to a majority from a particular course of action are sufficiently high to justify even a substantial harm to a minority. An often cited example is the proposal to save the lives of five individuals in need of organ transplants by sacrificing one, *unwilling* donor. The number of lives saved in such a scenario greatly exceeds the number of lives lost. Assuming a reasonable parity between the costs and benefits ascribable to survival or death in the case of each individual, a utilitarian calculation appears to heavily favor sacrificing the one to save the many. Of course sacrificing one's life to save many is typically identified as a heroic deed. The problem for utilitarianism is that it is not obvious that the theory requires that this be a voluntary act. On a larger scale, the enslavement of a minority in order to serve the good of the majority could, under the right conditions, apparently be justified on utilitarian grounds. In each of these examples, common moral intuitions appear to be at variance with the conclusions derived from utilitarianism.

By defining right and wrong as a matter of degree, utilitarianism avoids the moral dilemmas created by moral absolutes. However, since there are no absolutes at all within utilitarianism, there is also no room for the recognition of "rights": the theory admits no line that cannot be crossed for the sake of the greater good. If life, liberty, and property are all subject to the greatest good for the greatest number, there are obvious political consequences, and the failure to acknowledge basic rights as inviolable – or at least possessing very special status – is yet another way in which the consequences of the utilitarianism seem to run contrary to widely held moral intuitions. On the face of it, even the torture and murder of an innocent person would seem to be condoned by the theory if it served the good of the greater number.

Finally, the impartiality of the utilitarian principle can also lead to counterintuitive results. While Bentham's slogan "each person is to count as one, and no one as more than one" seems quite appropriate in the context of democratic politics, its application to personal relationships does not. Friendship and family typically involve special duties and commitments. For example, parents appear to have special duties toward their own children beyond those toward other children in distant lands. Impartiality may be required in certain circumstances, but it hardly seems a matter of indifference whether one feeds one's own children or someone else's. In addition, it is commonly held that individuals may create special duties and obligations through promises and contracts, but the only utilitarian reason for keeping a promise is to promote the greatest good, not to fulfill a duty. Thus, it would appear that if breaking a promise produces a greater good than keeping the promise, that will be not only permissible but morally preferable.

The utilitarian may simply respond to such criticisms by asserting that if the results of the theory conflict with common moral intuitions, that is so much the worse for those intuitions. It has frequently occurred in history that intuitions need to be revised as moral traditions develop and improve. Extreme and borderline cases often challenge broadly held intuitions. Is it wrong to murder someone in their sleep – even if it is Adolph Hitler? Is torture always wrong – even if it reveals a terrorist plot to kill hundreds? Such actions could have utilitarian justifications, and even if controversial there would be general satisfaction with their outcomes (consider Hiroshima).

On the other hand, there have been many attempts to revise utilitarianism in order to accommodate the conflicting moral intuitions, but it is quite difficult to do so in a nonarbitrary way. Most supplements to the basic principle have tended to be ad hoc rather than emerging from the same basic approach as the theory. The one revision that has been widely proposed and originates most closely from the same principle as the original is rule utilitarianism.

## Act and Rule Utilitarianism

According to the classical form of utilitarianism, each individual action is to be evaluated in terms of the utility principle. This is known as act utilitarianism. In contrast, rule utilitarianism seeks to establish a set of rules which, if followed, will tend to promote the greatest good for the greatest number. This revision of the theory has several potential advantages (Brandt 1979).

Rule utilitarianism can been put forward as a means of addressing some of the most serious moral objections raised against the theory. It is suggested that a collection of rules, justified by the basic utility principle, could be established to promote special relationships and protect rights. On this approach, a system of property rights, for example, could be shown to promote the greatest good for the greatest number. Similarly, keeping promises, caring for family, fulfilling contracts, and protecting the innocent might all be shown to generally promote the greatest good. The problem lies in the fact that the ultimate justification of each rule is the utility principle itself, and if in any given situation the violation of a rule would promote a greater good, the rule should be violated. So long as the ethical theory defines the good in terms of the utility principle, it appears that no subordinate rule would have sufficient authority to preclude exceptions.

Given the time and information required to perform accurate utilitarian calculations, it is not possible to evaluate the alternatives for every action to be undertaken. A system of rules could codify the wisdom of past experience and preclude the need for constant calculation. In this sense the rules would serve as convenient advice, saving time and requiring less information. It seems likely that following traditional rules like "Do not steal" and "Do not murder" is likely to promote the greatest good for the greatest number.

Rule-following could also be especially helpful for those who, regardless of available time and information, are otherwise incapable of performing the necessary calculations. On this view, the theory of utilitarianism, although it correctly describes the ultimate sanction of moral principles, is best reserved for the minority that are capable of applying it. The greatest good is best served by the masses when they follow rules out of duty and leave the difficult and subtle calculations to those in authority.

## Other Issues

Three further puzzles that arise for utilitarianism deserve mention. None is in any way fatal to the theory, nor do they point to the superiority of an alternative approach to ethics. They are, however, illustrative of the work yet to be done in spite of the more than century and a half since Mill first presented it in its classic form.

A surgeon may scrupulously adhere to proper techniques, committing no error in judgment or procedure, and yet the patient may die on the table. All things being equal, this is clearly an unfortunate outcome. How is utilitarianism to handle such a case? A lifeguard may swim out to save a drowning child and through some combination of circumstances herself also drown. Two lives were lost instead of one, but would it have been better if the lifeguard had stayed out of the water and watched the child drown? If we assume that such negative outcomes were neither foreseeable nor the result of poor choices are the corresponding actions nevertheless somehow not "right"? In other words, are all failures moral failures?

As a consequentialist theory, utilitarianism evaluates the morality of an action in terms of its outcome. But the appraisal of an outcome may change with time. Does the moral value of an action actually change as the implications of the consequences change? Would saving a child from serious injury or death cease to be a good thing if the child grows up to be a mass murderer? (If so, when does that happen?) Or should the morality of an act only be evaluated in terms of the immediate, or nearly contemporary, consequences? (Is there a clear justification for such a restriction?)

Finally, although utilitarianism has been criticized for apparently permitting certain abuses and not going far enough to protect basic rights, it may in some other senses be too demanding. The greatest good for the greatest number is better served by working at the soup kitchen than watching television. It is better served by money donated to charity rather than spent on a gourmet dinner. In fact, for anyone living *above* poverty and subsistence level, there is apparently some amount of time or other resources that would be best spent assisting those *below* that level – especially those very far below.

As an ethical theory, utilitarianism presents a standard for the moral evaluation of actions that is generally clear and usually easy to apply. It is not without its problems and limitations, but neither are the alternative ethical theories. Attempts to resolve the theory's difficulties – especially through the introduction of rule utilitarianism – have met with very limited success. It nevertheless remains a very useful approach in the analysis of practical and policy decisions.

# Utility and Consumer Behavior Theory

Suwastika Naidu
University of the South Pacific, Suva, Fiji Islands

## Synonyms

Consumer choice; Consumer satisfaction

## Definitions

**Consumer Behavior Theory**: These theories consider a range of factors that influence the choices of the consumers.
**Intrinsic Properties**: These are the internal properties of the object.
**Neoclassical Microeconomics**: This is the branch of economics that examines consumer utility.

## Introduction

Economic theories on consumer behavior have always fascinated microeconomists and policy makers. Understanding the way consumers behave is a challenging task as each consumer has unique characteristics and they respond differently to different situations (Bovi 2009). Economists have used different approaches to explain consumer behavior. The main aim of Samuelson's (1938) study was to examine utility as a psychological construct, while analyzing issues related to the marginal rate of substitution and how consumers behave to with changes in price. Samuelson (1938) extended Georgescu-Roegen's (1936) study of the pure theory of consumer behavior. Later, the works of Samuelson (1938), Debreu (1959, 1960), and Morishima (1959) were extended by Lancaster (1966). There are three ways in which the new approach to consumer theory is different from the traditional theory of consumer behavior. Firstly, goods do not provide direct utility to the consumers. It is the characteristic that the good possesses that provides direct utility to the consumers. Secondly, one good has many characteristics and different goods may have similar characteristics. Thirdly, composite goods may have different characteristics than individual goods.

The main aim of this paper is to review the seminal works of Paul Samuelson and Kelvin Lancaster in the field of consumer behavior. Both of their studies on the theory of consumer behavior are still very much alive in the academic literature. This paper is divided as follows. Section on "Literature Review Related to Samuelson's and Lancaster's Work on Consumer Theory" will review the literature that is related to Samuelson's and Lancaster's work on consumer behavior. Section "Critical Analysis of Samuelson's (1938) and Lancaster Study" will critically examine Samuelson's and Lancaster's work on consumer theory. Section on Logical Analysis of Samuelson (1938) Study will provide a logical analysis of Samuelson's and Lancaster's work on consumer theory. Section on Logical Analysis of Lancaster Study will present empirical evidences from studies that have applied Samuelson's and Lancaster's consumer theories. Section on Policy Implications will present policy implications, and section on Conclusion will provide conclusions and possible directions for future research in the field of consumer theory.

## Literature Review Related to Samuelson's and Lancaster's Work on Consumer Theory

There are many studies that have been published in the field of consumer theory. Studies conducted by Georgescu-Roegen (1936) inspired

Samuelson's studies on consumer theory, while studies conducted by Samuelson (1938), Debreu (1959, 1960), and Morishima (1959) inspired Lancaster's work. There are very few studies that have directly tested the hypotheses related to consumer theories that are proposed by Samuelson and Lancaster. There are two reasons attributed to this. First, lack of availability of time series data restricts testing the hypotheses proposed by Samuelson and Lancaster (Holländer 2001). Second, Samuelson and Lancaster have proposed the hypotheses related to consumer theory; however, what type of data that is needed to test these hypotheses is still not clear. Third, different studies have used different measures to test the hypotheses proposed by Samuelson and Lancaster. Therefore, comparing research findings across different studies may be biased.

To begin with, before Samuelson's work on consumer theory was published, extant literature on consumer theory was scarce. Two authors who dominated the field of study on consumer theory were Slutsky and Pareto. Slutsky (1915) criticized Pareto's theory that proposes that utility is independent from all psychological aspects (Pareto 1897; Pareto and Sensini 1906). Slutsky proposed that the pleasure an individual derives from consuming a unit of commodity is entirely a psychological concept. In his paper, Slutsky (1915) derived three important hypotheses. These three hypotheses were as follows: (1) the utility function and its first two derivatives should satisfy the continuity axiom of rational choice (If an individual prefers option A over B, then all choices closer to A should be preferred over B), (2) the characteristics of the utility function do not change with reference to the period concerned, and (3) if an individual's utility function increases or decreases as he or she switches from one good to another, the mode of this transition does not affect the utility function. Johnson (1913) and Brown (1952) proved that time lags have an impact on the behavior of consumers by using time series data from Canada.

Furthermore, Donnea (1972) introduced the concept of time constraint in the study of consumer behavior. According to Donnea (1972), an individual maximizes his or her utility based on two constraints. These two constraints are the budget constraint that relates to the income level of the individual and the second constraint is the time constraint. All decisions that individuals, businesses, and governments make are time bound. Dittmar and Drury conducted a survey of 32 consumers in the UK and found that each consumer is unique in terms of the choices he or she made. In addition to the preferences and low-cost choices, there are other factors that affect the choices made by consumers. These are advertising and pressure from peer groups. Holländer (2001) supported one of the propositions of Lancaster (1966) that emphasizes that utility based on personal preferences is a subjective choice by using data from Germany. He also concluded that measuring utility is a challenging task due to lack of data available on microeconomic measures.

Furthermore, Bovi's (2009) study used data from 10 European countries for 22 years and confirmed that consumer's utility is a psychological concept. The psychological factors are key factors that distort consumer's choice and behavior. Bovi debunked Pareto's theory on consumer choice that utility is independent on psychological factors and judgments. Park et al.'s (2011) exploratory study emphasized that two intrinsic characteristics of e-books make it lucrative for the current e-generation of consumers. These two intrinsic characteristics are ease of access and technology friendly. Albeit this study was not directly on testing Lancaster's hypotheses about consumer theory, it provides a strong basis for proving the primary basis of Lancaster's work that emphasizes that the intrinsic properties of goods provide utility to the consumer. Blumkin et al. (2012) argued that taxes on commodities and income tax affect consumers psychologically, and this has a negative impact on their utility. Income taxes have greater impact on consumption as compared to commodity taxes. Valin et al. proved Samuelson's hypothesis that prices of goods and income are two major constraints in the utility function of households. Valin's global study showed that demand forecasting models need to account for the prices of goods and income of households. Becchetti et al. (2016) used the

Cobb-Douglas production function and developed the theoretical framework that emphasized that some individuals get educated because they want to contribute positively towards the society while others get educated because they want to earn good wages. Different individuals get different intrinsic value from education. Table 1 provides the summary of studies reviewed for this paper.

Moreover, a close analysis of the studies reviewed above shows that there are very few studies that have tested the hypotheses proposed by Samuelson (1938) and Lancaster. Studies that have tested the hypotheses proposed by Samuelson (1938) and Lancaster have used different constructs and analysis techniques. This makes it difficult to compare research findings across different studies. According to Frey and Stutzer, incorrect predictions of utility can have an adverse impact on economic welfare. Therefore, due care should be taken while proposing the utility function. Authors should outline the theoretical framework but at the same time try to test it with empirical data for specificity and robustness purposes.

## Critical Analysis of Samuelson's (1938) and Lancaster's Study

### Criticisms of Consumer Theory Provided by Samuelson (1938) and Lancaster

There are many criticisms of consumer theory that has been provided by Samuelson (1938) and Lancaster. There are three important criticisms of consumer theory provided by Samuelson (1938). First, he believed that even though microeconomics has disintegrated utility from the psychological behavior of consumers, utility is a psychological concept. He criticized the field of study on consumer choice as it ignores the impact of consumer psychology on utility maximization (Current studies on consumer choice focus mainly on the analysis of utility by using budget constraints, indifference curves, and price ratios between two goods). Second, he questioned the concept of the increasing rate of marginal substitution and emphasized that there should be no reason for one to believe in the concept of increasing rate of marginal substitution. The increasing rate of

Source: Developed by the author of this paper (2016) by summarizing existing studies

marginal substitution leads to downward sloping demand curve which satisfies Eq. 1:

$$QD = 200 - 50P \quad (1)$$

In Eq. 1, QD is quantity demanded and P is the price of the product. According to Samuelson (1938), the increasing rate of marginal substitution satisfies the properties of the downward sloping demand curve. Third, Samuelson (1938) criticized that the notion that utility is a very important concept that has been ignored by the field of study on consumer choice. He highlighted in his study that the concept of marginal rate of substitution should incorporate the psychological factors that affect utility. Otherwise, any analysis involving the use of the marginal rate of substitution is ambiguous and abstract that does not capture the real-world phenomenon effectively.

There are two criticisms of the conventional consumer theory by Lancaster (1966). First, the intrinsic properties of goods have not been accounted for by the theory of consumer behavior. For instance, if we compare gold with water, we know that water has greater value in use while gold has lesser value in use. However, gold is a scarce resource and water is not scarce; therefore, the exchange value of gold is greater than the exchange value of water. The intrinsic property of goods captures the real-world phenomenon. Organizations also market their products based on the intrinsic value that consumers get from certain products (In marketing terms, this intrinsic value that consumers get by consuming certain products is called unique selling point of their products.). Second, in the recent decade, consumers respond very quickly to new product development and quality issues. The traditional consumer theory does not take into account these issues. The rest of the criticism of the conventional consumer theory and how Lancaster's theory has addressed the limitations of the conventional consumer theory is provided in Table 2.

## Criticisms of Samuelson's (1938) and Lancaster's Work by the Author of This Paper and Existing Authors

There are two criticisms of Samuelson's (1938) work by the author of this paper and existing authors. First, in Eq. 2a,b,c, Samuelson (1938) assumed that an ideal individual will always select the same goods under given conditions. This assumption is abstract and too far from what the real-world phenomenon is. Each individual is unique, and the goods that he or she will select will differ based on his or her tastes, cultural influences, and peer pressure. Second, Samuelson (1938) had proposed three axioms, but how these three axioms will be measured and the techniques that will be used to test these three axioms are not clear. Holländer (2001) also emphasized in his paper that due to lack of data availability and specificity on the measures and techniques, it is difficult to test the propositions of Samuelson (1938). Third, in the current decade, the currency in which the prices of goods are expressed has a lot of impact on the purchasing decisions of consumers. For example, some consumers from developing countries may not purchase goods in US dollars because they believe that it will be expensive, irrespective of whether the good is expensive or not. Fourth, time variable is a

**Utility and Consumer Behavior Theory, Table 2** Criticisms of the conventional consumer theory and contributions by Lancaster's theory

Source: Lancaster (1966)

constraint on utility maximization that has not been accounted for by Samuelson (1938). According to Donnea (1972), time is one of the important factors that affect consumers' utility. This has not been accounted for by Samuelson's (1938) study.

Similarly, there are three criticisms of Lancaster's (1966) work by the author of this paper and existing authors. First criticism is that Lancaster (1966) states that there is one-to-one relationship between goods and economic activity. However, this may not be true as the intrinsic properties of goods can have a number of characteristics and can be related to numerous economic activities at the same time. For instance, there are some consumers who may purchase goods for direct consumption while there may be others who may purchase goods both for direct consumption and also for further processing or value adding. Second, in a complex economy, the relationship between different intrinsic properties of goods may be very difficult to analyze. A combination of goods may have numerous close substitutes and complements. Third, Lancaster (1966) did not discuss about substitution effect that may arise from deceptive advertising of a good. Deceptive advertising may lead to changes in consumer taste in favor of the good that has been advertised in the media. This will lead to substitution effect, but the degree of substitution effect will be lower for advertising as compared to decrease in prices of the good that is advertised.

## Logical Analysis of Samuelson's (1938) Study

Samuelson (1938) embarked on his study immediately after four restrictive constraints were removed from the study of consumer theory. These four constraints were as follows: (1) marginal utility is a linear function, (2) utilities are independent, (3) utilities can only be measured cardinally (Cardinal utility function emphasizes on ordering utilities based on consumer preferences so that it is measurable like any other mathematical variables), and (4) consumer choice is integrated with preference elements. Unlike the classical economists, such as Adam Smith (1776), who believed in the concept of consumer sovereignty and *homo-economicus* man, Samuelson did not believe that humans are always rational. He assumed that human beings are not necessarily *homo-economicus*. They do engage in altruistic behavior quite often. Samuelson proposed three axioms in his paper.

The first axiom proposed that an individual's choice on the number of goods to purchase at any point in time is determined by the prices of goods and his or her given income. This can be noted mathematically as follows:

$$\delta_1 = f(p_1, p_2, p_3 \ldots p_n, I) \tag{2a}$$

$$\delta_2 = f(p_1, p_2, p_3 \ldots p_n, I) \tag{2b}$$

$$\vdots$$

$$\delta_n = f(p_1, p_2, p_3 \ldots p_n, I) \tag{2c}$$

In Eq. 2a,b,c, $\delta$ represents quantity of n goods purchased, $p_n$ shows the prices of these goods, and I denotes income. Samuelson (1938) assumed from Eq. 2a,b,c that an ideal consumer will choose the same goods under any given conditions.

Second axiom proposed that the currency or units in which the prices of goods are expressed do not affect an individual's purchasing decision. The quantity of goods purchased is not affected if we multiply all income and prices with the same positive number (Therefore, the function that we are considering here is the homogeneous function.). According to Samuelson (1938), the total cost of the goods purchased is given as follows:

$$\delta p = \sum_{j=1}^{k} \delta_j p_j \tag{3}$$

In Eq. 3, the cost of the bundle of goods produced, $\delta_j$ is the quantity of good $j$ purchased and $p_j$ is the prices of good $j$. If the prices of goods were lower for this batch of goods in period one and this individual does not prefer to purchase these goods in period one but purchased it in period two when the prices were higher, this implies that this individual prefers batch one over batch two given his

or her level of income. Here, Samuelson (1938) incorporates the psychological effects of utility on the purchasing behavior of consumers. A consumer, who prefers batch one good over batch two goods, has the greater psychological satisfaction from batch one as compared to batch two. This effect can be captured by the following equation:

$$\delta_1 > \delta_2 \tag{4}$$

Equation 4 clearly shows that goods purchased in batch one are preferred over goods purchased in batch two.

Third axiom states that there is consistency in human behavior. For example, if an individual prefers batch one over batch two in period one, this individual cannot prefer batch two over batch one at the same time. This axiom is captured by Eq. 5a,b as follows:

$$\delta_1 > \delta_2 \tag{5a}$$

$$\delta_2 \not> \delta_1 \tag{5b}$$

In Eq. 5a,b, if batch one is preferred over batch two, consumers cannot prefer batch two over batch one at the same time.

## Logical Analysis of Lancaster's (1966) Study

Similarly, Lancaster's (1966) study extended the existing literature by proposing that the intrinsic characteristics of the goods provide direct utility rather than the good itself. Utility ordering seeks to rank goods based on the attractiveness of the characteristics of the good to the consumer. In his new model of consumer theory, Lancaster 1966 assumed that the relationship between economic activity and goods consumed during an economic activity is linear. This is captured in Eq. 6 below:

$$y_k = \sum_l b_{kl} x_l \tag{6}$$

In Eq. 6, $b_{kl}$ captures the intrinsic characteristics of the goods and $x_l$ is the goods consumed during the economic activity. Lancaster (1966) also assumed that individual ranking of intrinsic properties of goods leads to ordinal utility function (Ordinal utility function specifies that measuring utility is not possible) given by U(z). The relationship between intrinsic characteristics of goods, quantity of goods available to the consumer, and economic activity is indirect. This is in contrast to the assumptions of the traditional consumer theory which assumes that the relationship between these three factors is direct.

### Consumption Technology and Consumer Behavior

Furthermore, Lancaster (1966) further emphasized that consumption technology affects consumer behavior. There are few important assumptions made by Lancaster (1966) while analyzing the role of technology in consumption and consumer behavior. The first assumption is that there is one-to-one relationship between goods and the level of economic activity. The second assumption captures three scenarios. These are as follows: (1) number of goods is more than the characteristics of the goods, (2) number of goods is less than the characteristics of the goods, and (3) number of goods is more than the number of characteristics in goods. Given the price of the goods, the consumer will choose the combination of goods that will maximize his or her utility and at the same time has minimized his or her cost. A consumer's characteristic frontier is convex to point (0,0). Figure 1 captures how the characteristic frontier of four goods with two unique characteristics will look like.

A consumer's composite set of choices can be divided into two parts. The first is the efficiency choice where the consumer will select the efficient combination of goods. This efficient combination of goods consists of those goods that can be attained at minimal cost. The second is the private choice where the consumer may choose goods based entirely on his or her preference. Efficiency choice is subjective, while personal choice is an objective choice. The characteristic frontier expands and contracts based on changes in consumer's income proposes two relationships between number of goods and economic activity

**Utility and Consumer Behavior Theory, Fig. 1** Characteristics frontier with four goods and two unique characteristics (Source: Lancaster 1966)

that is parallel to the properties of the Marshallian demand curve. These two relationships are as follows: (1) if the number of goods available in the market is less than the number of economic activity, then not all goods will be attainable by consumers at different prices and (2) if the number of goods available in the market is more than the number of economic activity, then all goods will be attainable by consumers at different prices. Goods that are scarce will be expensive, and all consumers will be able to purchase these goods. On the other hand, goods that are abundant in supply will be cheap and can be easily afforded by consumers.

## Efficiency Substitution Effect, Intrinsic Substitutes, and Intrinsic Complementary Goods

Lancaster (1966) assumed that as a result of the one-to-one relationship between goods and economic activities, there will be a total shift from the consumption of one differentiated product to another differentiated product due to the efficiency substitution effect (Consumers make consumption choices entirely based on the cost of the good. If the cost of the good is high, efficiency substitution effect implies switching to another good that is cheap.). Further, if there are many relationships between goods and economic activities, then efficiency substitution effect will not result in a complete shift in consumption from one good to another. The substitution effect will cause the quantity demanded of the good to fall. Therefore, this good will not completely wiped out of the market. The efficiency substitution effect (Objective means not based on consumer's opinion.) is objective, whereas the private substitution effect is subjective (Subjective means based entirely on consumer's opinion and preferences.). It is notable that the efficiency substitution effect is independent of the private substitution effect. In a complex economy, it is expected that both will incur simultaneously and the effect of one will reinforce the effect of the other.

In contrast to the characteristics of the modern economy, the simple economy has fewer characteristics and the efficiency substitution effect may not present in the simple economy at all. According to Lancaster, the two important characteristics that will be present in the simple economy will be Griffen's goods (Goods that may be consumed more as the price of the good rises) and lower price elasticity demand (Change in the price leads to less than proportionate change in quantity demanded.). Two factors that differentiate consumers who are part of the complex economy are consumption technology and income levels of consumers.

Intrinsically related goods are goods from the same commodity groups that may have same or similar intrinsic properties, and they are called intrinsically related goods, and goods that may be from the same commodity bundle and do not share similar intrinsic properties are called intrinsically unrelated goods. This can be effectively explained by considering matrix 1:

$$A \equiv \begin{bmatrix} A_1 & 0 \\ 0 & A_2 \end{bmatrix} \tag{7}$$

In Eq. 7, A is the economic activity, $A_1$ is the intrinsic properties of good 1, and $A_2$ is the

intrinsic properties of good 2, and then if $A_1$ and $A_2$ share similar intrinsic properties, they will be called intrinsically related, and if they do not share similar intrinsic properties, they are not intrinsically related. If the rise in the price of good $A_1$ will lead to more units of $A_2$ to be purchased, then they are called intrinsic substitutes. If a rise in the price of $A_1$ will reduce the consumption of both $A_1$ and $A_2$, then these two goods can be called intrinsic complements. In a complex economy, there will be more substitutes and complementary goods as compared to a simple economy. Deceptive advertising that does not provide information in a simplified manner leads to substitution effects, and economists do not like this as it causes inefficiency. According to economists, advertising should provide simple and right information to consumers.

### Labor, Alternative Employment Choice, and Leisure

In addition to the above arguments, suppose an individual chooses occupation one $O_1$ over occupation two $O_2$; this implies that this individual prefers more leisure as compared to work. Therefore, this individual will be on the indifference curve $M_1$. Alternatively, if an individual prefers more work over leisure, then this individual will be on the indifference curve $M_2$ (see Fig. 2).

In Fig. 2, *l* shows the leisure, Z1 is economic activity one, and Z2 is economic activity two. The individual who chooses occupation two is better off than an individual who chooses occupation one because he or she will be earning more money by working and enjoying less leisure.

In summary, Lancaster's consumer theory can be summarized in Fig. 3. Figure 3 shows the combination of intrinsic properties of the goods that can be purchased from the combination of goods a, b, and c. Some individuals will purchase goods at U1 in order to maximize economic activity D1, while others may purchase at U2 to maximize economic activity D2.

## Policy Implications

Furthermore, the studies conducted by Samuelson and Lancaster (1966) have implications for policy makers. There are two policy implications of this study. First, policy makers can use the propositions of Samuelson's study to design policies in order to prohibit the consumption of certain products, such as drugs, marijuana, and tobacco. According to Samuelson and Lancaster (1966), it is the goods and the intrinsic properties of these goods that provide utility to consumers. If they want to change the taste of consumers, they can use simple advertising and disclose the negative repercussions of these products in order to reduce the consumption of these commodities. Second, policy makers can also promote the consumption of commodities that may provide similar intrinsic properties as unhealthy products so that consumers can easily substitute unhealthy products with healthy ones. For example, increasing taxes on the consumption of unhealthy soft drinks will reduce the consumption of soft drinks and increase the consumption of healthy drinks.

**Utility and Consumer Behavior Theory, Fig. 3** Lancaster's consumer theory on linear attributes model

## Conclusion

The main aim of this paper was to review Samuelson's and Lancaster's work on consumer theory. The review of this study shows that Samuelson's and Lancaster's work complement each other. Lancaster has expanded the work of Samuelson by arguing that the good itself does not provide utility but it is the intrinsic properties of the goods that provide utility. Studies that have applied the propositions of Samuelson and Lancaster have supported their argument that utility is a psychological concept. Future researchers should conduct studies that try to integrate more aspects of a real-world phenomenon in the utility function. First, the linear utility function of Lancaster is very complex and needs to be expressed by using budget constraint line and indifference curve. Testing this theory by using real-world data is close to impossible. Second, in the Lancaster's paper, future researchers should also look at how the unfavorable intrinsic properties of the goods can affect consumer's choice.

## Value Congruence

Anthony D. Molina
Kent State University, Kent, OH, USA

### Synonyms

Person-environment fit; Person-group fit; Person-job fit; Person-organization fit

### Definition

Value congruence refers to the degree to which an individual's values match the values found in their work environment.

### Introduction

Research on value congruence focuses on the degree to which an individual's personal values match the values they encounter in their work environment, as well as the behavioral and attitudinal outcomes that result from varying degrees of agreement between these values. Different types of congruence explored in the literature include person-organization, person-job, person-group, and person-supervisor congruence (Kristoff-Brown et al. 2005). Scholarly attention to value congruence is relatively recent, with much of it emerging in the last two to three decades. A notable exception here is found in the work of Chester Barnard (1948) who emphasized the importance of values in integrating individuals into the organization. Similarly, Argyris (1964) was an early proponent of the idea that organizational effectiveness depended on successfully integrating individuals with the organization through the establishment of goal congruence and argued that incongruence led to employee behavior that undermined the organization's ability to achieve its goals.

The purpose of this entry is to provide a concise overview of what is known about the role that value congruence plays in shaping the attitudes and behaviors individuals in the workplace. It begins with a discussion of theoretical perspectives that inform our understanding of value congruence as a psychological construct and the role it plays in the development and maintenance of organizational culture. It then turns to an overview of the effects that value congruence is known to have on employee and organizational performance and practical considerations related to managerial practices that foster it. Finally, it concludes with an overview of what is known about the nature and role of value congruence in the context of public service organizations.

### Theoretical Perspectives

Shared values in the workplace influence attitudes, behaviors, and relationships between

individuals. This occurs through the creation of a shared understanding of acceptable behavior and the use of predetermined value scripts that facilitate decision-making (Paarlberg and Perry 2007). Value scripts allow individuals to make decisions and take actions in the workplace without consciously considering the values that are in play. In cases where value conflicts exist, however, the use of value scripts is disrupted and the competing values come into focus for the individuals involved. Liedtka (1989) has argued that image theory provides a theoretical framework for understanding how individuals act and make decisions in these circumstances. In short, image theory maintains that people make decisions about a particular course of action by assessing the degree of congruity between it and their own self-image, which is rooted in and reflective of their value system. In cases where an individual's personal values lack congruence with the values of the organization in which they work, ongoing conflict results (Liedtka 1989). This conflict is experienced by individuals as an internal disequilibrium that results in mixed emotions and anxiety over choosing the right course of action.

In contrast, value congruence between individuals and the organizations in which they work results in a number of beneficial outcomes, the most common of which are associated with positive attitudes and behaviors. In addition to image theory, a number of other theoretical perspectives have been used to explain the relationship between value congruence and positive work attitudes, including fit theory, self-concept theory, and the attraction-selection-attrition (ASA) framework (Bao et al. 2012). Fit theory maintains that individuals prefer environments that are consistent with their perceived personal attributes. This leads to higher levels of motivation and effort and lower levels of stress, conflict, and cognitive dissonance. Similarly, self-concept theory maintains that individuals seek to maintain a positive self-image and that this is facilitated more easily when their surrounding environment is consistent with their values.

The ASA framework holds that individuals are attracted to organizations whose values they perceive to be similar to their own (Schneider 1987). Likewise, organizations are more likely to recruit and select individuals who share values that are similar to those of its existing members. In cases where these perceptions are wrong and the values between the person and organization are not well matched, individuals are likely to leave the organization. As a result of this attrition, the values of those who belong to an organization become more congruent over time. This leads to the development of an organizational culture with a dominant value system that guides decision-making and behavior within the organization.

Importantly, values refer to normative beliefs about how a person ought to behave and not *necessarily* the manner in which a person actually wants to behave or how they behave in practice (Meglino and Ravlin 1998). In other words, values constitute elements of how we conceptualize our "ideal self." Acting contrary to established values can cause feelings of guilt and cognitive dissonance within the individual and result in social censure and punishment from others. Therefore, insofar as they refer to internalized norms about socially acceptable behavior in specific contexts, values exert a powerful influence on an individual's attitudes, decisions, and personal conduct in the workplace.

Kristoff-Brown et al. (2005) distinguish three types of approaches that can be used to assess value congruence: (1) perceived fit, (2) subjective fit, and (3) objective fit. Perceived fit is an assessment made by an individual regarding how congruent their values are with the environment. This is accomplished by simply asking the individual to rate how similar they perceive their values to be to those of an organization or a work group. Closely related, subjective fit is an assessment that is made by comparing the person's reported values with organizational values as reported by the same person. In this case, the person makes two assessments, first of their own values and then of the values of the work environment. Both perceived fit and subjective fit measures may be incorporated into the same instrument since they are reported by a single source.

Objective fit measures, on the other hand, evaluate the congruence between individual and environmental values by making comparisons

between assessments made by different sources. In this case, organizational values are assessed through document analysis or the reports of senior executives or, in some cases, outside stakeholders. The researcher then compares the two independent assessments in order to analyze the degree of congruence using statistical methods. According to Kristoff-Brown et al. (2005), perceived fit and subjective fit measures are likely to provide a more holistic and consistent assessment than objective fit measures alone. Additionally, they are also likely to be more strongly related to attitudes and behaviors in the work environment since it is the individual's perception of congruence that most directly influences these outcomes.

## Effects of Value Congruence

As noted above, value congruence produces a number of effects in the workplace. When individuals share similar value systems, they are more likely to perceive, interpret, and respond to events in a similar way (Meglino and Ravlin 1998). This has the effect of facilitating communication between individuals and makes it easier for them to coordinate activities by making their interactions more predictable. In turn, this reduces interpersonal conflict and role ambiguity. Taken together, these effects of value congruence enable individuals to be more successful in achieving their common goals.

Along these lines, increased levels of value congruence have been positively associated with increased employee satisfaction and other factors that affect organizational performance (Posner 2010). Posner and Schmidt (1993), for example, found that managers with higher levels of congruence both within and between their personal and organizational values systems reported more positive attitudes about the ethical practices of their colleagues. In contrast, those with lower levels of congruence within and between values systems reported less positive attitudes about the ethical climate within their organization. Moynihan and Pandey (2007) found that a higher level of person-organization value congruence resulted in lower levels of employee turnover. Posner (1992) found a positive relationship between value congruency and positive work attitudes, but no evidence of a relationship between value congruency and demographic factors such as age, gender, ethnicity, position, or tenure. Managers with higher levels of value congruence report increased motivation, lower levels of work-related stress and anxiety, and more positive perceptions of the organization (Posner 2010).

Edwards and Cable (2009) found that the outcomes related to value congruence are mediated through a set of interrelated variables, the most important of which are communication, attraction, and trust. Value congruence promotes communication because it establishes a set of shared standards about what is important, as well as a common framework for making sense of events that occur within the organization and in the external environment. Value congruence also directly leads to increased attraction among employees in terms of likeability and friendship but also indirectly increases attraction through increased communication. Finally, value congruence directly leads to increased levels of trust between members of an organization by fostering perceptions of integrity but also indirectly promotes trust through increased communication and attraction (Edwards and Cable 2009; Ren 2010). In turn, these three mediating variables are positively associated with increased levels of job satisfaction and organizational identification – that is, a sense of belonging – both of which increase the likelihood that an individual employee intends to stay with an organization. Therefore, the primary value of value congruence lies in the effect it has on increased levels of trust and communication (Edwards and Cable 2009).

Notwithstanding these positive effects, it is important to note that the effects of value congruence are not always beneficial in terms of organizational performance (Meglino and Ravlin 1998). As part of an organization's culture, values play both an external adaptation function and an internal integration function (Schein 2010). The external adaptation function consists of values that specify the behaviors that are appropriate in order for the organization to thrive in its

environment. The internal integration function of values, on the other hand, facilitates interactions between individuals within the organization by fostering similarities between their individual value systems. Importantly, the values that are responsible for internal integration may not be the same as those that are required for external adaptation. In other words, while value congruence may facilitate interactions between the members of an organization, these very values, though shared, may nevertheless come into conflict with those that are necessary for it to perform effectively in its environment.

## Managing Value Congruence

Given the positive effects of value congruence, managerial strategies that can be used to foster it have received increasing attention by scholars in recent years. Generally speaking, two tactics can be used to achieve value congruence between organizations and their employees: (1) pre-entry and (2) post-entry strategies (Bao et al. 2012). Pre-entry staffing strategies attempt to identify job candidates with values similar to the organization with the assumption that these candidates will be a better fit. Problems with this strategy relate to the extent to which candidates can have full information about an organization's values and the extent to which an organization can accurately assess a candidate's values.

Post-entry strategies, on the other hand, focus on socialization processes that are intended to increase value congruence over time. This approach is consistent with scholarly writing on organizational leadership going back many decades. Phil Selznick (1957), for example, famously argued that institutional leadership consists of infusing an organization with values that extend beyond mere technical requirements. From his perspective, the primary role of the executive is to define the mission of the organization and build a sense of purpose into its social structure. As such, organizational leaders act as agents of institutionalization that are "expert in the promotion and protection of values" (Selznick 1957, p. 28).

In a similar vein, values-based leadership in which leaders work to bring about value congruence by transmitting values that resonate with their employees is a popular theme in the study of leadership (Brown and Trevino 2009). However, because values are stable, it can be difficult for leaders to change the values of organizational members. Therefore, a number of scholars have investigated which types of leadership styles are more effective in achieving value congruence between leaders and their employees. For example, Brown and Trevino (2009) found that, while the socialized charismatic leadership style does tend to result in higher levels of value congruence, the extent of this relationship depends on the type of values that are being transmitted. In particular, occupational roles can contribute to the stability of values in individual making them less prone to change. This suggests that occupations with a strong set of professional values such as nursing, accounting, journalism, and social work may be less affected by the influence of particular leadership styles.

Along these lines, Paarlberg and Perry (2007) have argued that in order for organizational goals to be motivating for employees, they must be aligned with the zone of existing values that they already hold. Their study of managers in a Department of Defense installation found that, in high-performing work units, middle managers play a key role in aligning the values of employees and the organization by interpreting organizational values in a way that is resonant with their personal values and day-to-day work routines. Of particular importance was the ability of high-performing managers to link unit activities to important social contributions made by the organization. Whereas low-performing managers, for example, focused on the needs of institutional customers and purchasing agents, high-performing managers were focused on meeting the needs of "war fighters" within the armed forces. In this way, managers can facilitate a process of integration wherein employees are able to recognize how their efforts contribute to the accomplishment of important organizational goals in ways that appeal to their individual values.

Research suggests that, in general, transformational leadership styles are more effective in achieving value congruence than transactional styles of leadership. According to Bass (1985), transactional leadership consists of clarifying what actions employees must take in order to meet their responsibilities and then specifying what employees can expect to receive in return for satisfactory performance. In contrast, transformational leadership consists of fostering an employee's self-awareness of their personal values and motives, highlighting how the organization can satisfy those values and motives, and inspiring them to place the mission and goals of the organization above their personal interests. In effect, transformational leadership works by promoting the internalization of organizational values by group members.

Research has also found that managers must pay particular attention to value congruence during periods of organizational change. Higher levels of value congruence generally result in higher levels of support for organizational change, but perceived levels of congruence can either increase or decrease as a result of the change itself (Lamm et al. 2010). The concept of a psychological contract illustrates why fluctuations in the perception of value congruence warrant close attention by managers. A psychological contract refers to an employee's understanding of what they should expect from the organization and what the organization should expect from them in return (Bocchino et al. 2003). In exchange for performing their job responsibilities and complying with organizational policies and procedures, for example, an employee may expect salary increase, benefits, the opportunity to request for cash advance, and other intangible goods such as the ability to do work that they find fulfilling.

The development of a psychological contract takes place in the context of a set of values, which means that employees may feel a sense of anger and betrayal if the contract is violated (Bocchino et al. 2003). Research shows that employee perceptions of such violations negatively affect job satisfaction, trust, and loyalty toward the organization. In more extreme cases, violations of the psychological contract can even result in acts of violence or sabotage. Periods in which the organization is undergoing change are particularly prone to employee perceptions that the psychological contract has been violated. Therefore, managers should be particularly attentive to perceptions of value congruence during periods of organizational change (Bocchino et al. 2003).

Edwards and Cable (2009) suggest that managers should not focus exclusively on value congruence itself, but should also utilize strategies that positively affect communication and trust within the organization since these conditions mediate the effects of value congruence. To that end, managers should work to ensure that both formal and informal systems of communication are open, consistent, and regular. Similarly, initiatives to increase trust should include good practices such as giving the reasons that lie behind organizational decisions, providing frequent opportunities for question and answer sessions between employees and senior managers, and ensuring fairness in the systems used to manage and assess performance.

## Value Congruence in Public Service Organizations

Public service organizations present a specific context for understanding the conditions under which value congruence is fostered. In particular, research on public service motivation (PSM) provides important insights for understanding the nature of values in public service organizations. PSM refers to predispositions on the part of individuals to be motivated by the work, values, and goals that are found in public organizations (Perry et al. 2010). Furthermore, research shows that PSM is related to positive work outcomes such as productivity, managerial practices, accountability, and trust (Brewer et al. 2000). However, as Wright and Pandey (2008) point out, not all public organizations provide equivalent opportunities to satisfy the public service motivation needs of their employees. In other words, just because an organization is in the public sector does not mean that its members will be able to perform work that satisfies their desire to serve the public.

The foregoing suggests that organizational leaders should not take the effects of PSM for granted. Rather, they should utilize effective communication, performance feedback, and other supporting conditions that help highlight how the organization's values are congruent with those of the employee, as well as how their work with the organization contributes to the realization of goals that are in the public interest (Wright and Pandey 2008). Christensen and Wright (2011) caution, however, that leaders may do best to focus on the effects of person-job fit and not solely on the effects of person-organization fit. They point out that people with PSM are likely to be attracted to particular organizations because they offer jobs that are consistent with their motivations, rather than because they find the mission and values of the organization itself attractive. Therefore, in order to understand the positive outcomes of PSM, it is necessary to consider the extent to which an organization actually offers jobs that provide opportunities for individuals to act upon and satisfy their public service values and motivations.

Some organizations may be in a better position to foster PSM and value congruence than others. Along these lines, Peng et al. (2015) have argued that the institutional context of nonprofit organizations gives them an advantage in fostering value congruence. Because nonprofit organizations have lower levels of externally imposed political controls, they exercise fewer internal controls over the day-to-day work of employees and managers. This leads to a more decentralized organization in which there is more clarity among members regarding organizational goals and in which members exercise a higher degree of work autonomy. Taken together, these factors facilitate the internalization and integration of organizational values. As a result, their research found that members of nonprofit organizations report a higher level of perceived value congruence (Peng et al. 2015).

## Conclusion

This entry has provided an overview of what is known about value congruence and the role that it plays in shaping the attitudes and behaviors of individuals in the workplace. It began with a discussion of theoretical perspectives on value congruence such as image theory, fit theory, self-concept theory, and the attraction-selection-attrition framework. Because values consist of internalized norms about socially acceptable behavior in specific contexts, they exert a powerful influence on attitudes, decisions, and behaviors in the workplace. Next, the entry turned to a discussion of the effects of value congruence. When individuals that work together share similar values, they perceive, interpret, and respond to events in similar ways. This facilitates communication, builds trust, and makes it easier to coordinate activities between individuals. In turn, these effects of value congruence make it easier for the organization to achieve its goals.

This entry also discussed managerial strategies used to foster value congruence. These include pre-selection strategies that seek to recruit individuals with values similar to those found in the work environment and post-selection strategies that seek to facilitate congruence after the individual has joined the organization. Given the stability of values and difficulties in assessing them, either approach poses challenges. Research indicates, however, that strategies associated with values-based or transformational leadership styles are most effective in facilitating increased levels of value congruence. Finally, considerations specific to the institutional context of public service organizations were discussed. As research into PSM demonstrates, individuals are often motivated to work in public service organizations because of the values, work, and goals that are intrinsic to public institutions. Importantly, however, organizational leaders should not take the effects of PSM for granted. To facilitate the positive outcomes associated with PSM, it is important for organizational leaders to utilize communication, performance feedback, and other strategies in order to highlight ways in which the organization's values are congruent with those of the employee, as well as how their work contributes to the achievement of goals that are in the public interest.

# Value Measurement

David J. Ciuk
Department of Government, Franklin and Marshall College, Lancaster, PA, USA

A value, according to traditional psychological theory, is an enduring belief that a specific mode of conduct or end state of existence is personally or socially preferable to an opposite mode of conduct or end state of existence (Rokeach 1973). Values, however, rarely act in isolation; rather, they work in a "comparative and competitive" fashion. Therefore, it is useful to think in terms of value systems, which are defined as enduring organizations of beliefs concerning preferable modes of conduct or end states of existence

along a continuum of relative importance (Rokeach 1973). According to Schwartz (1992), values (1) are beliefs (2) that refer to desirable goals. They (3) transcend specific situations, (4) are ordered by relative importance, and (5) serve as standards or criteria. Finally, (6) it is the *relative* importance of the set of relevant values that guides action.

Values play an important role in research across a wide array of social science disciplines. In political science, for example, values are used to explain changes in political culture (Abramson and Inglehart 1995; Inglehart 1977), they structure the debate on the American welfare state (McClosky and Zaller 1984), and they may be at the root of polarization (Jacoby 2014). Additionally, values are connected to political attitudes in post-9/11 America (Ciuk 2016; Davis 2007; Davis and Silver 2004), they relate to ideology and partisanship (Feldman 1988; Rokeach 1973), and they affect attitudes on social welfare policy (Feldman and Zaller 1992), abortion policy (Alvarez and Brehm 1995), campaign finance reform (Grant and Rudolph 2003), government spending (Jacoby 2006), and climate change policy (Stoutenborough et al. 2014). Outside of political science, values play an important role in psychology (Oyserman et al. 2002), sociology (Hitlin and Piliavin 2004), consumer choice (Pepper et al. 2009), music (Gardikoitis and Baltzis 2012), sports (Lee et al. 2008), and vocational interests (Sagiv 2002).

Though it is quite clear that values play an important role in culture, attitudes, behavior, and decision making, the measurement of value preferences has long been a topic of debate. In this chapter, I discuss the two most often used techniques to measure value preferences – rankings and ratings – as well as the benefits and consequences that come with the researcher's choice of one technique over the other. I then review empirical work on value measurement, highlighting the instances when one technique may prove more appropriate than the other. I close by urging those pursuing research on values to consider the goals of their research, determine the tradeoffs that they are willing to make, and design an appropriate set of measures when making decisions about value measurement.

## Ranking Measures: Milton Rokeach, the RVS, and Critiques

Modern research on human values began in psychology with the influential and pioneering work of Milton Rokeach. In terms of measurement, Feldman (2003) notes that if Rokeach's first major contribution to the literature is his conceptualization of value systems, then his second contribution must be his thoughts regarding measurement. The Rokeach Value Survey (RVS) consists of two separate 18-item sets (one set for terminal values and the other set for instrumental values) for which respondents are asked to rank the items based on their personal importance as guiding principles in life (Rokeach 1973, p. 27). In asking respondents to rank order all 18 values in each set, the RVS effectively captures the comparative and competitive aspect of values while simultaneously avoiding problems with "end piling," which occur when respondents rate all values highly, producing a measure (or a set of measures) that suffers from a lack of variance (see Figs. 1, 2, and 3 for an illustration of end piling).

Although there are several practical and theoretical benefits using ranking techniques like the RVS to measure value preferences, a substantial body of research indicates that these measures are flawed for three reasons: (1) the RVS takes too long and is too demanding for most respondents, (2) ranking items create problems for traditional methods of analysis, and (3) the RVS produces measures that lack reliability.

First, scholars argue that ranking each item in two 18-item sets takes too long and is too cognitively demanding for most survey respondents. In other words, the lengthy ranking tasks stretch respondents' cognitive ability and focus, and over the course of the survey, the respondents grow tired. In the end, respondent error due to survey fatigue becomes a concern (Braithwaite and Law 1985; Feldman 2003; Schwartz 2007). In response to these critiques, modern work on values avoids these types of problems by

**Value Measurement, Fig. 1** Distributions of Ratings. These data are from a 2010 experiment funded by the Time-sharing Experiments for the Social Sciences program (principle investigators Jeremy Freese and Penny Visser). Value importance is coded from 1 (least important) to 5 (most important). Readers should note the modal response for all five values is 5 or "most important"

trimming the full battery of two 18-item sets to a subset of values that are immediately relevant to the behavior in question (Abramson and Inglehart 1995; Hofstede 2001; Kohn 1977). On one hand, the shorter batteries do cut down response time and measurement error. On the other, the smaller batteries limit the breadth and scope of the search for explanations on the behavior of interest.

Second, ranking procedures create ipsative scales that are problematic for traditional forms of econometric and psychometric methods. Briefly, ipsative scales are those that sum to a particular number. That is, if a survey asks respondents to rank a set of five values (e.g., values A, B, C, D, and E) from most important to least important where the most important value is coded 5, the second most important value is coded 4, and so on so the least important variable in the set is coded 1, the sum across each of the five columns in the data set (e.g., rank of value A, rank of value B, rank of value C, rank of value D, and rank of value E) will be 15. If the researcher then wants to use preferences on all five values to explain variance on some type of behavior, then

**Value Measurement, Fig. 2** Distributions of Rankings. These data are from a 2010 experiment funded by the Time-sharing Experiments for the Social Sciences program (principle investigators Jeremy Freese and Penny Visser). Value importance is coded from 1 (least important) to 5 (most important). Readers should note that end piling does not occur here. Responses are more evenly distributed here, relative to Fig. 1

traditional econometric methods such as ordinary least squares regression or generalized linear models (e.g., logit, probit, etc.) are ill equipped to handle such data due to perfect collinearity in the five variables. Often-used data reduction tools (e.g., factor analysis) also are ill equipped to handle such data (Davis and Davenport 1999; Inglehart and Abramson 1999). Methodological advances have quelled these concerns to some extent (Borg and Groenen 2005; Jackson and Alwin 1980). Another way to avoid such problems is to include only a subset of the value preference variables into the empirical model. Not only does this allow one to estimate a regression model (or something similar), but it also increases the parsimony of the model. At the same time, however, one must choose the "right" values to add to the model to avoid misspecification, and one might also consider checking the extent to which model results are sensitive to a particular specification.

Last, while concerns on length, complexity, and ipsative measures are certainly important, the critique that might cause the most concern

**Value Measurement, Fig. 3** Mean Ratings and Rankings. Again, these data are from a 2010 experiment funded by the Time-sharing Experiments for the Social Sciences program (principle investigators Jeremy Freese and Penny Visser). Value importance is coded from 1 (least important) to 5 (most important). *Dots* represent means, and *error bars* represent 95% confidence intervals. Readers should note the uniformity with which respondents *rated* all of the values. There is much more variance in recorded preferences among those that were asked to *rank* values in terms of importance

deals with whether or not ranking instruments like the RVS produce unreliable data. The root cause of this concern has to do with whether or not people make consistent choices when ranking one value over another. Maio et al. (1996) argue that the RVS and similar batteries force respondents to make choices between two values toward which they are indifferent or ambivalent. When asked to justify their value choices, some research suggests that people often question their choices and reverse them (Bernard et al. 2003; Maio and Olson 1998). In a similar vein, Braithwaite and Law (1985) raise concerns regarding ranking instruments forcing respondents to make ad hoc choices between values of roughly equal importance, behind which there is no systematic preference. In short, this body of research argues that, under some circumstances (e.g., ambivalence, indifference, when the respondent has not thought about a particular value comparison before), the RVS and other ranking procedures require respondents to perform a series of "mental coin flips" when completing the questionnaire, thus leading to a set of measures that is riddled with error. And, though some empirical work does address ranking instruments and measurement error (Miethe 1985), this is still a relatively active debate.

## Rating Measures: Shalom Schwartz, the SVS, and the PVQ

Rating instruments, the main alternative to rankings, are widely used in values research (Goren 2005; Goren et al. 2009; McCann 1997; Schwartz et al. 2010), and the most often-used "flavors" of rating batteries are both closely related to Shalom Schwartz: the Schwartz Value Survey (SVS) and the Portrait Values Questionnaire (PVQ). The SVS was the first instrument created specifically to measure value preferences according to Schwartz's theory of basic human values, which posits that there are ten basic values important to human life (self-direction, stimulation, hedonism, achievement, power, security, conformity, tradition, benevolence, and universalism) that guide behavior and choice (Schwartz 1992, 1994). Briefly, when completing the SVS, respondents are given two lists – the first has 30 items that describe potentially desirable end states as nouns and the second has 26 or 27 items (the earlier version has 26, the later version has 27) that describe potentially desirable end states as adjectives – and asked to rate how important each item is "as a guiding principle in MY life" on a 9-point scale that goes from "of supreme importance"

(coded 7) to "opposed to my values" (coded −1). The "non-symmetrical" scale is used because respondents tend to rate most value items on the high end of the scale. In order to protect against measurement error, multiple items are used to measure each of the ten basic human values. Schwartz's theory and measures are very successful with some scholars describing the "circumplex" structure of values as a "nearly universal system of values" (Piurko et al. 2011, p. 540).

Despite it being widely used, Schwartz notes that the SVS is imperfect – that it was not made to measure value preferences in non-Western societies and that people with little or no education had trouble completing the questionnaire (Schwartz 2007). The PVQ was designed to remedy such problems by presenting respondents with more concrete, less cognitively demanding tasks than the SVS. The PVQ includes very short, verbal "portraits" of different people. Each portrait details "a person's goals, aspirations, or wishes that point implicitly to the importance of a single value type" (Schwartz 2007, p. 273). For example, an item that measures the importance of self-direction offers the following description: "Thinking up new ideas and being creative is important to him/her. She likes to do things his/her own original way" (Schwartz 2007, p. 273). Respondents are asked "How much like you is this person?" And, responses are recorded on a 6-point scale ranging from "very much like me" to "not like me at all." There are 20-, 29-, and 40-item versions of the PVQ. All question wordings are gender matched to the respondent. Briefly, it is worth noting that respondents are asked to compare the person in the description to themselves rather than themselves to the person in the description. This is thought to keep the respondent focused on the value-relevant parts of the description, and it discourages the respondent from making comparisons outside the context of the question (Schwartz 2007).

Though these instruments are very often used to measure value preferences, they are not without flaws. First, respondents often engage in end piling (i.e., rating all values in the set very highly) (Rokeach 1968, 1973), which results in a set of measures that lack variance. Second, rating instruments, in and of themselves, cannot account for the "comparative and competitive" aspect of values. In other words, rating items consider values in isolation, and they do not tap the *relative* importance of values. Scholars argue that one can "correct" for this shortcoming by treating each respondent's mean response to each scale item (e.g., each item that measures the importance of self-direction) as a covariate in the analysis (Schwartz 1992). Alternatively, one can mean center each respondent's answers to all items in the survey. In either case, it is not the measure (or measures) that accounts for *relative* importance. Rather, *relative* importance is accounted for later in the analysis stage.

To summarize, ranking and rating instruments are both often used in values research. While rankings clearly capture the comparative and competitive aspects of values, there are drawbacks as well. Rating instruments, the main alternative to rankings, are very widely used, but there are tradeoffs here too. In the following section, I discuss empirical research that deals with the measurement qualities and characteristics of the two above-discussed techniques.

## Rankings Versus Ratings: Empirical Work on Value Measurement

As stated above, there are many scholars that prefer ranking batteries to rating batteries and vice versa. There are also scholars that advocate for hybrid measures that combine the two approaches (e.g., McCarty and Shrum 2000). The more complete picture is less black and white, however. First, the diversity of scholarly opinion reflects the complex nature of value measurement. Second, advocates of ranking batteries and advocates of rating batteries agree that, when assembled carefully, either type of measure is *mostly* accurate. The groups split on the issue of which technique is *more* accurate when respondents are faced with hard choices – when they are forced to make distinctions between two values under conditions of ambivalence or indifference or when survey fatigue is setting in. On one hand,

psychological theory suggests that values work in a comparative and competitive fashion (Rokeach 1973) and that it is the *relative* importance of relevant values that guide thought and action (Schwartz 1992, 1994), suggesting that ranking batteries are perhaps a more theoretically sound measure. On the other hand, ranking batteries are long, cognitively demanding, and difficult to administer during a telephone interview (Krosnick and Alwin 1988), and rating instruments alleviate these concerns. Empirically, which type of measure performs better?

As stated above, the body of research is split. Miethe (1985), for example, argues that value-preference data collected via rankings have less measurement error than preference data collected with other techniques. Coming to a similar conclusion, Krosnick and Alwin (1988) note that data collected via ratings are obscured by those that have trouble differentiating between values of roughly equal importance. Reaching opposite conclusions, scholars argue that because rating instruments allow people to rate two values equally, they better measure preferences for low-education respondents and those that are ambivalent or indifferent to particular value pairs. In other words, rating instruments do not force certain people to perform "mental coin flips" and choose one value over another for no systematic reason (Bernard et al. 2003; Maio and Olson 1998; Maio et al. 1996; Schwartz 1992).

Recent research makes these concerns central in an attempt to make clear the measurement qualities and characteristics of each technique. Jacoby (2006) tests the extent to which individuals have hierarchical value preferences. Briefly, if scholars that suggest rankings force respondents to choose randomly between two values about which they are ambivalent or indifferent, thus creating error-prone measures, then their value choices should not exhibit any systematic structure. On the other hand, if there are systematic preferences behind these choices, then value preferences should be transitive and exhibit a clear, hierarchical structure. Using the multi-investigator study, which asks respondents to rank order four values central to American political culture (economic security, liberty, equality, and social order), Jacoby finds that the large majority of respondents make transitive choices and have clearly structured, hierarchical value preferences. Further, he finds that when respondents do make intransitive choices, they are mostly due to low political sophistication and indifference rather than ambivalence.

In another thorough examination of the measurement characteristics of rankings and ratings, Ciuk and Jacoby (2015) assess (1) transitivity in value choices, (2) causes of transitivity/intransitivity, and (3) the predictive validity of rankings and ratings. Using a split-half experiment funded by the Time-sharing Experiments for the Social Sciences (TESS) program in which half of the respondents' value preferences are measured with ratings and half with rankings (more specifically, with the method of triads), the authors find that the vast majority of respondents make hierarchically structured value choices and have transitive preferences. Further, there are no significant differences between preferences on most and least important values – the rate at which respondents make hierarchically structured choices is roughly uniform across all five values in the survey. Next, the authors present evidence that suggests white respondents and those with more formal education are more likely than others to have completely transitive preferences. Finally, the authors estimate models of partisanship, ideology, presidential approval, and vote choice to the data. They find that the models fit to the "triads" data fits significantly better than the models fit to traditional ratings data. The author concludes that rankings data collected via the method of triads outperform ratings data, but they also note that the number of items needed to use the method of triads increases geometrically such that surveys become long and difficult to administer if the researcher is interested in examining the effects of preferences on more than five values on some form of behavior. Subsequent work, however, suggests that the method of triads produces data similar to other ranking strategies that take up less space on a survey (Ciuk 2016; Jacoby 2011).

## Conclusions and Recommendations

Clearly, there are benefits and drawbacks to both often-used techniques to measure value preferences. When making decisions on which technique to use, researchers ought to think about goals of the particular project, determine which tradeoffs they are willing to accept, and design the set of measures according to those considerations. For example, if one simply wants to examine the effects of a small number of value central to American political culture on voting behavior, policy preferences, presidential approval, or something similar, some form of ranking technique might be suitable. The data will allow the research to look at a full list of rank-ordered preferences for each respondent assembled in line with psychological theory. On the other hand, if only four or five values are of interest to a researcher and there is ample room on a survey, rankings via the method of triads is possible. In this case, in addition to obtaining a full list of rank-ordered preferences for each respondent, the research can also examine the structure of respondents' preferences. If the researcher is engaged in a larger-scale project where preferences on dozens of values will be used as independent variables, rankings battery may be too time-consuming and too complex for respondents, and, thus, ratings may be more appropriate. Whatever the case, researchers working on values have a wide range of tools available with respect to measurement, and, as the field continues to make progress, the properties of value measurement continue to improve.

# Vendor Diversity in Public Sector Purchasing

Christopher L. Atkinson
University of West Florida, Pensacola, FL, USA

## Synonyms

Disadvantaged business enterprises; Minority- and women-owned business programs; Small business programs; Supplier diversity

## Definition

Vendor Diversity in Public Sector Purchasing refers to public procurement programs and systems that foster inclusiveness and the potential particularly for small and disadvantaged businesses to compete for and win public sector contracts (also, the state of diversity in such a program or system). A diverse purchasing program reflects the business ownership of a community, region, state, or nation of the government entity and shows commitment to opportunity and capacity building for all vendors interested in government contracting.

## Introduction

Procurement has strategic value in public sector organizations, because of its ability to satisfy

broader needs, like innovation and diversity, in addition to sourcing products and services (Loader 2016). Vendor diversity programs are a particular subset of a larger movement toward inclusiveness in purchasing. There is an awareness among policymakers that public purchasing can drive employment, and as a result purchasing can be made to serve economic development ends; there is also an increasing mindfulness of the barriers that business owners, particularly from historically underserved groups, may face in approaching public sector contracting. Direct policies, such as preference programs, and indirect tactics, such as general support for small business communities through technical assistance, capacity building, knowledge sharing, lessening or removing administrative burdens, and loan programs, may all serve to support vendor diversity in the public context. Even where competition is desired, the predicament of small businesses in responding to the challenges of the government contracting environment is not understood as well as might be hoped (Ancarani et al. 2019).

This entry examines vendor diversity in public purchasing, by first discussing inclusion as a procurement policy and then examining the interests of government in providing for inclusion. The entry concludes with an examination of challenges and opportunities associated with supplier diversity and inclusion programs in the public sector.

## Inclusion as Procurement Policy: Distribution, Accountability, and Development

Qiao et al. (2009) identify three forms of preference in their survey of state and local procurement preference programs: to protect against competition from outside an area, to improve the ability of vendors to compete, and "to achieve particular social policy goals" (p. 373). They identify various socioeconomic programs, including set-asides for "small, minority, disadvantaged, veteran-owned, or women-owned businesses," as well as programs that require purchasing from "the developmentally disadvantaged such as the deaf and blind" (p. 374). Programs like the US AbilityOne Program, under the Javits-Wagner-O'Day (JWOD) Act, have allowed employment opportunities for exceptional individuals, with a primary market of products being government (US AbilityOne Commission 2019). Business certification has been offered for lesbian, gay, bisexual, and transgender business owners (Klocek et al. 2014). The range of eligible groups and programs designed to improve inclusion shows understanding of the barriers faced by some groups but also recognition of their potential to contribute to public needs in fulfilling government's requirements for products and services.

In keeping with Lowi's policy types (1972), vendor diversity and inclusion programs in public procurement may encompass a range of tactics as solutions to past and present societal problems or as aspirational models to highlight political ideals. Increasing competition in procurement is a regulatory matter and is widely accepted as achieving positive returns for government. Solicitations that encourage greater participation not only increase the potential for competition, with direct economic benefits to the government entity realized in savings, but also improve the chance that a given purchase may afford economic development benefits, through local purchasing and a multiplier effect in spending in a distributive policy model. Loan programs for marginalized businesses may take from the whole to afford assistance and protection to businesses in need in a redistributional policy approach, when the commercial lending market fails to serve these businesses. The establishment of agencies to respond to the need for inclusion represents a constituent-based policy (Lowi 1972).

For minority- and women-owned business programs, the purely capitalistic model may have resulted in overrepresentation of firms from certain groups, leaving other groups disadvantaged; inclusion programs may seek to correct a past "general sin" against businesses that have seen discrimination. The inclusion program would serve as a response to market failure to provide equitable opportunity (indirect, passive discrimination) or on the part of the government entity

itself (direct, active discrimination), in actively keeping firms from certain groups from participating in government contracting. Discrimination may exist through acts of commission or omission and can be difficult to thwart through means other than direction for the institution to act in certain ways and prohibiting offensive behaviors. Inclusion programs are not simply statements of institutional values in these instances: they are a form of compensatory justice (Kellough 2006), seeking to resolve problems caused by government or to ameliorate private sector discrimination and its negative effects on communities as a balancing factor.

Inclusive policy solutions are interventions in scenarios where the market has failed on its own to afford public value, as defined by political actors. A common theme is that government sees the market and its outcomes as suspect, necessitating value-driven policy solutions to provide for accountability in public spending. Even where they provide measurable benefit, inclusion programs are essentially coercive unless strictly voluntary, in that they often force systems and vendors to respond to public tenders in a manner responsive to the ideals of the government entity (Lowi 1972).

Inclusion programs may have unintended consequences, in reducing the pool for competition, for example, or driving up the price from an artificial limitation on offerors. The decisions made, by virtue of these policies, are not purely capitalist, and they may not always arrive at options that are the lowest price. However, regardless of one's agreement with the usefulness of inclusion programs in addressing past injustices, these programs can provide benefit in improving competition, reducing the potential for procurement that funnels projects to preferred vendors, and affording economic development benefits.

## Vendor Diversity as a Government Interest

Ram and Smallbone (2003) identified two major types of supplier diversity initiative: those driven by the buyer and business-to-business arrangements. Internationally, "equal treatment" in purchasing and economic renewal are compelling rationales for supplier diversity. There is attention to the potential for government purchasing, in particular, because of the scope of government purchasing and the volume of procurement (Ram and Smallbone 2003). Worthington et al. (2008) identified legislative actions, economic goals, stakeholder pressure, and "ethical influences" as shaping the need for supplier diversity programs. Social responsibility of the government enterprise remains an important aspect, as accountability and transparency contribute to the legitimacy of the whole. Procurement, as an important intersection between public and private purposes, is an obvious point where expectations exist for representative service.

While public sector purchasing is essentially a business function, the responsibility of public sector entities in providing accountability and transparency goes well beyond the business activities of a private sector organization (Arlbjørn and Freytag 2012). Government often seeks to represent the diversity of the public in which firms receive public money and, as a result, has interest in not only employment outcomes but fair distribution of contracts as a "social objective," where the private sector would be more focused on a profit motive (Mphela and Shunda 2018). There are reasons for this difference in focus. Diverse businesses represent a growing segment of the economy, yielding impressive cumulative annual sales and significant potential for the addition of new jobs. Successful supplier diversity programs can create strong relationships with community partners, such as inclusive chambers of commerce and third-sector organizations (Klocek et al. 2014).

As a matter of providing fair access, it is reasonable enough to suggest that all firms that possess capacity to perform or provide products, which are interested in pursuing government contracts, should be allowed an equal potential chance of winning such contracts. Encouraging diversity has benefits beyond just addressing past shortfalls – it can improve community capacity and better work performance; non-discrimination programs on their own potentially

do not respond forcefully enough to address injustice (Kellough 2006). In practice, though, other considerations such as years of experience and previous related or relevant work with government may hold sway in decisions, as government seeks to reduce the potential for failure in performance. In a highly competitive environment, inclusion and diversity exist along with competing priorities; market limitations can result in allegations of reverse discrimination or benefits accruing to other-than-disadvantaged individuals as a result of diversity programs. Despite the root in positive intentions, participation in diversity programs can stigmatize vendors, in that they are asking for help by participating; this may lead other businesses to assume a lack of capacity or undercut fair appraisal of their qualifications (Kellough 2006).

While there is government interest in responding to past injustice, and the inclusiveness of diversity programs justified on those grounds, inherent in programs that give additional benefit to certain groups over others is that they exclude some groups and individuals from full participation. A goal for the targeted group is seen as a prejudicial quota by ineligible groups. Policy in this area can be helped by avoiding overreach, responding only to the identified problem and offering a solution for it, and creating programs to equalize opportunity without creating undue hardship to ineligible vendors, lest there be accusations of unfairness in what are supposed to be impartial, business-driven practices (Goldman 1977). A major issue is that there is no universal conception of fairness in public procurement; given this, the entity making procurement choices must understand available options and deploy them in the most appropriate way given the context. Stakeholder views vary on inclusion and diversity in procurement, but stakeholders themselves may not be the source of a great program that best fits the context. Public sector leadership is needed to choose the options for inclusion that might work best given program goals. For programs to be effective, regardless of what options are chosen, there is a need for efforts to be well-explained and documented, with periodic reporting of benefits attained and challenges experienced.

## Challenges and Opportunities

Diversity and inclusion programs set out to afford a range of benefits to the public, and their considerable variety and range of implementation suggest strongly their ongoing appeal for governments. There is nevertheless a need to evaluate the performance of initiatives, to ensure that they function as desired. While attention to the main eligibility criteria for a business to be considered diverse is important, this alone does not help a business compete for and win contracts. Flynn and Davis (2017) found that "procedural capability has a significant effect on number of tenders submitted and value of contract sought," so training is warranted to help businesses understand government processes; "buyer engagement strategies" can improve communication with small businesses (p. 449). Procurement staff members with an awareness of the importance of diversity can assist with driving the success of programs; the benefits of sourcing choices (such as increased employment for a local economy or for people with exceptional needs) can be considerable (Preuss 2011).

Not all programs work as desired. Even with the presence of a program, small businesses, including diverse businesses, find barriers in finding out information about government contracting, dealing with impenetrable government systems, and responding to solicitations (Ram and Smallbone 2003). Employees that work in supplier diversity programs can feel a tension between program goals (inclusion) and the goals of the larger organization, such as efficiency in project completion (Preuss 2011) and cost. Orser et al. (2019) found that gender-based certification programs had little effect on the bidding process, in driving either bid frequency or achievement of contract awards.

Immigrant entrepreneurs pose special challenges for public sector supplier diversity programs. In addition to economic trials, these diverse business owners may face barriers of "information, advertising, human resources, and undercapitalization," and they may not be aware that public sector diversity programs even exist or that they will provide legitimate benefit (Kordestani et al. 2017, p. 1).

## Conclusion

It might be argued that pursuing the intention of inclusion in public procurement through what are incomplete and restricted performatives (e.g., goals on contracting) ignores larger considerations of free involvement and access to government for marginalized groups generally. Programs that require a high burden of proof for certification of diverse status, for example, may marginalize affected groups further, through a process of "othering" (Kamali 2009). Traditional assumptions of the superiority of large businesses, and of firms owned by privileged elites, serve to reinforce existing assumptions about what is possible in public contracting settings. There is thus a need to disrupt the prevailing narrative of eligibility certification and enforcement and a natural government preference for large businesses as vendors, which possibly limits the potential for attainment of true inclusion and opportunity. This is especially true when procurement systems are themselves not entirely open and remain beholden to elite expectations. Institutional evolution may be slow in responding to such profound concerns.

Instead of providing opportunity, the value in supplier diversity programs and other statements of social responsibility could exist and remain in the realm of the symbolic, unless inclusion and appreciation of diversity is a central organizational value supported at top levels of management and embraced throughout all levels. The elimination of "we" and "they" in public contracting may, as in other examples of inclusive policy, indicate a transformational moment for society, benefitting the whole with real and attainable prospects. Otherwise, programs may keep one foot firmly planted in modernity, with decidedly racist undertones and limited results (Kamali 2009), serving largely predetermined and predictable outcomes.

Even with cynicism about positive growth and change in organizations seemingly rampant, social responsibility programs have had positive effects in the private sector (Pope and Wæraas 2016). Supplier diversity programs in the public sector evidence at least a normative commitment to social responsibility. Expectations for public sector supplier diversity programs, to create positive change for affected groups and individuals, should be set high and remain a point of engagement. The need for tough responses to complex problems can be understood by a sophisticated public, assuming clear communication with stakeholders and consistent implementation by regulators. Without communication and commitment, there is the potential for programmatic entropy, resistance to implementation, and a loss of a sense of mission, leading to a less diverse public procurement system and decreased public benefit.

# Vertical and Horizontal Tax Competition in the USA

Julius A. Nukpezah[1] and Michael R. Overton[2]
[1]Department of Political Science and Public Administration, Mississippi State University, Starkville, MS, USA
[2]Department of Politics and Philosophy, University of Idaho, Moscow, ID, USA

## Synonyms

Horizontal tax externality, Interlocal competition; Vertical tax externality, Multilevel tax competition

## Definitions

*Vertical tax competition* refers to competition among overlapping governments, such as federal and state governments or state and local governments, for mobile tax base where the adoption of a tax policy or a change in tax rate by one elicits or prevents action in the other. *Vertical tax competition* occurs among federal, state, and local governments.

*Horizontal tax competition* refers to competition among neighboring subnational governments such as counties, municipalities, special districts, and school districts, generally over a mobile tax base or occasionally over tax rates. *Horizontal tax competition* occurs among similar levels of local governments.

## Introduction

Local governments in the USA exist in a polycentric system where multiple legally independent governments interact with one another in a shared regional economy (Ostrom et al. 1961). The decisions made by one local government are not completely internalized, but instead, ripple out impacting neighboring jurisdictions (Overton 2017), in both a short-term competitive and a long-term interdependent economic relationship (Overton and Nukpezah 2019). The presence of multiple legally independent local governments results in tax base and tax rate competition among subnational, or local, governments.

Tax competition among local governments can manifest as either horizontal competition among similar types of local governments or vertical competition among overlapping governments that share jurisdiction over a common geographic area (Wu and Hendrick 2009). While local governments compete over a variety of things – mobile capital, political prestige, firm location, and state and federal funds – this chapter entry focuses on *horizontal and vertical* competition among local governments over tax bases and tax rates.

This entry examines the research on tax competition as it pertains to the USA. First, it discusses the levels of governments within the

federal system. Second, it reviews the fundamentals of taxation to better understand competition. Third, the theoretical underpinnings of horizontal tax competition through two theoretical foundations are reviewed. Fourth, tax rate competition is discussed. Fifth, the theoretical framework and empirical support for vertical tax competition is presented. Finally, the benefits and the challenges of horizontal and vertical tax competition are enumerated followed by a conclusion.

## State and Local Governments in American Federalism

The Constitution of USA created a federal arrangement that establishes state and federal governments as sovereign entities. However, as an arbiter over subnational affairs in the realm coupled with the power of the US Congress to create laws deemed necessary, the constitutional authority of the federal government supersedes those of the states and, therefore, the relationship among the federal and state governments is a superior-subordinate relationship.

Local governments in the USA are creatures of the state where they are located and derive their authority from respective state Constitutions and statutes. The autonomy of a local government is highly dependent on the state where it is located. Some local governments, *Dillon's Rule local governments*, have little discretion apart from what the state directly authorizes while others, *Home Rule local governments*, have broad autonomy apart from the state.

Local governments are characterized as either general-purpose or single-purpose governments. General purpose governments provide multiple services such as public safety and emergency management services and include counties and municipalities (cities, towns, and villages). Single-purpose governments, on the other hand, perform only one function and include special districts, and independent school districts, which provide only educational services as examples.

Horizontal tax competition occurs among neighboring local governments of the same type. Vertical tax competition occurs among subnational, state, or federal governments that overlap. Most vertical tax competition that happens at subnational level occurs among counties, municipalities, school, and special districts that share jurisdiction over a common geography (Wu and Hendrick 2009; Burge and Piper 2012).

## Tax Instruments and Competition

Tax competition occurs when governments (federal, state, and local) compete over a tax base or a tax rate. A tax base is "the object or transaction to which a tax is applied" (Bland and Overton 2019) and a tax rate is the percentage applied to a tax base to determine tax revenue or liability. In the USA, there are three primary tax bases: income (personal or corporate), consumption (sales and excise), and wealth (property). Income taxes are taxes applied to individual income or corporate income; consumption taxes are taxes generally applied to transactions like purchases/sales; wealth taxes are taxes applied to assets like land and their improvements.

Generating tax revenue requires a well-defined tax base on which governments have legal authority to apply a tax rate. Most tax competition is over a mobile tax base – a tax base that can relocate with minimal costs or is perceived as able to relocate with minimal cost. The relative mobility of a tax base is determined by how costless it is to change taxable base.

## Subnational Governments and Horizontal Tax Competition

Horizontal tax competition occurs when neighboring local governments compete over the location of a mobile tax base or to set a tax rate. Local governments compete in a local market for public goods over a mobile tax base by either (1) differentiating the bundle of goods and services (BGS) they offer from neighbors thereby attracting residents and businesses (Tiebout 1956; Overton 2017) or by offering a similar BGS as their neighbor, but at a lower tax rate (Brennan and Buchanan 1980). A local market for public goods is analogous to a private market where cities in a polycentric system of governments

compete to attract households, and businesses, which ultimately form a local government's taxable base through increased property values, capital location, wages, and consumption activity. Local governments act like producers in a private market but provide local public goods, which are public goods with geographically bounded benefits (Bland and Overton 2016). Households and businesses "shop" for public goods by locating in communities that match their BGS at the lowest relative cost (Tiebout 1956; Brennan and Buchanan 1980).

### Theoretical Context: Allocative and Productive Efficiency

Horizontal tax competition is normatively argued to improve government expenditures and provide more efficient public services. Local governments act strategically to either provide a unique BGS that match the mobile tax base's preferences or by offering a similar bundle of goods and services as neighboring cities at a lower tax rate. These two strategic actions are rooted in different theoretical traditions that are often used interchangeably albeit, incorrectly. To understand these two traditions, it is important to define allocative and productive efficiency and apply them to local government competition.

### Allocative Efficiency and Tiebout

Allocative efficiency refers to who gets what or ensuring that resources are disbursed and used in a social optimal manner (Bland and Overton 2019). While a local market for public goods approaches the competitiveness of a private market, many of the idiosyncratic characteristics of local markets for public goods limit the allocative efficiency of the market, reducing it to something closer to a quasi-market. In 1954, Samuelson first articulated the distinction between private goods and public goods. A pure public good is non excludable (i.e., it is difficult to prevent individuals from consuming the good or service) and non-rivalrous (i.e., one person's consumption of the good or service does not prevent another person's consumption of the good or service) while a private good is excludable and rivalrous. Samuelson (1954) posited that public goods, unlike private goods, cannot be provided at a Pareto optimum level because pure public goods are indivisible. Thus, governments cannot provide varying quantities of pure public goods in order to accurately meet consumer demand.

Because pure public goods are non-excludable and non-rivalrous, rational consumers hide their true preferences and attempt to free ride on other taxpayers. Markets for public goods are inefficient resulting in under provision relative to consumer demand because no mechanism for accurate preference revelation exists in a local market for public goods.

In response to Samuelson (1954), Tiebout (1956) argued that, as long as citizens can move freely between local municipalities and have accurate information, citizens will locate in municipalities that best approximate their desired BGS. The idea is simple: no price mechanism is needed to achieve an efficient local market for public goods because citizens and businesses reveal their preferences by "voting with their feet." If a citizen is dissatisfied with a local government's BGS, they can relocate to a municipality that offers a BGS that parallels a citizen's unique preferences. Horizontal tax competition in the Tiebout (1956) tradition suggest local governments compete over a mobile tax base through the creation and promotion of a BGS.

*Empirical support:* Horizontal tax competition as outlined in the Tiebout (1956) tradition does exist under certain conditions, local government competition over a mobile tax base citizens or businesses to reveal their preferences for public goods by exiting communities whose service-tax package they do not prefer (Tiebout 1956), and entering communities whose bundle of goods align with their unique preferences. Evidence suggests that individuals do enter and exit communities based on the specific service-tax package offered. Similarly, Overton and Nukpezah (2019) find evidence of tax competition among Texas principal cities and their neighbors with regards sales tax revenue in the short-run and suggest that the relationship between principal cities and neighboring cities is highly dynamic and interdependent in the long run.

### Productive Efficiency and Public Choice

Productive efficiency refers to producing goods and services at the lowest per unit rate (Bland and Overton 2019). Public choice scholars have argued that competition prevents abuse of power by government officials and prevents governments from behaving like private sector monopolies (Brennan and Buchanan 1980). The Leviathan hypothesis argues that local governments behave like monopolistic private firms, and given the revenue maximizing behavior of bureaucrats, will spend more than is preferred by the median voter (Brennan and Buchanan 1980). However, local government competition over a mobile tax base can mitigate the monopoly power held by one local government through market-like competition (Brennan and Buchanan 1980). The unstated assumption of the public choice perspective is that governments offer the same bundle of goods and thus location decisions are made based on competing tax burdens.

Support for horizontal tax competition as outlined by the public choice tradition is mixed. First, businesses are sensitive to both a city's tax rate and the tax incentives it offers (Overton and Bland 2014), especially when making their final location decisions. Second, some scholars find evidence in support of lower government expenditures and collected revenues from government competition (Craw 2008). Third, Other scholars have found evidence that government competition does not lead to more productively efficient outcomes (Berry 2008).

Why are there conflicting results? Craw (2008) found that once the political process or "voice" was taken into account, local government competition resulted in lower spending levels. Yeung (2009) concluded from a meta-review that the unit of analysis mattered when determining decentralization's impact on revenues and expenditures. Studies where decentralization was measured as fragmentation (e.g., Berry (2008) were more likely to find that increased competition results in increased government expenditures while studies utilizing local governments as the unit of analysis are more likely to find that increased competition results in decreased government expenditures (e.g., Craw 2008).

### Movement Towards a Unified Theory of Competition

Missing from these theoretical traditions is an understanding that competition among local governments is not binary, but a continuum. The degree of competition among local governments is reflected in their strategic choices resulting from changes in the behavior of neighboring governments. (Overton 2017) merged these two traditions by applying product differentiation theory to the public choice and Tiebout theories of competition.

Differentiation refers to the similarity of the BGS offered by local governments. Local governments with undifferentiated BGS offer similar BGS and are sensitive to tax rate changes in neighboring local governments. These governments compete in a quasi-marketplace where location of a mobile tax base is determined by relative productive efficiency similar to that articulated by public choice scholars. Local governments providing differentiated BGSs are different from their neighbor's BGSs and compete in a quasi-marketplace where location of a mobile tax base is determined by preference matching rather than the lowest tax rates similar to Tiebout's (1956) theory. Both undifferentiated and differentiated local markets for public goods exist simultaneously often in the same local market for public goods, resulting in different competitive behaviors depending on the degree of differentiation of the local government's BGS (Overton 2017).

## Tax Rate Competition

Sometimes, tax competition occurs not over a tax base, but over the tax rate itself. Local politicians are sensitive and knowledgeable about the tax rate of neighboring jurisdictions. This occurs because in an undifferentiated local market for public goods, a lower tax rate provides a competitive advantage, but also because a lower tax rate is politically popular (Overton 2017). Local governments adopt similar tax rates as their neighbors because voters evaluate the efficacy of local policies by comparing the policies adopted by neighboring governments to their local government

(Besley and Case 1992). While manipulation of a tax rate is often a tool used to attract a mobile tax base, it can also serve as a political goal itself for local government officials.

Tax mimicry – the adoption of tax policies and rates similar to that of neighboring jurisdictions – enhances the nuance of tax competition theory (Zhao 2005; Sjoquist et al. 2007). Local governments are incentivized to adopt similar tax rates as their neighbors because voters evaluate the efficacy of local policies by comparing the policies adopted by neighboring governments to their local government (Besley and Case 1992). This theory is corroborated by Luna (2004) who finds that the sales tax rates of Tennessee counties are influenced by the sales tax rates of neighboring counties.

An important extension of the tax mimicry literature is the proximate polity theory. The proximate polity theory states that economic development policy is provided at a level determined by politicians to decrease their risk of policy failure (Minkoff 2012). Specifically, these decisions are made by considering the spending decisions of neighboring cities. Because politicians fear the exit options of citizens and businesses, they will provide a level of goods and services approximating the level provided by their neighbors. The proximate polity theory frame spatial proximity as an important economic and political influencer on local government competition. Using spatial regression analysis on a sample of 1,500 cities, Minkoff (2012) shows that local government expenditures are associated with their neighboring city's expenditures (gross spending, not per capita), median income, and population. These results imply that local governments make development decisions by considering the development decisions of their neighbors in order to minimize the risk that mobile businesses and residents will relocate to competing areas.

Empirical evidence has validated the relevance of the proximate polity theory repeatedly (Stokan 2013). From a survey of 109 municipalities in the Twin Cities metropolitan area, Goetz and Kayser (1993) determine that a city's level of perceived competition increases the likelihood that it would need to pursue more aggressive economic development policies. The study finds that a city's greatest perceived competitors are those cities with shared borders, similar absolute revenues, and similar population sizes (Goetz and Kayser 1993).

Moreover, competition between jurisdictions is not simply one between neighbors because neighbors do have different influences within a geographic area. For example, Rogers (2004) finds that county seats and higher populous urban areas report higher revenues with increases in local option sales tax (LOST). Perhaps, this is because larger urban areas and county seats are attractive and provide political, social, and economic benefits to the entire region. This idea is further substantiated by Burge and Rogers (2016) who created a leadership index with which they designated early adopters of state LOST policy as leaders and the other governments as followers. Their study observed that followers were more likely to increase their LOST rate when leaders have done so. However, followers were less likely to do so if the increase had come from another follower. Moreover, Burge and Rogers (2016) observe that leaders respond to LOST rate changes only when it is by a parent county and by local governments at state border.

## Multilevel Governments and Vertical Tax Competition

Vertical tax competition occurs when overlapping governments, governments that share jurisdiction over a common geography, compete over a shared tax base or tax rate where a change in tax policy by one level of government elicits a change in another level of government (Wu and Hendrick 2009; Burge and Piper 2012; Esteller-Moré and Solé-Ollé 2001). Vertical tax competition exists because either the tax base or tax rate of the shared geographic area is somehow limited. Berry (2008) argued that vertical fragmentation resulted in increased "overfishing" of a fiscal common (i.e., the shared geography). In this case, vertical competition for a limited tax base resulted from multiple overlapping governments.

### Theoretical Context: The Leader and Follower Hypothesis

Even though states are jurisdictionally independent of each other, they are all contained within federal jurisdiction and constrained by federal authority. The same unequal type of relationship exists among states and their local governments. Burge and Rogers (2016, 2018) draws on this unequal relationship to propose a leader and follower relationship, which provides the theoretical context in understanding vertical tax relationships. Because of the constitutional authority of federal and state governments as sovereigns, they have at their discretion the tools to make laws and policies and to address challenges that result making them leaders in policy initiation. The subservient governments within them follow with a variation of the policies made at the higher government level.

*Empirical support:* Extant research suggests that vertical competitive relationships exist between US federal and state governments regarding excise tax rate setting for gasoline and cigarettes (Besley and Rosen 1998). The research suggests that there is a positive response to federal excise tax rate changes by the states. For instance, when federal tax rate on gasoline increases by 10-cents per gallon, it leads to states increasing theirs by 3.2-cents per gallon, and vice versa, controlling for other variables such as youthfulness of the population and democratic control of the government that were found to be related to higher tax rates.

Also, analysis of vertical income tax competition between federal and state governments confirms that a positive competitive relationship exists between federal tax rates and state responses (Esteller-Moré and Solé-Ollé 2001). The authors find that a 1-point increase in the effective federal income tax rate is associated with a 0.1-point increase in state taxes.

There is evidence of vertical tax competition between state and local governments regarding taxes. For example, Burge and Rogers (2018) find that the adoption of LOST by Oklahoma local governments usually follows a variation of state adoptions. Similarly, Fox et al. (2015) find that state tax rate Granger causes local tax rates.

Given that property tax is a major source of revenue for local governments, it is a major source of strategic interactions among tiered local governments such as counties, municipalities, and special districts where changes in tax rates by one local government, such as counties lead to adoption of similar policies by other tiered governments such as school districts and counties (Wu and Hendrick 2009). For example, Wu and Hendrick (2009) find that an increase in property tax rates by Florida counties lead to a reduction in the rate of municipalities because both are general purpose governments serving the same base and provide substitute goods and services. However, municipalities increase their tax rates when school districts increase their rates because they provide complementary services.

## Benefits of Tax Competition

Local government competition has the following theoretical and empirical benefits:

1. Increased productive efficiency through lower tax rates and lower government expenditures (Brennan and Buchanan 1980).
2. Increased allocative efficiency through better preference matching among local government BGS and a mobile tax base (Tiebout 1956).
3. Increased political responsiveness to relatively high tax rates (Besley and Case 1992).

Benefit of vertical competition, which is driven by leader-follower hypothesis include:

1. Subnational governments benefit from tax innovations created by higher tiered governments and therefore do not have to reinvent the wheel.
2. It also provides a means through which higher tiered governments (federal and state) exercise control over lower tiered governments.

## Demerits of Tax Competition

Tax competition does have adverse consequences.

1. Increased zero sum games because a mobile tax base chooses one location at the expensive of all other neighboring local governments.
2. Increased opportunities for a race to the bottom where competing governments undercut one another in an attempt to attract a mobile tax base (Oates and Schwab 1988).
3. Increased pandering of BGS to businesses and higher income residents at the expense of redistributive services out of fear of mobile tax base flight (Peterson 1981). It should be noted that the empirical work on this detriment generally does not focus on tax competition specifically.

Vertical tax competition also has adverse effects, which include:

1. When multi-layered governemnts tax the same base, it increases the tax burden of residents leading to tax payer fatigue.
2. It could limit tax innovativeness when lower tiered governments have to look to policy innovations of a "leader" institution to enact their own policies.

## Conclusion

This chapter entry has discussed horizontal and vertical tax competition among subnational governments of the USA. Neighboring (horizontal) or overlapping (vertical) local governments compete over a mobile tax base in a local market for public goods. Horizontal tax competition can have positive political effects through tax mimicry or result in increased productive and allocative efficiency in the provision of public goods and services. However, tax competition could lead to a race to the bottom where governments undercut one another leading to impoverishment for all governments in a metropolitan area because of lower taxes. Consequently, while there are benefits of competition, governments can benefit by collaborating in multi-organizational arrangements to solve problems that cannot be solved or easily solved by independent organizations.

# Village Model for Aging in Place

Meena Subedi
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Aging; Arrangement; Retirement community; Senior citizen

## Definition

The Village Model is a membership-driven grassroots organization that underlines the provision of supportive services such as transportation, home maintenance, and companionship (Greenfield et al. 2012). It is a consumer-driven approach with a goal of encouraging "aging in place" through member supports, service referrals, and consumer engagement (Scharlach et al. 2011).

"Aging in place" is defined as the preference of an older adult to live in the residence of their choice as they age and being able to have necessary support system and service as their needs change with the age.

## Introduction

Policymakers have long supported and focused on several concepts and initiatives regarding aging in place, livable communities, and long-term care services. The Administration on Aging (AOA), Center for Disability (CFD), and Center for Aging and Community have combined to become the advocates for community living. "Aging in place" promotes the ability of older adults to remain in their homes and neighborhoods even in the face of functional decline. An increase in the disability-free life expectancy has enhanced the desire of elders to remain in their own homes and community for as long as possible rather than living in residential care (Crimmins et al. 2009). The Village Model emerged as an approach to aging in place with goals of encouraging and allowing older adults to become empowered, active, and engaged in their communities (Scharlach et al. 2011; AARP 2011). The Village Model offers community-based initiatives that have addressed the longing of elders to age in place.

## Village Model

The Village Model is an organized grassroots community approach to helping older adults remain in their own homes in the face of frailty

or disability (Scharlach et al. 2011; AARP 2011). Member supports, service referrals, and consumer engagement (Scharlach et al. 2011) are key factors of the Village Model. Villages are created and administered by the people of the community where the volunteers and paid staff manage the services. This community effort is a critical aspect of making aging in place an effective possibility and eventual success. The Village concept of community preparedness for an aging population provides support systems, companionship, and educational and recreational opportunities that enable senior people to age at home with dignity (Scharlach 2012) and has the potential to reduce unnecessary institutionalization of elders (Thomas and Blanchard 2009).

The Village Model concept emerged in 2001 with the establishment of Beacon Hill Village (BHV). The BHV was started by a group of seniors living in the Beacon Hill neighborhood of Boston, MA, in search of a way of helping each other to stay in the neighborhood for as long as possible (Greenfield et al. 2012). The Village Model concept captured the attention of policymakers, community developers, and the people located on the periphery very quickly. By 2012, there were about 180 Village Models nationwide out of which approximately 50 were in their developmental phase (Village-to-Village Network, 2013). Currently 231 Village Models are operating in the United States, and 86 are in their developmental phase (Village-to-Village Network, 2018*)*. The national Village-to-Village Network is an online system that supports and updates the development of Village Models. Most of the Village Models are in bigger cities such as Boston, MA; Los Angeles, CA; and Washington, DC. The studies on aging preferences and available resources to aging have offered the feasibility of the Village Model.

## Village Model Initiation in Oxford, Ohio

In the small college town of Oxford, Ohio, almost 6% of the population of 21,371 is 65 and older (US census, 2010); the population skews young because of the presence of the university. Efforts to enhance aging in place took place in Oxford because of the strong desire of elders to maintain independence for as long as they could and to avoid institutionalization. Some entities that were concerned about "aging in place" for the City of Oxford were the Ohio Department of Aging (ODA), area Senior Centers, the Council on Aging of Southwestern Ohio, Inc. (an Area Agency on Aging), local providers of health and social services, housing entities, community development organizations, and others. The City of Oxford is a relatively small town seasonally dominated by a 20+ age cohort which made the city very challenging regarding its development as a retirement community. However, many people expressed their preference to live in Oxford in their older age either due to retiring from positions within Miami University or because of the well-established resources at the University. Resources from Miami University such as the Institute for Learning in Retirement (ILR), the fitness and recreation center, transportation services, and libraries were ideal to community-dwelling older adults.

In the process of taking steps toward making Oxford a more comfortable place to grow old and a more attractive place to retire, Oxford Senior Citizens, Inc. (OSC) initiated the idea of establishing a Village Model in 2013. OSC collaborated with the City of Oxford and multiple community groups to explore The Village Model. The concept of aging in place played a vital role in the Village Model project because its goal was to allow individuals to stay in their home as long as possible by creating a network of resources. The finding from the exploratory study conducted by the OSC suggested that the elders from Oxford enjoy the intergenerational and diverse community in which they were living and yearn for the continuity of such a society.

The Oxford Village Model envisioned a network of service providers and activities that would flex and grow with the members' needs. This network is made available through telecommunication, and virtual means and members can access services such as transportation, home repairs, social and educational activities, and other day-to-day concerns on an "as needed" basis. Telecommunication has been a significant part of life for younger generations, but its use and

significance are not limited to one age category because it is ubiquitous (Vanderheiden 2006). Although advanced technology is not typically user-friendly to older generations, the enthusiasm of many older adults to learn advanced technology has encouraged organizations to rely on virtual and telecommunication options.

## Aging in Place

In the United States, people over the age of 65 constitute almost 13% of the entire population (US census, 2010). This figure is expected to increase to 20% by the year 2030 (Applebaum et al. 2009). Meanwhile, in the trend of aging in place, a network of support systems to an aging individual has arisen to support older adults in their desire to remain in comfort of their own home regardless of potential disability (Gardner 2011). As baby boomers begin to retire in large number, they will have different expectations than those of their parents and grandparents. Many of these changes have to do with the fact that today's retirees expect to live much longer than their parents or grandparents (Fowels and Greenberg 2011).

Aging in place is a social network which helps older adults in maintaining well-being and quality of life (Gardner 2011). It is also defined as remaining in the community, either in their family homes or in supported accommodations with some level of independence, rather than having to move into residential care (Davey, Nana, de Joux, and Arcus 2004). Aging in place is getting popular in recent years, and much of this shift is due to the general increase in home and community-based services. The availability of support systems such as transportation, meal programs, and home repairs, social and educational activities strengthens the ability to retain independence and fulfills the need to grow old gracefully. Aging in place embraces much broader concepts than just being able to live at home at an older age because it is related to a sense of identity both through independence and autonomy and through caring relationships and roles within the places people live (Davey, Nana, de Joux, and Arcus 2004)."It is the ability to continue to live in one's home safely, independently, and comfortably, regardless of age, income, or ability level" (http://www.ageinginplace.org). Aging in place represents a "fit" between individuals and their social and physical environments (Greenfield et al. 2012). Therefore, policymakers are seeking better opportunities to increase services and to reach a broader population of older adults and assist them in remaining independent and healthy in the comfort of their homes for as long as possible.

Most of the studies on aging in place have concluded that land use, transportation, and housing policies all contribute to the livability of a community. For example, land use policies may include the establishment of shopping centers or medical facilities within walking distance of residential areas. Transportation policies could involve improving traffic laws that protect pedestrians and establishing affordable public transportation services. Housing policies may promote the building of accessible and age-friendly housing. Such changes and efforts can help older adults achieve their desired goal to remain independent and in their own homes as they age.

### Disability and Aging in Place

While physical health declines with age, it does not necessarily mean that getting older means being incapacitated or severely disabled. Disability in older age is commonly measured by the ability to perform activities of daily living (ADLs) and instrumental activities of daily living (IADLs) (Crimmins et al. 2009). Aging in place could be a practical and appealing alternative to people with physical limitations or disabilities with some adaptations to the physical environment and support systems that facilitate activities of daily living. These include age-friendly/handicapped accessible houses, efficient public transportation for disabled, pedestrian accessibility, and home health-care services (Ball 2010). Moreover, the creation of a network of community-based services and supports that focus on individuals' needs, values, and preferences can enhance the ability of elders to age in place.

The reports of declining rates of disabilities among the aging population (AARP 2011) have not only reinforced the preference of people with disabilities to age in place but also have led to optimism in refining and defining the policies on aging for elders. Despite experiencing a late-life disability, most elders feel they are successfully aging when they mature at home (Romo et al. 2012). However, mobility disability is one of the most feared impairments among older adults because this disability limits a person's movement from one place to another, which in turn becomes an obstacle for independent aging.

## Conclusion

The institutional bias of long-term care has placed a massive burden on state budgets. The trend of taking care of older citizens is shifting toward a more preventive and proactive perspective. "The institutionalization to cope with the needs of frail older people is gradually being seen as morally unacceptable" (Thomas and Blanchard 2009, P.16). Therefore, aging in place with the help of The Village Model has grown as a feasible notion.

## Definitions

The following definitions, as adapted from a glossary of terms or other materials provided publicly

by Human Rights Campaign unless otherwise noted, hold relevance to this chapter.

- **Transgender**: An umbrella term for people whose gender identity and/or expression is different from cultural expectations based on the sex they were assigned at birth. Being transgender does not imply any specific sexual orientation (HRC).
- **Cisgender**: A term used to describe a person whose gender identity aligns with those typically associated with the sex assigned to them at birth (HRC).
- **Gender identity**: One's innermost concept of self as male, female, a blend of both or neither – how individuals perceive themselves and what they call themselves. One's gender identity can be the same or different from their sex assigned at birth (HRC).
- **Sex assigned at birth**: The sex (for example male, female, or intersex) given to a child at birth, most often based on the child's external anatomy. This is also referred to as "assigned sex at birth" (HRC).
- **Hate Crime**: Also known as a bias-motivated crime, occurs when the perpetrator intentionally selects the victim because of a bias or prejudice (HRC).
- **Transphobia**: The fear and hatred of, or discomfort with, transgender people (HRC).
- **Misgendering**: To use the wrong pronouns or other gender-specific words when referring to or speaking to someone, especially a transgender person (Cambridge English Dictionary).

## Introduction

Members of the lesbian, gay, bisexual, transgender, queer/questioning (LGBTQ) community are victims of ongoing emotional, physical, structural, and sexual violence. While this often-fatal trend has appropriately caught the attention of some scholars and policy makers, there are significant gaps in academic knowledge and practitioner application. Specifically, while scholars begin to build a knowledge bank regarding violence based on sexual orientation, a similar collection based on gender identity is lagging (Mckay et al. 2019). However, violence towards transgender and gender nonconforming individuals proves to have deadly consequences, especially for Black transgender women living within urban areas. The alarming, ongoing rate at which the transgender community faces violence is a Public Administration issue that warrants timely attention. The root causes of ongoing anti-transgender physical, emotional, and structural violence are identified in this chapter in accordance with well-established professionally published reports and knowledge reflective of those professionals and academics who advocate for the transgender community.

## Background, Limitations, and Relevance to Public Administration

The high rate of transgender murders in the United States (primarily transgender women of color) has been deemed an epidemic (HRC 2017–2019; Mckay et al. 2019). On a global scale, this issue has been deemed a "public health crisis" constituting "genocide of a vulnerable community" (Kidd and Witten 2008). Both advocates and scholars call for implementation of LGBTQ-affirming administrative policies to address the crisis (HRC 2016–2019; Mckay et al. 2019; Kidd and Witten 2008). Despite this, the anti-transgender violence epidemic remains under-researched in the field. Even among existing diversity and inclusion research, transgender representation is limited. Work by Public Administration scholars including that of Elias (2013) draws attention to this absence by highlighting the field's limited view of diversity, demonstrated through research on the benefits of representative bureaucracy. While academics agree that there are numerous benefits of a public arena reflecting the diversity of its governed, Elias asserts that the scope of diversity is dangerously limited as it stands. As societal understanding of diversity expands, so must the academic application of the concepts which lay the foundation of representation theory (2013). Pioneering research that reflects the United States' transgender community

is therefore that of specialized practitioners, most reputably the Human Rights Campaign (HRC).

States that do track violent crimes do not always regard antitransgender violence as a hate crime or accurately recognize the societal effects that act as a catalyst to violence. An additional limitation is caused by not properly recognizing an individual's transgender identity when tracking violence rates. The most recognized calculation of antitransgender fatal violence within the LGBTQ community has thus become the HRC annual Fatal Anti-Transgender Violence reports. Additionally, Transgender Day of Remembrance has been observed annually in the United States since 1999 as a day on which to count and recognize those community members lost to fatal anti-transgender violence (GLAAD n.d.). Professional nonprofit advocacy organizations like the HRC have calculated impactful data which recognizes harmful trends within communities leading to victimization at epidemic rates.

## Physical and Emotional Violence

### Homicide

The murder of transgender individuals is the most frequently discussed manifestation of anti-transgender violence. These ongoing violent crimes are often not categorized as hate crimes, as there is not always a clear connection between the victim's gender identity and the homicide. Mirroring the gap in criminal reporting, Public Administration research is similarly deficient. Based on an extensive review of literature highlighting anti-LGBTQ violence, Mckay et al. (2019) identify that the field's work can best be categorized in the following two areas: "Perpetration Research" an approach rooted in anti-LGBTQ stigma that is employed to justify the idea that protecting LGBTQ individuals will harm the cisgender/heterosexual community and "Victimization Research" which identifies trends among cases of LGBTQ victimization, heavily saturated with that concerning LGB individuals, while often excluding concerns of the transgender subsection of the community. Despite the gap in substantial quantitative evidence which validates the connection between gender identity and violent attacks, it is essential to understand that stigmatization and lack of opportunities for transgender individuals in the United States significantly contributes to the hardships. Thus, transgender individuals may lead lives that heightens their risk of violence, including homicide. While this fact does not justify violence, it does highlight the fatal consequences of transphobic structural violence and stigma-based biases.

In their ongoing annual reports titled *A National Epidemic: Fatal Anti-Transgender Violence in the United States*, the HRC reveals that transgender murders are still prevalent and require urgent attention from public administrators. Additionally, trends within the epidemic are equally as concerning. At the time of the 2019 report, at least 22 transgender and gender nonconforming individuals were killed in the USA since that January: 91% were Black women, 81% were under the age of 30, 68% lived in the South. At the time of the 2018 report, at least 22 transgender and gender nonconforming individuals were killed in the USA since the start of the year: 82% were women of color, 64% were under the age of 35, 55% lived in the South. In 2017, 25 transgender and gender nonconforming individuals were murdered in in the United States at the time of the November report, up from at least 23 in 2016, 22 in 2015, 13 in 2014, and 19 in 2013 (HRC 2017–2019).

While a significant portion of fatal anti-transgender violence likely meets the colloquial understanding of a hate crime, many US states do not officially label these events with the term. However, states that do recognize antitransgender violence as hate crimes have significantly lower rates of antitransgender fatal violence (HRC 2017–2020). The effect of this policy and protection is a Public Administration concern, especially in urban municipalities. While it is not possible to provide academic statistical evidence proving that rates of antitransgender violence or antitransgender hate crimes are more pervasive than violence against cisgender (or nontransgender) individuals, it is well documented that the "mere existence" of a transgender person is enough to render one

vulnerable to high degrees of possibly fatal violence (Kidd and Witten 2008). Additionally, trends of reported "visceral disgust" by perpetrators towards their victims due to the victims' gender identity combined with the level of brutality and frequency of these incidents warrants further action from public administrators in identifying and mitigating antitransgender violence regardless of the inconsistency of appropriate hate-crime-labeling (Kidd and Witten 2008).

### Suicide

In addition to homicide, the transgender community often suffers from fatalities via suicide. Due to the harsh realities faced by transgender individuals such as stigma and lack of opportunities, transgender individuals are at higher risk for suicide, evinced in the 2015 US Transgender Survey. The survey revealed that 81.7% individuals responding stated they'd seriously contemplated suicide throughout their lifetimes, while 48.3% had seriously considered it in the past year. When asked about suicide attempts, 40.4% of respondents reported attempting suicide at some point in their lifetimes, and 7.3% stated that they had attempted suicide in the past year (Herman et al. 2019). Additionally, gender dysphoria (or feeling of discomfort/distress that might occur in people whose gender identity differs from their sex assigned at birth) negatively affects mental health and can be dangerous if unaddressed. Individuals experiencing severe gender dysphoria are often unable to seek affirming support due to a variety of outside factors including lack of access to healthcare, lack of familial support, and/or lack of financial stability due to stigma. By excluding this subsection of citizens from administrators' understanding of diverse representation, gaps in representation are often filled with stigma-laden messages asserting that transgender individuals are unwelcome or excluded from utilization of key services, which might otherwise be employed to mitigate vulnerabilities.

Cavalcante (2018) highlights the detrimental effects of isolation felt by the transgender community as a result of societal stigma and administrative exclusion. Additionally, she emphasizes the importance of community support within the transgender community often obtained through the use of online resources. The transgender community's predilection for seeking supportive resources via the Internet exemplifies the strength of this medium while conversely demonstrating the detriment of societal barriers. This preference for virtual engagement ultimately enhances this community's isolation and eliminates the idea of in-person resources as viable options. This process further increases the risk factors of those transgender individuals with limited access to online communities, including those facing economic hardship, housing insecurity, and youth who are not able to utilize the Internet to seek help for fear of outing (exposing) themselves as transgender. These additional challenges must be taken into consideration as public administrators assess strategies to meet the needs of the community in order to maximize efficacy of solutions.

### Sexual and Family Violence

LGBTQ-related literature overwhelmingly suggests that this population of individuals are at significant risk of being victimized by emotional and physical violence from not only strangers, but family members, and acquaintances, even within supposed safe-spaces such as school. HRC (2019) has reported that over half of the transgender individuals killed between 2013 and 2019 were killed by someone close to them (an acquaintance, friend, family member, or intimate partner). Additionally, Stotzer (2009) revealed that between 13% and 86% of gender minority adults have experienced sexual assault victimization in their lifetime. Consistent with the trend of transgender individuals being excluded from important risk-factor mitigating resources, the transgender community's needs and experiences are often absent from violence-prevention education. Furthermore, when faced with intimate partner violence or family violence, transgender individuals are significantly less likely to call for police assistance due to the police force's ongoing marginalization of transgender women (Sakamoto et al. 2009, as cited in Ecker, Aubry, Sylvestre 2019). This isolating effect extends beyond treatment from law enforcement to additional safety nets

and services such as domestic violence shelters which are often gender-segregated and unwilling to house a transgender individual in a shelter which aligns with their gender identity (Spicer 2010, as cited in Ecker, Aubry, Sylvestre 2019).

Victims of domestic violence already face immense barriers when considering leaving an abusive situation. Beyond this difficulty, transgender victims must further grapple with the potential loss of a partner who otherwise understands and affirms their identity. The consequence of leaving an abusive relationship forces the victim to choose a potentially isolated life devoid of gender affirmation or to remain and tolerate the violence. The decision is often an arduous one, as victims typically do not have familial support and/or societal acceptance. Affirmation of their gender identity, in this case, becomes a bargaining chip, used to manipulate a transgender individual into enduring trauma. Similarly, LGBTQ youth face the danger of abuse, rejection, and manipulation not only from intimate partners, but from unsupportive caregivers. This level of trauma at such an early age has long-term effects on self-esteem, ability to establish support networks, and overall health, thereby increasing risk factors for countless challenges moving into adulthood (Ryan et al. 2010, as cited in Elias 2018).

### Bullying

Antitransgender stigma leads to bullying of transgender individuals at school and places otherwise assumed to be safe spaces for youth. LGBTQ youth report being subjected to acts of bullying in their school environment, at home, in religious environments, places of public recreation, public transportation, and within online environments (Mishna et al. 2009). Outing transgender kids, teasing them, intentionally misgendering, and deadnaming them (referring to a transgender individual by their incorrectly gendered birth name, rather than their gender-affirming chosen name), excluding them from activities or groups, isolating them in social spaces, or targeted torment from peers are examples of transgender youth bullying. Effects of this bullying are often linked to self-harm/suicide and bullying: each episode of LGBTQ victimization (e.g., physical or verbal harassment or abuse) increases the likelihood of a self-harming behavior by 2.5 times (The Trevor Project 2017). These instances of bullying may have dire and long-lasting consequences for transgender youth throughout life, as antitransgender school victimizations are also linked to mental health issues and an increased risk for contracting HIV.

Schools that do not make intentional efforts to address antitransgender bullying nor train staff to be gender affirming are especially dangerous for transgender youth. This lack of affirmation towards LGBTQ youth may additionally stem from administrators and teachers. Educators who refuse to affirm transgender youths' gender identity are perpetrating bullying, as those who do not address youth-on-youth bullying are complicit. Transgender youth are particularly vulnerable in gendered youth spaces like summer camps, locker rooms, sex-education class, and bathrooms. Transgender bullying in the workplace or other adult spaces often occur as microaggressions. Transgender adults who are causally excluded from opportunities within the workplace, parent groups, etc., as well as enduring transphobic slights in conversation are common in addition to overtly being treated with bias based on their gender expression or identity.

HRC's *Gender Expansive Youth Report* (2018b) states that 84% youth who identify as transgender do not consistently feel secure within the school environment. Public administrators should continue to work with Department of Education and school officials to implement and ensure intentionally inclusive school district policies towards transgender students, explicitly identifying transgender students as individuals protected from bullying and discrimination in academic environments.

## Structural Violence

### LGBTQ Panic Defense

The "LGBTQ panic" defense is a tactic utilized to justify a defendant's violent reaction to a victim's gender identity and/or sexual orientation. While not a standalone defense to criminal liability, it is

utilized to supplement other defenses (The LGBT Bar n.d.). When a defendant defers to an "LGBTQ panic" defense, they are stating that a victim's gender identity and/or sexual orientation caused the attack and that they should not be held legally responsible for their actions, nor should they suffer criminal repercussions. By fully or partially acquitting violent perpetrators, this defense implies that LGBTQ lives are insignificant and the violence or death that befalls them is of little consequence. This defense demonstrated the case of Matthew Shepard: in 1998, Matthew Shepard was beaten to death by two men. The defendants employed the "LGBTQ panic" defense to explain and justify the murder. Despite widespread criticism and public outcry, the defense is still utilized today in many states across the USA. Though the American Bar Association approved a resolution in 2013 that would eradicate this defense, implementation of this ruling has resulted in only some US states, including California, Colorado, Connecticut, Hawaii, Illinois, Maine, Nevada, New Jersey, New York, Rhode Island, and Washington banning the "LGBTQ panic" defense (Holden 2020).

## Antitransgender Legislation (Housing, Employment, Healthcare)

Evidence demonstrates that experiencing gender minority-based economic discrimination is the highest predictor of later experiencing harassment or violence (Lombardi et al. 2001). These results bolster the theory that policy-related discrimination increases the risk of gender minority-based violence. In addition to the challenges faced by housing-unstable individuals, LGBTQ individuals confronting them experience amplified vulnerabilities due to the intersectionality of physical and mental health challenges. These challenges are further exacerbated due to this subsector's increased risk of experiencing HIV or substance abuse. Homeless transgender individuals face elevated risks when navigating administrative resources for housing insecurity due to heightened likelihood of violence, stigma, and exclusion from affirming services (Ecker et al. 2019). Antitransgender laws in USA such as healthcare refusal, employment policies, bathroom laws, and gender marker restrictions, etc., unequivocally contribute to lack of opportunities, poor mental health, antitransgender stigma, and increases in risk factors for victimization of antitransgender violence (HRC 2019).

### Misgendering Following Death

It should be noted that even after death, transgender individuals continue to face stigmatization and misgendering. Police reporting and journalism covering their deaths often use incorrect pronouns as well as the deadname of the individual. This is harmful to the individual who passed, their friends and family grieving their memory, and the community at large (HRC 2017–2019). This postmortem lack of affirmation further drives a wedge of mistrust and misunderstanding between the targeted transgender community and law enforcement, journalists, and society as a whole.

## Moving Forward

When the social status quo reaches a tipping point and a catalyst of events and factors spark a shift in historical trajectory, society experiences what is deemed by social-consciousness-scholar Sendoval as a "punctum." Phillips (2006), while reflecting on the historical Stonewall Rebellion of 1969 which ignited the community's stand against anti-LGBTQ brutality, mark the moment as an undeniable punctum. However, 50 years after this pivotal catalyst, the transgender community that stood on the front lines of the civil rights movement at Stonewall, continues to fall victim to the same stigma-based root causes of violence today. Beyond recognizing the antitransgender violence epidemic, public administrators can make considerable efforts to include the transgender community in diversity and inclusion research, thereby normalizing the conversation of transgender rights and safety. Additionally, policy discussions should take into account that these issues lie beyond the sphere of diversity and inclusion and that there are key structural changes that must occur in order to protect this particularly vulnerable population. To

properly advance this issue, public administrators can address the following areas: root causes (stigma, lack of opportunities, increased risk factors) as well as the amplifying impact of intersectionality issues in the United States (HRC 2019).

## Identifying/Addressing Root Causes

### Eliminating Antitransgender Stigma

Antitransgender stigma saturates day-to-day life, including hostile anti-LGBTQ sentiments as well as cultural marginalization and invisibility. This often leads to lack of family acceptance and ultimately an absence of or stunted integration into society. Antitransgender violence begins with the dehumanization of transgender individuals. This incites discord by implying that life of transgender individuals is less important than those of cisgender individuals. This dangerous implication highlights a key concern: policy prioritization based on stigma can have devastating and immeasurable consequences. An extensive review conducted by Kidd and Witten (2008) of Public Administration literature, crime rates, and survey data pertaining to antitransgender violence demonstrates that the ongoing violence towards the transgender community is not only a crisis but exhibiting the patterns of genocide. Academics and practitioners are urged to address the epidemic by establishing access to LGBTQ affirming public education and public policies thereby minimizing violence through normalization and intentionally demonstrated solidarity.

In order to move forward in addressing this Public Administration crisis, policymakers must first address, diffuse, and demystify antitransgender stigma throughout medical and social climates of the United States. Academics in particular can begin to bridge this gap within the scholastic environment. The stigma faced by the transgender community begins at a young age and perpetuates misunderstandings and falsehoods about transgender individuals, which further encourages antitransgender political agendas and messaging (HRC 2019). These stigma-laden messages cause barriers at every level of society and render societal integration and acceptance nearly impossible. Additionally, stigma can have long-term effects on transgender individuals' mental and physical health and lead to instability in housing and employment. Finally, the intensity of family and social rejection often renders individuals without support systems or core networks to help them navigate these increased challenges. Public administrators can address antitransgender stigma through the inclusion of gender issues within the academic sphere of diversity, equity, and inclusion, representative bureaucracy, policy discussions, organization theory, and education administration. By normalizing these topics through the inclusion of transgender issues within the sphere of academic discussion, antitransgender violence can become understood as Public Administration concern rather than merely a fringe special academic interest.

### Launching Opportunities

Denial of opportunities prevents transgender individuals from fully participating in society. Transgender individuals face increased barriers if they are immigrants and asylum seekers who now must navigate biased policy in criminal justice systems. Additionally, antitransgender stigma in school environments cause setbacks in transgender students' education which later leads to employment discrimination within the workplace (HRC 2019). Furthermore, there are various changes a transgender individual must undergo in order to have their legal identification match their gender identity. The complexity of these administrative changes oftentimes leaves transgender individuals excluded from health care and social services. In order to prevent spikes in antitransgender violence, public administrators can address the equity chasms in terms of policies and procedures to ensure the possibility of transgender individual's full participation and acceptance in society. Furthermore, these absences of opportunity are often rooted in unequal formal laws and policies.

### Reducing Risk Factors

Antitransgender violence is rooted in increased risk factors for transgender individuals, which are directly caused by dehumanization and antitransgender stigma, as well as indirectly by way of denied opportunities (HRC 2019). Additionally, transgender individuals are at increased risk for intimate partner violence and sexual assault.

Furthermore, employment opportunities that are denied to transgender individuals often cause increased engagement in sex work. Policymakers, employers, and other public administrators should recognize that despite the clear presence of hate-related motives behind murder in transgender communities, structurally reinforced, bias-inducing risk factors and sweeping transphobic societal sentiments are dangerous and often unavoidable public stances that may have dire effects on the transgender community. This lack of acceptance frequently results in transgender individuals engaging in high-risk activities and/or lifestyles to cope with the limited avenues available that would allow them to survive and thrive in modern society.

Stigma and lack of opportunities further result in higher risk of homelessness among the transgender community. This is compounded by the disparate physical and mental health issues facing transgender individuals. The same risk factors, which lead towards a disproportionate rate of homelessness in the transgender population (e.g., homophobia, transphobia, discrimination), systemic inequalities (e.g., inadequate legal protections), interpersonal problems (e.g., familial conflict, relationship breakdown), intrapersonal problems (e.g., mental illness, addictions), and evictions (Caton et al. 2005; Gaetz et al. 2013 as cited in Ecker et al. 2019), make it exponentially more difficult for transgender individuals to access and utilize public resources. Transgender individuals thus become a part of the "hidden homeless" population, being unable to utilize homeless shelters due to the danger of being outed or due to exclusive and harmful policies which are openly discriminatory towards transgender individuals (Ecker et al. 2019, p. 303).

While Public Administration research has already identified that these types of risk factors can lead to disproportionately stunted success in society, it is important for public administrators to understand and identify reasons why this community's specific risk factors increases their susceptibility to violence. In order to end the epidemic of antitransgender violence, public administrators can recognize, address, and eliminate antitransgender structural violence in these aforementioned key areas. This imperative link between risk factors and violence must be accounted for when collecting Public Administration data. A key first step to identifying, addressing, and reducing these risk factors is the urgent re-consideration of how the Public Administration community defines diverse representation. With this definition in place, public administrators may commence diversifying and restructuring policies that are inclusive of the needs of these citizens (Elias 2018).

Public administrators can pursue this through intentional preemptive (rather than reactionary) inclusion of transgender individuals within the United States census as well as in municipal, state, and federal government policy, homelessness counts, HR guidelines and protections, and official government language, as well as subsequent research of policy impact. Finally, it is important to note that historically, federal protections for transgender individuals have been created exclusively as extensions to existing policies which protect sexual minorities (individuals with a sexual orientation other than heterosexual), and not gender minorities (individuals with a gender identity other than cisgender). While instances like these may be due to a lack of understanding surrounding the distinction between sexual orientation and gender identity, it is erroneous that LGBTQ protections that are slightly modified to include transgender individuals will meet the unique needs of this community and the complex social stigma they continue to face (Taylor, Lewis & Jacobsmeier 2012, as cite in Elias 2017).

### Addressing the Amplifying Impact of Intersectionality

Antitransgender violence is most frequently endured by Black transgender women (HRC 2019). Transgender women of color are stigmatized both for their gender identity and for being a racial minority. Because of these biases, transgender women of color face heightened risks of physical and/or life-threatening violence. Beyond grappling with possible discrimination and violent repercussions from their own families as well as from the Black community, transgender women are more likely to be living in poverty. 30.8% of queer Black people are living in poverty, compared to 25.3% of Black people outside the

LGBTQ community (The Williams Institute 2019). Furthermore, transgender women of color often lack support systems, which may lead to a sense of hopelessness and an increase in high-risk behavior such as unprotected sex (thus increasing risks for contracting HIV and STIs), psychological distress, depression, alcohol consumption, aggression, and suicide. Through recognizing the risk factors unique to the Black transgender community, (poverty, violence, higher likelihood of substance abuse, etc.), public administrators have the opportunity to create positive and lasting change in the sphere of antitransgender violence by first addressing these disparities within the Black community.

## Conclusion

Victimization of the LGBTQ community, in particular emotional, physical, structural, and sexual violence against the transgender community, has reached and maintained epidemic status in the United States. This chapter outlines the key manifestations and root causes of violence towards transgender and gender nonconforming individuals, highlighting deadly consequences as well as the disproportionate rate of victimization faced by Black transgender women, often within urban areas. These root-causes, risk factors, and violent occurrences warrant timely attention from the field of Public Administration.

# Virtual Employee Management: Mitigating the Impact of COVID-19 at the Workplace

Robert Frank Kyagaba[1] and Peter Kayiira Byansi[2]
[1]Faculty of Business and Administration, Ndejje University, Kampala, Uganda
[2]Uganda Martyrs University, Kampala, Uganda

## Synonyms

Digital platforms; Virtual employee management

## Definition

Virtual employee management associates with handling organizational workers who work remotely from different geographical locations to ensure effective institutional performance.

## Introduction

Toward the end of 2019, a global catastrophe befell the world, ostensibly originating from Wuhan, China. This was the novel coronavirus which causes a disease called COVID-19. This would eventually become one of the most impactful, universal distractions of the world during current times. In a period of 4 months, the virus had traversed the globe, resulting into millions of infections, some of which turned fatal triggering one of the sharpest economic declines of modern times. These were partly caused by inevitable continued work absenteeism arising out of the total and partial lockdowns imposed by different governments. The continued absenteeism if not put under control could end up producing adverse effects to the economies of the concerned organizations and countries at large (De Blasio et al. 2012). In order not to be swallowed up by the catastrophe, institutions sought means of remaining competitive and relevant during this period. A number of challenges emerged, such as fragile economies, instability of different currencies' exchange rates, and the demands for change in addressing the disruptions, put the working space settings in a critical condition. It called for transformation which if not embarked on would threaten institutional stability. The transformation resulted into an emergence of complex working conditions that required innovativeness to address the ensuing dynamisms (Winasis et al. 2020).

Interestingly, institutions had capital, equipment, time, and marketing resources in abundance but lacked the critical resource, i.e., human capital since most of it was locked up in homes in fear of contracting COVID-19. The most logical solution was to turn to institutional human resources management (HR) departments to create strategies to neutralize the catastrophe. Scholars including Snell et al. (2002) and Ulrich et al. (2017) have argued the importance of a strategic HR approach during such challenging times as essential in ensuring institutional competitiveness. Accordingly, institutions turned their attention to virtual employee management (VEM) as an alternative to the traditional system of employment management. According to Henderson et al. (2016), at such a time, the adoption of VEM becomes mandatory so as to facilitate collaboration across isolated employees and stakeholders. These are defined as codependent groups of persons living in different places and relying on communication technology to undertake institutional tasks. Wherever they may be located, VEM permits

employees to execute responsibilities together in order to reduce travel and other related expenses, time, stress, and the spread of contagious diseases as is the case with COVID-19 today. It became necessary for institutions to adopt this method since it had been in existence since the times of the industrial revolution.

## Historical Perspective of VEM

VEM is not a new phenomenon, and according to Liu et al. (2007), it was primarily the scarcity of resources that would eventually lead to the emergence of virtual teams at the place of work. The concept originates from the notion of remote workplace which dates back to the preindustrial revolution when families worked from home. Residential structures would be partitioned into living as well as work space quotas. The industrial revolution dramatically changed the working models and arrangements where manufacturers drew people from their homes to work in factories and construction sites. At the turn of the twentieth century, local governments zoned places to separate residential from commercial areas and industrial sectors, geographically separated from work and home activities.

Several innovations took place, and in 1938 the US Navy invented an electromagnetic computer which paved the way for the current microprocessors that are important to the virtual systems of the day. The innovations gave birth to Jack Nilles' telecommuting of the 1970s during the OPEC oil crisis. It had become expensive to travel to work due to rising oil prices, and workers were compelled to work from the comfort of their homes as a way of reducing the cost of driving to work.

VEM became popular as Perkins (2018) argued that the estimated number of employees working in offices would decrease by almost 13% between 2009 and 2011. At the same time, it was projected that by 2020 employees working from geographically apart locations would be at about 90%. It is important to note that this did not envisage the circumstances under which the world is operating today.

## The VEM Concept

Unlike the traditional organization where employees relate physically with colleagues and managers, the virtual workplace incorporates a tripartite arrangement with employees and the organization on either side, mediated by information technology. The separation of employees geographically is an important factor in describing the virtuality of the engagement (Snell et al. 2002). Under this arrangement, individuals work toward a common goal, but without centralized buildings, physical plant, or other characteristics of a traditional organization. Institutions on their part design unique management systems that maximize the benefits of divergent individuals that are not geographically in one location but share the uniqueness of working toward achieving organizational goals and aided by the power of information technology (IT) (Staples et al. 1999). Accordingly, the manner in which it is utilized has significant impact not only on business outcomes but also on the relationship between the employee and employer (Kovács and Kot 2017). The method of operation introduces us to the strategies that need to be put to use.

## VEM Attributes

The concept of virtual employee management (VEM) is an alternative to the traditional system of employment management. Henderson et al. (2016) commend that institutions desire to turn at times of necessity as was the case when the COVID-19 pandemic struck world economies. In order to understand it, there are basically three perceptions that can be applied to effectively comprehend the concept: employees, institutional structures, as well as legal frameworks under which to operate.

## Employees

There are a number of aspects to consider while dealing with organizational employees at such times of natural calamities, e.g., epidemics and the

sudden transformation from the traditional way of doing things to a new world all together. It is important to note that employees need to be prepared psychologically to handle the ensuing variations as they occur in the employment world. The psychological readiness of employees would work as the genesis of effective work performance to avert issues associated with nonperformance, noncompliance to work procedures, and avoidance of feelings of being isolated, among others. Adamovic et al. (2016) argues that there is a great need for flexibility not only among managers but the institutional employees as well. In a related development, Snell et al. (2002) argued that employees on regular basis need to go through some form of change and urges institutional HR departments to spearhead the process since they act as epicenters of organizational changes be they structural or otherwise. They further contend that the pressures imposed on individual employees need to be handled professionally so as to avert any crisis that may arise. This in effect will facilitate institutional transformation to support broader organizational reinventions. Institutional intellectual capital does not work in isolation but supplemented by other factors including information technology.

## Information Technology

The concept of virtual employee management cannot be completed without the component of information technology (IT). Computers as storage and processing devices need to be availed in a bid to compete the job. These need to be supplemented by the accessibility of suitable soft- and hardware for use at any appropriate moment. Acquiring these is not enough but needs to be complemented with appropriate training in the use of the acquired technology to implement the remote working. Training must be conducted in the use of the different off-the-shelf digital platforms such as TEAMs, Zoom, Skype, Navision, and WhatsApp. Some institutions go to an extent of developing tailor-made ones, but even in such circumstances, employees need to be conversant with their use. These need to be complemented with enough Internet bandwidth to facilitate remote working. Putting in place systems to handle employees and information technology is not enough in VEM, but the inclusion of structural frameworks is very necessary if work is to be conducted without any problem.

## Institutional Legal Framework

Organizations the world over are duty bound to operate in a legal framework as a way of not only protecting their interests but to also work in accordance with what might be termed as the public good. Working in a legal vacuum creates a lot of challenges for institutions and their stakeholders (Staples et al. 1999). At the onset of VEM, institutions are duty bound to ensure that there is protection of the business interest in terms of competition, observance of confidentiality, and workers' rights. It is important to observe that many institutions already had policies to employee with the traditional work systems which could not be simply applied at this time of the COVID-19 pandemic owing to the dynamics that were associated with the working conditions of the time. Legislative considerations are important not only for competiveness but for data protection, taxation, labor, and antidiscrimination laws. The landscape of virtual workers is dissimilar, and a lot of considerations must be put into play (Kovács and Kot 2017).

## Strategies

It is important to understand that when pandemics and other natural calamities arise unannounced, such kind of occurrences when they happen always cause a lot of disruptions as well as confusion (De Blasio et al. 2012). Bearing this in mind, the advent of the COVID-19 affected a number of global economies forcing them into full and partial lockdowns. This necessitated institutions to seek for alternative ways of being strategic, flexible, and cost-efficient and deliver the necessary services (Snell et al. 2002). This led to a surge in virtual work across the world necessitating a shift from the traditional form of

employment to working from home and for extended hours. This impacted organizations in terms of teamwork, interpersonal relationships, and managing the workforce differently (Levin and Kurtzberg 2020). Virtual work management is therefore one of the biggest challenges of traditional managers. They find it difficult to coordinate and control autonomous workers when they operate. Working separately from coworkers, supervisors, and other organization members leads to feelings of isolation, greater need for self-organization, and sometimes stress which necessitates a paradigm shift of organizational restructuring, system changes, and individual perceptions that lead to maximum utilization of resources for institutional benefits (Raghuram et al. 2000).

It is important to note that when the pandemic surfaced, not many organizations were ready to handle the situation. Institutions did not have structures in place, including the required technology, competencies and legal frameworks necessary for such challenges (Kovács and Kot 2017). If institutions had to operate, it was obligatory for them to observe and adhere to the known HR principles since a host of them retained their staff. Roles including staffing, development, staff welfare, and compensation, among others, needed to be handled effectively to ensure institutions benefitted out of the arrangement. In this regard, organizations readied and equipped themselves to address the challenge. They put in place in place frameworks to address issues of confidentiality, rules of engagement with not only the employees but other stakeholders, as well as identifying the best and most appropriate digital platforms to employ.

## Challenges

One of the biggest challenges associated with managing virtual employees at this time related to employee handling in a bid to achieve organizational goals. The emergency of COVID-19 and the unprecedented lockdown measures caused a lot of uncertainty and anxiety among employees in different organizations. These as espoused by Levin and Kurtzberg (2020) caused a lot of anguish in terms of unbalanced psychological, physical, and mental health instability. Feelings of isolation from colleagues, team members, and supervisors were a daily occurrence among institutional employees. The sudden change from active life to being confined at home and in some cases getting overworked without realizing it caused uncertainty the future of jobs and lives in the process affecting relationships among employees, employers, and other stakeholders. Since employers were not in direct contact with employees, tendencies of employee neglect surfaced as evidenced by Adamovic et al. (2016) that tend to affect institutional performance. Whereas there are challenges associated with human capital, there were other challenges associated with ensuring effective virtual work engagements, and this is the availability of appropriate technology for the job.

Scholars have underscored the importance of information technology in operations of virtual teams, and Wang et al. (2019) argue that it plays a significant role in ensuring information sharing, knowledge transferability, and institutional transformation which made incumbent for institutions to utilize it. However, it is important to note that when COVID-19 struck, many organizations had only utilized the computer and related software for office work ranging from working with figures, emails, and other routine tasks, and as such few had experienced the beauty of working with a computer beyond the said boundaries. Working remotely created more challenge among which included the procurement of either additional or upgrading of hardware and/or software in form of computers, laptops, mifis, modems, and computer programs for easy access. Some of the institutions did not have financial resources to handle this, and yet work is needed to be done. Secondly, employees and managers lacked training in the use of the associated technology. This was also coupled with the related safety of not only the equipment but the information relating to the institutions. This meant that issues of confidentiality could not be guaranteed. Additionally, institutions experienced erratic Internet upsurges in addition to the clogging of popular digital platforms including TEAMs, Zoom, Skype, and

WhatsApp on a frequent basis which often times compromised performance and the quality of work. These could not operate in a vacuum and needed legal frameworks to guide their operation.

Whereas institutions needed IT infrastructure and some human resources, they were not ready with institutional legal frameworks to guide the operation of virtual systems too. Although some institutions had necessary policies to guide the processes, many did not have anything in place at all. This kind of situation put institutions in precarious circumstances where they could face litigations arising out of misuse of IT either knowingly or otherwise. The absence of such frameworks meant that business confidentiality was compromised in addition to employee procedures since the ones in place could not be transferred to the virtual world automatically.

## Recommendations

Employers need to concentrate on monitoring employee in order to ensure not only their psychological stability but also achievement of results. There is a need for managers to put in place systems that make employees accountable for their performance, the performance of their teams, and their psychological well-being. This can be attained by holding regular virtual meetings and performance reviews, transparent and clear communication, provision of regular and constructive performance feedback to individuals and teams, and recognition of excellent individual and team performance. These strategies will increase manager-employee communication, minimize feelings of alienation, improve employee motivation and commitment, and ensure that managers and their teams not only assess progress but also address challenges as they arise and achieve agreed performance targets and meet stakeholders' expectations. Furthermore, managers should invest in appropriate digital and information technology solutions as these form the backbone for VEM.

There is need for institutions to ensure that IT applications are constantly available for use on a daily basis. Their perception toward the phenomenon needs to ensure readiness to apply the systems on a daily basis and allocate financial resources for hard- and software in addition to constant trainings associated with the dynamic applications of the IT world. Reliable Internet providers too need to be procured so that the intermittent irregularities associated with the services are handled once and for all. Lastly there is need to put in place legal frameworks to regulate virtual application for the good of institutions, employees, and other associates.

Institutions need to ready themselves with appropriate policies and legal frameworks to guide the application of virtual systems. Institutions need to protect themselves from competitor intrusion, observe employee safety and compliance to organizational procedures, as well as make sure there is value for money in the work provided. Whereas there are already policies associated with the workplace, it is important for institutions not to assume that they can be adopted without any changes and expect them to work and hold employees by them. This is expecting too much from employees and other stakeholders, yet the inevitable changes continue to appear on a daily basis.

The absence of such frameworks meant that business confidentiality was compromised in addition to employee procedures since the ones in place could not be transferred to the virtual world automatically.

## Conclusion

The emergency of COVID-19 upended both individual and organizational processes, structures, and systems. Most importantly, it put a spotlight on possible new ways of working. While working from office was the dominant mode, the emergence of the pandemic taught the world that working from home is a new reality. Employees may not wish to forfeit their newfound freedom of working remotely from the plying eye sight of the employer. In addition, it has also amplified the importance of technology infrastructure and being technology savvy in a changing world of employment. Remote working during this COVID-19 period has put a

spotlight on the importance of flexibility, shared purpose, self-care, and self-accountability as important approaches to managing remote workers and enhancing their commitment and performance.

# Virtual Volunteering and Nonprofit Organizations

Pamela Medina
University of Colorado Denver, Denver, CO, USA

## Synonyms

Cyber service; Digital volunteering; E-volunteering; Online volunteering

## Definition

Virtual volunteering, also known as online volunteering, involves completion of long- or short-term volunteer assignments off-site through the use of an Internet-connected device.

## Introduction

Virtual volunteering is a means of providing volunteer service activities online. Under this scenario, public agencies utilize the Internet to recruit, distribute information, communicate, and engage with volunteers in an online setting. Volunteers are also able to complete assignments, in part or in full, through the Internet. Volunteering without physical presence has been used for many years; however with the advent of new technology, including increased use of mobile technology, additional opportunities are presented to diminish barriers present with traditional volunteering (Murray and Harrison 2002). Like traditional in-person volunteering, there are a variety of benefits that can be linked to service for the individual volunteer, the community, and the mission of a public agency. Moreover, concrete volunteer management skills are necessary in order for virtual volunteering to be effective and beneficial in the three aforementioned areas. This entry seeks to introduce the concept of virtual volunteering and provides a discussion of benefits to public agencies and volunteers and a

description of current participation, practice, and management challenges.

## Benefits to Public Agencies

As governments reduce the direct provision of services, the nonprofit sector has seen an increased demand for volunteers, which are critical components contributing to the success of the organization (Hossli 2001). Virtual volunteering, or online volunteering, has been increasing in the past decade with a unique ability to add flexibility to the volunteer experience for both individual volunteers and public agencies. One of the major benefits of virtual volunteering for agencies is the wide scope of services that can be provided by volunteers in an online setting, providing an opportunity for more expansive recruitment. In this case, public agencies searching for volunteers are no longer confined to recruitment from the pool of available volunteers in a local area but can recruit with diminished geographic boundaries in order to select volunteers best suited for the requested activities. These activities include, but are not limited to, conducting online research, writing budget reports, drafting grant proposals, electronically visiting clients, providing online mentoring and tutoring, developing websites, providing consulting services to agencies, developing brochures and other materials, conducting outreach, and translation. Indeed, virtual volunteering is widely used in education because of the ease of access and convenience for providing online tutoring services with unlimited geographic boundaries. The virtual component not only links volunteers with the needed skills to provide expert service but also reduces lost opportunity costs for volunteers in terms of time required to deliver service.

In an American study of virtual volunteer service, it was noted that approximately 45% of virtual volunteers created or maintained websites for an organization. To date, most data on virtual volunteering reflects this finding, with volunteering tasks highly tied to assignments related to technology. This can be highly beneficial to resource constrained public agencies as they are able to be more flexible in setting expectations for volunteer time, particularly for those activities which involve a greater level of technical skills and expertise. In the same study, it was noted that approximately 31% of the agencies that used online volunteers were focused on technology as part of their organizational mission (Cravens 2000). This can also be beneficial to public agencies utilizing social media, which has experienced a steep increase in use, as volunteers are able to update content remotely.

Volunteer assignments can also be a hybrid of online and in-person service, combining services to the benefit of both the agency and the individual volunteer. A unique feature of this is the capability to recruit volunteers that are best suited for the needs of the agency, without being limited by physical and geographic boundaries. For instance, expert volunteers with disabilities or home-based obligations may have been previously restricted from volunteering due to personal or time-based restrictions (Cravens 2000). A study of virtual volunteering and aging in the United States noted that among older online volunteers, approximately half of participants had a chronic illness and acknowledged the convenience of being able to complete their volunteering assignments from home (Mukherjee 2010). Virtual volunteering opens up a new avenue of recruitment for those that may be homebound. This is beneficial to the agency which can rely on the greater experience of retirees, particularly with technically oriented projects such as budgeting, reporting, and consulting, without having to place an additional burden of travel on the volunteer.

Research on traditional volunteering has noted that episodic volunteering is growing in popularity, particularly for those who would not otherwise volunteer (Hustinx and Lammertyn 2003; Handy et al. 2006). Episodic volunteering reflects the demand for short-term and flexible volunteering opportunities (Macduff 2005). This makes online volunteering an attractive option for recruits, who can volunteer as their needs and availability change. This provides an added benefit for agencies, who can call on episodic volunteers when their skills are needed, making them feel valued while also working within the time constraints of the individual. Current literature continues to explore episodic volunteering management

challenges, more often for traditional in-person volunteering, as managing these types of volunteers presents additional difficulties for retention (Hyde et al. 2016).

However, while virtual volunteering presents an alternative to in-person volunteering for those who may have geographic boundaries, it should not be considered as an alternative for those who do not have the time commitment to complete volunteer activities. Time commitments for virtual volunteers are reduced not because of a reduction of commitment to activities but a reduction of travel time and expenses which may deter a volunteer with certain restrictions from being able to participate in causes that they care about. Moreover, reducing this limitation also increases the ability of the agency to recruit mission-driven volunteers that they may otherwise not have access to.

More recent literature expands on this concept of episodic volunteering online in terms of looking at opportunities for completing micro-tasks. Micro-tasks are small assignments which can be completed in a short time, often in one sitting. This can include short translation, small-level research, editing, short feedback or consulting, analyzing one set of data, etc. (Cravens 2016). For agencies that are committed and capable of effectively managing online volunteering, these tasks can also be completed through the use of mobile technology including tablets and smartphones. Although this is not necessarily a benefit for all organizations, as few small nonprofits may have the capacity to manage this type of volunteering, it does present an additional benefit in reduced time for delivery of materials to the agency, as well as flexibility in time for completion for the volunteer. As the use of mobile technology expands for additional purposes, this feature may be highly sought out by potential volunteers who are comfortable and familiar with using mobile technology to complete work-related tasks or activities.

## Benefits to Volunteers

Existing literature on volunteering notes varied motivations and benefits to volunteers for providing service. Some of these motivations range from altruistic motives of mutual aid to more individual expected benefits including developing job skills and a social network. In a traditional environment, volunteering can improve career benefits and help individuals and communities develop social capital (Stukas et al. 2016). Data on virtual volunteering parallels these traditional motivations. In a study analyzing reasons for volunteering online, it was discovered that volunteers were frequently motivated by personal support of the mission of the agency they volunteered for (Cravens 2000). This is well reflected in the literature on volunteering, noting that volunteer satisfaction is also directly related to the match between their motivations and the ability of the organization to satisfy the needs of the volunteer (Stukas et al. 2016). Virtual volunteering has the capacity to take this satisfaction further, by providing a broader range of volunteer opportunities more well suited to the needs and abilities of their recruits. This opportunity is unique in that volunteers have the flexibility to apply for volunteer positions that match their interests and expertise and can be completed during hours that are most convenient for them.

Crowdsourcing, utilizing distributed intelligence for problem-solving, is an emerging area for a nontraditional type of virtual volunteering. Crowdsourcing essentially harnesses the expertise of a crowd in order to gather information or complete a task. In its current form, this is often seen in fund-raising. This concept is not new and in fact was used in the production of the Oxford Dictionary through an open call for contributions. However, the accessibility of crowdsourcing is inextricably linked to the rise in the use of Internet-assisted technologies. For this reason, crowdsourcing is also a potential mechanism for episodic volunteering. In this scenario, an agency can request for substantive technical, managerial, or service delivery questions, and experts in the topic area can provide quick online responses in an open feed. Crowdsourcing has seen increased use in the public sector, primarily through government services such as SeeClickFix, allowing citizens to submit issues related to public works and relying on citizen feedback rather than local surveillance. Although not a commonly used

mechanism for virtual volunteering, this is an emerging opportunity that would present increased ease of access for the episodic volunteer.

As noted in the study on older online volunteers, the online setting allows for those that may be homebound to participate in activities within the community (Mukherjee 2010). Traditional research on volunteering demonstrates that volunteering is of great benefit, particularly for senior citizens, as it provides them with a sense of purpose and allows them to interact with others. When managed appropriately, virtual volunteering presents a new opportunity for those who may otherwise be restricted in their capability to be physically present for volunteer fieldwork.

Current virtual volunteers are also focused on time-limited volunteering, which utilizes their existing skills and allows them to gain new ones (McClintock 2002). For example, the UN Online Volunteering service clearly lists the time commitment required to participate in certain activities, ranging from completion of one project to participation in a long-term ongoing project, as well as inclusion of expected hourly commitments to complete tasks. Online volunteering is beneficial to both agencies and individuals in its ability to allow for more flexible and time-restricted activities.

Finally, due to the vast number of online opportunities presented throughout the globe, virtual volunteers have the added benefit of gaining skills in cultural competence. This is both a benefit to the individual, in that skills are developed which could improve potential career options by providing critical global experience that may not otherwise have been possible, but it is also an important community benefit. Unlike other local experiences, virtual volunteers who work with agencies around the world are also improving understanding across cultures and contributing to increased global relationships and understanding of diversity.

## Participation

Although virtual volunteering is not heavily researched from an academic perspective, evidence shows that it has existed at least as long as the Internet, and participation in virtual volunteering is quite expansive in its various formats. According to research by the Virtual Volunteering Project, online volunteers often support local organizations in person, as well as through their online commitment (Cravens 2006). Additionally, studies have noted that contrary to conventional wisdom, people of all groups participate in online volunteering, with the median age of participation at 31 in the United States. Most online volunteers also participate in face-to-face volunteering and note that scheduling flexibility and convenience are the most cited reasons for volunteering online. Interestingly, agencies also get a large number of online volunteer recruits from those that live within their own communities (Cravens 2000).

The first major study of virtual volunteering was initiated out of an overwhelming number of requests from potential volunteers wishing to provide service on Impact Online, now VolunteerMatch.com, an online database of volunteer opportunities. As a result, the Virtual Volunteering Project was launched in 1996 to further understand differences in virtual volunteering and to encourage and provide resources for agencies interested in pursuing virtual volunteers (Cravens 2000). Currently, VolunteerMatch lists over 5000 virtual volunteering opportunities across the globe, an increase from approximately 3000 in 2010.

The United Nations Volunteers (UNV) hosts the largest virtual volunteering database, known as UN Online Volunteering, launched in 2004. This database includes registered nonprofit and public agencies from around the world, with volunteering opportunities presented for various assignments in various languages. Through the online portal, agencies are able to recruit, engage, and monitor volunteer activities online. These two examples demonstrate the growth in the use of virtual volunteer options and the likelihood that it will remain in use for years to come.

## Practice and Management Challenges

As a relatively new field of opportunity, there are limited academic studies of virtual volunteering,

and evidence-based practices are largely unexplored. Among the existing works, many of the practical recommendations for managing online volunteers reflect best practices for managing volunteers in a traditional setting. For example, it is noted that organizations utilizing volunteers online should provide clear goals for volunteers with fully articulated assignments and maintain regular communication. However, virtual volunteers also require an additional focus on communication from both managing organizations and other volunteers (Bezmalinovic Dhebar and Stokes 2008). This presents an additional management challenge for agencies working with virtual volunteers. As the prior study noted, volunteers did not need daily communication and micromanagement but did want to know that what they understood and interpreted the organization's instructions correctly and that they were on the right track when it came to completing assignments. This is also true for in-person volunteers; however, feedback on volunteer activities may be easier to provide on the part of the volunteer manager if they are working directly with the volunteer in their physical location.

Moreover, similar to in-person volunteering, agencies struggle with trying to recruit, manage, and involve any volunteers in an effective manner. Thus, in order to make improvements in virtual volunteering practice, agencies need training on general volunteer management as well as an additional focus on what may change in the online setting. This can include general instruction on the benefits of utilizing volunteers, advantages to the community, as well as micro-practices of volunteer communication. Cravens provides a list of attributes necessary for host organizations to successfully utilize online volunteers. This includes excellent literacy, comfort with working online, comfort with following protocol, stable staffing, basic volunteer management skills, a delegated responsible party for managing online volunteers, a commitment to support volunteers, an openness to diverse working styles, and a broad understanding of community stretching beyond their immediate area (Cravens 2006).

Although virtual volunteering provides more flexibility in completion of assignments, special attention is required on the part of the volunteer manager or coordinator in order to ensure that virtual volunteers are participating effectively. Virtual volunteering is unique in that assignments and communication are usually completed in writing. As such, volunteers and volunteer managers are accustomed to working with online communication. In addition to maintaining frequent and open channels of communication, virtual volunteers should also be able to provide feedback on their levels of satisfaction with their experience in order to ensure that volunteers are retained. While retention is a challenge in both the traditional and virtual settings, this is potentially amplified when communication is lacking between the manager and the volunteer. With written communication as the norm, this presents an opportunity for volunteer managers to understand whether volunteers are satisfied with their work and their communication and evaluate their experiences for volunteer managers to improve how they interact with volunteers. This internal monitoring can be embedded into the volunteer practice and could potentially assist with improving retention rates of volunteers as well as increasing the number of services provided by a volunteer which has already developed a strong relationship with the agency. Retention of virtual volunteers is particularly important in the virtual setting due to increased effort on the front end in recruiting volunteers, who are not subject to the same forms of social pressure which often impact intentions to volunteer (Penner 2002).

Volunteering, in general, does not stand alone as an action that only benefits an individual and a host agency. Rather, volunteering has been highly linked with improvements in community-level civic engagement (Putnam 2000). This is in part because volunteering allows individuals to connect with others, develop social skills, and take a vested interest in issues that affect their communities. Volunteers may learn about social problems, engage in political discussion, and learn critical political and social skills that are acquired through these types of discussion while volunteering. In these cases, volunteering increases political efficacy and improves opportunities for deliberative democracy. However, it is

unclear whether online volunteering is capable of producing the same developments in social capital as volunteering in person, particularly when the host agency is not well versed in volunteer management involving consistent communication and relationship development. As academic research on virtual volunteering expands, practical advice could be provided to understand if management strategies for developing volunteer social capital in an offline setting are effective when they are mimicked in an online setting. Currently, few large-scale surveys that aim to measure social capital and civic engagement focus on the effect of online volunteering on overall community-level engagement measures.

## Conclusion

Virtual volunteering is able to utilize technology in order to advance public agency goals by providing a new means for volunteers to provide service. This feature provides agencies with increased capacity by recruiting highly skilled volunteers, diminishing geographic boundaries, and opening recruitment efforts to those who may be more interested and vested in the mission of the organization. As the use of the Internet and mobile technology expands worldwide, virtual volunteering management practices will become highly sought after skills for success of public agencies.

# Virtue Ethics

Chris Russell
Salt Lake City, UT, USA

## Synonyms

Character; Goodness; Integrity; Nobility

## Definition

Aristotle defined virtue as "a purposive disposition, lying in a mean that is relative to us, and determined by a rational principle, and by that which a prudent man would use to determine it. It is a mean between two kinds of vice, one of excess and the other of deficiency" (as cited in Van Hooft 2006, p. 60).

## Introduction

This entry focuses on virtue ethics as a branch of moral philosophy. It provides an overview of virtue theory, definition of key terms, and an account of its relevance to contemporary public administration. Many different theories have resulted from virtue theory, but this entry does not attempt to account for them. Not all virtue theory emanates directly from Aristotle – for example, ancient Persian philosophy emphasized virtue ethics in both public and private life (Frye 1975). While this entry's account of virtue comprises largely of Aristotelian concepts, it does, occasionally, refer to ancient Persia's model of virtue ethics. Furthermore, in distinguishing virtue from consequentialist and deontological ethical theories, it is important to understand that the line of demarcation between the three approaches is now more blurry than distinct. They need not necessarily be seen as rival approaches.

## Overview

Up until the latter half of the twentieth century, moral theory consisted largely of consequentialist theories and deontological theories. The former seek to prescribe correct action in terms of producing good consequences, while the latter seek to prescribe correct action through the agent's motives and intentions. In other words, consequentialists focus on the results of an action, whereas deontologists focus on what was intended by an action, particularly if the agent acted according to duty (Oakley and Cocking 2001). Both theories are based on the application of rules. Overtime, certain philosophers began to question such reliance on simple rules.

The ancient Greek philosopher Aristotle found questions of morality to be complex and not easily captured in rules. Problems pertaining to ethics are complex and diverse and may vary depending on each person and situation. Virtue theory, thus, emerged as an alternative to seemingly endless debates about achieving morality through either desirable results or duty to rules. This approach recognizes the complexity of ethical matters, and it accepts that the kind of ethical guidance necessary will depend on the nature of the situation (Athanassoulis 2012).

Rather than simply following an ethical procedure or process, virtue ethics emphasizes developing the right character. It does not ask the question, "What should I do?" Instead, for virtue ethicists, the question becomes, "How should I live my life?" or "What kind of person should I be?" (Athanassoulis 2012). It seeks to answer questions not by consulting principles, norms, or policies that pertain to a given situation. Rather, it considers the agent's character along with other morally salient features of the situation. Virtue ethics does not deem rules or results to be unimportant, but it asserts that they cannot replace the central role of character; character allows one to flourish by doing well and achieving happiness (Oakley and Cocking 2001).

## Unpacking Virtue and Other Key Terms

Virtue theory considers character to be more important than whether an action is regarded as right or wrong. In other words, virtuous acts are not merely acts that bring about certain consequences. These result from particular states of character, virtuous states of character (Athanassoulis 2012). In order to understand the ethics of virtue, one needs to understand the notion of character.

Character is the predisposition to behave consistently with one's espoused values and principles (Cooper 2004). Character reveals who people are through their commitments and by the attitudes and behaviors through which they identify.

The process of character formation may be gradual, subject to change, experimentation, and discovery, but the settled state of one's character is stable and dependable (Athanassoulis 2012). Character develops through daily practice. Thus, daily intentional exercise of virtue enhances the probability of appropriate behavior when it is time to make a difficult choice (Hart 1992).

Virtue refers to excellence of character and typically encompasses traits such as goodness, honesty, courage, and modesty (Van Hooft 2006). For example, in the ancient Persian Empire, good thoughts, good talks, and good deeds were key virtues (Frye 1975). Virtues as dispositional character traits are shaped and developed over a long period of time and subject to the influence of numerous factors (Athanassoulis 2012). Virtue theory holds that a good human being is one who is good at being a human being, living as a human being excellently. Yet humans are not born with virtue. They acquire it through learning from others and forming virtuous habits.

One's friends and communal relations contribute informally to cultivating virtue. Friends not only provide for a full and happy life, but they typically reflect one's own virtue (Van Hooft 2006). Moreover, friends and other community members model important behavior in certain situations and contexts. These role models provide necessary learning experiences, even if their conduct is not altogether virtuous. In doing so, they model behaviors of how to be (or not to be), rather than provide precise prescriptions of what to do (Athanassoulis 2012).

Although humans must practice virtue in order to acquire it, they must also internalize the habit. This means that, at a certain point, they must want to act in a certain way. For example, one with virtue wants to tell the truth not out of a sense of duty but because that person loves telling the truth and simply desires to do so (Van Hooft 2006). Thus, developing a virtuous character requires more than just doing. It requires an integration of both thought and feeling (Cooper 1992).

Developing a virtuous character requires one to perceive the particulars of a situation when making a choice. In other words, the decision-maker must perceive the morally salient features of the situation in order to decide properly concerning the right course of action. The Doctrine of the Mean exemplifies such perception in decision-making. One fulfills the Doctrine of the Mean when they utilize their feelings and actions in order to render a decision that avoids excess and deficiency. A commonly referenced example of this concept is choosing to act courageously in a risky situation while avoiding extreme actions of either foolhardiness or cowardice. Each situation requires a slightly different assessment and choice of action.

To illustrate, suppose one day somebody comes across their best friend and notices that something is not right with that person. Based upon the close relationship and the ability to perceive the particulars of the friend's body language, this person perceives that she cannot greet her friend in the usual sarcastic tone. Instead, she inquires what the matter is and then listens to her friend's response. The ability to empathize and be sensitive to context concerning the friend's current struggles determines the appropriate course of action. In this particular case, the Doctrine of the Mean may call for listening carefully to the friend's feelings but also giving that person some space to work things out. Either way, perceiving the right action trumps adherence to simple rules or formulas.

In addition to perceiving the particulars of a situation, one must possess the judgment to know why an action is good and to choose accordingly. Practical wisdom is the disposition to make correct emotional judgments in choices relating to the noble and the good. It equips the agent to understand not merely what should be done but how and why a course of action should be followed. Practical wisdom is not a simple application guide that is mechanically applied when a dilemma emerges. Rather, it provides practical judgment, inducing one to detect and pursue the good path in whatever situation presents (Athanassoulis 2012).

Suppose a comparison is made between one utilizing practical wisdom and another mere cleverness (Van Hooft 2006). Both parties enter into a situation where they can obtain a certain amount of money to donate to a worthy cause. They

properly scan the situation, assessing the contextual factors and respective options. Drawing upon their knowledge and motivations, both parties successfully obtain a certain amount of money.

The clever one, though successful, does not exhibit virtue because he decides to donate the money to himself. In this case, the clever party uses his knowledge and experience successfully to obtain the money but only enriches himself. The party exercising practical wisdom also uses her skills to obtain the money. However, she notices a need for the money in the community, and this need motivates her to impart the money to the appropriate cause.

In sum, the virtuous man develops his character and draws upon it to guide how he should be or what he should do in this life. Character is developed overtime through habituation. Virtuous character traits seek to uphold excellence and are developed throughout life by interacting with and learning from others. Internalizing virtuous traits involves more than merely completing certain tasks. It involves the ability to perceive important moral factors of a situation in order to make measured, careful decisions. Finally, in various situations, the virtuous man uses his judgment to determine and pursue the good and noble path.

## Renewed Interest in Virtue in Public Administration

Throughout most of the twentieth century, virtue was an afterthought in discussions of philosophy. The idea of virtue had long lost favor to more rule-based philosophies, largely as a result of the influence of Christian theology (Cooper 1992). By the 1970s, early scholars of administrative ethics focused heavily on ethical reasoning. Such reasoning resulted in the theorizing of cognitive strategies designed to rectify ethical dilemmas.

However, a few scholars began to question such an approach in the 1980s. In the aftermath of Watergate and other public scandals, these researchers questioned placing too much trust in the rational analysis of ethical reasoning. Such reliance on cognitive strategies could result in the training of administrators to rationalize whatever behavior suited them in the moment (Cooper 2004). Thus, prioritizing reason at the expense of character jeopardizes the noble and good.

The end of the twentieth century also marked a dramatic decline of the public's trust and confidence in its leaders, particularly in the USA. Being led by leaders neither trusted nor admired risks undermining the future welfare and freedoms of society. Absence of trust impairs the leaders' ability to govern, invoking public skepticism, condemnation, and hostility (Hart 1992). While a certain amount of skepticism regarding public leaders may not be unusual, finding leaders of good character seems just as important today than ever.

In response to these concerns, researchers began to call attention to virtue as a significant component of administrative ethics. In particular, they emphasize the need to focus on and cultivate the development of character in public service. Potential ways to foster such an ethic reside in education and training, gradually building an ethos in public organizations centered on virtue (Cooper 2004). For example, in ancient Persia, formal educational systems assisted in developing virtuous citizens (Frye 1975). Research further encourages reflecting on and assessing the character of others in the public realm through stories and biographical histories (Cooper 2004).

Virtue theory's contribution to administrative ethics lies in its basic focus on seeking the good and establishing practices that cultivate nobility. It need not rely upon convoluted schemes or formulas to bring about the "right" course of action. In this sense, it is quite intuitive and not difficult to understand or to detect. As a result, it is an attractive compass for providing guidance to complex and diverse challenges. Some guidance may come from moral exemplars, contemporary or historical, which can be sought out, celebrated, and emulated. Virtue may not be a sufficient protection for democracy, but neither should it be minimized (Hart 1992).

Virtue ethics is not without certain flaws. More recent criticism, in particular, challenges the notion that people possess stable character traits. Citing various empirical studies, certain

researchers assert that situational pressures dictate a person's behavior, not character traits (Harman 2003). In other words, when a difficult dilemma arises, people fail to draw upon a stable disposition of character. In such challenging circumstances, even good people succumb to situational pressures, displaying a fragmented character and often failing to do well.

An oft-cited example of such behavior is Stanley Milgram's experiments in the 1960s. Milgram created a basic organizational structure in a scientific laboratory setting where subjects received conflicting instructions from an authority figure. He found that the experiment induced obedience from large numbers of people. At a certain point, subjects displayed willingness to administer powerful and dangerous electrical shocks to other human beings. The majority of the subjects followed orders from their superiors even while protesting that they were imposing horrific shocks on other participants in the experiment. Such experiments do show that situational factors can and do shape people's behavior at certain points in time.

Notwithstanding, subsequent research rebuts the notion that virtue traits do not exist. Upon examining empirical evidence, some scholars find that such evidence does not prove sufficiently the nonexistence of character traits. Empirical data do not consistently support the thesis that situations rule behavior. Furthermore, the contrived contexts of such experimental studies do not resemble that of the natural world. While human beings can be morally weak when confronted with difficult situations, such evidence does not discount character and virtues (Alzola 2007). History provides evidence that many people in positions of trust do the right thing when confronted with difficult dilemmas, drawing strength from character (Hart 1992).

Other weaknesses attributed to virtue theory include a sense of ambiguity and a less than straightforward plan of action (Oakley and Cocking 2001). Not everyone agrees concerning the definition of virtue, nor how such an approach should be implemented. While virtue theory alone may not be enough to carry administrative ethics in the twenty-first century, its value should not be underestimated. The theory's appeal to basic virtues and its search for goodness presents a fresh, albeit, important perspective to modernism's complex challenges and agendas. Virtuous leaders invite trust and provide a buffer to manipulation through ethical rationalizations. After all, ethics in public administration means very little without the character to do what one professes to do (Cooper 2004).

## Conclusion

As briefly stated in the Introduction, divisions between virtue and consequentialist and deontological theories may be less distinct than originally thought. Still, significant differences set virtue theory apart and highlight its value. Rule-based ethics may remind some of their duty and bring to pass certain positive outcomes. Yet, as discussed previously, morality is complex and not easily captured in rules. Moreover, so-called positive outcomes resulting from rule-based ethics may not be positive for all interests and concerns involved. Adhering to one's duty may not ultimately serve noble ends.

In response to these concerns, virtue theory is a viable alternative approach to ethics in the twenty-first century. Virtue ethics does not ignore the value of rules, but it challenges one to probe the purpose of their life and to qualify their thoughts and actions in order to live a meaningful, worthy life. Key tenets involve individual character development and organizational cultivation of an ethos of virtue. Virtue theory is not without weaknesses, as stressful dilemmas can undermine virtuous behavior in certain situations. Yet people can and do act with virtue, particularly leaders in public administration. Education and training are necessary components in the continual process of establishing virtue in government.

# Vocational Rehabilitation System in the USA, A Brief Labor History of

Andjela H. Kaur
University of North Dakota, Grand Forks, ND, USA

## Synonyms

Public vocational rehabilitation; Rehabilitation counseling; State-fed rehabilitation

## Definition

The US vocational rehabilitation system is a network of interdependent services contributing to gainful employment of persons who experience barriers to finding work. Historical development of this system has been driven largely by the formation of vocational rehabilitation agencies funded by the federal and state governments. At the center of the historical and contemporary vocational rehabilitation process is the recognition of the labor power of disabled people through legislative action and scientific research. There are three tenets of the vocational rehabilitation system: labor and rehabilitation legislation, expert knowledge exchange, and utilization of disabled people's labor. These foundational elements were incrementally set in place during the eighteenth, nineteenth, and early twentieth centuries and have since continuously provided the structure for the ongoing development and maintenance of the vocational rehabilitation system in the USA.

## Introduction

The state-federal vocational rehabilitation program serves approximately one million people a year, costs the nation $2.5 billion annually (78.7% of whose budget comes from the federal government), and has in 2014 had a success rate, as measured by employment of its clients, of 60% (Chan et al. 2014). The 50 US states, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Northern Mariana Islands all have vocational rehabilitation agencies, totaling 80 agencies nationwide. Historical development of the US vocational rehabilitation system correlates with the evolution of the federal labor, rehabilitation and disability laws and policies, the emergence of vocational rehabilitation professions, growth of rehabilitation industry, and the creation and expansion of a particular class of workers—disabled workers. The continuous interdependence of these factors can be examined across three distinct periods in the history of vocational rehabilitation: early development (1800s–1940s), professionalization (1950s–1990s), and marketing (1990s to the present).

## Early Development (1800s–1940s)

In its early development in the eighteenth, nineteenth, and early twentieth centuries, vocational rehabilitation was not a nationally centralized

effort. Nonetheless, the belief that persons could be rehabilitated through work was prevalent in the early settlements in the Northeast, and the practice of rehabilitation through work was common. Modeling the relief practice on the Elizabethan Poor Laws, which included Old Poor Laws of 1594 and 1601, as well as the Law of Settlement and Removal of 1662, British colonists in Massachusetts used locally collected funds to provide support for the poor residents of their townships. The relief was restricted to the residents who were marked either as vagrants (drunkards and criminals) or the involuntarily unemployed and helpless (orphans, elderly, and disabled). The most common forms of relief were poorhouses (also called almshouses) and outdoor relief, the predecessors of the contemporary institutional care and welfare payment systems. Although neither form of relief explicitly mandated that the recipients of aid must work in order to get the relief, the managers of these relief institutions habitually auctioned the unemployed poor as farm hands and domestic servants or rented them out for other kinds of occasional and temporary labor. While the need for paid work was a matter of sustenance for the poor, the idea that learning a vocational skill may lead one out of poverty was an important component of the public justification for the existence of these early relief institutions.

Another, and perhaps more direct, influence on the formation of the system of vocational rehabilitation in the USA is found in the establishment and the expansion of the workhouses in the 1700s and 1800s. Workhouses, also called houses of correction, were built with the dual purpose: to provide the poor with work opportunities and to imprison "the vagrants" and "the insane" and put them to work for the benefit of the institution and the community. Whether the inmates were imprisoned due to poverty, criminality, or for being labeled "lazy" (capable but unwilling to work), they were all expected to rehabilitate through work. Strict discipline, rigid daily routines, and working in silence were the most commonly imposed means of rehabilitation in these early rehabilitation institutions (Rothman 1971).

The advancement of eugenics at the turn of the twentieth century further influenced the development of vocational rehabilitation in the USA. Eugenic science simultaneously built its case in favor of genetic explanations for intellectual and psychiatric disabilities and provided a rationale for the separation of inmates on the basis of the disability criterion (Ferguson 2013). This segregation of disabled inmates led to the establishment of asylums, a distinct type of workhouse which provided scientific justification for both therapeutic treatment and vocational rehabilitation of its residents. Superintendents of these institutions shared their knowledge on the topics of institutional management and vocational training through annual reports. These reports usually contained information on the prescribed daily routines for the residents, types of vocational training mandated by the institution, as well as the best practices in the management of inmates' labor (Walter 1893). The latter were promoted as the central tenet of successful rehabilitation of inmates through work.

Contradictory justifications for the use of unpaid labor of disabled inmates were common in these reports: the early proponents of the vocational rehabilitation system viewed disabled workers simultaneously as capable of "rehabilitative" work and incapable of mastering the skills they learned through the very same labor which was rehabilitating them and sustaining the institutions. Consequently, many unemployed persons labeled as disabled were institutionalized, the use of their labor for the upkeep of the institutions was normalized, and their institutionalization remained permanent (Rothman 1971). Indeed, their uncompensated labor was primarily represented by the vocational rehabilitation experts of the time as itself a means of rehabilitation and secondarily as the inmates' payback to the system of publicly and privately funded institutional rehabilitation.

The early development of the vocational rehabilitation system is also marked by the establishment of public education which popularized manual training and vocational education. In the late 1800s and early 1900s manual and vocational training emerged as a possible way to address the increasing need for skilled labor in the emerging industries of the new industrial economy.

Superintendents from both institutional backgrounds—asylums and public schools—united in their advocacy for the Smith-Hughes Act of 1917, which established the Federal Vocational Board and provided federal funds for state vocational education programs (Steffes 2012). Three years later, the Smith-Fess Act (1920) established the basis of the federal-state vocational rehabilitation system by mandating the formation of federal and state entities to oversee the state efforts and matching federal grants, thus setting the foundation for the state-federal vocational rehabilitation program. The funds provided by the Vocational Rehabilitation Act of 1918 which enabled free access to occupational training for disabled veterans additionally supported the growth of the vocational rehabilitation system (Berkowitz 1987).

By the onset of the Second World War, and during the labor shortages that preceded it, disabled workers were mainly employed for the upkeep of the institutions that housed them. The war made an important difference to these workers. Due to the war-induced labor shortages, unemployed people who were labeled disabled were given jobs that made apparent their industriousness to the national leaders. Consequently, legislative interest in vocational rehabilitation increased, as did the funds for the development of the public-private system of vocational rehabilitation (Ditchman et al. 2013).

Publicly funded state offices managed the enrollment of unemployed persons marked as disabled into the rehabilitation programs, and these programs, private non-for-profit enterprises, managed their labor (Solomon 1972). This allocation of public funding and the priority given to vocational training set in motion the development of the system of community-based vocational rehabilitation aimed at training and retraining of disabled people for jobs in the growing industries and simultaneously supported the growth of the rehabilitation industry itself. In the next phase of growth of the VR system, the elements central to the system—supporting legislation, expert knowledge exchange, and utilization of disabled people's labor—came together to create a vibrant rehabilitation industry and establish the rehabilitation counseling profession as an important factor in the field of vocational rehabilitation and disability employment (Switzer 1970).

## Professionalization (1950s–1990s)

The next phase in the history of the vocational rehabilitation system is characterized primarily by the rehabilitation and disability legislation that established the need for expert-based management of disabled people's labor power and prompted the growth of the rehabilitation industry. Central to the professionalization of vocational rehabilitation and the structuring of its enterprise were the laws that provided funds for the establishment of the rehabilitation counseling profession, as well as the legislation which enabled subminimum wage for disabled workers, namely the Fair Labor Standards Act of 1938.

Due to its inception as a legally mandated and government-funded profession, the professionalization of rehabilitation counseling has been closely related to the structures put in place by the legislation that was to carry out federal aid at the state level. As noted, the Smith Fess Act of 1920 called for the formation of federal and state entities to oversee the state efforts and matching federal grants setting the foundation for the state-federal vocational rehabilitation program. After the passage of the Social Security Act of 1935 the state-federal program became a major employer of rehabilitation counselors, and the enactment of the Rehabilitation Act Amendments of 1954 has gained the profession, both the financial backing from the government and the status as an occupation responsible for the training and employment of disabled workers (Wright 1980).

The Rehabilitation Act Amendments of (1954) provided the first federal dollars for the support of education of vocational rehabilitation professionals which prompted a rapid development of rehabilitation counseling profession as a field of expertise in employment of those unemployable due to disability. This act provided the funds for (a) expansion of rehabilitation programs and services; (b) research and training programs; (c) preservice training of rehabilitation personnel;

and (d) expansion of the existing and development of new rehabilitation facilities, such as sheltered workshops. Following the 1954 amendments, rehabilitation legislation continued to expand service provisions in terms of specific disabilities covered and the types of services supported as it continued to refine the requirements for a quality education of rehabilitation professionals (Parker and Boland 2012).

According to the Rehabilitation Service Administration (the federal agency that oversees funding for vocational rehabilitation in the USA), in 2015 the US federal government allocated 30 million dollars to training related to vocational rehabilitation. The greatest number of grants were appropriated for the graduate-level training of rehabilitation counselors. Some graduates of accredited graduate-level rehabilitation counseling programs choose to take a national Certified Rehabilitation Counselor (CRC) exam which has since 1974 been regulated by the Commission on Rehabilitation Counseling Certification (CRCC). Presently there are 16,000 Certified Rehabilitation Counselors in the CRCC database (CRCC nd). It can thus be said that the goal of the 1954 Act to establish quality education for rehabilitation counseling professionals has been met and sustained for decades.

While the legislative activity in the 1950s and 1960s was largely focused on the expansion of the vocational rehabilitation system through research, professional education, and diversification of service delivery, legislative priorities have significantly shifted in the 1970s. Historians of vocational rehabilitation in the USA mark the Rehabilitation Act Amendments of 1973 as a fundamental change in the government's approach to disability employment, from an economic-return philosophy to a disability rights philosophy, and as a turn to the politics of individual choice for the consumer of rehabilitation services (Brubaker 1981). This legislative change came at the time of the emergence of the disability rights movement and a simultaneously increased interest on the part of the state in reducing public spending on rehabilitation and involving the private sector in the process of rehabilitation. While promoting the individual rights of disabled persons, the government transferred some of the financial responsibility for rehabilitation onto the private sector. This change created an increase in employment for disabled workers in community-based segregated settings (as opposed to the prison-like institutions in which many had previously lived and worked), and benefited the private rehabilitation businesses by virtue of subsequently adopted subminimum wage laws.

Fair Labor Standards Act (FLSA) of 1938 tied the wage to worker productivity within the system of existing charitable rehabilitation organizations and of human service providers who provided vocational rehabilitation services. The provision in the Section 14 (c) of the FLSA is the foundation for the subsequent legislation on the subminimum wage and the creation of segregated work spaces for disabled people, sheltered workshops and work activity centers. During the period between 1938 and 1986, the number of sheltered workshops and work activity centers grew steadily. A study on the treatment of disabled workers under the subminimum wage law of 1938 reveals that in 1978, according to the Wage and Hour Administrator at the Department of Labor, 163,000 workers were employed in 3511 certified sheltered workshops, and that, in a hearing in 1980, the Assistant Secretary for Employment Standards reported that there were 4000 certified workshops employing nearly 180,000 workers. While private sector rehabilitation was booming, disabled workers were paying the price for their own "rehabilitation": for fiscal years 1977–79, Department of Labor reported that 317 (or 60 %) of the 524 private workshops investigated in the report to Congress in 1981 had underpaid 11,482 handicapped workers by about $2.7 million, even with the subminimum wage provisions in place (Crawford and Goodman 2013; Beckwith 2016).

Vocational rehabilitation professionals, particularly members of the then-newly established rehabilitation counseling profession, were integral to the staffing of these private enterprises (Asfahl 1971). For example, vocational rehabilitation professionals often helped management staffs decide on the standards of workers' productivity, which was a necessary step in filing applications for subminimum certification prior to 1986 FLSA

Amendments, and subsequently for determinations of the commensurate rate. Commensurate rate replaced the statutory subminimum wage floor of 50% and reaffirmed the power of the shelter workshop management to determine rates based on worker productivity with no wage floor considerations. The commensurate rate is calculated as the portion of the wage of nondisabled workers who are doing the same work in the geographic vicinity of the sheltered workshop or work activity center which employs persons with disabilities ("prevailing wage") adjusted for a measured productivity deficit. The commensurate rate calculations are carried out by vocational rehabilitation experts through time studies and piece rate determinations (Whittaker 2005).

Due to the confluence of dual interests—the rehabilitation industry's impetus to grow the rehabilitation business and the governmental mandates for successful vocational rehabilitation of disabled people—this period in the history of vocational rehabilitation is also marked by a clear division between the interests of the employers/management and those of the employees/disabled workers. The records of congressional hearings show that workers' groups challenged the subminimum wage and the representatives from the National Association of Rehabilitation Facilities defended its rationale, which was that due to lower productivity of disabled workers, their wages should be lower than the wages of those not marked as disabled. Legislators repeatedly favored the professionals' arguments, so the FLSA and its subsequent amendments were for years tailored to the needs of the rehabilitation industry and against the financial well-being of disabled workers (Whittaker 2005).

After three decades of political advocacy and multiple legal challenges posed by disability advocacy groups, in 2015 the Workforce Investment and Opportunity Act (WIOA) established some limitations on the use of subminimum wage and mandated integrated competitive employment as the preferred type of employment outcome of vocational rehabilitation. The phrase "competitive integrated employment" was used over the years in connection to the effort to obtain a minimum wage for persons with disabilities, especially those labeled intellectually and developmentally disabled. This struggle for equal pay is illustrated by several class action suits which over time led to firmer constraints on subminimum wage licenses and the introduction of the language of "competitive integrated employment" into the legislation, both of which are explicit in the WIOA. This stated prioritization of integrated competitive employment reflected in the law and advocated for by the disability rights activists has prompted the next phase of the development of the vocational rehabilitation system in the USA. This phase is characterized by the marketing of the vocational rehabilitation system and disabled workers as partners to businesses.

## Marketing (1990s to the Present)

In response to the advocacy efforts that led to the legislating of integrated competitive employment, the rehabilitation counseling profession has since the early 1990s been reorganizing its practices to build an image of itself as a business partner with exclusive access to these quality workers and their labor (Buys and Rennie 2001; Habeck et al. 2010; Luecking 2008). Consequently, it has also been building the case of the disabled worker as a competitive labor commodity.

A body of research in a field scientist of vocational rehabilitation broadly termed "employer relations" has been developed to help rehabilitation counselors make a compelling case for this competitive product of vocational rehabilitation. In 2014, a seminal study on business case engagement and the employment engagement strategies funded by the US Department of Labor's Office of Disability Employment Policy to help vocational rehabilitation professionals strengthen their arguments in favor of the competitiveness of disabled workers in the contemporary job market proposed two main strategies to market the labor of disabled people. The first was constructing a solid and inclusive brand for people with disabilities that can be marketed to employers and provoke positive emotional, cognitive, and behavioral

responses. The second involves conceptualizing the private employment sector as a market comprising different segments with distinct levels of interest in employing people with disabilities, varying levels of knowledge, and particular technical assistance requirements. To satisfy these recommendations, the professionals must show that the labor of disabled people is competitively branded to appeal to businesses which have various needs (ODEP 2014).

With the help of mobile Internet technologies, state agencies have been able to employ this marketing strategy in disseminating a business-friendly narrative about what kind of labor persons with disabilities can offer. Many state vocational rehabilitation agencies have created business relations departments, and most agencies foreground their participation in this trend on their websites, as do several national web portals related to employment of people with disabilities (e.g., NET, the TAP, and the disABLEDperson.com). On these websites, vocational rehabilitation experts often make the business-friendly case for disability employment by representing the labor of disabled people as a special kind of commodity that comes with perks, such as substituted wages through on-the-job training programs or tax credits. This kind of representation, however, poses a problem for disabled workers because the potential employers may choose to hire them only to obtain the perks (DeLeire 2000). Nonetheless, some research data indicate that the state-federal vocational rehabilitation system and rehabilitation counseling professionals have continued to participate in the employment of disabled people with success.

According to the reports issued by the Rehabilitation Service Administration, for the past 22 years state agencies have claimed successful employment outcomes for an average of 205, 335 workers annually, with the highest outcome of 236, 143 in 2000 and the lowest of 171,964 in 2010; the median number served in this period was 205,619 (RSA 1989–2012). Further data show that disabled workers who obtained jobs through the state VR in the period 2008–2104 had the most success finding employment in the Office and Administrative Support Occupations (Zhang et al. 2018), and that the income for consumers of vocational rehabilitation services, relative to the poverty threshold, increased to 185% at the time of successful closure to vocational rehabilitation services due to employment, compared to 57% of the poverty threshold which applied for all surveyed clients at application for services (Walls and Dowler 2015).

Simultaneous with the reports on successes and importance of the vocational rehabilitation system, research, often financed by federal funds provided through the previously mentioned legislation, repeatedly emphasizes the need to improve employment rates for people with disabilities. According to the Bureau of Labor Statistics (BLS) unemployment report issued in January 2017, only 6.8% of working-age disabled people were employed in December 2016, whereas the employment–population ratio for nondisabled persons was 22.8% for the same period (BLS 2018). Further, research has shown that people with disabilities who count as employed by the BLS measures are more likely to participate in "nonstandard jobs" or "alternative work arrangements" such as part-time, telecommuting, temporary, flexible schedules, and self-employment work (Shur 2003). Such positions traditionally pay lower wages (on average 10% less an hour), rarely offer employer-sponsored training, and come with no or fewer benefits than full-time positions. People with disabilities looking for work are less likely to obtain jobs than their able-bodied counterparts and are more likely to earn less on average than workers labeled as able (Shur et al. 2013). In addition to its significant historical contributions to the employment of disabled workers, the vocational rehabilitation system in the USA is likely to continue to evolve to meet the needs of disabled workers, the mandates of the profession, and the conditions of the labor market.

## Conclusion

Vocational rehabilitation and labor legislation, rehabilitation science and industry, and disabled people's labor are constitutive elements of the vocational rehabilitation system in the USA. The

system began to organize itself in the eighteenth century around the philosophy of rehabilitation of the poor and unemployed through work. Subsequently, in the nineteenth and early twentieth century, it evolved into a network of institutions which, based on eugenic science, specialized in the rehabilitation of disabled persons. These institutions exploited their inhabitants under the pretext of vocational education and rehabilitation. Following the Second World War, the vocational rehabilitation system was tied to the development of vocational rehabilitation legislation that established rehabilitation counseling professionals as the leading experts in the rehabilitation of disabled workers. In the period between 1940s and 1990s, both rehabilitation professionals and disabled workers interacted with the system of privately owned sheltered workshops that paid subminimum wages to their disabled employees. The twenty-first-century disability and rehabilitation employment laws discourage subminimum wage and encourage rehabilitation professionals to market themselves and disabled workers as partners to employers. Vocational rehabilitation in the USA has through its history contributed to the employment of persons with disabilities and it will continue to develop to better serve disabled workers in the future.

# Volunteer Motivations and Nonprofit Organizations

Robert A. Stebbins
University of Calgary, Calgary, AB, Canada

## Synonyms

Motive; Nonprofit organization; Serious leisure perspective; Volunteer; Volunteer motivation; Volunteering

## Introduction

The scientific literature on the motives to volunteer is awash with general statements on this proclivity, which is, however, highly personal and individual. Perhaps the best known of these is the altruism/self-interest motive: people volunteer for both altruistic and self-beneficial reasons. This proposition is a well-known part of what Musick and Wilson (2008) call the "functional theory of motives" for volunteering. This theory, they note, "is based on the assumption that all persons have the same basic psychological needs" (p. 34). The goal of research done in the name of the functional theory is to determine these needs as they lead people to volunteer. Motives as needs are thus viewed as antecedents to volunteer action.

After reviewing some of the main points of the functional theory, Musick and Wilson present the sociological position on the motive to volunteer. They hold that motives to volunteer should also refer to particular outcomes such as serving on a board of directors, providing information to visitors in a museum, or reading stories to children at a day-care center. The sociologists also raise questions about the resources available to would-be volunteers (e.g., they must use a car, have familiarity with a certain activity, or possess knowledge of a foreign language). Nevertheless, this sociological position, though headed in the right direction, needs badly to be fleshed out. That is, much more remains to be said about outcomes and resources among other features of the social side of volunteering. In short, volunteer motivation can be defined as the sum of the antecedents and consequents that stimulate a person to take up and continue to engage in a particular volunteer activity.

This chapter presents a leisure study approach to these matters, showing in the process what the outcomes look like in volunteering and the nature of the personal resources and social organization needed to achieve them. First, a set of basic concepts is discussed. In the main section, volunteering is framed in the serious leisure perspective (SLP). The final section centers on the volitional versus the economic definitions of volunteering, both of which bear profoundly on the motive to volunteer.

## Conceptual Foundation

The three foundational concepts for this chapter are defined as follows. The first is volunteering. Definitions of it abound, with the version underlying this chapter being the following "volitional definition":

> un-coerced, intentionally-productive, altruistic, helping activity framed in a distinctive context and engaged in during free time. It is also altruistic-helping activity that people want to do and, using their abilities and resources, actually do in either a satisfying or a fulfilling way (or both). (Stebbins 2015, p. 21)

Stebbins (2015) describes the development of this definition based on previous work along these lines. The volitional definition is consonant with the SLP and hence with the sociological perspective set out above. An economic definition of volunteering will be introduced in a later section.

Motive is defined here in symbolic interactionist terms as "the reasons and purposes on the basis of which people steer their conduct" (Albas and Albas 2003, p. 349). This conceptualization harmonizes well with the sociological position (i.e., outcomes sought) and, as will become evident, the serious leisure perspective. More purely (functional) psychological definitions of motive treat of it as an antecedent to action ("a mainspring to action"), instead of part of action as does the above definition.

The definition of leisure guiding discussion in this chapter is the one developed over the years in the SLP: "un-coerced, contextually framed activity engaged in during free time, which people want to do and, using their abilities and resources, actually do in either a satisfying or a fulfilling way (or both)" (Stebbins 2012, p. 2). That it bears a close resemblance to the preceding definition of volunteering is no accident, for volunteering is conceived of here as one of three principal forms of leisure.

## The Serious Leisure Perspective

The serious leisure perspective provides the theoretical and empirical foundation for what may now be the most widely accepted classification of leisure activities presently available (see, e.g., Gallant et al. 2013). In line with the extensive exploration that underlies the perspective, its three forms (serious, casual, and project-based leisure) considered together there are not conceived of, however, as necessarily encompassing all possible leisure activities. For one or more new forms could be discovered or existing forms substantially changed. Over 40 years of research and theoretic work on leisure in the name of the SLP have resulted in a typological map of the world of leisure. A full discussion of the theory and research undergirding this map, the three forms, and the six distinguishing qualities of serious leisure (considered shortly) is available in Stebbins (2007b, 2015) and Elkington and Stebbins (2014).

The serious form comes in two varieties: serious leisure and devotee work. Because of their similarity, they will where appropriate be referred to together as the serious pursuits. *Serious leisure* (as opposed to casual leisure and project-based leisure) is the systematic pursuit of an amateur, hobbyist, or volunteer activity. Participants find it so interesting and fulfilling that, in the typical case, they launch themselves on a (leisure) career centered on acquiring and expressing its special skills, knowledge, and experience.

*Devotee work* is activity in which participants feel a powerful devotion, or strong, positive attachment, to an occupation that they are proud to be in. Devotee work was introduced by Stebbins in 2004 and subsequently elaborated by him in 2014 (Stebbins 2004/2014). In such work the sense of career and achievement is high, and the core activity is endowed with such intense appeal that the line between this work and leisure is virtually erased. Thus, one way of understanding this level of appeal is to view devotee work as serious leisure from which a full or partial livelihood is possible. For evidence supporting this proposition, see Walker and Fenton's (2013) study of productive leisure researchers.

The term *career* is used broadly in these definitions, being based on Erving Goffman's (1961) elaboration of the idea of "moral career." Such careers are available in all substantial, complicated roles, including especially those in work, leisure, politics, religion, volunteering, and interpersonal relationships. George Floro (1978) discussed over 35 years ago the possibility of finding a career in volunteer work. The adjective "serious" (a word Stebbins' research respondents often used) embodies such qualities as

earnestness, sincerity, importance, and carefulness. This adjective signals the importance of these three forms of activity in the everyday lives of participants, especially in that pursuing the three eventually engenders deep self-fulfillment.

*Casual leisure* is immediately intrinsically rewarding, relatively short-lived pleasurable activity requiring little or no special training to enjoy it (Elkington and Stebbins 2014). It is fundamentally hedonic, engaged in for the significant level of pure enjoyment, or pleasure, found there, evident in its several types set out in Fig. 1. Casual leisure is further distinguished from serious leisure by six characteristics of the latter to be presented shortly.

*Project-based leisure* is a short-term, moderately complicated, either one-shot or occasional, though infrequent, creative undertaking carried out in free time (Elkington and Stebbins 2014). It requires considerable planning, effort, and sometimes skill or knowledge, but for all that is neither serious leisure nor activity intended to develop into such. Nor is it casual leisure. The adjective "occasional" describes widely spaced, undertakings for such regular occasions as art festivals, sports events, religious holidays, individual birthdays, or national holidays. The adjective "creative" indicates that the undertaking results in something new or different, showing imagination, and possibly routine skill or knowledge. Though most projects would appear to be continuously pursued until completed, it is conceivable that some might be interrupted for several weeks, months, or even years. As will be noted later, volunteering may also be of the casual or project-based variety.

## Distinguishing Qualities

Serious leisure is further defined and thereby separated from casual and project-based leisure by six distinguishing qualities (Stebbins 2007b, 2015). One is the occasional need to *persevere*. It is clear that some positive feelings about the activity come from sticking with it through thick and thin, conquering adversity. A second quality is finding a leisure (nonwork) *career* in the serious leisure role. Careers in serious leisure commonly rest on a third quality: significant personal *effort* based on specially acquired knowledge, training, experience, and/or skill. Fourth, several *durable benefits*, or broad outcomes, of serious leisure have been identified so far, mostly through research on amateurs. They are self-development, self-enrichment, self-expression, regeneration or renewal of self, feelings of accomplishment, enhancement of self-image, social interaction and belongingness, and lasting physical products of the activity (e.g., a painting, scientific paper, a piece of furniture). Self-gratification, the combination of superficial enjoyment and deep fulfillment, is a further benefit and also one of the main benefits of casual leisure, where, however, one experiences enjoyment only. Of these benefits, self-fulfillment – realizing or having realized to the fullest one's gifts and character and one's potential – is for many participants the most powerful of all.

A fifth quality of serious leisure is the *unique ethos* that develops with reference to each activity. That is, a broad subculture eventually emerges around it consisting of special beliefs, norms, events, traditions, moral principles, and, where appropriate, performance standards. The structure holding these diverse elements together is a parallel social world, wherein participants can pursue their free-time interests. Unruh (1980) developed the following definition:

> A *social world* must be seen as a unit of social organization which is diffuse and amorphous in character. Generally larger than groups or organizations, social worlds are not necessarily defined by formal boundaries, membership lists, or spatial territory. . .. A social world must be seen as an internally recognizable constellation of actors, organizations, events, and practices which have coalesced into a perceived sphere of interest and involvement for participants. Characteristically, a social world lacks a powerful centralized authority structure and is delimited by. . .effective communication and not territory nor formal group membership. (p. 277)

The sixth quality revolves around the preceding five: serious leisure participants tend to *identify* strongly with their chosen pursuits. In contrast, casual leisure is too fleeting, mundane, and commonplace for most people to find a distinctive identity there.

**Volunteer Motivations and Nonprofit Organizations, Fig. 1** Source: http://www.seriousleisure.net/Diagrams

In the field of leisure studies, these three types and their subtypes are considered together under the heading of the serious leisure perspective. Figure 1 offers a diagrammatic view of their interrelationship. It shows well how volunteering as serious, casual, and project-based activities fit in the larger world of leisure opportunities. It further shows that people have many activities to choose from (within their limits of time, money, capability, availability, and the like), which indicates that volunteering often has to compete with other attractive free-time opportunities.

## Motive and Activity

At the center of the definitions of volunteering and leisure presented above lies the concept of un-coerced activity. An activity is a type of pursuit, wherein participants in it mentally or physically (often both) think or do something, motivated by the hope of achieving a desired end. Psychologically, an activity is a set of behaviors sufficiently coordinated to reach the end. Life is filled with activities, both pleasant and unpleasant: sleeping, mowing the lawn, riding the train to work, having a tooth filled, eating lunch, playing tennis matches, running a meeting, and on and on. Activities, as this list illustrates, may be categorized as work, leisure, or as nonwork obligations. They are, furthermore, general. In some instances they refer to the behavioral side of recognizable roles, for example, commuter, tennis player, and chair of a meeting. In others we may recognize the activity but not conceive of it so formally as a role, exemplified in someone sleeping, mowing a lawn, or eating lunch (not as patron in a restaurant).

The concept of activity is an abstraction, and as such, one broader than that of role. In other words

roles are associated with particular statuses, or positions, in society, whereas with activities, some are status based whereas others are not. For instance, sleeper is not a status, even if sleeping is an activity, and at times, a prized leisure activity at that.

Any particular activity, leisure or otherwise, is pursued to achieve an end or an outcome referred to earlier as part of the sociological position. In other words, a main motive for performing a volunteer activity is to find satisfaction in volunteer casual leisure or durable benefits in career volunteering or a volunteer leisure project. Satisfaction is equated here with hedonic pleasure (e.g., relaxation, entertainment, gratitude stemming from doing a volunteer activity), but what about durable benefits?

To find these in a serious pursuit or a leisure project is to experience self-development, self-enrichment, self-expression, feelings of accomplishment, enhancement of self-image, social interaction and belongingness, and so on. These are the benefits of a given leisure or devotee work activity, which are so powerful that its costs are seen by the participant as more or less insignificant by comparison. This is at once the meaning of the activity for the participant and that person's motive for engaging in it.

## Economic Vis-à-Vis Volitional Definitions of Volunteering

This section begins with the general idea of work, which Applebaum (1992, p. x) says has no satisfactory definition, since the idea relates to all human activities. That caveat aside he sees work, among other ways, as performance of useful activity (making things, performing services) done as all or part of sustaining life, as a livelihood. Some people are remunerated for their work, whereas others get paid in kind or they directly maintain body and soul with the fruits of their labor (e.g., subsistence farming, hunting, fishing). Volunteering as unpaid but productive work, sometimes known as the economic conception of such activity, is commonly defined as an absence of payment that would go toward making a livelihood, be that payment in money or in kind. But since it contributes little or nothing to the volunteer's livelihood, it is certainly not work as Applebaum defines it. Despite the illogical relationship of these two ideas, the economic conception dominates in nonprofit sector studies, where it is often used to describe volunteering in formal organizations. The origins of this concept seem to stretch far back into the history of economics as a discipline, and as Musick and Wilson (2008) observe, the concept has appeal as an easy measure carried out with empirical indicators.

Today, many definitions of volunteering include the element of unpaid work or unpaid productive work as one of several constituting a more complete definition. In other words, the champions of these broader statements are arguing that the economic definition is in itself incomplete and, some scholars would argue, also partial (i.e., biased). Musick and Wilson (2008) state in their assessment of this definition that it "tells nothing about the diverse meaning of volunteer work, nor does it explain why productive work is, in this case, unpaid. We need to remain open to the possibility that volunteerism is defined, in part, by its motivation" (p. 12).

And when speaking of motivation, another problem emerges, one rooted in the use of "productive" in the economic definition. For volunteering is not always productive, in the sense that it inevitably adds value to the target of benefits, be it an individual, group, flora, or fauna. That is, volunteering does not always result in the effect intended by the volunteers or their managers and, indeed, may even have a negative impact (Grotz 2011). Moreover, volunteers themselves are sometimes disappointed with the results of their efforts, suggesting that those efforts may have been partially, even totally, ineffective. In short, productiveness fails as an element in the definition of volunteering that can be used to distinguish volunteering from the activities in work where productivity is also absent at times (e.g., where workers loaf, are poorly directed, lack necessary tools).

What is unique, however, is the attitude or motive that volunteers *intend* to be productive. For this reason the economic definition has been

modified in the following way: *volunteering is intentionally productive unpaid work* (Stebbins 2013). From the standpoint of this definition, it matters little whether the volunteering is actually productive, only that volunteers engage in the activity with the intention or, at minimum, with the hope of it turning out to be productive. Further, to escape the illogicality of volunteer "work," it will shortly be replaced with volunteer "activity."

Thus Stebbins (2013) argues that the first is, in part, descriptive; it portrays volunteering as, at bottom, intentionally productive unpaid work. But the problem with this blanket qualification is that by no means all such "work" is voluntary, as the domain of nonwork obligation so clearly shows (activities in this domain are by definition disagreeable, the agreeable ones being essentially leisure – see the next two paragraphs). Moreover, some other kinds of unpaid work hardly resemble paid work, since they are essentially leisure. Is it not true, then, that a principal attraction of this economic conception is its capacity to steer attention to an important sphere of life situated beyond employment, beyond livelihood?

What is the domain of nonwork obligation? On the *activity* level, the great proportion of everyday life can be conceptualized as being experienced in one of three domains: work, leisure, and nonwork obligation (Stebbins 2009, 2012). Obligation outside that experienced while pursuing a livelihood is seriously understudied. The problem is that much of it falls under the heading of family and/or domestic life, while obligatory communal involvements are also possible. Moreover, obligation is sometimes seriously misunderstood, as exemplified in coerced "volunteering." To speak of obligation is to speak not about how people are prevented from entering certain leisure activities – the object of much of research on leisure constraints – but about how people fail to define a given activity as leisure or redefine it as other than leisure, as an unpleasant obligation. Obligation is both a state of mind, an attitude – a person feels obligated – and a form of behavior, he must carry out a particular course of action and engage in a particular activity. But even while obligation is substantially mental and behavioral, it roots, too, in the social and cultural world of the obligated actor.

Obligation fits with leisure in at least two ways: leisure may include certain agreeable obligations and the third domain of life – nonwork obligation – consists of disagreeable requirements capable of shrinking the leisure space. Agreeable obligation is very much a part of some leisure, evident when such obligation accompanies positive commitment to an activity that evokes pleasant memories and expectations (these two have been identified as essential features of leisure, Kaplan 1960). On the other hand, disagreeable obligation has no place in leisure, because among other reasons, it fails to leave the participant with a pleasant memory or expectation of the activity. Rather, it is the stuff of the third domain: nonwork obligation. This domain is the classificatory home of all we must do that we would rather avoid that is not related to work (including moonlighting). So far I have been able to identify three types: unpaid labor, unpleasant tasks, and odious self-care (for examples, see Stebbins 2012).

Another key quality of the economic definition is that the unpaid activity in question is sometimes described in the intellectual circles oriented by this definition as *intentionally* productive. In volunteering, volunteers intend to generate something of value for both self and other nonfamily individuals, including group or community, if not a combination of these three. The various examples offered two paragraphs ago attest to both this intention and, in these instances, its productive outcome.

Now, the concept of intentionally productive unpaid work occupies some common ground with the SLP. The latter, particularly in its serious leisure and project-based forms, includes following Stebbins (2007b, 2015) a set of ten personal and social rewards that participants may realize through participation in the activities that forms subsume (the rewards are presented later). In other words, unpaid volunteer work, when productive, leads to these benefits for self (i.e., intrinsic "psychic benefits" and possibly extrinsic instrumental payoffs) as well as for other individuals, groups, or the community as a whole.

It is this second quality of the idea of unpaid work as intended productivity that carries it beyond description into explanation. Such work is supposed to produce results, thereby showing the utility of volunteering. Furthermore, now on the explanatory level, the definitional ball gets passed to leisure studies.

Thus Stebbins (2013) proposes following definition of the work–leisure axis of volunteering, on which we find the economic–volitional puzzle. Volunteering is *un-coerced, intentionally productive, altruistic, helping activity framed in a distinctive context and engaged in during free time. It is also altruistic-helping activity that people want to do and, using their abilities and resources, actually do in either a satisfying or a fulfilling way (or both)*.

If people are compensated, the payment in cash or in kind is significantly less-than-market-value. "Activity" (and core activity) is substituted for "work" in this definition, because the first is the more precise term for what people do in and get from their leisure and volunteering. The adjective "intentionally productive" is added to distinguish the beneficial social consequences of volunteering, which are absent in some other kinds of leisure (e.g., walking in a park, reading for pleasure or self-improvement, watching people from a sidewalk cafe). And the adjective "altruistic" includes the generally accepted proposition that all such activity is also functionally motivated by self-interested considerations (Stebbins 1996). The locution "less-than-market-valued," which now replaces "unpaid," admits quasi-volunteering to the definition. When performing it, people help reach a public service goal, are recognized socially as a type of volunteer, and receive an in-cash or in-kind compensation significantly less than the market value of the labor provided (e.g., a stipend for Peace Corps volunteers, an honorarium for a president of a nonprofit board of directors) (Smith 2000).

In this regard, Rochester et al. (2010) frame in a unique way serious leisure volunteering and its related perspectives. They integrate it with activism and unpaid work or service diagramed as three overlapping sets. To understand volunteering fully, one must also consider this broader picture. That is, volunteering may be seen as a combination of unpaid (i.e., less-than-market-valued) work and activism, a combination of activism and serious leisure, a combination of serious leisure and unpaid work, and as a combination of all three perspectives. This conceptualization is consistent with the economic–volitional definition just presented.

## Theoretic Typology of Volunteers and Volunteering

Earlier, Stebbins (2007a) developed an SLP-driven, two-dimensional, theoretic typology of volunteers and volunteering. His informal observations made over the years suggested that volunteer activities are motivated, in part, by one of six types of interest: interest in activities focused on (1) people, (2) ideas, (3) things, (4) flora, (5) fauna, or (6) the natural environment. Each type offers its volunteers an opportunity to pursue, through an altruistic activity, a particular kind of interest. But volunteers and volunteering cannot be explained by interest alone; other theoretic elements are needed. They come from the SLP, the three forms of which make up the second dimension of this typology. This perspective sets out the motivational and contextual (sociocultural, historical) foundation of the resulting 18 types.

### Popular Volunteering

Examples of career, or serious leisure, volunteering with people include ski patrol, search and rescue, emergency medical worker, trained/experienced hospital volunteer, and tutor of second-language learners. The worldwide volunteer organization the Guardian Angels, which safeguards against crime and violence in neighborhoods and schools, and now, cyberspace, further exemplifies this type. Casual volunteering with people is seen in, among other activities, ushering, handing out leaflets, collecting donations (including fund-raising), giving directions, and serving in community welcoming clubs. Popular volunteering in leisure projects is evident in the various people-oriented roles volunteers fill at conferences, art festivals, children's festivals, and sporting tournaments.

### Idea-Based Volunteering

Volunteering centered on ideas often gets expressed in a service of some sort. Serious leisure examples are legion: pro bono legal service, volunteer consulting, volunteer retired business people advising on business, and political party volunteers working on strategy or policy. Not conceivable as a service, however, is advocacy volunteering (including protest activity), which nonetheless requires manipulating ideas, in this instance, to persuade a target group. Moreover, for those wanting only a limited volunteer experience, any of these could also be carried out as leisure projects. Finally, there appear to be no instances of casual volunteering using ideas and perhaps for good reason. Casual leisure is fundamentally hedonic and, as such, not idea-based volunteer activity as conceived of here.

### Material Volunteering

It is possible that volunteer work with human-made things is the arena for the largest amount of project-based leisure in this typology on volunteering. Some material volunteers organize their work for Habitat for Humanity as a project, as do those who donate their trade skills to fix a plumbing or electrical problem at their church, prepare food for the needy on Thanksgiving Day, or help construct the set for a high school play. Examples of material volunteering as serious leisure include regular volunteers who repair and restore furniture and clothing donated to the Salvation Army, prepare meals for the indigent, and perform secretarial or bookkeeping services for a nonprofit group. Volunteers providing water filters and electrical lighting to Third World countries are engaging in serious leisure material volunteering, as are volunteer firefighters (when not rescuing people). Casual material volunteering refers to such activities as regularly stuffing envelopes for a nonprofit group mailing, picking up trash along beaches or roadsides (could also be classified as environmental volunteering), and keeping the score at adolescent sporting matches.

### Floral Volunteering

Career volunteering here occurs as, for example, gardening (flowers, shrubs), say, for a church, town square, friend, or neighbor. Vegetable gardening for the needy also falls into this category, as does planting each season trees and shrubs to beautify a park or community organization. As with idea-based volunteering, any of these might also be pursued as leisure projects. The casual floral volunteer performs for church, community, charitable organization, and the like such altruistic activities as raking leaves, watering lawns and plants, and weeding gardens. To constitute leisure volunteering, these must, however, be seen by the volunteer as agreeable, not as an unpleasant obligation.

### Faunal Volunteering

Faunal volunteers work with animals, including birds, fish, and reptiles. Career volunteers in this type serve, among places, at the Society for Prevention of Cruelty to Animals, in animal rescue units, at the local zoo, and in animal rehabilitation services. Knowledgeable people who care for someone's pet (outside the volunteer's family) on a regular basis (serious leisure) or as a one-off service (project-based leisure) are also part of this type. Volunteering only to feed a holidaying friend's bird or cat or walk that person's dog, assuming this experience is enjoyable, are instances of casual leisure in the area of faunal volunteering.

### Environmental Volunteering

Environmental volunteering entails either monitoring or changing a particular set of external conditions affecting the people, flora, or fauna living in them. The change striven for is not always defined as favorable by everyone it may affect (e.g., mountain hikers might oppose a campaign by dirt-bikers' for new trails in areas where the former have enjoyed exclusive use). Career volunteering here includes maintaining hiking trails and trout streams as well as creating, organizing, and conducting environmentally related publicity campaigns (e.g., anti-smoking, clean air, clean water, anti-logging or mining, access to natural recreational resources such as lakes, forests, ocean frontage). Any of these could also be pursued as leisure projects. The casual volunteer also finds opportunities in these examples, seen in

**Volunteer Motivations and Nonprofit Organizations, Table 1** A leisure-based theoretic typology of volunteers and volunteering (Stebbins 2007a)

| Leisure interest | Type of volunteer | | |
|---|---|---|---|
| | Serious leisure (SL) | Casual leisure (CL) | Project-based leisure (PBL) |
| Popular | SL popular | CL popular | PBL popular |
| Idea-based | SL idea-based | CL idea-based | PBL idea-based |
| Material | SL material | CL material | PBL material |
| Floral | SL floral | CL floral | PBL floral |
| Faunal | SL faunal | CL faunal | PBL faunal |
| Environmental | SL environmental | CL environmental | PBL environmental |

door-to-door distribution of leaflets promoting a clean air campaign and picking up litter in a park or along a highway.

Cross-classifying the two dimensions resulted in Table 1. Not surprisingly, perhaps, some volunteers pursue two even three interests during the same activity.

## Conclusion

Some readers might argue that the foregoing definition of the work–leisure axis and its bearing on the motive to volunteer, because it forms part of the larger incomplete definition of volunteering as a whole, is itself premature. Yet, all scientific definitions are subject to revision according to the data and theory at hand. All are actually or potentially incomplete. That is, we must still pursue a variety of research questions whose answers will facilitate theorizing in this area. One is the motivational foundation of marginal volunteering. Answering it does not mean that the more particular work–leisure definition put forward in this article is therefore inadequate. Rather, what is at stake is the scope of the concept of volunteering (and hence that of the volunteer), as defined here. Can marginal volunteering eventually find a place in this work–leisure definition? Likewise, research is needed on the motive to engage in stipended volunteering and in altruistic activity in families and how these two may be defined as volunteering. For those interested in these questions and others the answers to which might extend the scope of our definition, some ground remains to be covered. Most broadly, there is need to study further Grotz's (2011) "third principle," which is his slogan for the twin phenomena of negligible and actually harmful volunteer effect. We must improve our understanding of intentionally productive volunteer activities that flop. As Musick and Wilson (2008, p. 12) put it, "we need to remain open to the possibility that volunteerism is defined, in part, by its motivation." And that even when the motives involved fail to produce the desired outcome.

Nonprofit organization

## Introduction

During its history, Palestine has passed through many historical and political stages that have affected their voluntary sector, also known as civil work. According to Harb (2003), civil work in Palestine was both formed and impacted during the following political stages. First, the Turkish Ottoman Empire (1517–1917) controlled Palestine for 400 years. Second, during the British Mandate (1918–1948), voluntary associations, political parties, and labor organizations were first established. Third, the period of 1948–1967 was marked by two wars. In 1948, the first Arab-Israeli war took place, and 77% of Palestine was occupied. In 1967, the second Arab-Israeli war took place and ended with the occupation of the rest of Palestine, i.e., the West Bank and Gaza. Voluntary work in this period, as it had taken place under the British Mandate, declined and voluntary work occurred in a secret manner with a political dimension. After 1967, voluntary work was connected to what became known as the Palestinian National Question, and the Palestinian political parties were part of this work. Fourth, in the 1970s, voluntary work increased when Palestinian university students and instructors were involved, primarily due to a prerequisite for each student before graduation from any of the Palestinian universities to finish a total of 120 voluntary hours. Fifth, the 1980s witnessed an increase in voluntary work with more diverse civil organizations entering the sector and with funding sent from international organizations to civil society organizations.

People's reliance on agriculture helped in strengthening voluntary attitudes, and this happened from the Ottoman era to Jordanian times in Palestine. After the Israeli occupation, Israel worked to evacuate the farmers from the land by turning them into laborers inside Israel. The Palestinian Ministry of Agriculture indicated that 15.6% worked in agriculture in 2008, and the Palestinian Labor Force Report 2015 indicated that only 9% of the Palestinian labors work in agriculture.

## Volunteerism and Funding

Harb (2003) classified the development of the voluntary sector and the accompanying funding issue into three stages:

1. 1970s – funding was not available at all, which resulted in self-reliance in terms of human and financial resources.
2. 1980s – where the voluntary work was evident in Palestinian society, and the funding was only considered as an auxiliary tool to motivate the voluntary work.
3. 1990s – what had been purely voluntary became a partial paid work arrangement which had the unintended consequence of limiting the incentive of volunteers.

Professional organizations with high-salaried executives became commonplace as a result of the international funding of nonprofits from sources such as the United States Agency for International Development (USAID) or the European Union (EU). During this period, the number of nongovernmental organizations proliferated, and foreign funds increased as well.

Funding to NGOs also affected the voluntary spirits by making it less likely for people to agree to work under the donors' conditions, so NGOs had to shift from using volunteers to using paid employees. People's values have changed because the original values were more oriented to volunteerism. For example, this orientation was evident in years past when one built a house to find all neighbors there to assist in the construction.

Funding has had a negative effect on volunteerism. The problem is that those nonprofits that have to implement funded projects have to expend money in any way possible, and this means that they pay for all services they gain from former volunteers. This shifted the role of participants in NGO initiatives from volunteers to employees with salaries and benefits.

There has not been enough planning for nonprofit initiatives, and this also influenced the voluntary spirit since the results were not strong enough to encourage volunteering.

It is noteworthy mentioning that not all donors are the same; there are donors with transparent missions and others with hidden agendas. The USAID was classified as a donor that breaks the Palestinian law with its funding conditions. For example, Palestinian NGO law, number (1), year 2000, article (32), states that Palestinian NGOs are eligible for unconditional support and assistance to their missions. The USAID Antiterrorism Certificate (ATC) contradicts the cited article of the Palestinian law, according to NGOs understanding, where each NGO has to sign the ATC before obtaining any fund from the USAID.

Volunteering has its influence only on the field in which one volunteers. This depends on the way funds are expended; if there is effective planning, then external funding is positive. If it is unplanned and spontaneous, then the funding has a negative impact on social capital. Work has become conditional on the availability of funds; that is, if there are funds, people volunteer, but if there are not funds, nobody works. Strategically, voluntary work should not rely on external funding, and it must be self-reliant. External funding has been instrumental in damaging social values.

### Decline in Voluntary Sector

Volunteerism in Palestine has deteriorated for different reasons, including the construction of a physical separation wall and its economic effects as well as the military closures in the occupied Palestinian territories (OPT). Under these economic conditions, residents placed all their efforts in job seeking to secure the necessary income for their daily existence, which immediately dampened their voluntary spirits. Volunteerism was also influenced by establishing nongovernmental organizations (NGOs) that changed voluntary work into paid work. If one made a comparison of volunteerism before and after the establishment of the Palestinian National Authority (PNA), he/she will find out that volunteerism deteriorated after the PNA since many organizations have their own agendas and, therefore, have to pay people to work with them to achieve those agendas.

In the first Intifada, Uprising, which started in 1987, Israeli soldiers broke the locks of Palestinian shops on general strike days, while Palestinian

youth volunteered to guard burgled shops from theft. In the first Intifada, the occupying forces closed schools and universities and banned education, while social schooling and education appeared to be the response to this aggression. All factors pushed toward the deterioration of volunteerism which forms an important component of social capital.

Between 1967 and the emergence of the PNA, voluntary work was not affected, and local leadership of the community was formed from unions and voluntary bodies. However, after the PNA, the official government assumed this role, and, accordingly, much of volunteerism disappeared. Many jobs emerged after the PNA was established, and this influenced social work because government employees focused on their paid jobs. The PNA weakened public participation and shifted all public works to contracts and bids.

Many of the NGOs did the same as the PNA in employing people, who were paid for all their initiatives, even conducting workshops and discussion groups. NGOs paid for hotels, per diem expenses, and other costs for participants in workshops, and they allocated large amounts of money for their board members' travel.

The whole community is moving to the pure capital direction according to economic factors that affect volunteerism. It is not easy to manage between life needs under difficult economic life and volunteering. The difficult economic situation in Palestine forces people to place high priority on paid work and think of their own personal interests. This comes at the expense of volunteering since people cannot volunteer while they are consumed with enhancing their incomes under difficult economic situation. Searching for paid work at the expense of volunteering has become a mindset in the whole community.

Since 1990, volunteering deteriorated, as there are economic, political, and social reasons for the deterioration in volunteering. The last 25 years entailed an economic transition, and this influenced people's interest in volunteering.

One of the major components of civil society is the political movement and political parties. Between 1972 and 1987, the Israeli army arrested volunteers and pressured volunteers. The voluntary movement in Palestine was completely integrated in the political movements, where leaders of voluntary organizations were also political activists. Voluntary work during that period was implemented in a secret manner. Therefore, voluntary activities at that time considered as political activities and were forbidden by the Israeli army. Many of the voluntary movement's leaders were arrested and placed in Israeli jails because of their voluntary activities, which were considered political activities by Israeli army.

The weak results of nonprofit initiatives form clear evidence of the weak planning for these initiatives. The weaker planning is, the weaker results are. The NGOs are controlled from external funders without internal strategies; this makes funding conditional upon donors' priorities and desires. Even if the NGOs have their own strategies, they remain ineffective and unimplemented, while donors' visions dominate local priorities and strategies.

External funding has an effect on motivation for volunteering, while the priority afforded voluntary work has become very limited and even absent in the people's minds. In one of the NGOs, a budget surplus was spent on refurnishing of the NGO premises and purchasing high-tech devices. Donor's monitoring of funds given to NGOs is not enough. Spending of funds is also not wise enough inside NGOs and this discouraged voluntary spirits.

The extent of external funding has an effect on the shape and nature of voluntary work; payment to trainers who would have otherwise volunteered has dampened the voluntary spirit. In spite of huge funding, board members and steering committees do not receive financial benefits in the form of salaries, but they do have budgets for their travel. Participants offered different views on these benefits. Executive employees receive high salaries in NGOs. In effect, first-line leaders in NGOs have become executives with large salaries, and this has led to deterioration in the voluntary movement.

Volunteers have become unwilling to attend a workshop or activity with an NGO that pays its employees large salaries while not offering to pay participants' transport costs. In paid jobs at

voluntary bodies, an employee works for a direct supervisor and is subject to the supervisor's directions and instructions. Volunteering becomes more difficult under such conditions.

Payments for executives in NGOs have created an imbalance in society; for example, a school teacher is paid US $700 per month, while his graduate student gets four times this payment at an NGO. The benefits given to employees, such as cars, salaries, and mobile phones, were all means for shifting employees' interests from voluntary work to personal benefits, especially with the lessening of political interests caused by the decrease in status of parties.

The reality that leaders of political parties are not democratic and each leader seeks power has negatively affected voluntary work in Palestine. In all developed countries, the president is in office for four to 8 years by law, while in Palestine even a trade unionist remains in the position of leadership all his life.

Homes, schools, universities, and worship houses play an important role in spreading volunteerism in the Palestinian community. The family is the nucleus of the community. If each family spread the seeds of volunteerism, the school then could complete this effort. However, there are no laws and regulations that support this thought. The family must be aware of voluntary work, especially after the fears some of the families have expressed about volunteering with organizations that have external funding.

At the social level, there are still occasions where volunteering is present, such as wedding parties, olive harvesting, funerals, and condolences. There is a generation gap in understanding the concept of volunteering, and there must be a revision of this thinking in order to encourage volunteering among younger citizens. It is also important that a volunteer is asked to assume a role in something he/she likes in order to strengthen the spirit of volunteering.

As for worship houses, sometimes they are viewed as politicized. As for mosques, some visitors to mosques undertake voluntary works for religious reasons related to their faith and not for political motivations. Others use mosques for their personal, political, or social agenda. The role of worship houses in voluntary work could not be ignored. Although worship houses have a positive role, they divide the community between those committed to worshiping in mosques and those uncommitted.

Universities consider voluntary work in their curricula, but the problem is that some host organizations give students certificates without real volunteering. Universities must take practical measures to follow up on the volunteering and community service process and make it as effective as possible. Student unions in universities serve specific political movements, which result in students disliking voluntary work. Universities do not have a diverse range of voluntary programs, but rather they have the official community service modules, which require volunteering and link it to students' graduation requirements.

Voluntary work is a major pillar of social capital which could be strengthened through awareness-raising and supportive legislation and regulations. Logically, voluntary work enriches social capital, but currently there are political objectives behind volunteerism. The role of voluntary work is clearer in Palestinian rural communities than it is in urban communities. Voluntary work also serves the volunteer himself since it helps in building a useful network of contacts. As far as voluntary work is politicized, this will have its effect on social capital.

Most of the NGOs adhere to donors' priorities and their policies, while others work as mediators between the donors and beneficiaries. The ministry of planning does not consider the public interest in this regard, and does not play an effective role in dealing with funding organizations. Some NGOs that were established after the PNA take the form of profit centers because their main objective is fundraising. Most of the NGOs weakened social capital for these reasons. An excessive number of licenses were given to NGOs when the PNA was in power, especially in 2009, when hundreds of youth organizations were registered. So there is much funding for NGOs, but there is limited control and monitoring of it.

The deterioration of voluntary work and the establishment of the PNA were not coincidental,

but it was the relationship between the reason and the result. Appearance of the PNA directly affected volunteerism. There are different reasons behind that conclusion, such as the following:

- PNA salaries became a target for most people, and this resulted in limited productivity, ignorance of volunteering, and loading ministries with unneeded employees. The social cadre was employed at the PNA offices.
- The PNA did not involve the public in its procedures and works, while legislation was not used to serve the social needs of the citizens.
- The PNA focused on securing funds from donors to cover salaries, and this was at the expense of voluntary work. A huge percentage of donors' money went to PNA salaries which do not serve voluntary work, where 54% of the PNA' budget for 2016 was allocated as salaries.
- Employees' personal motivations and attitudes toward volunteering were dampened by the influence of salary and benefits.
- Bureaucracy in PNA organizations forced employees to go through a long and de-motivating process, if the employee expressed an interest in volunteering. Any employee in any PNA ministry who wishes to volunteer must obtain the minister's personal approval. To get the approval, the employee must apply through his/her direct supervisor, and the letter moves slowly through bureaucratic channels to the minister's office. In parallel, the request must be sent to the General Employment Bureau at the PNA, and this takes a long time to process. Even after this lengthy process, approval from the minister and the General Employment Bureau is not guaranteed.
- The internal political crisis between the PNA in West Bank – Ramallah and the Hamas government in Gaza made people angry about volunteering and, accordingly, avoided it by all means. The rift taking place between the West Bank and Gaza is demoralizing to the citizens of both sectors. People feel negatively toward public works and sometimes made them lose hope about the future.
- Accountability and transparency are crucial in voluntary work, but they seem unlikely to be achieved under the current political situation, especially after the rift between West Bank and Gaza.
- PNA leaders returned from different countries (Jordan, Lebanon, Egypt, and Tunisia) with different backgrounds and perspectives on voluntary work. Some of them believed in strict control over voluntary work.

The benefits young people receive from their paid jobs affect their motivation to volunteer. If a young person is to choose between a paid job and a volunteering opportunity, surely he/she will choose the paid job. However, good will on the part of youths to volunteer is present, but it needs enhancement and leadership to make use of it. With wise leadership, youth will volunteer in different ways even if they do it in order to gain experience while looking for jobs.

## Difficulties that Face Volunteers

There are several difficulties that face volunteers in Palestine on the community, political, social, and financial levels. The community, especially in rural areas, is doubtful about the intentions of volunteers as a result of traditions and norms. Also there is no appropriate understanding of the spirit of voluntary work, i.e., the community does not understand the essence of volunteering. It is noteworthy mentioning that, on community level, there are negative alternatives for potential volunteers, such as youth turning to theft and drug dealing.

Other difficulties are political difficulties in which the volunteers might be arrested by Israeli forces, since Israelis consider volunteerism as political activity. The concern of the parents on their sons and daughter of being arrested might cause the parents to discourage their sons and daughters to participate in voluntary activities.

Volunteering is centered in major cities, especially Ramallah, and there is not a linkage between major cities and remote rural areas in voluntary fields which limit the scope and size of

volunteerism. The type of the voluntary work – specialty and the nature of voluntary work, for example, asking young women to clean the streets – could limit volunteering.

Financial difficulties due to life expenses and the financial needs of volunteers and the strong linkage between volunteering and financial benefits result in making volunteerism even weaker.

## Conclusions

It is obvious that the volunteerism in Palestine is deteriorating, especially after the increase in the number of the Palestinian NGOs and the establishment of the PNA in 1994. In order to enhance the voluntary work and encouraging young generation to volunteer, the following are recommended: promote the culture of volunteering though the family and schools; strengthen the appreciation of voluntary work in schools; preserve the original positive values in the society; center voluntary work on youth, and not through bureaucrats; respect the cultural, ideological, and intellectual aspects of voluntary work; highlight the positive results of voluntary work on the community, involving the elderly in the voluntary work, especially ones with experience; and have a superior view of volunteering because volunteering was prevalent when they were young.

On the legislation, government, and third sector levels, it is recommended to enact legislation for civil service that regulates the relationship between the volunteer sector and the authorities without any contradiction and competition, establish bridges of trust between voluntary organizations and other bodies as well as directly with volunteers, limit external funding of voluntary work to basic costs only, reject and eliminate conditional funding, allocate part of the government budget for voluntary work, and establish a national commission for volunteering, i.e., a regulatory body.

It is also recommended to accredit voluntary experience as work experience from the proposed national commission for voluntary work, where a national commission for voluntary work should be formed. This commission should accredit and certify any voluntary experience for persons to enable them to have it placed on their curriculum vitae (CVs) and resumes.

# Volunteers and Volunteer Management

Christopher J. Einolf
DePaul University School of Public Service, Chicago, IL, USA

## Synonyms

Altruists; Interns; Unpaid staff

## Definition

Volunteering is an unpaid non-compulsory work, that is, the time individuals give without pay to activities performed either through an organization or directly for others outside their own household.

## Introduction

Volunteering is an important phenomenon worldwide. Volunteers provide essential social services, create and promote arts and culture, and contribute to associational life. Volunteering is an important form of social capital; volunteers contribute to civil society; volunteers form social movements and carry out political advocacy. Volunteers form an important part of the workforce, and in poor countries volunteers are an important part of economic development; the International Labor

Organization has recognized the importance of volunteering and is the source of the definition above (Butcher and Einolf 2016). In addition to being a means to these ends, volunteering is an end in itself, as it brings people together in relationships of solidarity and gives people a sense of purpose, meaning, and belonging.

This entry first discusses the prevalence of volunteering in the United States and other countries. It then answers the question of who volunteers and why, dividing causes into demographic characteristics, resources, motivations, and social networks. The third section discusses best practices in the management of volunteers, and the last section focuses on volunteers who work for government agencies.

## Prevalence of Volunteering

The most recent US Current Population Survey calculates that 24.9% of Americans volunteer. Other developed countries collect statistics on volunteering, but accurate cross-national comparisons are difficult because different countries use different survey methods and the wording of questions on volunteering can greatly influence how people respond. One study of 36 countries found that volunteer rates ranged from less than 1% of the population in Japan, Mexico, and Pakistan to a high of 52% in Norway, with most countries reporting rates between 5% and 20%. In general, economically developed countries reported a greater percentage of the population engaged in formal volunteering than poor countries. Another study found volunteer rates to be highest in North America (37.0%), followed by Western Europe (24.2%), Africa (21.7%), Latin America and the Caribbean (21.4%), Asia (21.4%), Eastern Europe (17.3%), and the Middle East (11.2%) (Butcher and Einolf 2016).

## Types of Volunteer Organizations

Voluntary organizations can be divided into three types: functional ones that provide services to clients, moral ones that advocate for the betterment of the community, and interactive ones that bring people together to pursue leisure activities and support each other psychologically. Functional organizations include homeless shelters, food banks, social services agencies, hospitals, universities, museums, and performing arts nonprofits. Functional organizations also include membership organizations and associations. Most of the literature on volunteer management addresses functional organizations that have a small number of volunteers and a large number of paid staff.

Moral and interactive organizations probably make up the majority of volunteer organizations, but they are little studied, and there is almost no research on the best practices of management within them. Moral organizations advocate for the betterment of the community, and these include political groups, issue advocacy groups, and neighborhood citizens' groups. Interactive organizations foster social interaction through sports, hobbies, and other leisure activities and also include 12-step self-help groups such as Alcoholics Anonymous.

## Who Volunteers and Why

There is an extensive literature on who volunteers and why (Einolf and Chambré 2011; Musick and Wilson 2008), and the correlates of volunteering can be divided into four broad categories: demographic factors, resources, motivations, and the social environment. The social environment can be further subdivided into social context, social roles, and social networks.

Certain demographic characteristics are associated with volunteering. In the United States, women are more likely to volunteer and volunteer more hours. Volunteer participation tends to increase with age, decreasing only in late old age as health issues force people to cut back on volunteering. Married people volunteer more than single people, although the difference lies almost entirely in volunteering with religious congregations. Couples with school-aged children volunteer more than couples without children. Whites are the most likely to volunteer, followed

by Native Americans, African-Americans, Hispanics, and Asian Americans, but, among those who do volunteer, African-Americans volunteer the most hours (Musick and Wilson 2008).

Resources include the health and free time that make volunteering possible, and the education and skills that make someone a more effective volunteer. People in poor mental or physical health are less likely to volunteer. Retirees and people who work part time are more likely to volunteer than those who work full time because they have more time during the work day to volunteer. People who are paid a salary instead of an hourly wage are also more likely to volunteer because they can take off work to volunteer without losing wages for the lost time, and because salaried employees generally have more control over their work schedule. Skills are also important resources in volunteering, so that educated people are more likely to volunteer than less-educated people (Musick and Wilson 2008).

Volunteer motivations include self-enhancement, career development, the desire to understand the world, the desire for social relationships, protecting oneself against negative feelings, and prosocial values such as empathy, altruism, and a sense of moral obligation. Religious people tend to volunteer more, although scholars disagree on whether this is due to the altruistic values that are preached by religions or the social networks that come with religious participation. Personality traits that correlate with volunteering include resilience, extraversion, self-efficacy, and low levels of neuroticism. After a person volunteers for a while, she develops a role identity as a volunteer, thinking to herself that "I am the kind of person who volunteers," and "volunteering is an important part of who I am," and this role identity explains why some individuals continue volunteering throughout their lives (Einolf and Chambré 2011).

The fourth type of causal factor that affects volunteering is social environment, which includes social context, social roles, and social integration. Participation in volunteering varies widely among countries due to differences in culture, religion, the history of volunteering, government policies, the economy, the role of the welfare state, and the size of the nonprofit sector (Butcher and Einolf 2016). Within the United States, the level of volunteer participation differs among states, cities, counties, and neighborhoods. Major events, such as the AIDS epidemic of the 1980s and the terrorist attacks of September 11, 2001, can cause volunteer rates to increase as people step up to meet a new challenge (Einolf and Chambré 2011).

A social role is a set of norms and behaviors that go with a particular social identity, and these norms and behaviors can sometimes encourage volunteering. For example, the role of parent carries with it the expectation to volunteer at a child's school, religious congregation, and leisure activities. Other social roles, such as member of a religious congregation, community group, or professional association, can include expectations of volunteering (Einolf and Chambré 2011). Participation in volunteering can compensate for the loss of other roles, and role replacement is one of the main reasons that some people increase volunteer participation after they retire.

Social networks hold a strong influence over people's volunteering. Most people volunteer because someone asked them to, and people with broad social networks are more likely to be asked. Social networks can build trust, and people who have a strong sense of trust feel more solidarity with other people and feel more inclined to help them. Some social networks, such as those that exist in religious institutions and service clubs, provide external norms that favor volunteering. These external norms motivate people to volunteer even when they are not intrinsically motivated to do so, because other people in their group expect it of them.

## Managing Volunteers

Compared to the extensive literature on who volunteers and why, the literature on effective volunteer management practices is small. Much of this literature is written by practitioners and consultants, but there are some scholarly articles that use scientific methods to test the effectiveness

of volunteer management practices (for a comprehensive review, see Studer and Von Schnurbein 2013). Much of the best practices, literature for managing volunteers follows a human resources management (HRM) approach, treating volunteers as a special category of staff and assuming that nonprofits should manage volunteers in a similar way to managing paid employees. The first half of this section defines the HRM approach and discusses the literature that tests it, and the second half discusses alternatives.

## The Human Resources Management (HRM) Approach

The majority of the literature on volunteer management takes a human resources management (HRM) approach, assuming that volunteers are similar to paid labor and should be managed in similar ways. Many versions of the HRM approach have been proposed over the years, but these different versions all include the same core functions of job design, recruitment, placement, orientation and training, supervision, evaluation, and recognition.

A practical guide applying the HRM approach makes these recommendations for managing volunteers (Brudney 2012):

1. Plan the volunteer program carefully by considering the costs and benefits of participation, setting reasonable expectations, establishing a rationale and goals, and involving paid staff in the program's design.
2. Write policies for volunteer management.
3. Purchase liability insurance for volunteers.
4. Designate who will manage volunteers.
5. Create written job descriptions.
6. Recruit volunteers.
7. Interview potential volunteers to screen out undesirable volunteers and to match volunteers with suitable assignments.
8. Hold an initial orientation and training session.
9. Give follow-up training and professional development opportunities.
10. Keep records of volunteer hours and activities.
11. Supervise volunteers closely and communicate with them frequently.
12. Evaluate volunteers' individual performance and evaluate the volunteer program as a whole.
13. Recognize volunteers' contributions.

Dozens of studies have tested the HRM approach and supported some of its features. No study has found that having written policies (step 2), writing job descriptions (step 5), or keeping good records (step 10) makes it easier to recruit volunteers or less likely that volunteer will quit. No study has tested what type of volunteer manager position works best (step 4). A few studies have found that planning (step 1), liability insurance (step 3), screening and matching (step 7), and evaluation (step 12) lead to better volunteer recruitment, satisfaction, and retention. Studies have found strong support for the importance of effective job design (step 5); recruitment (step 6); orientation and training (steps 8 and 9); supervision, communication, and support (step 11); and recognition (step 13).

The first step in working directly with volunteers is recruiting them. Matching recruitment messages to potential volunteers' motives makes them more likely to volunteer. People are more likely to volunteer when they anticipate feeling pride in the organization, expect to be treated with respect, and feel that the organization welcomes newcomers. People are more likely to volunteer when they feel that their labor is needed and when they expect public recognition for their efforts. Recruiting a diverse workforce of volunteers is more effective when organizations acknowledge and point out the value of diversity (Boezeman and Ellemers 2014). Organizations that budgeted adequate funds for supporting volunteers, had staff who believed in the importance of working with volunteers, and took the time to train and supervise volunteers had more success with recruitment. The most effective way to recruit new volunteers was to ask current volunteers to recruit their friends and colleagues.

One of the best supported features of the HRM approach is the importance of effective job design. While the mere existence of job descriptions (step 5) is not enough, creating good volunteer jobs makes volunteers happier and more likely to keep volunteering. Volunteers who understood the role of their job in the organization and its relationship to the organization's goals were also more likely to continue. A volunteer job is most appealing if "(1) the job involves several nonrepetitive tasks; (2) the job involves a complete process; (3) tasks are chosen by oneself; (4) jobs have clearly defined objectives; (5) the ultimate purpose of the job is known; (6) the job is useful for others; (7) the job can be done with great autonomy; [and] (8) the job requires cooperation with others" (Hidalgo and Moreno 2009, p. 598).

Preparing volunteers for their work through orientation and training encourages volunteers to work more hours, do better work, and continue volunteering (Hager and Brudney 2004; Hidalgo and Moreno 2009). Recognizing and thanking volunteers for their work also encourages them to keep volunteering. Volunteers who have positive perceptions of the supervision, communication, and support they receive from the organization volunteer more hours and are more likely to continue volunteering. However, the more often volunteer managers supervised and communicated with their volunteers, the less likely the managers were to have adequate numbers of volunteers. It seems that volunteers like freedom and autonomy and prefer to be managed with a light touch, while volunteer managers may overdo things out of a desire to stay in touch and in control.

## Alternatives to the Human Resources Management Approach

There are other ways to manage volunteers besides treating them like unpaid staff in a conventional bureaucracy. These approaches include fulfilling the terms of an unwritten psychological contract, fostering good experiences among the peer group of volunteers, treating volunteers as a natural resource, and adopting a decentralized, non-bureaucratic management structure that allows volunteers' maximum autonomy.

Volunteers may not want to be treated like paid employees, as the HRM approach dictates, but want their experience to fulfill needs for meaning, connection, and emotional support. This expectation is part of the unwritten psychological contract that volunteers make with the agencies where they work. Volunteers therefore want "appreciation and a caring management approach," that is, "limited in autocratic and bureaucratic interactions" (Stirling et al. 2011, p. 324). Ironically, volunteer managers who follow the HRM approach may be turning the volunteer experience into exactly the type of work-like, bureaucratic experience that volunteers are trying to avoid. As the organization's management style becomes more professional and bureaucratic, its volunteers may feel that their psychological contract to receive caring, connection, and support is being violated, which may cause them to feel dissatisfied and quit.

Volunteers may seek connection, belonging, and support from paid staff but primarily seek these rewards in their relationships with fellow volunteers. Volunteers who report strong support from and a good relationship with other volunteers donate more time and are more likely to continue volunteering (Hidalgo and Moreno 2009). In addition to the social support and friendly interactions that may make volunteers happier, close relationships with peers can lead to the development of external norms or shared values that make one feel obligated to continue volunteering.

Another interesting alternative to the HRM approach is one that conceives of volunteers as a natural resource. Too many nonprofits exploit the volunteer resource without concern for replenishing it, concentrating on recruitment rather than management and retention. Volunteer managers should instead treat the pool of volunteers as a renewable resource, making sure that they do not "overfish" the pool through aggressive recruitment. They should also be careful not to overwork or mismanage current volunteers,

which may cause them to be so burned out and disaffected that they leave the pool of potential volunteers entirely.

Finally, it is possible to manage volunteers successfully using an approach that avoids work-like bureaucracy altogether. An insightful case study of a volunteer organization that organized leisure activities in a public park found that the organization used a very loose type of management, exercising little control over its volunteers. Instead, it integrated its programs with volunteers' values, passions, and interests and adopted an informal structure that allowed for maximum volunteer autonomy (Barnes and Sharpe 2009).

## Public Sector Volunteers

While most scholars associate volunteers with the nonprofit sector, public sector volunteers, most of whom work for local government bodies, make up about 25–30% of the volunteer labor force in the United States (Gazley and Brudney 2005). State and local government agencies tend to use fewer of the human resources approach best practices than nonprofit organizations. Most local governments in the United States use volunteers, with the most common areas being fire departments, parks and recreation, economic development/ planning/ tourism, libraries, and arts/culture/museums. At the state level, governments most often use volunteers for work with the environment, health, hospitals, natural resources, parks and recreation, and public welfare.

While many theorists suppose that government staff and volunteers would come into conflict, empirical research has found only limited evidence of this. A longitudinal analysis of the work of stipended volunteers within the US Small Business Administration found no evidence of staff-volunteer conflict or the substitution of volunteers for paid staff. One would expect that unionized employees would oppose the use of volunteers for fear that they would take away work from paid employees, but having large numbers of unionized staff did not make state agencies less likely to use volunteers.

## Volunteering, Social Capital, and Citizenship

Volunteering has consequences not only for the people and organizations served but also for volunteers themselves and for society in general. For individuals, volunteering is associated with better mental health, physical health, and happiness and can lead people to better career opportunities (Musick and Wilson 2008). For society, volunteering is important for its contributions to social capital and civic engagement.

Social capital, defined as norms, networks, and trust (Putnam 2000), is important for the functioning of the economy and democracy. Volunteers join networks with others which reinforce norms of cooperation and helping and develop trust. Many forms of volunteering create bridging social capital, bringing people from different walks of life together in a common group. Bridging social capital is thought to be particularly important in supporting a healthy democracy (Putnam 2000).

Volunteering can also lead individuals to become better citizens. Volunteering builds trust, encourages people to think beyond their own needs, makes them aware of issues, and "makes them more aware of the structural nature of social problems and the need for political solutions" (Musick and Wilson 2008, p. 461). Volunteer work also teaches civic skills such as writing, speaking, planning, and running meetings, which are useful in political participation. However, volunteering can lead to pursuing apolitical solutions to social problems, helping one person at a time, rather than looking at problems systemically and advocating for social change.

## Conclusion

Volunteering is important in providing social services, contributing to social capital and civic participation, and supporting political engagement. About 25% of Americans do volunteer work, making the United States one of the most active volunteer societies in the world. Current scholarship on volunteering has gone far to explain who

volunteers and why, as well as the effects of volunteering on social capital, civic participation, and civil society. However, current scholarship has only begun to test which volunteer management practices are most effective.

The causes and correlates of volunteering can be divided into demographic factors, resources, motivations, and the social environment. In the United States, women, whites, married people, people with children, and people who are middle aged or in early old age are more likely to volunteer. Education, income, health, and free time are all resources that correlate positively with volunteering. Motivations for volunteering include altruistic values but also include self-oriented motives such as the desire to learn new things, make friends, and advance one's career. The social environment has a powerful influence on individuals' decisions to do volunteer work, and social environment includes the social context, social roles, and social networks to which individuals belong.

Most guides to managing volunteers assume a human resources management (HRM) approach that treats volunteers as similar to paid staff. These guides advise managers to adopt professional practices in recruiting, selecting, orienting, training, placing, supervising, and evaluating volunteers. Support for the HRM approach has been mixed, with the strongest support existing for the value of recruitment, job design, orientation and training, supervision and support, and recognition. Other approaches look at psychological contracts, support from fellow volunteers, treating volunteers as a renewable resource, and using a loose, non-bureaucratic structure that allows volunteers' autonomy.

Volunteers in the public sector make up about 25–30% of the labor force in the United States. Public agencies are less likely than nonprofits to adopt HRM best practices in managing volunteers, but concerns about conflicts between paid staff and volunteers seem not to be justified.

Volunteering has a number of positive effects both on individuals and on society. Volunteers tend to be both mentally and physically healthier and happier than non-volunteers, and volunteering can lead to career opportunities. Volunteering contributes to social capital and can encourage good citizenship and political participation. The promotion and effective management of volunteerism is therefore an important task for public administrators and nonprofit managers, and a continuing challenge for scholarly work.

# Volunteers in the Public Sector

Jeffrey L. Brudney, Joseph L. Harris and Hayley K. Sink
Department of Public and International Affairs, University of North Carolina Wilmington, Wilmington, NC, USA

Volunteers are not usually thought of in the context of government. Indeed, most volunteers donate their time to nonprofit organizations rather than public agencies. Yet, citizens contribute a surprisingly large amount of labor to governments at all levels. Accordingly, this chapter examines the involvement of volunteers in the delivery of services funded and provided by public agencies. Given our focus on service delivery, we do not cover citizen involvement in public policy making, for example, sitting on a government board or oversight committee, or citizen participation in government in other ways, such as by attending public meetings, council proceedings, legislative hearings, or the like; contacting public officials, whether elected or appointed, to raise a complaint, concern, or issue; or engaging in additional political behaviors, including voting, displaying a yard sign, wearing a political button, etc. Although these forms of citizen participation in governmental affairs are important and deserving of attention, they lie outside the boundaries of this chapter on volunteering to assist governments in the delivery of publicly provided services.

Notwithstanding the limited scope of this definition, the involvement of citizens as volunteers in the delivery of public services is substantial. Based on the 2015 US Bureau of Labor Statistics (BLS) (2016) report, *Volunteering in the United States*, as well as other surveys pertaining to volunteer involvement in government (Corporation for National and Community Service 2015; Independent Sector 2016), we can extrapolate the number of Americans donating time to public service annually. Surveys of volunteer behavior dating back to the late 1990s show that between 20.0% and 28.9% of all volunteers donate time to government organizations, which would amount to some 12.5–18.1 million people assisting government in service delivery in 2015. They donate between 1.3 billion and 2.1 billion hours, with an attributed dollar value between $30.0 billion and $48.4 billion. As these data displayed in Table 1 show, not only is this volume of labor contributed by citizens to government significant in its own right, but it also provides a large pool of the human resources used to deliver important public services, such as education, libraries, culture and the arts, recreation, and public safety.

**Volunteers in the Public Sector, Table 1** Volunteer involvement in government in the USA

| Volunteer involvement | Measurement |
|---|---|
| Percentage of volunteers donating time to government | 20.0–28.9% |
| Number of individuals who assist government in service delivery | 12.5–18.1 million |
| Number of hours volunteered to government | 1.3–2.1 billion |
| Assigned dollar value of hours volunteered to government | $30.4 billion to $48.4 billion |

Source: Adapted from the US Bureau of Labor Statistics (2016) report *Volunteering in the United States*, Corporation for National and Community Service (2015), and Independent Sector (2016)

This chapter on volunteer involvement in the public service consists of four parts. To guide our understanding of the topic, we begin with a general definition of volunteers that has been developed and accepted in the academic literature; we also describe the volunteer population in the USA. In the next section, we show that the definition of volunteers in the public sector draws from the general definition but is more restrictive. Given our definition we next provide a more detailed examination of the magnitude and scope of volunteer involvement in public service delivery, followed by an examination of the institutional and legal environment for volunteers in government. We conclude with a treatment of the consequences of our discussion for the management of volunteers in the public sector.

## Volunteers: Who and What

The identification of who a volunteer is and what a volunteer does is constantly evolving. Although individuals have come together voluntarily to identify and meet the needs of communities for centuries (Cnaan et al. 1996; Karl 1984), the terms "volunteering" and especially "volunteer management" were not widely studied until the late 1960s and early 1970s (Brudney et al. 2016; Naylor 1967).

Volunteerism, or the act of volunteering, has many definitions. Broadly, volunteering can be viewed as an action that aids a person, group, or cause in which the volunteer gives her or his time with or without personal benefit (Wilson and Musick 1999).

The US Bureau of Labor Statistics (2016) annually collects data on the extent and demographics of volunteering in the USA. The BLS defines volunteering in the following item: "This month, we are interested in volunteer activities, that is, activities for which people are not paid, except perhaps expenses. We only want you to include volunteer activities that you did through or for an organization, even if you only did them once in a while."

By this definition, the Bureau of Labor Statistics (2016) found that one-quarter of the US population (24.9%) volunteered through or for an organization in the year ending in September 2015. The volunteer rate for women (27.8%) surpassed that for men (21.8%). The rates of volunteering were highest among 35–44-year-olds (28.9%) and 45–54-year-olds (28.0%); the rate was lowest for 20–24-year-olds (18.4%). Whites volunteered at a rate of 26.4%, Blacks at 19.3%, Asians at 17.0%, and Hispanics at 15.5%. About 30% of married individuals volunteered (29.9%), compared to about 20% of people who have never been married (19.9%). In addition, parents with children under the age of 18 volunteered at a higher rate (31.3%) than persons without children under this age (22.6%). Individuals with more formal education volunteered at a higher rate relative to those with less. About 40% of those holding a bachelor's degree volunteered (38.8%), compared to 26.6% of persons with a college or an associate's degree, 15.6% of high school graduates, and 8.1% of persons who did not complete high school. Among the employed, 26.3% of full-time workers volunteered, versus 31.1% of people who worked part-time. In comparison, unemployed persons and those not in the labor force volunteered at lower rates, 23.3% and 21.4%, respectively.

In an effort to synthesize the various definitions of "volunteer," Cnaan et al. (1996) identified and reviewed 11 common definitions of volunteering, including those presented by the US President's Task Force on Private Sector Initiatives in 1982, the Fair Labor Standards Act and Regulations (1985), the Independent Sector in 1986, and the National Association of Counties in 1990. Although Cnaan et al. (1996) found no one "correct" or universally accepted definition of the term volunteer, they concluded that underlying all definitions lie four important dimensions that characterize volunteer activity: free choice, remuneration, structure, and intended beneficiaries. The free choice dimension ranges from free will to choose to volunteer, to a relatively uncoerced volunteer experience, to an obligation to volunteer. The remuneration dimension ranges from no remuneration expected or received, to no remuneration expected, to expenses reimbursed as allowed, and finally to a stipend or low pay received. Structure refers to whether the volunteer activity occurs under the auspices of an organization (formal volunteering) or is undertaken outside such auspices (informal volunteering). Intended beneficiaries range from a volunteer experience that benefits and helps strangers, to one that benefits and helps friends and relatives, to a volunteer experience that benefits oneself. Table 2 presents the four dimensions.

According to Cnaan et al. (1996), people are more likely to label an activity as volunteering when it entails free choice, no remuneration is received, the act is conducted within a formal organization structure, and the benefit is focused on helping others not known to the individual. Although a particular activity may still constitute volunteering under some definitions, people are less likely to perceive acts as falling under this label when the reverse of these dimensions holds

**Volunteers in the Public Sector, Table 2** The four key dimensions of volunteerism

| Dimension | Description | Interpretation of volunteer dimensions | | | |
|---|---|---|---|---|---|
| | | Pure-strict ← | | → | Moderate-loose |
| Free choice | Dimension ranges from free will to choose to volunteer, an uncoerced volunteer experience, to an obligation to volunteer | Free choice | Relatively uncoerced | Obligation to volunteer | – |
| Remuneration | Dimension ranges from no remuneration expected or received, no remuneration expected, expenses reimbursed, to a stipend or low pay | None at all | None expected | Expenses reimbursed | Stipend/ low pay |
| Structure | Dimension ranges from formal (organizationally based volunteering) to informal (individually based volunteering) | Formal structure | – | Informal structure | – |
| Intended beneficiaries | Dimension ranges from a volunteer experience that benefits and helps strangers, benefits and helps friends and/or relatives to a volunteer experience that benefits self, friends, relatives, and others known by the volunteer | Benefits/ helps strangers | Benefits/ helps friends and/or relatives | Benefits/helps self, friends, relatives, and others known by the volunteer | – |

Source: Adapted from Cnaan et al. (1996)

the "volunteer" activity entailed obligation, the individual received a stipend or low pay, the activity did not occur as part of an organization but informally or alone, and the individual benefitted directly from the activity.

The most stringent or "purist" definition of volunteer (Cnaan et al. 1996, p. 370) refers to those who give their time freely (free choice), with no remuneration (remuneration), in a formal organization (structure), and with the volunteer activity benefitting strangers or other people (intended beneficiaries). By contrast, people who give their time under the converse conditions would be considered members of the volunteer pool only under more generous definitions. Observers would be less likely to consider as volunteers who have some obligation to volunteer (e.g., people mandated by the legal system to conduct community service without compensation), who receive some stipend or low compensation (e.g., members of AmeriCorps, VISTA, or PeaceCorps), or who give their time in an unorganized setting or alone (e.g., watching a neighbor's child at a park) or benefit themselves (e.g., students obtaining job experience through an internship). The purpose of the dimensional framework is not to include or exclude people from falling under the definition of a volunteer but to recognize that the term has a variety of meanings and interpretations that should be taken into account for both research and practice. In the next section, we elaborate the definition of one segment of the volunteer universe: those who donate their time to assist government agencies in delivering services.

## Defining Volunteers in the Public Sector

To understand the nature, scope, and magnitude of volunteers involved in public service delivery, we must define the term more specifically. With reference to the dimensions of volunteering presented by Cnaan et al. (1996), Brudney (1999) identifies the following characteristics of volunteers in the public sector:

- **Free choice**: the volunteer's time must be offered freely, instead of mandated or coerced.
- **Remuneration**: although volunteers in the public sector do not receive remuneration for contributing their time and labor, they are

entitled to compensation for the out-of-pocket expenses associated with volunteering, such as mileage, meals, and parking (Fair Labor Standards Act 1985).
- **Structure**: the volunteer activity occurs in a formal setting, that is, in an organization.
- **Intended beneficiaries**: the volunteer activity is intended to benefit the clients of government agencies ("strangers"), although volunteers may receive nonmonetary benefits.

Brudney (1999) clarifies further the definition of volunteers in the public sector:

- **Service delivery**: public sector volunteer programs place participants in positions with continuing responsibilities for service delivery or organizational maintenance. This characteristic distinguishes service delivery volunteers from other participants in government, such as members of citizen commissions, boards, panels, committees, etc., who participate in government in a policy-making capacity (see above).
- **Organizational auspices**: the volunteer activity is sponsored and housed under the auspices of a government agency. As members of a government organization, volunteers may receive additional or different benefits and may be subject to more protections as well as more restrictions on their behavior than volunteers in other settings (see below).

Based on this definition, the next section describes the magnitude and scope of volunteer involvement in the public sector in the USA.

## Volunteer Involvement in the Public Sector: Magnitude and Scope

Brudney examined volunteer participation in the delivery of services funded and provided by public agencies in his 1990 book, *Fostering Volunteer Programs in the Public Sector: Planning, Initiating, and Managing Voluntary Activities*. The book documented the increase in volunteer participation in the public sector throughout the 1980s.

Brudney's (1990) research showed that in 1985, 13.2% of the American populace – about 23 million people – volunteered to assist in the delivery of publicly provided services at the local, state, or federal levels of government. According to Weisbrod (1988, p. 202), in 1985 volunteers supplied public organizations with a substantial amount of productive labor, the equivalent in total hours to 1.2 million full-time employees. Based on surveys of service delivery approaches used by cities and counties, the International City/County Management Association (ICMA) estimated that in 1982 more than half (56.5%) of localities with populations over 4500 involved volunteers in at least one program or policy domain. By 1985 the figure had risen to 72.6% (Brudney 1990). In 1988 the extent of volunteer participation reported by cities and counties ranked second only to contracting as an alternative means for government to deliver services with respect to both the number of service domains where the method is utilized and the proportion of local governments that have adopted it (Brudney 1990).

Through the reporting of results of five surveys conducted by the Gallup Organization between 1988 and 1999 on the level of volunteering by the American public, Weitzman et al. (2002) were able to update some of these findings. These surveys showed a high level of volunteering in the public sector, especially in 1988, 1990, and 1992, ranging between 26.6% and 28.9% of all volunteers in the USA. The results from the last 2 years in which the survey was administered suggest a decline in those rates, but still attest to substantial levels of volunteering to government agencies: 20.0% of all volunteers in 1996 and 20.2% in 1999 (such a sharp "decline" suggests to us a change in survey methodology, but we are not able to verify this surmise). Table 3 presents the detailed findings.

In sum, evidence available from population surveys leads us to estimate that between 20% and 30% of all volunteers in the USA donate time to a government agency. This estimate is remarkably consistent with Brudney's (1990) conclusion that a "significant amount of volunteer labor is directed to public agencies: U.S. government agencies operate as many as

**Volunteers in the Public Sector, Table 3** Extent of volunteering to government

| Year of survey | Percentage of volunteers donating time to government | Percentage of all volunteer hours donated to government | Assigned dollar value (billions) |
|---|---|---|---|
| 1999 | 20.2 | 16.4 | $37.0 |
| 1996 | 20.0 | 17.2 | $34.7 |
| 1992 | 26.6 | 25.3 | $55.1 |
| 1990 | 27.7 | 26.2 | $43.9 |
| 1988 | 28.9 | 22.7 | $34.0 |

**Volunteers in the Public Sector, Table 4** Areas of volunteer activity in government

| Area of activity | Percentage of volunteers to government |
|---|---|
| Education | 43.4 |
| Adult recreation | 25.5 |
| Youth development | 21.6 |
| Human services | 18.9 |
| Environment | 18.2 |
| International and foreign affairs | 15.9 |
| Health | 14.5 |
| Arts, culture, and the humanities | 13.7 |

Source: Adapted from Weitzman et al. (2002)

20–30% of all organized volunteer programs, and perhaps another 20–30% of these programs are associated with the public sector" (p. 2). Similarly, based on analysis of ICMA surveys on alternative service delivery approaches used by local governments, Nesbit and Brudney (2013) found that although the use of volunteers by cities and counties declined from 1988 to 2007, in 2007 over one-quarter (27%) of local governments involved volunteers in the delivery of public services. Nesbit and Brudney (2013) reported that the population size of a locality is related to the type of public services volunteers provide: smaller jurisdictions are more likely to use volunteers in public safety, and larger jurisdictions are more likely to use them in health and human services and cultural and arts programs.

Weitzman et al. (2002) also provided estimates of the share of volunteer hours donated to government agencies in the USA over the 1988–1999 period. The share of hours volunteered to government fluctuated from a low of 16.4% of all hours volunteered in 1999 to a high of 26.2% of total hours in 1990. Regrettably, since the time that these data were collected, the Gallup Organization (as well as other survey organizations) has not fielded more contemporary surveys that allow firm estimation of the percentage, size, and monetary attribution of the pool of volunteers donating time to government. Nevertheless, based on these earlier surveys, we can provide rough estimates of the likely size of this pool in the mid-2010s. Assuming that the percentage of all volunteers donating time to the public sector has remained comparable to the 1988–1999 period at between 20.0% and 28.9% of all people volunteering in the USA, we project that as of 2016, the level of volunteer involvement in government to deliver services ranges between 12.5 million and 18.1 million US citizens annually, donating approximately 1.3 billion to 2.1 billion hours, valued at $30 billion to $48.4 billion (as enumerated in Table 1).

Table 4 shows the percentage of volunteers to government who donated time in different public policy domains in the year ending in March 1999 (the most recent data available). Education commands the most volunteers, with over 40% (43.4%). Adult recreation follows with one-quarter of the volunteers to government (25.5%), and youth development has nearly as many with just over one in five volunteers (21.6%). Human services (18.9%) and environment (18.2%) attract nearly identical percentages of volunteers to government, with international and foreign affairs (15.9%), health (14.5%), and arts, culture, and the humanities (13.7%) closely behind. Because volunteers to government might contribute their time in multiple service domains, the percentages sum to more than 100.0.

Another area in which government has a particular interest in enlisting citizen volunteers is fire, emergency, and first responder services. The International Association of Fire Chiefs (2005) found that an estimated 800,000 volunteer firefighters serve 73% of the fire departments in the

USA (19,224 of a total of 26,354 departments). An additional 4892 departments are comprised of a combination of volunteer firefighters and paid firefighters. Though volunteer firefighters represent the majority of firefighters in the USA, since 1995 the total number of volunteer firefighters has decreased by 10%. Across the USA, although 39% of fire departments provide no emergency medical services, 46% provide basic life support, and an additional 16% provide advanced life support (Haynes and Stein 2016). Additionally, volunteer emergency responders are mobilized in communities through the Federal Emergency Management Agency's (FEMA) Community Emergency Response Team (CERT), to be better prepared for disaster response. In 2016 more than 2600 CERT volunteer programs existed in the USA, (Department of Homeland Security 2016).

## The Institutional and Legal Environment of Volunteer Involvement in the Public Sector

Given our definition of volunteers in the public sector, and the fact that these volunteers fall under the federal Volunteer Protection Act (VPA) of 1997 (42 U.S.C. Sections 14501-14507, 1997), the provisions of the VPA merit attention, especially in relation to their consequences for the management of volunteers in government. Although the Act is intended to shield all volunteers from liability under certain conditions (see below), whether donating time to a government agency or to a nonprofit organization, we might expect to see it institutionalized more regularly in government. The Act protects volunteers from liability under specific conditions; however, liability is transferred rather than abrogated: the government (or nonprofit) organization sponsor or host can be held liable for the actions of its volunteers. In addition, Groble and Brudney (2015) find that in court cases involving them, volunteers have had mixed success in invoking the protections conferred by the VPA.

Section 4 of the Volunteer Protection Act (1997) establishes the criteria relating to protections of volunteers from liability for their actions while donating time to a nonprofit or government organization. Section 4 of the VPA states:

> No volunteer of a nonprofit organization or governmental entity shall be liable for harm caused by an act or omission of the volunteer on behalf of the organization or entity if –

1. The volunteer was acting within the scope of the volunteer's responsibilities in the nonprofit organization or governmental entity at the time of the act or omission.
2. If appropriate or required, the volunteer was properly licensed, certified, or authorized by the appropriate authorities for the activities or practice in the state in which the harm occurred, where the activities were or practice was undertaken within the scope of the volunteer's responsibilities in the nonprofit organization or governmental entity.
3. The harm was not caused by willful or criminal misconduct, gross negligence, reckless misconduct, or a conscious, flagrant indifference to the rights or safety of the individual harmed by the volunteer.
4. The harm was not caused by the volunteer operating a motor vehicle, vessel, aircraft, or other vehicles for which the state requires the operator or the owner of the vehicle, craft, or vessel to:
   (A) Possess an operator's license
   (B) Maintain insurance

The VPA provides the foundation for the treatment and protection of volunteer liability for host organizations. Moreover, the provisions of Section 4 set a baseline for volunteer administration practice.

The first criterion of Section 4 specifies that the volunteer must have job responsibilities as a protection from liability, as most clearly articulated in a job description or job guide for assigned duties. We might anticipate that volunteers in government agencies would be more likely to work under a job description since their exposure to liability is lessened with this precaution. The second criterion of Section 4 states that if training or certification is required to perform the duties assigned to the volunteer, the volunteer must

demonstrate these qualifications to merit protection under the VPA. As with paid employees, good ("best") practice suggests that volunteers be deployed in positions for which they have the relevant training and/or certification. The third criterion establishes that the volunteer must not act consciously or willfully to violate the rights, safety, or health of clients, employees, and other volunteers. Because no organization would countenance such behavior, the associated human resource management precaution is screening volunteer applications and monitoring volunteer behavior to prevent abuses (Freyss and Behrens 1994, p. 1). The last criterion of Section 4 maintains that if an operator's license for conveyance, such as for an automobile, vessel, or aircraft, is required to perform the assigned duties, the volunteer must have the mandated licensure and insurance coverage. The organization must check that the volunteer meets the requirements. As Freyss and Behrens (1994) point out, "Volunteers Require More Than Amateur Status," as demonstrated in part by necessary planning and precautions for risk management pursuant to the Volunteer Protection Act.

## Human Resource Management of Volunteers in the Public Sector

The foregoing analysis suggests that volunteer management in government organizations, versus nonprofit agencies, will have distinctive characteristics for two primary reasons. First, government organizations are enmeshed in a legal setting that draws its legitimacy from the public jurisdiction and ultimately the governed. As a result, it is likely that the legal provisions and structure surrounding the involvement of volunteers will feature more rules, processes, and procedures than in nonprofit organizations, which operate outside of public authority and auspices. In addition, government organizations are typically older and larger than most nonprofits; Brudney and Sink (2017) maintain that such entities call for more formal supervision, oversight, and structuring of volunteer activities. Second, since government is accountable for the lawful and appropriate expenditure of public funding as well as proper exercise of authority, one can also expect the management of volunteers in public sector agencies to exhibit more paperwork, clearances, sign-offs, and procedures than required or manifested in most nonprofit organizations. Consequently, we would expect management of volunteers in the public sector to be subject to greater checks, precautions, and rules and regulations than in the typical nonprofit.

As opposed to nonprofit organizations, which have greater autonomy with respect to volunteer involvement and activities, statute law and/or government policy can impede or even prevent volunteer participation in the public sector. The most significant example is a federal regulation that prohibits national agencies from accepting the services of volunteers "except for emergencies involving the safety of human life or the protection of property (31 U.S.C. 1342)," unless a law has been established specifically exempting the agency (Brudney 1990, p. 123). State and local governments can exercise their own restrictions and regulations on the involvement of public sector volunteers. Legal cases brought before US courts illustrate the administrative environment surrounding volunteers in the public sector.

In *Garcia v. San Antonio Metropolitan Transit Authority* (1985), Garcia and other employees brought suit against the San Antonio Metropolitan Transit Authority to recover overtime pay owed to them. The court held that congress has the power under the Commerce Clause to extend the Fair Labor Standards Act (FSLA) to protect wage and hour requirements of state and local government employees through the provision of overtime pay. Congress later amended the Act to provide an exemption for volunteers from coverage under the FLSA in response to complaints from state and local government agencies that the FLSA was too rigid and expensive to implement.

In *Mendel v. City of Gibraltar* (2015), "volunteer" firefighter Paul Mendel received what was considered a "substantial hourly wage" from the City of Gibraltar for his service, which resulted in a legal case to determine if the classification of Mendel's position was justly that of a "volunteer"

or "employee" under the Fair Labor Standards Act and the Family and Medical Leave Act (FMLA). Following the termination of Mendel's employment, Mendel and his attorneys argued that his rights had been violated under the FMLA; the case was brought before the US District Court and the US Court of Appeals. Although the District Court ruled in favor of the City of Gibraltar, the US Court of Appeals ruled that the firefighters were employees, as opposed to volunteers, citing 29 U.-S.C. Sections 2601-2654 (FMLA 1993,) and, in fact, are covered under the FLSA and FMLA, despite the volunteer nature of this government service delivery.

Given the interest of the courts in personnel matters relating to volunteers serving in government, we would expect to find a greater amount of supervision and oversight of volunteers in the public sector. Brudney (1990) suggests that leaders and managers in government may view volunteers more as unpaid workers who contribute micro-bits of time to the public sector (the typical volunteer contributes about 2–4 h per week) rather than as citizen participants who want to promote their policy preferences or seek involvement in public affairs. Accordingly, we would expect to find more procedures in government surrounding the "employment" and use of volunteer workers, such as application forms, background checks, hierarchical chain of command, documentation, etc., as well as orientation emphasizing the particular values of public service, such as confidentiality, non-discrimination, and efficiency. Indeed, in her pioneering book on volunteer administration, Harriet H. Naylor (1967), who worked as the national director of the Office of Volunteer Development at what was formerly known as the US Department of Health, Education, and Welfare (HEW), proposed personnel management procedures for volunteers that were similar to those for paid employees.

Finally, if our surmise is correct that volunteers in the public sector work in a more rule-bound, structured, and "bureaucratic" organizational environment, we must consider the special challenges created not only for human resource management but also for volunteer motivation. No evidence exists that volunteers are motivated by the "opportunity" to contribute their time in an environment that resembles the paid workplace; by contrast, ample data and studies support the converse notion that through their service, volunteers seek to meet their higher-order needs for such intrinsic rewards as personal identity, individual fulfillment, and self-actualization (Musick and Wilson 2008). In addition, organization mission areas tend to be more circumscribed in government than in the nonprofit sector: a government volunteer working in the area of homelessness, for example, might be tasked with meeting the needs of the homeless for shelter, while a nonprofit volunteer in the same mission area might be encouraged to assist with the full range of needs of the homeless, including but not limited to housing, counseling, nutrition, medical care, etc. Volunteer job descriptions in government can be more limited, thus potentially robbing the job of some of its intrinsic incentives. If so, managers in government organizations will face greater challenges in motivating volunteers than their counterparts in nonprofit organizations, which typically feature greater flexibility and fewer restrictions than public agencies in motivating, inspiring, and directing volunteers. As a result, we might expect to encounter greater difficulty in recruitment and retention of volunteers in the public sector.

## Conclusion

This chapter focuses on volunteers in the public sector. The chapter began by considering the definition of volunteers in general and then provided a more restricted definition based on volunteer involvement in the public sector. Based on this foundation, we generated estimates of the extent or magnitude of volunteer participation in public agencies, as well as the particular policy areas in which volunteers are active. Finally, we turned to the institutional and legal environment of volunteers in the public sector and commented on special needs for effective human resource management in relation to volunteers in the public sector.

Although this chapter draws on the most recent data and analysis to support our observations, unfortunately much of the most "current" information is dated. For example, we can derive estimates of volunteering in the public sector for the contemporary period, but we must also point out that they are based on data that emanate from survey research undertaken in 1988 through 1999. To our knowledge, since the publication of Brudney's *Fostering Volunteer Programs in the Public Sector* in 1990, no systematic research has followed to ascertain or replicate the size, scope, management, results, implications, and so forth of volunteer involvement in the public sector. Moreover, even though we presented justification for our argument that the organizational environment of volunteers differs for government versus nonprofit agencies, scant research has examined systematically the existence, let alone, the degree of such differences. We commend to further research both evaluating and updating the conclusions presented in this chapter. We have no doubt that such inquiry would shed important, new light on a neglected topic: volunteers in the public sector.

## Weber, Max, and the Civil Servant

Siegrun Fox Freyss
Department of Political Science, California State University, Los Angeles, Los Angeles, CA, USA

### Synonyms

Administrator; Analyst; Expert; Manager; Professional; Specialist

### Definition of Public Servant

Public sector employee with broad qualifications required for effective professional and managerial work in government.

### Introduction

The profession of the public administrator emerged in the late 1800s. The new best practices and new professional principles associated with public service were combined under the terms merit system or civil service and widely adopted by national, state, and local governments. Max Weber, a scholar and practitioner of public administration, provided detailed descriptors to make the new personnel policies transparent, their benefits, as well as their darker side.

### The Professional Civil Servant

Servants in fiefdoms versus public servants in nation-states – Weber used this contrast to distinguish between rulers and their servants under premodern, agrarian conditions versus government officials in modern, industrial countries. Weber, 1864–1920, was instrumental in identifying the core features of the efficient, modern bureaucracy, as well as the ideal characteristics of public-sector employees. Even though Weber wrote a 100 years ago, his observations are still relevant in the twenty-first century (Waters and Waters 2015).

Weber was a prolific writer with a broad historical and spatial sweep (Mommsen 1992). Being part of the Section on Public Personnel Administration, this chapter focuses on his thoughts on public bureaucrats and less on the organizational aspects of bureaucracies. The chapter will first summarize Weber's own arguments and then place them in the context of organization theory. One caveat, Weber was not rigorous in his definitions and categorizations, and this chapter retains these weaknesses and does not gloss over them.

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

To understand Weber's vision of the modern administrator in its ideal form, one has to identify Weber's vision of the public bureaucracy. In abbreviated form, the characteristics of the modern bureaucracy are:

I. Fixed and official jurisdictional areas
   1. Regular activities distributed as official duties
   2. The authority to give instructions strictly delimited by rules
   3. For regular fulfillment of official duties, employment only of persons with the right qualifications
II. Office hierarchy and graded authority
   1. Firmly ordered system of superior and subordinate ranks
   2. Supervision of lower offices by higher ones
   3. Once established, the office is to continue its existence and outlast its incumbents
III. The management of the modern office based on written documents and records
   Sizeable staff required to make copies and keep the files organized
   (Gerth and Mills 1991, pp. 196–197)

Separation of the official's workplace from his private home is another important historical change. This includes keeping public monies and equipment apart from the official's private property. The government job should not be exploited for private gain. Furthermore, the position demands the full working capacity of the official. In contrast, in the past, government functions were given a lower priority than personal business interests (Gerth and Mills 1991, pp. 197–198). The term "fiefdom" implies exploitation of the land and of people living on the land.

In the subsequent section, Weber continues describing the characteristics of the modern official's position:

I. Office holding should be treated like a vocation:
   1. This requires a firmly prescribed course of training, ending in a rigorous examination.
   2. Accepting an appointment obliges the office holder to faithfully manage the functions of the office.
   3. In return for his dedication to the agency, the official will have job security.
   4. Under feudal relations, loyalty is bestowed onto a person of superior birth, while under rational-bureaucratic conditions loyalty binds the incumbent to an impersonal office (Gerth and Mills 1991, p. 199).
II. Depending on his rank and responsibilities, the modern official can enjoy social esteem.
   1. Traditionally, esteem was tied to persons of a superior social and economic stratum. However, great demand for new competencies and for trained experts in the modern, industrial age changes the nature of esteem.
   2. Officials are appointed to their positions, not elected.
   3. The official is employed with tenure for life. This provision is supposed to guarantee that dismissals are based on objective criteria.
   4. The official should receive a fixed salary and a pension in old age.
   5. When first appointed, officials embark on a career, and they can expect regular promotions (Gerth and Mills 1991, pp. 199–203).

Success or the competent fulfilment of the public servant's responsibilities depends on the historical, political, and constitutional framework of the state. Weber distinguishes between three types of governmental powers separated by different levels of legitimacy:

1. Traditional powers/domination
2. Charismatic powers/domination
3. Legal-rational powers/domination

Traditional powers, also called domination in English translations, are derived from long-standing practices, such as patriarchies. Authority and obedience are derived from unwritten norms and passed on from one generation to the next. In contrast, the charismatic leader emerges unexpectedly, and his authority creates a following

and support. Since power and legitimacy are tied to one person, his achievements are not likely to survive his demise (Gerth and Mills 1991, pp. 206 and 246).

In Weber's view, the modern, secular, and increasingly complex state and the capitalist economy are best served by legal and rational authority, not tradition or charisma. The legal framework of bureaucracy generates efficiency, precision, speed, and other benefits for society and the economy. Other advantages of compliance with written rules are conformity, continuity, consistency, and predictability. In general, bureaucratic organizations have technical advantages, in that their output can be measured (Gerth and Mills 1991, p. 214).

In paradigmatic terms, Weber's contribution to organization theory falls under the mechanistic school of thought. He sees the potential of well-managed bureaucracies as machine-like. For the individual official, the process of enculturation starts with education and training, followed by tests and examinations. Once hired, employees are asked to give their full attention to the job, but "his obligatory time in the bureau may be firmly delimited" (Gerth and Mills 1991, p. 198). Unlike in fiefdoms, under modern, democratic conditions, senior government officials should not exploit their subordinates nor should government jobs be exploited for private gain.

Civil servants are expected to adapt and become efficient cogs in the bureaucratic machine. In Weber's own words, "The individual bureaucrat cannot squirm out of the apparatus in which he is harnessed. . . he is only a single cog in an ever-moving mechanism. . ." (Gerth and Mills 1991, p. 228). Interestingly, Weber did not like this possibility since it showed the individual as dehumanized. Weber wrote his observations during fundamental political changes, when Germany was transitioning from aristocratic rule to fledgling democracy (Gerth and Mills 1991, pp. 32–44). Weber himself was active in democratic politics, and he recognized that a well-functioning bureaucratic machine could be a threat to individual freedom and other democratic values, calling it *stahlhartes Gehäuse*, originally translated as iron cage and more recently as a "shell as hard as steel" (Lassman 1994, p. xvi; Allen 2004, p. 134).

Weber was influenced by socio-economic theorists of his time, such as Émile Durkheim and Karl Marx, and vice versa, he had substantial influence on European and American sociologists and organization theorists. It is noteworthy that his arguments on the modern public servant dovetailed with arguments in the United States on the merit system and civil service, which were first codified at the federal level by the Civil Service Act of 1883, also called Pendleton Act, (Van Riper 1958; Johnson and Libecap 1994, pp. 1–11).

## Conclusion

The profession of the public administrator or public employee received a scholarly and practical foundation with the work of Weber. His insights are still relevant, in modern, industrialized countries where corruption and self-dealing can occur anytime, as well as in developing regions where poverty cannot be erased because powerful people run their territories like fiefdoms.

| Monopoly | There is one seller or provider of product or service |
| Welfare effects | Refers to the impact of the actions by an economic unit on the well-being of individuals in society |

## Introduction

One of the important roles of the government is to provide public goods to the society. The state tries to provide those goods that may be difficult for the private sector to provide in a way that maximizes public welfare (Schmitz 2015; Jack and Recalde 2015). Globally, there are many state-owned monopolies that have been entrusted with this task. Monopolies exist due to various reasons associated with technical and legal barriers to entry. There are many advantages of state-owned monopolies. First, state-owned monopolies can undertake research and development with the aid from the government. It has been noted in many studies that innovative activities carried out by monopolies enhances social welfare (Yao and Gan 2010; Li and Wang 2010; Chu et al. 2012; Spulber 2013). Second, the state-owned monopolies can incur a low marginal cost over a wide range of output. This leads to technical barriers to entry while benefitting consumers in the long run. In the developing countries, it is difficult to find monopolies whose benefits to the society outweigh the costs that they have on the society.

Moreover, there are many disadvantages of having a state-owned monopoly. First, monopolies generate deadweight loss. When exploring market structures, specifically monopoly market, inefficiency is an aspect that is usually associated with this market structure (Amir et al. 2016; Carlton and Keating 2015). Deadweight loss is generated when the consumer surplus that is present in the competitive market is transferred to monopoly profits. In this case the consumers lose while the monopoly benefits. Second, monopolies provide high tax revenue to the government by charging higher prices to consumers. Third, state-owned monopolies have strong government support, and these disincentives them to be less accountable and transparent to the taxpayers.

The main aim of this entry is to estimate and examine the deadweight loss generated by state-owned monopolies in Fiji and Samoa. The two state-owned monopolies that were selected in this entry were Fiji Electricity Authority (FEA) and Samoa Electric Power Corporation (SEPC). (The selection of these two companies was done entirely on the availability of data.) These two state-owned entities play a crucial role in the provision of electricity to Fijians and Samoans. The performance of these two companies comes under limelight due to inefficiency factor. Additionally, this entry also seeks to examine the impact of government policies on the deadweight loss generated by monopolies.

There are two reasons why this entry needs to be conducted. First, none of the existing studies to date has examined the economic inefficiency generated by state-owned monopolies in Fiji and Samoa. Second, none of the existing studies have examined the impact of government policies on the deadweight loss generated by monopolies. This study extends the existing literature by filling these two gaps in the existing literature.

This study contributes to the existing literature in two ways. First, it emphasizes that deadweight

loss is not the only loss or economic inefficiency generated by the monopoly. There are welfare losses that arise due to misallocation of public funds by the government to help the monopolies. Second, it also tries to emphasize that the monopolies will try to maximize their profits even if their profit goal is constrained by government regulation. This will distort the impact of government policies on the social welfare. (Government provides subsidies to state-owned monopolies, and these monopolies should reduce their prices so that consumers can benefit. However, these monopolies may not reduce their prices to balance off the cost that is subsidized by the government. They may reduce their prices slightly.)

This entry is divided into six sections. Section "Overview of Fiji Electricity Authority (FEA) and Samoa Electric Power Corporation (SEPC)" provides an overview of FEA and SEPC. Section "Theoretical Framework and Literature Review" outlines theoretical framework and reviews the existing literature. Section "Data Collection and Model Specification" outlines data collection and model specification. Section "Research Findings and Discussions" presents and discusses the research findings. Section "Conclusions, Theoretical Contributions and Policy Implications" outlines the conclusion, theoretical contributions and policy implications of this entry.

## Overview of Fiji Electricity Authority (FEA) and Samoa Electric Power Corporation (SEPC)

One of the key roles of national government is to effectively and efficiently deliver basic utilities to the general public. In order to effectively undertake this role, the government usually establishes state-owned enterprises and provides monopoly power to these state-owned enterprises. State-owned monopolies usually arise due to legal barriers to entry, whereby the state favors its enterprises in a number of ways. Some of these ways are providing unwarranted tax benefits and subsidies. This phenomenon is present in the utility industry of Fiji and Samoa.

### Fiji Electricity Authority

The FEA is a fully owned government entity in Fiji that is regulated by the Electricity Act of 1966. The primary role of the FEA in Fiji's economy is to generate and provide electricity to the people of Fiji (Fiji Electricity Authority 2016). The power sector of Fiji has experienced structural changes in two specific time periods. These two specific time periods were in late 1990s and from year 2001 to 2013 (Dornan 2013). The initial plan of the government was to privatize the power industry, but this has never happened. In the second phase of the reform, FEA was only corporatized, and it was noticed that their performance improved because they adopted good practices from the private sector (Dornan 2013). Figure 1 shows that the production of electricity is more than the quantity consumed in Fiji.

Figure 1 shows that the production of electricity by the FEA increased from 835,168,583 kWh in 2010 to 794,874,155 kWh in 2014. The consumption of electricity also increased from 764,232,031 kWh in 2010 to 794,113,640 kWh in 2014. Figure 2 shows that FEA's profits, total revenue, and total costs have been volatile from year 2010.

Figure 2 shows that the tax benefits provided to FEA in 2012 have pushed after tax net profits up.

### Samoa Power Corporation (SEPC)

The SEPC was setup in 1972 with the main goal of provision of electricity to the general public of Samoa. This company has been in existence for the last 44 years and is governed by the Power Electric Act of 1980 (Samoa Electric Power Corporation 2014). The main goal of the SEPC is to provide electricity at affordable prices to the Samoans. The SEPC focuses on delivering its services by using sustainable and innovative practices. There are many problems faced by SEPC. Some of these challenges are managing electricity tariffs, natural disasters, volatility of fuel prices, and human resources (Samoa Power Corporation 2014). The government of Samoa has been supportive of the role that SEPC plays in the economy of Samoa. In an attempt to support the SEPC, the government of Samoa has exempted SEPC from paying taxes on its profits and provided annual

**Welfare Effects, Government Policies, and Deadweight Loss, Fig. 1** Production and consumption of electricity by FEA. (Source: Created by the authors of this paper by using data from the Fiji Electricity Authority (2010, 2011, 2012, 2013, 2014))

**Welfare Effects, Government Policies, and Deadweight Loss, Fig. 2** Total revenue, profits and costs of FEA. (Source: Created by the authors of this paper by using data from the Fiji Electricity Authority (2010, 2011, 2012, 2013, 2014))

subsidies for the provision of electricity. Figure 3 shows the production and consumption of electricity by SEPC. Figure 3 shows that the electricity produced is more than the electricity consumed in Samoa.

Figure 3 shows that the production of electricity by the SEPC increased from 111353960 kWh in 2010 to 124985632 kWh in 2014. The consumption of electricity also increased from 91699781 kWh in 2010 to 106280682 kWh in 2014. Figure 4 shows that SEPC's profits, total revenue, and total costs have been volatile from year 2010.

Figure 4 shows that the gap between the marginal cost and marginal revenue of the SEPC is very low. Therefore, the profits made by SEPC are low.

The next subsection will outline the theoretical framework used in this entry.

## Theoretical Framework and Literature Review

It has been randomly emphasized by the existing theoretical models on welfare losses generated by monopolies that the society losses when government tries to provide unjustified benefits to the monopoly. These benefits can be in two forms (Posner 1975; Shleifer 2005; Solis and Maudos

**Welfare Effects, Government Policies, and Deadweight Loss, Fig. 3** Production and consumption of electricity by the SEPC. (Source: Created by the authors of this paper by using data from the Samoa Electric Power Corporation (2010, 2011, 2012, 2013, 2014))

**Welfare Effects, Government Policies, and Deadweight Loss, Fig. 4** Total revenue, profits, and costs of SEPC. (Source: Created by the authors of this paper by using data from the Samoa Electric Power Corporation (2010, 2011, 2012, 2013, 2014))

2008). First, the government allows the monopoly to charge higher prices than what competitive firms would charge. This results in deadweight loss resulting in market inefficiency. Figure 5 illustrates how deadweight loss is generated by a state-owned monopoly.

In Fig. 5, point A represents the price charged by the monopoly, and point B represents the price charged by the competitive market. Area ABC in Fig. 5 shows the deadweight loss. Second, there is opportunity costs associated with government pumping financial resources for the improvement of the overall welfare of the monopoly at the expense of public welfare. All these factors need to be incorporated while analyzing the welfare loss associated with the state-owned monopolies. Capturing these two transmission mechanisms in the welfare loss function, we get:

$$WL_{mt} = f(\pi_{mt}, TR_{mt}, TC_{mt}; R_{mt}) \qquad (1)$$

In Eq. 1, $WL_{mt}$ is the welfare loss generated by the monopoly in period $t$, $\pi_{mt}$ is the profit of the monopoly in period $t$, $TR_{mt}$ is the total revenue of the monopoly in period $t$, and $TC_{mt}$ is the total cost of the monopoly in period $t$. The welfare function

**Welfare Effects, Government Policies, and Deadweight Loss, Fig. 5** Deadweight loss generated by a state-owned monopoly. (Source: Developed by the author of this paper (2016) by using information from Posner (1975))

is constrained by government regulations. Changes in government regulation have an impact on the degree of welfare loss experienced by the citizens. Therefore, $R_{mt}$ is the regulation of the monopoly in period $t$. Rewriting Eq. 1 in its specific form we get:

$$TR_{mt} = p_1 f(k, l) \tag{2}$$

In Eq. 2, $p_1$is the price per unit of output of the monopoly, and $f(k,l)$ is the output produced.

$$TC_{mt} = p_2 k + p_3 l \tag{3}$$

In Eq. 3, $p_2$is the price per unit of capital, $p_3$ is the price per unit of labour, $k$ is capital, and $l$ is labor. From Eqs. 2 and 3, monopoly profits can be calculated as follows:

$$\pi_{mt} = p_1 f(k, l) - (p_2 k + p_3 l) \tag{4}$$

The rate of return on capital investment of a firm can be calculated as follows:

$$\mathrm{RRKI}_{mt} = (p_1 f(k,\ l) - p_3 l)/k \tag{5}$$

Assuming that the rate of return on capital investment by the monopoly is constrained by government regulation denoted by $m$, so the monopoly Lagrangian expression subject to government regulation constraint is given as follows:

$$\mathcal{L} = p_1 f(k, l) - (p_2 k + p_3 l) + \lambda(p_3 l + mk - p_1 f(k,\ l)) \tag{6}$$

Differentiating Eq. 6 with respect to $l$, $k$, and $\lambda$ and equating the first differential equal to 0, we get:

$$\frac{\partial \mathcal{L}}{\partial l} = p_1 f_l - p_3 + \lambda(p_3 - p_1 f_l) = 0 \tag{7}$$

$$\frac{\partial \mathcal{L}}{\partial k} = p_1 f_k - p_2 + \lambda(m - p_1 f_k) = 0 \tag{8}$$

$$\frac{\partial \mathcal{L}}{\partial \lambda} = p_3 p_2 + mk - p_1 f(k, l) = 0 \tag{9}$$

Equations 7, 8, and 9 capture the effect that a monopoly will try to maximize profits in the midst of regulatory constraints. There are two ways how monopolies will be able to foster this. First, if the government is charging higher taxes on profits, monopoly will try to reduce the burden of the tax by increasing their marginal revenue per unit of output and reducing marginal cost. Second, if the government provides subsidy to the monopoly, it may choose to continue to charge the same price as it has the market power to do so. Alternatively, the monopoly can also reduce the price if the government pressures them to do so.

There are two ways how this entry contributes to the existing literature. First, it emphasizes that deadweight loss is not the only loss or economic inefficiency generated by the monopoly. There are welfare losses that arise due to misallocation of public funds by the government to help the state-owned monopolies. Second, it also tries to emphasize that the monopolies will try to maximize their

**Welfare Effects, Government Policies, and Deadweight Loss, Fig. 6** Effect of subsidy on welfare of monopoly and social welfare. (Source: Created by authors of this paper (2016))

profits in the midst of regulatory constraint. This will distort the impact of policies on the social welfare. Figure 6 captures this by using the budget constraint framework.

Figure 6 shows that if the government provides subsidy, the production cost of monopoly should decrease, and economic welfare should increase from E to C. However, monopolies can still charge higher prices because they have total control of the market. This results in the graph to shift from E to D causing less increase in social welfare.

## Literature Review

There have been many notable debates in the academic literature on the impact of monopoly on the national economy (Hałaburda and Yehezkel 2013). One of the notable issues highlighted in the existing studies is that monopolies cause deadweight and price discrimination (Wang and Chen 2012). This leads to economy inefficiency and loss of economic welfare. Undoubtedly, the topic on deadweight loss and price discrimination is a notable one, but to date much hasn't been done to estimate deadweight loss (Wang and Chen 2012). The existing literature on the effects of monopoly on national economy can be divided into two categories. First is the economic inefficiency caused by monopolies (Flynn et al. 2009; Morita and Waldman 2010; Hałaburda and Yehezkel 2013; Kim and Lee 2014) and the second is the impact of regulation on the welfare losses generated by the monopoly (Goolsbee 2006; Liu and Lu 2015). This subsection will review existing studies on these two categories.

### Deadweight Loss and Monopoly Behavior

Deadweight loss is an economic inefficiency that arises when monopolies charge higher prices to consumers, resulting in the transfer of consumer surplus to the monopoly profits (Flynn et al. 2009; Morita and Waldman 2010). Chen and Sappington (2011), Hałaburda and Yehezkel (2013), and Kim and Lee (2014) found that deadweight loss from a state-owned monopoly may be high as compared to a monopoly from the private sector. Private sector monopolies tend to be more transparent in disclosing information to public and may face strict government regulation, while the state-owned monopolies are supported and backed by the government; therefore there is less incentive for them to disclose information to public. Wang and Chen (2012) argued that there are many countries around the world that have been implementing reforms in the energy sector to improve the efficiency of the energy sector. During the 1980s, the government of China encouraged the private sector to invest in the energy sector because there was a massive shortage of electricity supply in China. In the recent years, the private sector is losing interest in the energy sector of China with the government-owned monopoly becoming stronger day by day.

Wang and his colleague argued that the development of this relative monopoly may be harmful to the interest of the general public. (Relative monopoly is also known as imperfect monopoly. A relative monopoly is one where the product sold by the monopoly does not have a close substitute but may have a remote substitute. For example, the remote substitute of mobile phones may be landline phones.) Yao and Gan (2010) analyzed the impact of monopoly innovation on the welfare of consumers. Yao and his colleague emphasized that previous studies have used partial equilibrium model to assess the welfare impact of monopoly and found that monopoly innovation leads to greater welfare loss. This study also found that technological advancement increases social welfare. Cowan and Vickers found that a monopolist's third-degree price discrimination has ambiguous effects on social welfare. Neumann (1999), Lee (2006), and Reksulak et al. (2008) found that welfare loss tends to increase as the monopoly exercises greater power over innovative activities. Kahana and Katz (1990) examined the welfare loss that arises from the rent seeking behavior of a price discriminating monopolist. This study found that price discrimination increases social welfare loss as some consumers are better off than others (see Table 1 for the summary of these studies).

### Impact of Government Regulation on Monopoly Behavior

Harberger (1954) and Worcester (1973) considered the notion of quantifying allocation of resources and welfare impact of monopoly. By using data from various industries, this study found that misallocation of resources that may be induced by government policies increases welfare loss of the consumer by 0.1%. Building on these students, Jenny and Weber (1983) found that welfare loss ranged from 0.85% to 7.39% of the GDP. Goolsbee (2006) found that when the taxes on monopoly profits increases, the deadweight loss will also increase as consumers will be charged higher prices to offset the losses that monopoly's experience by paying the government taxes on profits. Darby and Zucker (2006) debunked the myth that technological advancement may only benefit consumers under competitive market but not under monopoly market. Viani (2007) used data from 74 countries to determine the reasons for the rise of monopoly in different countries. This study found that some of the factors that give rise to the monopoly are financial constraint of the government, political notion, and election preference. When government grants companies monopoly rights, they are able to increase their revenue by 66%. Lakdawalla and Sood (2009) study on the US and European pharmaceutical industry found that there is an opportunity cost associated with providing monopolies with unwarranted government financial support. The financial resources invested in the state-owned monopolies can be rechanneled to other priority areas of the nation because these monopolies generate deadweight loss at the expense of public funds. Lin and Jiang (2011) found that by eliminating subsidies for the electricity industry of China, the demand for electricity will significantly fall as the prices of electricity will increase. Crawford et al. (2011) found that monopoly power leads to deterioration of the quality of service delivery in the cable industry when the government provides unjustified support for the monopoly. Liu and Lu (2015) argued that cutting taxes on the profits of the US monopolies will improve social welfare (see Table 1 for the summary of these studies).

A close synthesis of the above literature shows that there are many studies that have proposed models for deadweight loss generated by monopoly. However, very few studies have constructively applied these models and calculated deadweight loss generated by state-owned monopolies. Similarly, the impact of government regulation on the behavior of monopoly has been applied at the macro level rather than at the micro level. This study contributes to the existing literature in two ways. First, none of the existing studies have examined the welfare loss generated by monopolies in the Pacific Island Countries. This study examines the welfare loss generated by monopolies in Fiji and Samoa. Second, this entry used the Harberger (1954) framework for estimating deadweight loss that was later polarized by Worcester (1973), Jenny and Weber

(1983), and Reksulak et al. (2008). Harberger (1954) framework is one of the most popular and cited studies in the existing literature. Using this framework in this study will enable research findings to be compared with existing studies.

## Data Collection and Model Specification

### Data Collection

The main aim of this entry is to estimate and examine the deadweight loss generated by state-owned monopolies in Fiji and Samoa. This entry also seeks to examine the impact of government policies on the deadweight loss generated by monopolies. Two monopolies were selected in this entry. These two monopolies were the FEA and SEPC. The selection of the companies to be studied in this entry was done entirely on the availability of data. To determine the economic inefficiency generated by monopolies before and after regulation, we needed data on price, quantity produced, profits and cost. We collected data from the annual reports of FEA and SEPC. Data from the year 2010 to 2014 were collected, and deadweight loss for each period was calculated. The

marginal revenue and elasticity were held constant on annual basis.

### Model Specification

In this entry, Harberger (1954) framework for estimating deadweight loss that was later polarized by Worcester (1973), Jenny and Weber (1983), and Reksulak et al. (2008) will be used for estimating the deadweight loss. For estimating deadweight loss after regulation, we will equate marginal revenue (MR) equal to marginal cost (MC). Constant marginal cost on annual basis is given by *mc*. (This may include the combination effect of both taxes and subsidies.) The demand curve of the monopoly with the constant price elasticity of demand is captured by Eq. 10 below:

$$Q = p_1^{e_{q,p}} \tag{10}$$

In Eq. 10, $q$ is quantity, $p_1$ is the price, and $e_{q,p}$ is the price elasticity of demand. The elasticity of demand was calculated by using the following equation:

$$e_{q,p} = \left(\frac{Q_2 - Q_1}{P_2 - P_1}\right) * \left(\frac{P_2}{Q_2}\right) \tag{11}$$

In Eq. 11, $Q_1$ and $Q_2$ are the quantities of the respective periods, and $P_1$ and $P_2$ are the prices from the respective periods. The first step involved in estimating the deadweight loss is to compare the consumer surplus of monopoly with consumer surplus of the competitive market. The ratio of consumer surplus is given as follows:

$$\frac{\text{CONSUM}}{\text{CONSUC}} = \frac{1}{1 + \left(\frac{1}{e_{q,p}}\right)}^{e_{q,p}+1} \tag{12}$$

In Eq. 12, CONSUM is consumer surplus for the monopoly, and CONSUC is consumer surplus for the competitive market. Dividing the profit function of the monopoly (see Eq. 4) with CONSUC and simplifying we get:

$$\text{DWL} = \frac{\pi_{mt}}{\text{CONSUC}} = \frac{e_{q,p}}{1 + e_{q,p}}^{e_{q,p}} \tag{13}$$

In Eq. 13, DWL represents deadweight loss.

## Research Findings and Discussions

Table 2 shows that the consumer surplus ratio for monopoly to competitive market increased from −0.19 in 2011 to 0.48 in 2014. The deadweight loss also increased from −1.28 to 0.27 in 2014. In 2013, 81% of consumer surplus that may be present in the competitive market was transferred into monopoly profits. In 2014, 48% of consumer surplus that may be present in the competitive market was transferred into monopoly profits.

Table 3 shows that consumer surplus ratio for monopoly to competitive market increased from −0.33 in 2011 to 0.34 in 2014. The deadweight loss also increased from −1.31 in 2011 to 0.40 in 2014. In 2012, 20% of consumer surplus that may be present in the competitive market was transferred into monopoly profits. In 2014, 34% of consumer surplus that may be present in the

**Welfare Effects, Government Policies, and Deadweight Loss, Table 2** Elasticity, marginal cost, monopoly and competitive market consumer surplus ratio and deadweight loss for FEA

| Year | Elasticity | MC=AC | M:CM | DWL |
|---|---|---|---|---|
| 2011 | −0.132380204 | 0.326742491 | −0.19 | −1.28 |
| 2012 | −0.695476356 | 0.298089833 | −1.28 | −0.56 |
| 2013 | −1.084923055 | 0.303485746 | 0.81 | 0.06 |
| 2014 | −2.229784542 | 0.370580463 | 0.48 | 0.27 |

Note:
MC is marginal cost
AC is average cost
M:CM: monopoly and competitive market consumer surplus ratio
DWL: deadweight loss

M:CM: monopoly and competitive market consumer surplus ratio
DWL: deadweight loss

competitive market was transferred into monopoly profits.

Table 3 shows that the consumer surplus ratio for monopoly to competitive market increased from −0.33 in 2011 to 0.34 in 2014. The deadweight loss also increased from −1.31 in 2011 to 0.40 in 2014. This entry noted that FEA and SEPC recorded positive deadweight loss during the periods when transfer of consumer surplus to monopoly profits was high. There are a number of factors that have caused the increase in the deadweight loss generated by these two companies. One of the factors that have increased the deadweight loss is the inelastic demand for electricity. Due to fluctuations in fuel prices, the cost of fuel in Fiji and Samoa has been highly volatile. As compared to the price of electricity, the price of fuel is much higher. Therefore, people cannot easily substitute the need for electricity with other alternative commodities. Another factor that has caused inflexibility in the demand for electricity in Fiji and Samoa is the growing demand for electricity by manufacturing and business warehouses. The tourism industry of Fiji and Samoa has facilities for electricity use; therefore if the price of electricity increases, they are not able to substitute it with other products. Alternatively, some consumers in Fiji and Samoa have solar panels, but setting up the solar system is very expensive and requires large amounts of capital investment that may not be easily affordable by ordinary consumers.

The findings from this study is similar to the findings of the studies conducted by Chen and Sappington (2011), Wang and Chen (2012), Hałaburda and Yehezkel (2013), and Kim and Lee (2014). The transfer of consumer surplus estimated in this study from consumers in a competitive market to monopoly profits is relatively high. These two state-owned monopolies may be getting unwarranted support from the government to charge high prices to consumers so that the government can maximize its revenues. Wang and Chen (2012) found that the relative state-owned monopoly in China in the energy sector has strong government support, and this has maximized the social welfare loss.

### Impact of Tax on Deadweight Loss

Table 4 shows that deadweight loss in dollars increased from −$120051968.3 in 2011 to $403777.9327 in 2014.

Table 5 shows that deadweight loss in dollars increased from −$118868096.1 in 2011 to $352625.4723 in 2014. Comparison of Tables 4 and 5 shows that tax on profits reduces deadweight loss generated by the monopoly.

Table 6 shows that deadweight loss in dollars increased from −$931140.6386 to $2861615.975.

The SEPC does not pay tax on its profits. In the case of Fiji, the FEA pays taxes to the government of Fiji. When government charges tax on its profits, it is able to reduce deadweight loss. By charging taxes, the government of Fiji has reduced the deadweight loss by 0.99% in 2011, 20.58% in 2013, and 12.67% in 2014. By charging tax to the FEA, the government of Fiji can use tax collections for priority areas in the country that needs greater attention. Some of these priority areas are

health, education, poverty alleviation, and natural disaster management. The findings from this study contradict with the findings from the study conducted by Liu and Lu (2015). This study argues for taxing monopoly on their profits while Liu and Lu (2015) argue against taxing monopoly on their profits.

## Impact of Fuel Levy Subsidy on Deadweight Loss

Table 7 shows that by eliminating fuel levy subsidy, deadweight loss generated by SEPC will increase from $4002935.541 in year 2011 to $24785443.16 in 2014. By providing fuel levy subsidy, the government has significantly

**Welfare Effects, Government Policies, and Deadweight Loss, Table 8** Percentage change in deadweight loss by providing fuel levy subsidy to SEPC

| Year | DWL before fuel subsidy | DWL after fuel subsidy | % change |
|---|---|---|---|
| 2011 | 4,002,936 | −931,141 | −123.261445 |
| 2012 | 6,345,702 | −2,988,327 | −147.092136 |
| 2013 | 4,806,434 | −290,109 | −106.035854 |
| 2014 | 24,785,443 | 2,861,616 | −88.454449 |

**Welfare Effects, Government Policies, and Deadweight Loss, Table 9** Percentage change in deadweight loss by charging taxes on profits for FEA

| Year | DWL before tax on profits | DWL after tax on profits | % change |
|---|---|---|---|
| 2011 | −120051968.3 | −118868096.1 | −0.98613 |
| 2012 | −27223008.8 | −33170282.65 | 21.8465 |
| 2013 | 3148365.994 | 2500412.258 | −20.5806 |
| 2014 | 403777.9327 | 352625.4723 | −12.6685 |

DWL represents deadweight loss

reduced the deadweight loss generated by the monopoly.

Table 8 shows that by providing fuel levy subsidy, the government of Samoa has reduced the deadweight loss by 123% in 2011, 147.09% in 2012, 106.03% in 2013, and 88.45% in 2014.

Table 9 shows that by charging taxes, the government of Fiji has reduced the deadweight loss by 0.99% in 2011, 20.58% in 2013, and 12.67% in 2014. The deadweight loss increased in the year 2012 because the government provided tax benefits to FEA and this increased by 21.85%.

The government of Samoa provides fuel levy subsidy to SEPC. From year 2012 to 2014, the government of Samoa provided fuel levy subsidy to SEPC amounting to a constant amount of $6,500,000 per year. By providing fuel levy subsidy to SEPC, the government of Samoa has reduced the deadweight loss by 123% in 2011, 147.09% in 2012, 106.03% in 2013, and 88.45% in 2014. Deadweight loss decreased when the government of Samoa provided subsidy to SEPC. By subsiding electricity production, the government of Samoa reduced the cost per unit of electricity; therefore, Samoans could enjoy provision of electricity at cheaper prices. This finding from this study is similar to the findings of the studies conducted by Harberger and Worcester (1973). These two authors argued that misallocation of resources will increase the welfare loss generated by the monopoly. Albeit, the government of Samoa is subsiding electricity production, the SEPC is still charging higher prices to consumers. Prices could have been further reduced, but, due to strong monopoly power, the monopoly may not opt to reduce prices. These are opportunity costs associated with subsiding SEPC. For instance, the fiscal stimulus provided by the government of Samoa to SEPC could have been spent on other sectors of the economy that need more attention, such as, health, and education.

## Conclusions, Theoretical Contributions and Policy Implications

The main aim of this entry is to examine the deadweight loss generated by state-owned monopolies in Fiji and Samoa. This entry also seeks to examine the impact of government policies on the deadweight loss generated by monopolies. The findings from this entry showed that the deadweight loss generated by the FEA increased from −1.28 in 2011 to 0.27 in 2014. In the case of SEPC, the deadweight loss also

increased from −1.31 in 2011 to 0.40 in 2014. By charging taxes, the government of Fiji has reduced the deadweight loss by 0.99% in 2011, 20.58% in 2013, and 12.67% in 2014. By providing fuel levy subsidy to SEPC, the government of Samoa has reduced the deadweight loss by 123% in 2011, 147.09% in 2012, 106.03% in 2013, and 88.45% in 2014.

There are two important theoretical contributions of this entry. First, this entry emphasizes that deadweight loss is not the only loss or economic inefficiency generated by the monopoly. There are welfare losses that arise due to misallocation of public funds to help the state-owned monopolies. There are many ways in which public funds are misallocated in Fiji and Samoa. Some of these ways are providing tax benefits to monopolies and exempting taxes on the profits of the state-owned monopolies. The government of Samoa has been providing the SEPC with subsidies. If these subsidies are subtracted from the revenues, SEPC will go in loss. Alternatively, if the government of Samoa does not provide any subsidies to SEPC, it can use these subsidies to invest in other priority areas of the nation that needs urgent attention from the government.

Second, this entry also tries to emphasize that the monopolies will try to maximize their profits even if their profit maximization goals is constrained by government regulations. This will distort the impact of government policies on social welfare. Taxes can constrain monopoly profits, while subsidies will maximize monopoly profits. If taxes on profits are high, the monopoly can recover from this loss by increasing marginal revenue and minimizing marginal cost.

There are five important policy implications of this entry. First, the government in the Pacific Island Countries lacks financial resources to improve the welfare system of their respective countries. In these countries, providing monopolies with too much support may be damaging to the public interest. In order to improve social welfare, government should tax monopolies profits. The government of Samoa should tax the profits of the monopoly and channel these funds to other areas of the economy that need fiscal stimulus for growth. Second, the government of Samoa is providing large amounts of subsidies to SEPC. It is very essential for policy makers to analyze the opportunity cost of investing large amounts of public revenue for the benefit of the monopoly. A cost-benefit analysis needs to be conducted before the government of Samoa takes a decision on the amount of subsidy they should provide to SEPC. Third, the government should regulate the prices charged by the state-owned monopolies. This will minimize the social welfare loss and enable public to enjoy electricity services at cheaper prices. Fourth, due to inefficiency generated by the state-owned monopolies in the electricity sector of Fiji, the government of Fiji should open up markets for the private sector. This will foster competition and regulate the prices of the electricity in Samoa and Fiji. This study found that the existence of monopoly has social welfare implications in the form of loss of consumer welfare. Hence, deregulation of the market is an aspect that tends to be an attractive route to enhance consumer welfare, as it would incite competition and reduce prices. Fifth, renewable energy is a notion that has been factored in many Pacific Island Countries, where government tends to provide grants business wishing to set up renewable energy papers. The government needs to encourage investment in other forms of renewable electricity generation.

There are two limitations of this entry. First, marginal cost and elasticity were held constant on annual basis. Second, it is difficult to generalize the findings from this study to other Pacific Island Countries as this study is based on only two Pacific Island Countries. These two Pacific Island Countries are large small island countries in the Oceania region.

Future researchers can build on this study by using alternative deadweight loss estimation models that have flexible marginal cost and elasticity. Future researchers can also conduct similar studies in other small island countries in the Pacific so that findings from this study can be compared with future studies.

# Whistleblowers in Organizations

Anna Marie Schuh
Department of Political Science and Public Administration, Roosevelt University, Chicago, IL, USA

## Synonyms

Informant; Whistle-blower

## Definition

Whistleblower: Someone who discloses information about organizational improprieties. Such improprieties may involve violation of law, malpractice, corruption, or health and safety vulnerabilities. Whistleblowers can come from inside or outside of the organization as long as they have access to explicit information about the impropriety. Disclosure may be within or outside of the organization. External disclosure may be to regulatory agencies, media, or the public at large.
Retaliation: Actions taken against an individual who discloses information about an impropriety
Pretaliation: An enforcement action taken by an oversight agency before whistleblower retaliation occurs

## Introduction

Whistleblowing has been around for a long time. For example, it has been almost 500 years since Martin Luther functioned as a whistleblower by nailing his 95 theses outlining corruption in the Catholic Church to the Wittenberg All Saints Church on October 31, 1517, which resulted in the Protestant Reformation. Protection of whistleblowers also has a long history. For example, in 1777 the Continental Congress passed a law protecting two naval officers who disclosed torture of British prisoners. The US Internal Revenue Service whistleblowing award system goes back to 1867. More contemporary whistleblowers such as Edward Snowden and Bradley Manning have raised compelling issues through whistleblowing. In these latter cases, the individuals raised the issues at significant personal cost, and the disclosures have sparked national debates. Whether such disclosures are accurate or appropriate or whether they are motivated by personal good or the greater good, whistleblower disclosures impact organizations.

Fung notes that whistleblowers are important because democracies and organizations are not perfect. Whistleblowers raise issues that the public may overlook. Whistleblowers make politicians and policy makers act because of their disclosures. Whistleblowers allow the voters to understand issues and exercise an informed franchise. Whistleblowers provide information that the press can use to hold the government accountable.

Fung adds that whistleblowers can cause serious damage to democracies and organizations. Whistleblowers take on the role of judge in determining what information to disclose, and yet whistleblowers may be fallible judges making determinations with inadequate information or understanding. Whistleblowers often disrespect the rule of law when they go outside the system without even attempting to work with the system. Whistleblowers can degrade democracy when they override the judgements of elected and appointed officials (Fung 2013).

In a specific example, Moran notes that the 1970s was a difficult time for the Central Intelligence Agency (CIA) and its whistleblowers. Both the CIA and the whistleblowers were wounded in many ways. Because the agency mishandled the initial whistleblowers through intimidation, spying, and stealing whistleblower manuscripts, citizens became suspicious of the CIA. At the same time, because of the CIA tactics, Moran notes the whistleblowers were devastated psychologically and financially (Moran 2015).

From an overall perspective, effective whistleblowers have a role in a healthy society because they shed light on problems and provide opportunities for change. However, both the individual whistleblower and the home organization

face serious challenges during the whistleblower process.

Two questions help frame the challenges in the whistleblower discussion. The first question involves whether the individual is truly a whistleblower or disgruntled employee. Scholars and citizens debate whether those disclosing private information are providing a public service, betraying a trust, looking for a reward, merely avenging a wrong, or even being used as a pawn by another person or organization. Whistleblowers can be any of these things or several of the things at the same time. However, motivation is a key factor in discerning whether or not the disclosure act is both honest and honorable.

With respect to motivation, Gundlach et al. (2008) suggest that both cognitive and emotional responses affect the whistleblower's decision-making. They add that anger with the organization can translate the whistleblower's cognitive assessment of the situational facts into a whistleblower decision of wrong doing whether or not there is actual wrongdoing. They add that open, transparent communication is a way to insure an accurate organizational assessment.

The second question is whether whistleblowing helps or hinders organization operations. One position is that internal whistleblowing surfaces problems and enhances problem resolution. Dhamija proposes an internal whistleblower hotline followed by an internal audit is the best way to control fraud in an organization suggesting that whistleblowing can be part of an accountability system. A second position is that internal whistleblowing is a means to hide problems from the public (Dhamija 2014). As Leifer et al. suggest, when whistleblowing is handled internally, the problem and resolution are not transparent and the public does not receive the benefits of public disclosure. This lack of transparency can diminish public trust. A third position is that public disclosure only makes it more difficult to govern or manage. From an operational perspective, some issues such as labor relations or human resource management problems are more readily solved without public scrutiny during the resolution period. Also, as Leifer et al. note, both business and public organizations can lose the public confidence because of open whistleblowing disclosures. Such lack of public confidence may reduce program effectiveness as was the case in the intelligence-gathering efforts mentioned earlier (Leifer 2014).

## Whistleblower Types

Webster notes that government deals with two types of whistleblowers: whistleblowers about internal government practices (public) and whistleblowers about business practices that violate government law (private). From an internal perspective, organizations both inside and outside the government have an interest in encouraging internal whistleblowers for two reasons: maintaining public integrity and solving problems at the lowest possible level. To do this, organizations need internal whistleblower programs that are both effective and safe for the whistleblower.

As Hastings indicates, in dealing with business practice whistleblowing, government as the overseer has to balance the tension between supporting internal reporting so that the organization can fix the problem and the need to protect external whistleblowing for those fearful of organizational retaliation (Hastings 2015). External whistleblowing is particularly important when the potentially offending organization does not want to solve the problem. In rule making, oversight agencies need to navigate the tension between legitimate organizational anti-disclosure rules and legitimate employee fears of retaliation for wrongdoing disclosure. One way to do that is to adopt a consistent and transparent policy about information sharing between the oversight agency and the organization.

Business practice whistleblowing is further complicated by legislation that provides rewards for whistleblowing. Organizations such as the Internal Revenue Service or the Securities and Exchange Commission (SEC) have such legislation. Archambeault and Webber note that when whistleblowers seek awards, whistleblowers also seek anonymity.

Archambeault and Webber identify three categories of SEC whistleblowers by the level of desired anonymity: those who allow disclosure of name and contact information, those who only provide an attorney's name and contact information, and those who want no disclosure at all. The latter group rarely provides information that results in successful whistleblowing because investigators do not have access to source information which hinders development of the wrongdoing case (Archambeault and Webber 2015).

## Whistleblower Legislation and Enforcement

The first major law addressing US whistleblowers came during the Civil War. In 1863, President Abraham Lincoln introduced the False Claims Act which targeted the sale of fake gunpowder to the Union. This law provided that whistleblowers could collect up to 50% of the money the government collected from the enforcement of this law. In 1947 the law was amended to limit awards to information the government did not already have. In 1986, the law was again amended to protect whistleblowers from threats, harassment, or other acts of retaliation. In 1978, the Civil Service Reform Act singled out federal employee whistleblowers by providing them with protections for disclosing legal violations or gross mismanagement. In 1989, the Whistleblower Protection Act was passed to improve the 1978 federal employee protections (Peffer et al.).

In 2002 as a result of the collapse of several major organizations such as Enron and World Com, the Congress passed the Sarbanes-Oxley Act which highlighted the importance of whistleblowers in preventing financial crises. This was followed by the Dodd-Frank Wall Street Reform and Consumer Protection Act in 2010 which further highlighted the role of whistleblowers in the financial arena (Leifer et al.).

Unfortunately legislation supporting whistleblowers has not been particularly successful. Peffer et al. note that the vast majority of cases under the Whistleblower Protection Act are found in favor of the agency (Peffer et al. 2015). Leifer et al. indicate that the Sarbanes-Oxley Act has neither encouraged whistleblowers nor adequately rewarded them (Leifer 2014). However, Korb does find that whistleblowing after Dodd-Frank did increase by 20% between 2012 and 2014 (Korb 2015).

As Hastings suggests, the dilemma of oversight agencies is to maintain a balance between protecting the public policy and protecting the whistleblower (Hastings 2015). Early intervention deprives the organization of a chance to right the wrong through its own efforts; however, late intervention allows an organization to make more serious violations. At the same time, early disclosure by whistleblowers may result in more serious retaliation by the offending organization. Consequently, both employers and employees need to feel safe in the context of disclosure.

While monetary awards can increase whistleblowing activity, Webster notes that there are risks to monetary awards. Some of the more problematic risks include:

- Increased disclosures for personal gain
- Increased employer suspicion of whistleblowers
- Deferred reporting to secure financial reward
- Employee focus on policing the employer
- More difficult working environments
- Greed rather than principled actions (Webster 2015)

Hastings adds that some organizations try to circumvent whistleblower rules through employer/employee agreements that make it difficult for employees to exercise their whistleblower rights. Such rules attempt to restrict communication with the oversight agency. For example, employers might require employees sign employment, confidentiality, and severance agreements that prohibit employees from communicating organizational problems directly with the oversight agency. These agreements may also limit employee rights with respect to independent counsel and whistleblower awards. Such

agreements may also prohibit sharing information with a third party (Hastings 2015).

While the purpose of such agreements may be merely to encourage internal reporting and to protect confidential information, often the agreements are intended to intimidate and ultimately have a chilling effect on whistleblowing. As Hastings further notes, many of these agreements are unenforceable; however, the signer does not know that. Enforceability is not always clear because it relates to such factors as the clarity of the agreement language and the way in which the agreement was explained. While employees have an unwaivable right to report violations as well as to receive rewards for reporting inappropriate employer actions, preemployment agreements can raise employee concerns about these rights (Hastings 2015).

Pretaliation action by the oversight agency is one way to address this problem. Hastings offers an example of such SEC enforcement of Dodd-Frank with respect to KBR, Incorporated (KBR). In this example, as a result of SEC court action, KBR disclosed the preemployment agreements, indicated that the agreements could not prevent the employee from exercising whistleblower rights, and subsequently revised all future agreements (Hastings 2015).

## Good Practices That Support Whistleblowing

Miceli et al. highlight the fact that whistleblower concerns are typically organizational ethical problems (Miceli et al. 2009). As noted previously, healthy organizations want strong whistleblower policies so that problems can be surfaced and resolved early. Early resolution mitigates more serious complications. Early resolution often means that the public never becomes aware of the problem allowing the organization to avoid harmful publicity. Respectful employee whistleblower policies encourage better employee morale. Comprehensive whistleblower policies can be an effective tool in encouraging strong individual and organizational performance management.

Dworkin and Near provide a broad list of essentials for organizational whistleblower policies. More specifically, they advocate the following:

1. A Written Policy (A written policy provides clarity to the operation of the process. In addition, clarity both highlights for employees the importance of whistleblowing to organizational management and it reassures employees that whistleblowing is an acceptable employee behavior.)
2. Compliance Training (Training highlights the perspective that management wants the process to work. It provides an opportunity to clarify the policy so that all supervisors and employees have the same understanding. It provides supervisors and employees an opportunity to raise concerns about the policy, and these concerns can lead to process improvements.)
3. Top Down Policy Development (When top management initiates the policy, supervisors understand that the policy is an integral part of organizational business. This makes supervisors more responsible to the policy and increases policy credibility with employees.)
4. Anonymous Reporting (No policy is trusted by all employees. Anonymous reporting allows employees to raise issues even if those employees do not trust management.)
5. Alternate Reporting Chain (Trust is the primary concern in any whistleblowing policy. Forcing reporting through the same supervisory chain in which the problem occurs diminishes trust. An alternate reporting chain increases trust.)
6. Consistent Management Monitoring (Visible management monitoring of the system and the resolution of problems surfaced by the system signals to employees that management supports whistleblowing as an organizational improvement mechanism.)
7. Employee Feedback (Feedback from employees who report problems is an essential component to a credible system. Such feedback reinforces to employees the notion that any reporting risk incurred is justified because

the employer takes the report seriously by following through on the concern.)

8. Employee Evaluation for Compliance (Using compliance with the organization's whistleblower policy as a performance management criterion confirms to employees that the organization considers whistleblowing an essential organizational practice (Dworkin and Near 1997)).

From an oversight perspective, Webster offers good practices that the government agency can initiate to support whistleblowers. The first practice relates to clear government guidance on the disclosure processes. Potential whistleblowers are more likely to come forward when they understand the disclosure process, what it requires, and how it protects them from organization retaliation. The second effort relates to publication of best practices so organizations can learn from each other. The third initiative involves government provision of clear information about the awards process so that potential whistleblowers can know what to expect from a disclosure. Finally, the oversight agency should provide annual reporting on disclosures results. This is additional information that the potential whistleblower can use to assess usefulness of pursuing the process (Webster 2015).

## International Approaches

Miceli et al. note that whistleblower concerns affect all countries and they identify documented cases in 25 countries during the period 1996 through 2008 (Miceli et al. 2009). Countries have dealt with those concerns in very different ways. In September 2014, Transparency International Australia issued a study jointly conducted by the University of Melbourne and Griffith University on Whistleblower Protection laws in the G20 countries. This study (Wolfe et al. 2014) reviewed the G20 public and private sector whistleblower systems countries against 14 criteria (i.e., coverage, wrongdoing, definition of whistleblowers, reporting channels, external reporting channels, thresholds, anonymity, confidentiality, internal disclosure procedures, breadth of retaliation, remedies, sanctions, oversight, and transparency) that the evaluating group developed specifically for the study.

From an overall perspective, the USA was the only country that had some coverage in both the public and private sector for all 14 elements. Australia had some coverage in all 14 elements for the public sector while Canada had some coverage in 13 of the 14 elements for the public sector. The UK, South Korea, and France had some coverage in 11 of the 14 elements in both the public and private section. On the other end of the spectrum, Saudi Arabia had partial coverage in only one element in either the private or public sector. Russia has no coverage in the private sector while Canada, India, and Italy cover only one element in the private sector.

From an element-specific perspective, the study found that most countries did not have several important whistleblower features. More specifically, many countries lacked a three-tiered reporting system that included the legislature, the media, and outside supportive organizations such as labor or nonprofit organizations. Most countries did not have anonymous channels for reporting wrongdoing. Most countries did not adequately protect internal disclosure procedures. Finally, most countries did not have transparent and accountable enforcement of whistleblower laws.

## Conclusion

Whistleblowers are complex individuals who disclose organizational secrets about potential wrongdoing for a range of reasons. Whistleblowers are important to organizational health because they can raise problems early which in turn can foster early resolution. However, whistleblowers also can create serious organizational problems when they misunderstand an organization's actions and bring costly scrutiny to an otherwise appropriate situation.

Public administrators need to develop safe, effective, and transparent systems that allow

whistleblowers to raise issues as early as possible. Such systems foster accountability and can allow quick problem resolution, particularly if employees trust both management and the system.

# Whistleblowing

Anna Chacko
Department of Telehealth, John A. Burns School of Medicine, University of Hawaii, Honolulu, HI, USA
Boston University Medical Center, Boston, MA, USA

Whistleblowing has been defined as disclosure to those in authority by a person (usually an employee) of mismanagement, corruption, illegality, or other wrongdoing (The Free Dictionary by Farlex – Whistleblowing).

In most instances, the whistleblower is motivated by a sincere desire to improve the functioning of the entity that he may be complaining about. However, whistleblowers rarely get closure, restitution, or recognition of acts requiring daunting effort and courage.

Mankind evolved from a raggle-taggle bunch of cavemen into groups, starting as villages and tribes into kingdoms, democracies, theocracies, plutocracies, and finally globalized market states. This has been accompanied by a concomitant increase in world population and wealth: agencies, and bureaucracies have emerged to allocate resources to accommodate increasing demands and requirements. Agencies were designed to administer the government/corporate expenditures in a prudent if not honest fashion; however, they can and do fail sometimes. Bureaucrats and businesses take advantage of the (limited) oversight established by the agencies, bringing about wide-scale cheating, overbilling, thieving, and defrauding taxpayers/stakeholders and jeopardizing the well-being of the organization. This unchecked misconduct has brought about the development of laws and writs in order to expose and discourage unchecked malfeasance; punitive measures and disincentives for scofflaws have been established. Once incentives had been established for exposing wrongdoing, a whole new set of scenarios has developed whistleblowers, false claims acts, qui tam suits, etc.

The congress has repeatedly refined or reversed the Whistleblower Protection Act/Law with several amendments. Whether this has made a difference to protect the whistleblower remains to be seen. It is important to review the history (Statutes of the realm 12 Edward II, Ch. 6 (1318), 177–178. Quoted by Charles Doyle for the Congressional Research Service (2009), 2.) and evolution of whistleblowing in order to understand the circumstances under which whistleblowing and whistleblower protection became law. A recounting of the history of whistleblowers will bring to light their sagging plight and wavering support provided by those in power, and leadership's efforts to expose and expunge wrongdoing, or to collude with the "perp."

The idea of exposing wrongdoing is surprisingly ancient. The English Crown's recognition of malfeasance among contractors led to the establishment of what is now known as the qui tam suit (Britannica.com (http://britannica.com/) Withred King of Kent last updated 7-3-2007 *qui tam pro domino rege quam pro se ipso in hac parte sequituri* = he who sues in the matter for the king as well as for himself.). The earliest known account of whistleblowing and qui tam suits was in AD 695 in the Kingdom of Kent, in England, when Wihtred of Kent, an Anglo-Saxon King, sets the precedent of providing incentive for informers who exposed those who had committed the sin of working on the Sabbath (Whistleblowersinternational.com (http://whistleblowersinternational.com/) The birth of Qui Tam in Medieval England, Qui Tam A definition: A history: Whistleblowingprotection.org (http://whistleblowingprotection.org/)).

In 1318 qui tam laws (Britannica.com (http://britannica.com/) Withred King of Kent last updated 7-3-2007 *qui tam pro domino rege quam pro se ipso in hac parte sequituri* = he who sues in the matter for the king as well as for himself.) were enforced during the reign of Edward II to reward the commoner who exposed fraud involving the commerce of wines. This writ was actually formalized in England following the Glorious Revolution of 1688. This was the revolution bringing about the overthrow of James II known for his Catholic leanings. This resulted in the establishment of a decidedly protestant monarchy with the protestant Dutch William of Orange and his English wife Mary who became joint monarchs. It also established the authority of the British Parliament over the king. This period saw the quasi formalization of the qui tam writ, where a "commoner" was given a reward of £100 for the apprehension of any Roman Catholic priest, breeding a class of people – common informers who harassed the priests for gain, even when the government would not have. In England, increased qui tam provisions saw a proliferation of professional informers who were given the unsavory appellation of "viperous vermin" by Edward Coke in his work at the Institutes of the Laws of England.

In the 1600s, colonists coming to America brought the concept of qui tam along with them. This became law in 1686 (From the Colonial Laws of Massachusetts (1686) Qui Tam: The False Claims Act and Related Federal Statutes by Charles Doyle for the Congressional Research Service (2009), 2.) and was put in to effect in the colony of Massachusetts over the fraudulent sale of bread.

In 1863, during the Civil War, Abraham Lincoln and his congress became concerned that suppliers of goods to the Union Army were defrauding the Army. Lincoln spoke out against those who would jeopardize the safety of the Union soldiers, saying "Worse than traitors in arms are the men who pretend loyalty to the flag, feast and fatten on the misfortunes of the nation while patriotic blood is crimsoning the plains of the south." The congress then enacted the Federal *False Claims Act* (FCA) (The False Claims Act, 31 U.S.C. §§ 3279–3733). The FCA was also called the Lincoln Act because it was enacted at President Lincoln's request. It was originally to recover monies from unscrupulous contractors who sold the Union Army decrepit horses, mules in ill health, faulty rifles and ammunitions, rancid rations, and provisions. At this time a successful whistleblower was able to collect 50% of the money recovered by the government.

The administrations of Republican presidents Theodore Roosevelt (1902) and William Howard

Taft (1909) prohibited employees from communicating with the congress without authorization from their supervisors. The measure originating from these two Republican administrations gutted any measures that would protect whistleblowers from retaliation, reprisal, and retribution, making them afraid and impotent against a corrupt leadership. Even if the whistleblowers might not say anything, the fact they had to seek permission from their supervisors who might have been the scofflaws, the potential whistleblower could be targeted for retaliation. Despite the First Amendment, there was no protection for federal employees/whistleblowers from retaliation even dismissal. Senator Robert M. La Follete (R) of Wisconsin, known for his progressive views and support of reform legislation, made seminal changes to the Act. The changes proposed by Sen. La Follette and Rep. Lloyd conferred job protection rights to federal employees who accessed the congress to register complaints about their supervisors guilty of fraud, misconduct, or corruption. The law declared it "the duty of all persons in the service of the USA, as well as all other inhabitants thereof, to give the earliest information to the congress or any other proper authority of any misconduct, frauds, or misdemeanors committed by any officers or persons in the service of these states, which may come to their knowledge." The language in this act was placed in the Civil Service Reform Act of 1978 and codified in 5 USC § 7211. This act was the first federal law enacted specifically to protect whistleblowers.

During WWII AG Francis Biddle asked the congress to repeal the qui tam provisions of the FCA on the grounds that these had "become mere parasitical actions, . . . solely because of the hope of a large reward" (The False Claims Act: It's more than just healthcare. Grubman Scott R. Georgia Defense Lawyers Association – 2015 Law Journal.) In 1943, the act was amended to reduce the relator's share of the recovered procedure to 10–25%. An amendment also added a "government knowledge bar" which prevented whistleblowers from filing a qui tam suit if the lawsuit was based on information already known to the government. This brought about the near demise of the FCA. However, the FCA limped along until President Reagan came into office.

In 1985, a government report detailed in NYT, several powerful companies including General Dynamics, General Electric, and Rockwell International pleaded guilty to multiple counts of fraud ("The Trouble with Defense Contractors", Richard Halloran: New York Times Dec 8, 1985.). Although reparations were made, complete with assurances of contrition and corrective action, there do not appear to be any reports on precluding these companies from bidding on defense contracts in the future. It was opined that these fraudulent practices were costing the taxpayers $10–100 billion annually. Iowa Senator Chuck Grassley authored several major amendments to the FCA that "restored the teeth and breathed new life into a law that was designed to do nothing but to protect all American taxpayers." The congress moved to increase the penalties and the whistleblowers' share of recovered money.

In 2009 Fraud Enforcement and Recovery Act (FERA) was signed into law when the congress moved to fortify the False Claims Act securing a recovery of $27 billion in taxpayer money. This strengthened the FCA as the government's fraud-fighting statute of choice.

In "Truth be Told," a GAP feature, Bea Edwards includes a commentary by renowned attorney Matthew Parish on accountability at the United Nations. He opines that exposing wrongdoing and penalizing perpetrators is challenging and controversial. The solution, he says is to "create an institutional culture that promotes exposure of the wrongdoing that inevitably occurs by virtue of the moral frailties of humankind." Parish states that the bureaucratic structure at the UN is labyrinthine and so complex that only insiders, knowledgeable of the blizzard of regulations, would be able to wend their way through the morass of deception and fraud. An outsider or an outside investigative body would be ill-equipped to uncover fraud. It would have to be an insider who could expose wrongdoing. The UN is by design a kleptocracy, and insiders who could be whistleblowers are bound to secrecy. "Bureaucracy that is incomprehensible to outsiders loses its incentive for self-restraint. . .by elaborating

more labyrinthine structures, managers acquiring greater authorities, managing higher budgets and more staff, and acquiring increasing prestigious emoluments of office" ("The Trouble with Defense Contractors", Richard Halloran: New York Times Dec 8, 1985.).

Unfortunately this secret underbelly of bureaucracies is not characteristic of just the UN. It is present, although in a far more clandestine manner, with government agencies and possibly the private sector.

Corrupt leaders devise draconian methods to silence whistleblowers and cover up their own complicity in deception and fraud. Within government agencies in the USA, other than the Department of Defense, there is rarely an explicit gag order to muzzle whistleblowers. The agencies resort to using multiple weapons in their armamentarium to deal with "unquellable" whistleblowing employees – some examples are as follows:

- One of the weapons is to refuse a FOIA request or making an FOIA response completely unusable.
- Under the FOIA, documents can be requested and released to anyone including a whistleblower.
- The agency frequently responds by sending out redacted documents, white pages completely covered with black ink that are of no value.
- Another fallback mechanism is to refuse to release documents under the pretext of personnel/personal information.
- Demoralizing the whistleblower is a frequently used tactic.

In the Department of Veterans Affairs, for instance, it is not uncommon to see that scofflaws are rarely ever prosecuted, even when they lie to the congress while under oath. They are often promoted or hidden from public view (like the idiot child sequestered in the attic) and allowed to retire. When the clamor from the proletariat becomes intolerable or threatening to the leadership, these scofflaws are encouraged to retire with sizeable retirements and pensions. This serves to dissuade all except the most resolute and persistent potential whistleblower.

Although regulations state that a retiring employee in leadership may not work for a contractor and use his prior office to secure profitable contracts with his erstwhile employer – i.e., the government – it is not uncommon to find that there is an active revolving door strategy in effect and even officials who have left the agency under a cloud secure very lucrative employment with government contractors. To the onlooker as well as the whistleblower, the agency has rewarded the wrongdoer.

Another ploy employed by government agencies or their leadership is to secure or establish territories gradually so that the denizens of their immediate environment come to believe that their malfeasance is merely the way things are – a creeping acceptance of the hugely unacceptable becoming palatable when taken in small doses.

If the whistleblower decides, imprudently to take on the government or other behemoth, his monetary resources dwindle at an alarming rate, he is labeled a trouble-maker and unable to secure jobs commensurate with his training or education, and unless he is made of sterner stuff, he, his family and friends, falls prey to a PTSD of sorts.

The majority of FCA cases are in areas other than healthcare. A fairly long list is provided by GAP titled "Timeline of Whistleblowers" reveals a very large list of whistleblowers – most of whom are not involved in healthcare. With the "attempted" repeal of the Affordable Care Act, it is conceivable that healthcare issues will come under closer study. Whether this will result in meaningful improvement in healthcare delivery is debatable.

Blowing the whistle on corrupt or dangerous practices can and should become an integral part of good governance. Ideally, society itself and its governments ought to rely on whistleblowers to act as deterrents to fraud and abuse, making them an important tool for keeping control on destructive avarice and mendacity. Whether or not the government utilizes this tool is often unpredictable being based on politics and expediency.

# Whole of Government Accounting

Consolidation; Group accounting; Reporting

## Definition

The Whole of Government Accounting (WGA) refers to a view of the overall financial position of the government of a particular jurisdiction and is prepared via the consolidation of the financial statements and transactions of all entities controlled by the jurisdiction's government (Guthrie 1998, p. 2).

## Introduction

During the last decades, public sector organizations in several countries have undergone enormous changes. One of the most notable initiatives has been the externalization of public services through corporatization, contracting out, agencies, public and private partnerships, and privatization of activities and entities not at the core of public administration. All these initiatives are part of New Public Management (NPM). Definitions of NPM vary, but it is often taken involving downsizing, privatization, corporatization, competition, and devolution (Gruening 2001; Reichard 2002; Wollmann 2004).

The growing diffusion of decentralized (public, private, and nonprofit) has profoundly modified public governance. This process involves not only the authority to produce public services but also the need to create stronger communication in order to coordinate, steer, and control the corporations. Governance is not just about corporate management and marketization but also about the changing nature of government and how to understand such changes (Tricker 1994; Kettl 2000).

The increasing use of market-like mechanisms, and the growth of public and private partnerships of a variety of public services in different countries, has blurred the boundaries between the public and private sectors (Osborne and Gaebler 1992; Bovaird 2004). The creation of decentralized entities with respect to government renders the themes of control and adequate definition of internal and external accountability relationships to a position of critical importance (Chan 2003). Accountability relationships between the corporations and the government may be regarded as "internal accountability." Accountability relationships between the government and its stakeholders may be considered as "external accountability."

The ownership of a public service organization often is still within the government ownership,

who cannot ignore its social objectives or satisfaction of the needs and development of the community. "However the recent changes have indeed been geared to moving certain activities and organizations out of public ownership. These will not be excluded from this consideration, as there are often important residual accountabilities which link these organizations to governments. The organizations are still closely associated with the public sector and they are, principally, staffed by the same employees who were there previously. They provide a mirror in which the changes in the organizations which have remained in public ownership can be reflected and compared" (Broadbent and Guthrie 1992, p. 24).

The wider concept of accountability is related to the need to be accountable for the global results achieved by the different activities within the government responsibility and provided internally by the government and externally by decentralized entities. The traditional financial reports of the government are tools that are being used to be accountable to particular activities realized within the organization. The Whole of Government Accounts (WGAs) are full accrual-based accounts covering the whole public sector to be audited by the National Audit Office (Olson et al. 1998). The aim of WGA is to produce a single financial report that encompasses all government activities and entities within its area of authority, i.e., city, region, or central government in a country (Grossi and Newberry 2009).

Internationally there are two different conceptions about the role that a WGA can perform (Heald and Georgiou 2011). In Australia as well as in other several countries (i.e., New Zealand, the USA, Canada, Sweden, etc.), WGAs are really particular jurisdictions (i.e., commonwealth and each state/region/city). In contract, the WGA was conceived in 1998 in macroeconomic terms and is the consolidated financial statements for the whole of the UK public sector, showing what the UK government spends and receives, and what it owns and owes. The UK WGAs are the most comprehensive set of audited consolidated government accounts published globally, comprising all 5500 public entities in the UK public sector. These include central government departments and arm's-length bodies, local government bodies, the health sector, and public corporations such as the Bank of England. WGA provides details of the government's revenue and expenditure, assets, and liabilities, using IFRS-based policies (CIPFA 2015).

## Multiplicity of the Consolidation Approaches

Grossi and Pepe (2009) analyze consolidation approaches in the public sector in six countries (Sweden, the UK, the USA, Canada, New Zealand, and Australia) highlighting differences and similarities. Several countries compile the consolidated financial reporting in their public sector (whole, federal/central, state, or local government), but only few countries (Sweden, the UK, the USA, Canada, New Zealand, and Australia) have already established consolidation standards, in addition to IPSASB. The authors identified two diverging trends. The first trend, mainly in the Anglo-Saxon countries (the UK, Australia, and New Zealand), consists of the convergence of the accounting standards toward a private sector approach. The second trend, present only in some countries (the USA, Canada, and Sweden), is characterized by an influential role of the government, and the accounting standards are modified for application to the public sector (p. 255). Their article has identified two main features of the development of WGA. First, the dynamics of WGA continue to change; thus, nothing should be considered stable. Second, while the convergence process has brought harmonization, comparison, and homogeneity, there still remains the problem of finding the appropriate combination of private and public sector approaches (p. 256).

The International Public Sector Accounting Standards Board (IPSASB)'s approach to consolidation is based on the concept of control mostly like the International Accounting Standards Board (IASB). According to IPSAS 35, the definition of control focuses on an entity's ability

to influence the nature and amount of benefits through its power over another entity. According to IPSAS 35, the main driver behind government consolidation is the criterion of control, drawn on IAS 27 and IFRS 10 that clearly adopted a principle of control with a wide meaning of direction plus benefit. This means that also in the case of IPSAS, some related parties (e.g., entities that are significantly funded by the government budget or have almost exclusive contract with it, but are not "controlled" by the government according to the control criterion) are not included in the area of consolidation (Grossi and Steccolini 2015). In this sense, it is worth underling that the IPSASB approach is mainly based on the decision-making approach, similar to what occurs in the private sector, while a different approach, based more on the criterion of financial accountability as the Governmental Accounting Standards Board (GASB) 14, would be more useful with the characteristics of the public sector organizations (Tagesson and Grossi 2012).

Bergmann et al.'s (2016) comparative study presents an overview of the different consolidation approaches in Organisation for Economic Co-operation and Development (OECD) countries and focused on the methods applied and the guiding multiple principles and perspective (control, budgetary, organizational and legal, statistical, and risk) followed to define the perimeter of consolidation. Their study shows that a trend toward accrual accounting and the presentation of consolidated financial statements according to International Accounting Standards is obvious. Moreover, countries that are explicitly following International Accounting Standards, like Australia, Canada, Estonia, New Zealand, the UK and, in the near future, Spain and Chile, seem to be clearly oriented toward the control criterion (p. 11). Countries with a looser link to international standards by tendency show a scope of consolidation that can rather be explained by historical developments or that has been defined later on (e.g., Denmark, Sweden, and the USA) and therefore lacks the stringency and taxonomy that it would have following accounting standards (p. 11).

## The Usefulness and the Users

WGA has been numerous and substantial, with emphasis placed on the resulting accounting system providing better information for decision-making at all levels of government and for many forms of governmental activity (Chow et al. 2007, p. 27). WGA may serve to increase accountability and transparency toward internal and external stakeholders. Otherwise, internal and external users of financial information would not be able to base their decisions on reliable and relevant information about the financial position, financial performance, and cash flows of the "whole" government, or they might find it more difficult to form an idea on it.

Bergmann et al. (2016) identified several internal and external users of WGA in general.

Internal stakeholders, namely, politicians and public managers, consider WGA and consolidated financial statements as useful tools for steering and controlling the direct and indirect provision of public services. They are a relevant tool for public decision-making in programming and controlling the different public policies (p. 4). According to Chow et al. (2015), an important factor determining the use and usefulness of consolidated government accounts is the political buy-in at the outset. "Politicians' use of public accounts is heavily biased toward the budgetary process, which is the main arena where contests for resource allocation take place. Parliamentary scrutiny, which theoretically could benefit from the implementation of consolidated government accounting, is also conditional on greater financial literacy among politicians, which limits such work to specialist members of parliament" (p. 4).

WGA might also to be considered useful by external stakeholders (e.g., citizens, voters, taxpayers, suppliers, other public administrations, international organizations, banks, financial institutions, and rating agencies) since WGA help to give a comprehensive view of the "whole" government and its publicly owned corporations. In particular, banks are interested in WGA in order to understand the real and effective opportunities of creditworthiness of the governments and their owned corporations. Moreover, WGA could be a

useful and informative tool for rating agencies to determine Bergmann et al. (2016)). Chow et al. (2015) have different opinion regarding the usefulness of WGA for financial markets, credit rating agencies, and other analysts. They stated that "credit rating agencies prefer global statistical reporting frameworks based on universal standards such as the UN/EU statistical accounts rather than consolidated government accounts" (p. 4).

## International Experiences

According to the new study of Bergmann et al. (2016), internationally there are two experiences of WGA (the UK and Estonia) and several experiences (Australia, Canada, New Zealand, Spain, Sweden, Switzerland, and the USA) of implementation of consolidated financial statements in the central or federal and local government.

In the UK WGA means that consolidation comprises all state levels (central government and all local governments) and public corporations. The parliament, the National Audit Office, and the nationalized banks are excluded by WGA. The UK focus was initially to bring together, via the WGA-UK consolidation program, the various central government accounts along with those of local government and public corporations (Chow et al. 2015).

The case of Estonia seems to be especially remarkable as both the National Bank and other entities with a strong balance sheet are consolidated at the highest level, with two CFSs reflecting, on the one side, the public sector without public enterprises and financial institutions (GGS) and, on the other side, the total of the public sector with all controlled entities (p. 14). Since 2004, a full accrual accounting and reporting system in accordance with IPSASs has been implemented throughout the whole government in Estonia. The Estonian accounting and reporting system provides data on assets, liabilities, revenues, expenses, commitments, and payments, and the Ministry of Finance compiles a consolidated financial statement (CFS) for the whole government, including all government levels and their decentralized entities (Argento et al. 2016).

Australia consolidates the individual accounts according to the standards of Australian Accounting Standards Board (AASB) for commonwealth (federal) government, each of six states and two territory governments (e.g., New South Wales, Victoria), and all local government municipalities. Australia doesn't consolidate the whole of government as a single entity (Chow et al. 2015).

Canada consolidates according to the standards of Canada's Public Sector Accounting Board (PSAB) for federal government, each of the ten provincial and three territorial governments (e.g., Ontario, Yukon), and all local governments. Government business enterprises (GBEs) are excluded by the consolidation. Canada doesn't consolidate the whole of government as a single entity (Chow et al. 2015).

New Zealand compiles consolidated reports for central government (including Crown entities, state-owned enterprises, all three offices of the parliament, and the Reserve Bank of New Zealand) and all local governments according to the NZ PBE standards. Local government accounts are not included in the central governments accounts because they are not controlled by the central government. New Zealand doesn't consolidate the whole of government as a single entity (The Treasury 2005, 2016).

In Spain, recently it has been passed a new regulation that requires the preparation of consolidated statements for public sector entities (Orden 1489/2013, standards for the preparation of consolidated accounts in the public sector). The standards are applicable for the central and the local government, which are based on the IPSASs, but for the local government, its implementation is expected in 2017. Full consolidation is applicable for controlled entities and proportional method for joint ventures, while the equity method is applicable for associates (Brusca et al. 2016).

In Sweden government accounts are consolidated according to the standards of the Swedish National Financial Management Authority (SNFMA) using the equity method, and local government accounts are consolidated according

to the standards of the Swedish Council on Municipal Accounting (SCMA) based on proportional method. Sweden doesn't consolidate the whole of government as a single entity (ESV 2013; Tagesson and Grossi 2015).

The Swiss federal government has prepared its federal consolidated financial statement since the financial year 2009 mainly according to IPSAS. The Swiss federal government has adopted a pragmatic approach to define the area of consolidation that includes the central federal administration as parent entity, the decentralized federal administration, entities that present separate financial statements, and entities of decentralized federal administration with their own financial statements. The consolidation also includes other entities which discharge public sector functions and are closely linked to the federal budget, such as social insurance funds with their own accounts, the unemployment insurance (ALV), compensation fund, Swiss Federal Railways (SBB), or Swiss Post (Argento et al. 2012).

The USA consolidates the federal government accounts according to the standards issued by the Federal Accounting Standards Advisory Board (FASAB) and state and municipal accounts according to the standards issued by the Governmental Accounting Standards Board (GASB). The USA standards to define the area of consolidation are mainly based on the concept of financial accountability that it is significantly different from the IPSAS approach based on control. The USA doesn't consolidate the whole of government as a single entity (Grossi and Pepe 2009).

## Conclusions

Our findings suggest that WGA and consolidated financial statements in the public sector may serve to increase accountability and transparency toward internal and external stakeholders (politicians and public managers, citizens, voters, taxpayers, suppliers, other public administrations, international organizations, banks, financial institutions, and rating agencies).

Previous scholars identified emerging international trends in terms of consolidation approaches (Grossi and Pepe 2009). The first trend, mainly in the Anglo-Saxon countries (the UK, Australia, and New Zealand), consists of the convergence of the accounting standards toward a private sector approach. The second trend, present only in some countries (Canada, Sweden, and the USA), is characterized by an influential role of the government, and the accounting standards are modified for application to the public sector.

Even if control criterion based on IPSAS is still dominating in the consolidation in the public sector especially in some countries, there are interesting alternatives or better integrative solutions based on budgetary criterion that could help to overcome the criticalities arising from the implementation of IPSAS (Grossi & Steccolini). Only few countries implemented a full WGA in the public sector (Estonia and the UK), but there is a growing number of experiences (Australia, Canada, New Zealand, Spain, Sweden, Switzerland, and the USA) of implementation of consolidated financial statements in the central or federal and local government based on international and national standards.

## Synonyms

Decentralization; Local governance; Political participation

## Definitions

**Local governance:** the active involvement of local population in the political, social, and citizenship activities within the territorial boundaries of a local government

**Political participation:** a direct and indirect form of participation where citizens cast votes, elect representatives with mandates to make and executive public policies, and have a right to contest and win public elections (Wagle 2006)

**Decentralization:** the devolving of political authorities from the central to the local levels of government

## Introduction

The continual underrepresentation of women in national and local politics marks a fundamental

deficit in governance that has raised concerns for international, national, and local actors in democratic societies. Consequently, the past decades have seen diverse implementation strategies aimed at redress. For instance, the international conferences on women (Mexico 1975, Copenhagen 1980, Nairobi 1985, and Beijing, 1995) and the ratification of international conventions (CEDAW, MDGs, SDGs) have all championed calls for women's equal participation on the basis of equality, legitimacy, and democracy.

Ghana as a signatory to many international gender conventions has over the years streamlined women issues in national developments and instituted practical measures to address the gender disparity that exists in governance and other social life. The country has made steady progress in increasing the visibility of women in leadership and governance roles through appointments in parliament, ministries, and judiciary and other public institutions. However, while few women are gradually breaking the "glass ceiling" to make their presence felt in politics and governance, traditional patriarchal societies are such that women are put back in their "proper place" (Tamale 2000, p. 12). Consequently, very few women are able to permeate the entrenched masculinity of the very nature of the political institution in Ghana.

At the local district assembly level, the situation is not much different. While the implementation of the decentralization policy, the Local Governance Act, and the district assembly concepts has aimed to reposition participation as a bottom-up approach in order to ensure more women's active involvements in politics (Ahwoi 2010; Ofei-Aboagye 2004), decades after implementations, a review of women's status persistently is low (see Table 1). At best, women's political participation hinges on voting in electoral processes without contestation for political positions (Tagoe and Abakah 2015). This paper thus takes a dive into the status of women in local politics in Ghana while arguing for possible consideration of empowerment framework to enhance participation.

## The Status of Women in Local Politics in Ghana

Women's participation in politics in Ghana has witnessed only a steady growth over the past decades. This is in spite of the many efforts to encourage more women's participation in politics and other decision-making roles. Women's formal participation in political activities could be traced to the First Republic when women supported the activities of the Convention People's Party (CPP) and participated in the political process as members of the National Assembly (Parkes 1992). Hence, between 1960 and 1966, there were ten women elected to the National Assembly (Akuffo 1992). However, subsequent governments after the CPP could not do much to ensure women's visibility in political activities. Thus it was not until the 1980s that women began to organize themselves into a political force through the activities of the 31st December Women's Movement with the ultimate aim of helping women to

become more visible and have their voices heard in society (Tagoe and Abakah 2015).

Hitherto, the establishment of the National Commission on Women and Development (NCWD), in 1975, gave some impetus for the mobilization of more women for political engagements (Boateng and Kosi 2015). The NCWD was tasked to ensure that Ghana is committed to the achievement of the objectives of the International Women's Year and that of UN Decade for Women. Accordingly, between 1975 and 1986, Ghana initiated and implemented programs, projects, and activities to increase women's participation in public life at the local and national levels. These activities aimed to enhance women's access to formal education and professional training and improve upon their standard of living and their status in society by increasing their income earning capacity to assist in the development of their individual communities (Awumbila 2001; Odame 2010).

To further encourage more women, the Provisional National Defence Council (PNDC) in 1987 introduced the decentralization, local governance, and the district assembly concepts to increase the tempo of women's political engagements in the country. This shifting of the locus of power to the grass root was to pave the way for ordinary citizens to participate in local politics on a nonparty basis. In so doing, women would have equal chances as men to participate in local politics. For instance, the "ordinary residence" requirement in the qualification criteria for district assembly elections, the free and state-sponsored local government elections, and the nonpartisan character of the local government elections have all been designed to ensure not just participation but to encourage more women's engagements in political decision-making at least at the local level (Ahwoi 2010). In addition, the government directive of 30% reservation of seats for women in local government was done in a bid to encourage a more inclusive form of participation at the local level.

However, in spite the implementation of these significant policies under the decentralization structures, women continue to be marginalized because of economic, religious, social, and educational factors. Due to these factors, women continue to be heavily underrepresented in the District Assemblies in Ghana (see Table 1).

Since 1994, none of the district assembly elections have recorded more than 10% of female representation. The 2006 district assembly elections recorded the highest so far with 10.1% women representation with a decline during the 2010 district assembly elections. While women's participation in terms of contesting and getting elected in the district assembly elections is marginal, women's appointments into the assembly regardless of the 50% quota are equally low. Meanwhile, in 2002, the government of Ghana increased the quota of female appointed members at the district level from 30% to 50% resulting in women constituting 35.5% of appointed members for 97 out of the 110 districts (men constituting 1188 and women 655). Yet this figure even fell short of the 40% target set by the National Plan of Action and 50% that the government aspired to achieve (Agyare-Kwabi 2013). In 2013, out of the 216 District Chief Executives, only 11 were women. Currently, there are only 36 women Metropolitan, Municipal and District Chief Executives (MMDCEs) appointees in Ghana (The Ghanaian Times 2015), a figure still below the United Nation standard of 33%.

## Factors That Affect Women's Political Participation

The essence of local governance is to ensure a more participatory approach to governance of local communities by integrating and giving opportunity to more women to equally have a say in matters that affect them at that level. Therefore if local governance is to ensure that there is improvement in participation, then no one should be left on the periphery of the decision-making process. However, rural-urban inequalities, rural poverty, and inequalities among individuals limit the capacity of most Ghanaians, especially women to participate effectively in politics at the local government level.

The high level of poverty experienced by Ghanaian women strips them of any power to participate fully in the decision-making process at the

household, community, and national levels. According to the Ghana Human Development Report in 2009, Ghanaian women live in absolute poverty resulting from restrictions in their access to the services and jobs needed for a minimal standard of living (UNDP 2009). This low employment level gives poverty a stronghold in the household of women, as they do not get enough income to support themselves and their families, let alone to finance any political activity. Therefore with a highly commercialization of the political processes in Ghana, most women are found outside the space for meaningful political engagements. Likewise, the lack of opportunities to participate fully in politics is reenforced by structural and attitudinal barriers. The gender division of labor places the burden of household work on women and limits their time and ability to participate in formal political activities.

In addition, patriarchal beliefs and structures continuously persist in traditional societies in Ghana, which recognizes women as inferior to men in almost all aspects of social, political, and economic life. Culturally, women are not allowed to participate in the political space freely as men, as the act of public participation has been observed as the reserved for men. The male preference of leadership and male control of resources place men ahead of women in terms of their political participation. Surprisingly, such customs and laws have been used in rationalizing and perpetuating these beliefs to the extent that women themselves seem to have accepted and internalized them. Consequently, women who open up to contest for political positions are described with names and branded insolents, wanting to defy the normal.

Another factor worth mentioning is women's education. Indeed, there are as many females (2.7 million) than men (1.4 million) with no formal education in Ghana (Ghana Statistical Service (GSS) 2014). It is also very likely for men to obtain secondary of higher education than their women counterpart (UNDP 2009). Formal education offers the civic skills, knowledge, and attitudes needed for effective political engagements. It also provides the network of association from which social capital could be drawn for political participation. Therefore the lower levels of women's education imply that women do not only lack the requisite confidence and skills for participation but also will miss out of potential friends and associates who could recruit them into politics. Boateng (2017) observed that culturally unlike women, men have more established ways of networking widely, while women need to strategically garner social capital in ways that are beneficial to contesting for political seats at the district assembly level.

Finally, the creeping partisan nature of district assembly elections deters most suitable candidates from contesting. Even though, constitutionally, the local politics is to be devoid of partisanship, Ofei-Aboagye (2004) observed the gradual politicization of district assembly elections which tends to affect women's involvement. Political parties are seen endorsing, sponsoring, and offering platforms to their preferred candidates which most of the times happen to be men. Also, the issue of vote buying and selling attitude in the district assembly elections to canvass votes affects women contestation as men are more resourceful with economic power than women to "buy" votes from the electorates. Vote buying and selling come in many facades such as offering and demanding material and monetary gifts to influence the voters.

## Empowerment as a Strategy for Enhancing Women's Political Participation

Considering the minimal impact of the decentralization process in increasing women participation at the local level, the paper proposes the consideration of empowerment framework to enhance women's participation in local politics. Empowerment can be seen as a process, which offers the capacity and enables one to gain power, authority, and influence over themselves, institutions, and societies (Hur 2006). Therefore women empowerment refers to the process of awareness creation and capacity building leading to greater participation, greater decision-making power and control, and to transformation action (Karl 1995). From the feminists'

perspective, women empowerment process should lead to the liberation of women from false value systems and ideologies of oppression (Oxaal and Baden 1997). It should lead to a situation where each one can become a whole being regardless of gender and use their fullest potential to construct a more humane society for all (Akhtar 1992 quoted in Batliwala 1994: 131).

Using empowerment framework to enhance participation involves five processes: welfare, access, conscientization, participation, and control (UNICEF 1993). The welfare level requires the elimination of all gender gaps between women and men in development issues. However, the framework emphasizes that improving women's welfare alone will only make them passive participants without influence. There must be in place other empowerment levels. The access level emphasizes the need to give women the right to obtain services, products, and commodities. At the level of conscientization, awareness is created among women of their discrimination to enable them take actions to overcome those obstacles. Participation level on the other hand enables women to take part and have a share in resource and power allocation, while the level of control allows women to direct and influence events to protect their interest.

From the framework, the major step to empower women for increased political participation at the local level is to provide the facilities needed devoid of gender biases. Increasing the limited access of women to resources, which includes education, their access to credit facilities, and equal opportunities to leadership within the political and other institutional structures, could also enhance women's participation. In this case, the quota system must strictly be implemented to see more women appointments into the local district assemblies.

Also, awareness must be created through capacity building programs among women on the need for their participation in local governance activities for national development. The National Commission for Civic Education (NCCE) can liaise with the district information offices to regularly organized programs aimed at sensitizing women on the need to engage actively in politics. This can help decolonizing the long-held view that politics is for only men. When women are aware of their marginalized situation, they can then take and initiate actions toward their participation. This notwithstanding, women must be given equal control in decision-making while eliminating the male domination through more women appointments to equally provide avenue for women's presence to be felt.

Finally, there must be both individual and collective efforts toward women's empowerment for effective participation (Hur 2006). Individually, women themselves must take initiatives to develop their abilities and capabilities in order to acquire the requisite skills and the civic attitudes needed for their political participation. It is at this point that women's education has a role to play. Political education must also be given to women to equip them with requisite knowledge, skills, and attitudes needed for effective participation.

At the community level, women must be encouraged to participate in group activities to develop their awareness and the ability to organize to take action and bring about desirable change. Development agencies and civil society organizations (CSOs) can support women's collective empowerment by funding women's organizations, which work to address the causes of gender inequalities in local politics in Ghana. They can also foster dialogue between those in position of power and organization with women's empowerment goals. Empowerment policies and programs must also build on women's strength to facilitate their personal empowerment through mentorship.

Women empowerment is more than simply opening up access to women in decision- making. It must include the processes that lead women to perceive themselves as able and entitled to occupy that decision-making space. It must also be personal and collective approach in a bid to bring out the possible results of increasing women representation within the political space.

## Conclusion

Although Ghana as a country has made remarkable strides in women representation within

the political space, there continues to be serious issues that challenge women's contestation into meaningful political roles. At the local level, even though participation is repositioned as a bottom-up approach to encourage more women's involvement, women's participation so far cannot be said to be encouraging. As a way forward, Ghana needs to consider alternative implementation strategies by using women's empowerment framework as a panacea to address the gender deficits in local governance participation. Ghanaian women must be resourced educationally and empowered through other nonformal educational activities to raise awareness on the need for more women's active engagements in politics. Bottlenecks associated with political institutions must be purged to increase women's trust and interests for political participation. Women also must be sensitized to delineate the long-held misconception that politics is men's business.

# Women and Work-Life Balance in Federal Law Enforcement

Helen H. Yu
University of Hawai'i at Manoa, Honolulu, HI, USA

W

## Synonyms

Family-friendly policies; Gender; Policing; Work-family conflict; Work-life programs

## Definitions

Work-life balance is the practice of reducing work-family conflict by providing workplace flexibilities to help employees balance the needs of their families and the responsibilities of their jobs, resulting in maximized organizational performance. Key workplace flexibilities include work-life programs and family-friendly policies such as flexible work schedules, telework, worksite health and wellness, employee assistance programs, and dependent care.

## Introduction

Continuous changes in employee demographics, as well as the shifting nature of family arrangements, make work-life balance an important issue in public administration. For example, the percentage of women in the federal workforce rose from 34% in 1990 to 44% in 2015 (US Office of Personnel Management 2016). In addition, the percentage of women in the labor force with children under the age of 18 increased from 47.4% in 1975 to 69.9% in 2015 (US Department of Labor 2017). Furthermore, the percentage of unmarried women in the labor force with children under the age of 18 was higher in 2015 than married women with children in the same age span (US Department of Labor 2017). Altogether, these changes can negatively impact work-life balance. As the largest employer in the United States, the federal government has paid attention to the demographic shift and has implemented work-life programs in response. Unfortunately, not all workgroups in the federal government have benefitted from these programs. This chapter focuses on one such workgroup and highlights the challenges women face in federal law enforcement for achieving work-life balance.

## Background

### Federal Work-Life Programs

The federal government serves as a model employer for maintaining a healthy work-life balance. Many family-friendly policies are codified in legislative and executive actions and include: part-time employment (*Federal Employees Part-Time Career Enhancement Act of 1978*); alternative work schedules (*Federal Employees Flexible and Compressed Work Schedules Act of 1982*); leave for family responsibilities (*Family and Medical Leave Act of 1993* and the *Federal Employees Family Friendly Leave Act of 1994)*; telecommuting (*Telework Enhancement Act of 2010*); and commitment to workplace flexibilities and employee health (Presidential Memorandum [June 23, 2014] on *Enhancing Workplace Flexibilities and Work-Life Programs* and Presidential Memorandum [January 15, 2015] on *Modernizing Federal Leave Policies for Childbirth, Adoption and Foster Care to Recruit and Retain Talent and Improve Productivity*).

In addition, the US Office of Personnel Management (2018a) is responsible for providing work-life guidance and tools to help federal organizations develop and manage key work-life programs to meet the needs of their workforce. Six work-life programs are available to the federal workforce: alternative work schedules (e.g., flexible work schedules – latitude in determining when employees start and end their workday – and compressed work schedules – increase of hours in a workday but less workdays in a workweek); telework (e.g., permissibility to perform work from home or any other location less the workplace); worksite health and wellness programs (e.g., health education, physical activity promotion, and lactation support); employee assistance programs (e.g., assessments, counseling, and referrals); childcare assistance programs (e.g., onsite daycare services, referral services, and childcare subsidies); and elder care programs (e.g., support groups and emergency backup care).

### Research and Managerial Support for Work-Life Balance

In response to the changing demographic makeup of our workforce, much research has been conducted to verify the impact of family-friendly policies and work-life programs. For example,

Caillier (2016) found a positive relationship with both alternative work schedules and childcare assistance programs with reduced turnover intentions, suggesting that if organizations are perceived to care about the personal lives of their employees, as well as their family obligations, then employees will reciprocate by remaining with the organization. Moreover, in the 2015 Federal Employee Viewpoint Survey, satisfaction with work-life programs is rated very high among women who participated (US Office of Personnel Management 2016).

Managerial commitment plays a prominent role in placing work-life programs into practice. Nishii and Wright (2007) describe a three-level analysis on variability which suggests that the goals of agency leaders who approve human resource practices (e.g., family-friendly policies) do not necessarily transfer to supervisors and middle managers that execute and implement these policies. In turn, supervisors and middle managers fail to enact the policies as designed or apply discretionary equitability across the workforce, creating inconsistent outcomes from employees who are to receive such benefits. This appears to be true for supervisors and middle managers in federal law enforcement since they appear to be resistant to these programs or feel mission obligations override work-life balance. This is not surprising. Recruitment literature from many law enforcement agencies describe the position of a federal officer as more than a job but a calling with great responsibilities. Despite the implication, federal law enforcement agencies are not short on applicants. For example, the Federal Bureau of Investigation (2016) received 22,692 applications for 543 special agent vacancies in fiscal year 2011; however, they also acknowledged the lack of women [and minorities] from joining the agency and "described it as a crisis that can undermine investigations and keep the agency out of touch with the communities it serves" (Goldman 2016, p. 24). Although they have a recruitment plan to increase the overall number of female officers, the capacity for reducing turnover intentions will continue to be at risk if family-friendly policies and work-life programs are not incorporated as part of the solution.

## Federal Law Enforcement

Over 90 federal law enforcement agencies exist across the entire federal domain, employing over 120,000 sworn officers authorized to make arrests and carry firearms (Federal Law Enforcement Training Centers 2018; Reaves 2012). Although women account for just 15.5% of those officers, federal law enforcement is an attractive career option for women because it offers a wide range of job opportunities beyond those of traditional policing to include criminal investigation, inspections, corrections and detention, security and protection, and court operations (Reaves 2012). Two distinct career requirements separate federal officers from their state and local counterparts: law enforcement availability pay (LEAP) and workplace mobility.

Unlike local or state policing, federal law enforcement officers automatically work beyond the standard 40-h workweek. By law, federal officers classified in the GS-1810/1811 job series receive LEAP – supplemental compensation equal to 25% of the officer's basic pay – because of the large amount of overtime that these officers work and the expectation to carry their firearm and exercise their arrest authority whenever necessary (US Office of Personnel Management 2018b). Federal officers are required to submit to an annual certification attesting that they meet the requirements for the upcoming 1-year period (US Office of Personnel Management 2018b). Most agencies incorporate LEAP into the work schedule and require their officers to work 10-h days while still being on call after standard working hours and on weekends. The extra 2-h a day (not including commute time) can be a detriment to all officers with family responsibilities, especially those with young children.

Likewise, federal law enforcement officers are subject to travel and mobility requirements. Unlike local and state policing where workplace jurisdiction is set, federal law enforcement agencies operate in all 50 states plus territories, the District of Columbia, and in an ever-increasing number of foreign countries (Reaves 2012). As a

result, many federal law enforcement agencies mandate frequent transfers for career advancement and officer professional development, creating geographical separations from children and spouses that do not desire or are unable to relocate with the federal officer (Yu 2015, 2019). In addition, refusing a transfer can delay or block future promotional opportunities. Altogether, such unique occupational requirements in federal law enforcement can impede family obligations and family cohesiveness with the demands of mission requirements.

## Women and Work-Life Balance in Federal Law Enforcement

Decades of research have chronicled women's struggles to integrate into all levels of law enforcement – local, state, and federal. Male officers' resistance to female officers has been well documented, and the literature on law enforcement culture continues to describe a distinct subculture that celebrates masculine values and a social structure that exists purposely and specifically to oppress female officers (Dick and Jankowicz 2001; Martin and Jurik 2006). Although the masculine work culture and lack of support from male colleagues can create harmful workplace experiences that impact women's professional well-being, it does not appear to play a major role with turnover intentions. In other words, female officers cannot be intimidated. In Yu's (2015) exploratory study of the challenges women face in federal law enforcement, an overwhelming 90.5% of the women in her study would not depart federal law enforcement due to male or cultural negativity. The same cannot be said with work-life balance. In Yu's (2019) exploratory study of family-friendly policies for reducing turnover intentions among women in federal law enforcement, over half (54.9%) the women cited lack work-life balance as cause for departure and identified four family-friendly policies for improving family obligations and family cohesiveness while reducing turnover intentions. Although some of these policies have been incorporated by some agencies, they require discretionary approval by a supervisor or middle manager. Others are new policy proposals in response to a specific occupational workgroup.

Paid maternity leave is the top family-friendly policy proposal for improving work-life balance in federal law enforcement (Yu 2019). The United States is the only developed country in the world that does not mandate paid maternity leave for its working mothers, and despite the federal government's representation as a model employer for achieving work-life balance, they have yet to pass such legislation. Women in federal law enforcement often deplete 2–3 years of sick and annual leave to have a baby and bond with it for 6–12 weeks, leaving no remaining days for medical appointments or health and vacation days for the next 12 months. Some women are having children later in their careers in order to accumulate sick and annual leave while others make the decision to either forego children or only have one or two as a result of occupational demands. Until Congress passes such legislation, federal agencies should allow the transference of sick and annual leave between spouses (and same sex spouses) that work within the same agency, demonstrating compliance with the latest Presidential Memorandum (January 15, 2015) on modernizing federal leave policies.

The next two most cited family-friendly policy proposals for improving work-life balance are flexible work arrangements (e.g., alternative work schedules and part-time agent program) (Yu 2019). As mentioned previously, most federal officers are required to maintain a 50-h work schedule (plus 24/7 availability) to fulfill occupational requirements for mandated availability pay. Although some federal law enforcement agencies offer alternative work schedules for its federal officers, nearly all require lower-level approval from the officer's supervisor or middle manager who appears to respond in an inconsistent discretionary fashion. With the exception of national emergencies, there is no reason to deny any requests to work an alternative work schedule. Another consideration for a flexible work arrangement is the part-time agent program. This program reduces officers' work hours from the mandated 50-h work schedule to somewhere between 20 and 32 h per week for up to 10 years and does not alter retirement dates, while supporting US Office of Personnel Management (2018c) guidelines that encourage part-time

employment to retain highly qualified employees or those with special skills unable to work a full-time schedule. However, akin to alternative work schedules, the downside to the part-time agent program is its discretionary implementation by supervisors or middle managers and its perceived occupational acceptance. While middle managers may approve any individual to participate in the part-time agent program, they can also revoke its status at a moment's notice, and some divisions within an agency are reported to have blanket policies prohibiting federal officers from participating, particularly the "operational" divisions. Furthermore, part-time status does not appear to be career enhancing or looked favorably upon by fellow coworkers. Since the vast majority of those who utilize the part-time agent program are women, they are likely disproportionately impacted by promotional opportunities as well. Despite the drawbacks, women in federal law enforcement are fully aware of the conditions that are associated with part-time employment and are willing to forego promotional opportunities if it improves work-life balance. Supervisors and middle managers appear to be guilty for not implementing the policy in accordance with the agency's intent for providing a flexible working environment.

Finally, the fourth most cited family-friendly policy proposal for improving work-life balance are flexible transfer policies. Women in federal law enforcement report a mandatory relocation policy to their agency's headquarters in the District of Columbia for promotions and inflexible office transfers as impediments to family obligations and family cohesiveness. In order to promote into a managerial position (GS-14 and higher), agency leaders require their federal officers to submit to a transfer to headquarters for officer professional development and career enhancement. In addition, managerial positions have a term limit that require federal officers to either step down at the end of the term or submit to relocation to headquarters. As a side note, federal officers are not required to pursue managerial promotions and can choose to have a career in federal law enforcement having never achieved a grade beyond GS-13, commonly attained after 5 years of service. Many of the female officers in Yu's (2019) study report bypassing promotional opportunities because they did not want to transfer due to family considerations. Despite changes in employee demographics, women continue to be the primary caregiver and will often sacrifice their career for children, elderly parents, and their spouse, making employment with frequent transfers more difficult (Sabharwal 2015). The reluctance to relocate is reported to effect male officers in a different manner. The perception is that male officers have spouses that are either stay-at-home wives or have careers in mobile occupations (e.g., nurse, teacher, and retail). In addition, men officers are perceived to accept family separations as par for the course if the family is unwilling or cannot transfer to another location. The family arrangement is different for female officers. It is rare for female officers to have stay-at-home husbands as nearly all have careers of their own. In addition, children of divorced or single parents often remain with the mother and they are often subjected to child custody arrangements that do not allow a child to permanently move across state lines. Unless agency leaders limit the number of transfers for promotions and/or consider spousal and child custody arrangements, the current mobility requirement will continue to impede family obligations and family cohesiveness and disproportionately impact women for managerial positions.

Achieving work-life balance will continue to be a factor for retaining women in federal law enforcement. Employee turnover is an extremely costly problem for all public organizations not just law enforcement agencies. They can harm an organization directly in terms of human resource actions (e.g., recruitment, selection, and training) and indirectly by loss of productivity, transferring employees to fill key vacancies, and disruptions in employee social networks that build morale. However, as federal law enforcement agencies increasingly have to compete for quality candidates in order to reflect the diversity of the communities they serve, they must understand the challenges female officers encounter with maintaining work-life balance and implement courses of action to minimize the costs of turnover.

## Conclusion

Federal law enforcement agencies have not kept pace with other federal organizations when implementing family-friendly policies in the workplace despite the US Office of Personnel Management providing guidance and tools to help develop and manage key work-life programs to meet the needs of their workforce. In addition, supervisors and middle managers in federal law enforcement appear less adaptive to family-care needs and implement these policies in a discretionary manner since the role of law enforcement officer is expected to supersede any other commitment. However, any effort for increasing the presence of women in federal law enforcement must take work-life balance into account and promote family-friendly policies.

# Women in Parliamentary Politics: Comparing the Barriers to Their Participation in Australia and Bangladesh

Fardaus Ara[1] and Jeremy Northcote[2]

[1]Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

[2]Murdoch University, Perth, WA, Australia

## Synonyms

Gender in national politics; Women and political participation; Women in electoral politics; Women's representation in the national legislature

## Definition

Women in parliamentary politics refer to the group of women elected to a national legislature through direct or indirect election who try to influence government and lawmakers to address gender needs and make women-friendly laws and policies.

## Introduction

Women comprise a little more than half of the world's population. Although they have contributed substantially to the social and economic development of societies, their participation in formal political structures and processes remains marginal globally (Bari 2005) regardless of the level of modernization within countries. On average, women occupy 25% of seats in national parliaments (Inter-Parliamentary Union [IPU] 2020). Except in countries that feature legislated quotas, there is no country either developed or developing where women are represented in politics in proportion to their population. However, it is generally the case that women have higher rates of participation in national politics in developed countries than in developing ones.

Classical sociological approaches (Verba and Nie 1972; Wolfinger and Rosenstone 1980; Lipset 1959; Rostow 1960; Deutsch 1961; Bell 1976; and Inkeles and Smith 1974) contend that modernization heightens women's opportunity for professional development and thus generating a superior pool of women eligible to serve the political office. Furthermore, scholars like Kenworthy and Malami (1999), Reynolds (1999), Rule (1981), and Alexander and Welzel (2007) argue that higher levels of economic development allow more social amenities to assist women in society, as the expenses of labor and time of child-rearing and household work decrease and consequently women get more free time for social activities. Likewise, Inglehart et al. (2002) claim that various levels of modernization change cultural attitudes toward women in society and bring gender equality.

However, there are controversies among academics regarding the assumption that modernization leads to gender parity in society. Esther Boserup (1970) criticizes the traditional notion that technology gives women freedom. She claims that the modernization of technology rather makes women dependent on men. Moreover, Nilsson (2004) has identified modernity as a patriarchal construction, which creates processes and outcomes that support men.

Several studies have tried to explore the causes of underrepresentation of women in politics across countries at the international level. However, global studies on women's political representation comparing developed and developing countries are mostly quantitative in nature. In this context, this research tries to identify the barriers to the participation of women at the parliament to compare if there are commonalities or differences regarding the barriers between developed countries (with Australia employed as a case example) and developing countries (with Bangladesh used as the case example).

## Methodology

This study investigates the barriers to women's participation in the national parliament using a qualitative, comparative case study approach. Using qualitative data derived from interviews with female politicians in Australia and Bangladesh, it is argued that for the most part, the barriers experienced by women in both countries are similar, despite immense differences between Australia and Bangladesh in terms of modernization. It is found that modernization does not remove patriarchal barriers to women's participation but changes their form.

All serving federal Australian Labor Party (ALP), Liberal Party (LIB), and Greens (GRN) women Members and Senators (2013–2016 period) in Australia were contacted for interviews, with 14 accepting face-to-face or phone-based interviews, 11 from the ALP, 2 from the GRN, and one from the LIB. In Bangladesh, 12 parliamentary female representatives (2014–2019 period) were interviewed in person, including

6 from the Awami League (AL), 4 from the Bangladesh Nationalist Party (BNP), and 2 from the Jatiya Party (JP). The interview questions were designed to collect background information of the women representatives first and then continued to extract information about their experiences in the political career ranging from involvement in politics, pre-selection, party membership, experience in political office, and the barriers to their political careers.

The two countries suited the unique comparison that the researchers wanted to investigate. They stand at the opposite ends of the modernization continuum. Australia ranks sixth on the Human Development Index (HDI), while Bangladesh ranks 135 (UNDP 2019). These two countries are situated in two different geographical locations with differences in GDP, education, and socioeconomic context. Australia was the first country to grant political rights (to vote and stand) to women in 1902, while women in Bangladesh were first allowed voting rights in 1935 while Bangladesh was under colonial rule, known as East Bengal. However, Bangladesh emerged as an independent country in 1971, and since then women are allowed to vote and stand in elections.

Australia (ranked 48th) is ahead of Bangladesh (ranked 99th) regarding the percentage of women in the Lower House of parliament (IPU 2020), although Bangladesh's participation rate is flattered somewhat by the quota system, which has led to 50 out of the 72 female members in the 11th parliament appointed by parties to women-only positions (Anik 2019).

However, there is one indicator where Bangladesh is ahead of Australia. Australia only recently had its first female Prime Minister with Julia Gillard (2010–2013), who claims to have experienced a variety of difficulties on account of her gender. In contrast, Bangladesh has been governed by the female head of state since 1991, with both major parties headed by women who have exchanged positions of Prime Minister during that time. However, the situation with female political leaders in South Asia (including Pakistan, India, Sri Lanka, Myanmar, and Thailand) is that, without exception, they are widows, daughters, or sisters of prominent male politicians who preceded them and in this sense are representatives of political dynasties rather than rank-and-file female candidates.

The choice of comparing a developing country (Bangladesh) with a developed one (Australia) marks a departure from the majority of prior research, which has either focused on Western industrialized democracies or on developing countries only, with few studies comparing countries from opposite ends of the development spectrum. However, considerable caution must be exercised in terms of treating these countries as a representative of developing and developed countries in general, and in this respect, the findings should be regarded as suggestive rather than as conclusive concerning issues around modernization.

## Political Participation of Women in Australia and Bangladesh

The Commonwealth of Australia is a federation of six states: New South Wales, Queensland, South Australia, Tasmania, Victoria, and Western Australia, along with two territories, Northern Territory and Australian Capital Territory. National political organizations in Australia mirror the British legacy (Australia being a former British colony) and the impact of North American federalism. The party or coalition with the majority of seats on a preferred basis in the election in the Lower House or House of Representatives (150 members) forms the government. Bills need to be approved by the Senate or the Upper House (consisting of 76 members, 12 from each of the 6 states and 2 from each of the mainland territories) to become laws. At the federal level, the government normally rotates between ALP and a coalition of the LIB and the Nationals (NAT). Other parties like the GRN and Independents regularly win seats in the Senate but seldom in the House of Representatives (McAllister 2006). Women in Australia have enjoyed the right to vote in elections and hold public office as federally elected representatives since the early twentieth century, but it is only since the 1980s that

women have begun to stand for office and win office in reasonable numbers (Table 1).

The ALP has exercised a 40:40:20 quota that guarantees that at least 40% of Labor seats are filled by women and a minimum of 40% by men. The rest may be filled by either gender (McAllister 2006). Later on, a target of 50% within a decade has instituted in 2015. The coalition parties (LIB and NAT) do not have any quota system claiming that quotas are discriminatory toward men and the nomination of candidates should be based on merit (McAllister 2006; McCann and Wilson 2014). They argue that more women may get the opportunity to join electoral politics by mentoring, training, and networking sessions (Drabsch 2007). In Australia, the ALP has the highest share of women in parliament credited by many to the Labor's quota policy. Among the current coalition government's 96 MPs and senators, there are just 20 women, and for Labor, of the 95 MPs and senators, 44 are women (Mcllroy 2019).

In the federal election of 2016, women represented 36.1% of candidates for the Senate and 31.4% of candidates for the House of Representatives (Table 1). Of the 150 seats in the Lower House, women were elected in 43 electorates (28.7%), while in the Senate, 30 seats out of 76 seats (40%) were won by female candidates (Table 1).

Although women have started to participate in federal parliament in growing numbers, this is not always reflected in their elevation to more powerful positions within political parties and government, such as party leaders and Cabinet (Drabsch 2007). However, since the 1980s women have started to consistently gain party leadership positions. As of 6 February 2020, the second Morrison ministry of the LIB/NAT coalition government has six women with a full ministerial rank (Prime Minister of Australia 2020).

The situation of women in national politics in Bangladesh is somewhat different from the Australian experience. Bangladesh, officially known as the Peoples' Republic of Bangladesh, is the seventh most populated country in the world and the fourth largest Muslim-majority nation. The major political parties in Bangladesh are the

AL, BNP, JP, and the Jamaat-e-Islami (JI). Since 1990 either the AL or coalitions of the BNP and the Islamic fundamentalist party JI have been ruling the country.

The Parliament of Bangladesh is a single chamber (unicameral), consisting of 300 directly elected members from single territorial constituencies through the "first-past-the-post" system for a term of 5 years. In addition to 300 general members, there are 50 reserved seats for women in parliament who are elected by the elected general members of the parliament (Jahan and Amundsen 2012). General seats are more important than the reserved seats in terms of power and status.

Despite the right to vote and the two major political parties being led by two female leaders since 1990, the number of women standing for election and elected to the general constituencies has been very low, less than 3% before 2008. Since the ninth parliament, the proportion of female candidates and elected representatives has increased but remains below 7% (Table 2).

Seemingly contradicting the low representation of women in Bangladesh parliament is the curious situation whereby the position of Prime Minister has rotated for the past 18 years between two women who have served as leaders of the two main parties, Sheikh Hasina of AL and Khaleda Zia of BNP. However, it seems that voters in Bangladesh voted these particular women as political party symbols. Their emergence as leaders of two major political parties in a male-dominated political environment can be explained by their kinship linkages to male authority, not as reflecting any advances toward gender equality. Very few women have served as senior ministers

**Women in Parliamentary Politics: Comparing the Barriers to Their Participation in Australia and Bangladesh, Table 2** Women representation in different parliaments in Bangladesh

| Parliament | Female candidates in general seats | | Number of elected women members in general and reserved seats | | | Women elected in general seats (%) | Total (%) |

Source: Bangladesh Election Commission (http://www.ecs.gov.bd/English/index.php); Democracy Watch (2009); IPU (2020)

in Bangladeshi parliament. There is only one woman with full ministerial rank in the current parliament. Usually, the election is a "political game" to capture state power. Party leaders do not gamble by selecting female candidates in national elections as they have little confidence in women to win. Therefore, it is tough for female candidates to succeed in elections against male competitors in Bangladesh (Chowdhury 2002; Panday 2013).

## Barriers to Political Participation of Women

### Family Responsibility

The scarcity of time for public life due to the crisis of balancing family and professional responsibilities is the most often cited hindrance to the political participation of women around the world (Shvedova 2005). The Australian parliamentary participants identified family responsibility as the major impediment to political participation of women in Australia, as women, particularly with young children, suffer due to lack of time to spend in politics. Furthermore, lack of support from husbands or partners and other family members, lack of time to balance between family and politics, and extensive travelling that are closely related to family responsibilities hinder the participation of women in politics. This is a finding that emerged in other studies (Mcllroy 2019; O'Flaherty 2005; Sawer and Simms 1993).

Similarly, the parliamentary participants in Bangladesh identified family responsibility, particularly looking after children, as an impediment to the political participation of women. Much like the Australian participants, lack of support from the family members and difficulty in balancing time for family and politics hinder their participation in politics.

### Lack of Finance

Worldwide, women generally have less financial assets than men; around the world, men earn more than women, and women are engaged predominantly in inadequately paid and unprotected jobs, as well as in the informal sector and migrant labor pools. Consequently, women face financial challenges that become extreme during the process of gaining a nomination. Nomination costs require a huge amount of money essential to building name recognition, touring, attending party meetings, arranging a campaign team, and establishing an electorate. Public financing might commence, party support may increase, and visibility may be more prominent that will help in attracting additional supplies of financial assistance only after securing the nomination (Sidhu and Meena 2007).

All the Australian participants admitted the necessity of finance. According to them, candidacy costs lots of money, and fund-raising is a difficult job for women as they often do not have the contacts in business or the trade union sector to collect donations. Thus, if they do not have personal wealth, fund-raising can be a challenge for women, as previous research has found (Drabsch 2003).

Parliamentary participants in Bangladesh recognized the importance of finance for participating in politics, a factor also cited by Ahmed (2008) and F. D. Chowdhury (2009). Often the financial status of the candidate and their connections with wealthy donors is a key consideration in attracting party support. The financial status enables politicians to be less corrupt in two ways: first, it means that politicians do not need to leverage money off others to finance their nomination; secondly, it means that politicians are less tempted by financial incentives during the course of their duties. Although women technically receive rights to family property through inheritance law, the emphasis on patrilineal wealth means that in practice men often exercise control over financial resources. A woman who is single or who does not have the support of their partners may find accessing financial support for their political careers extremely difficult in Bangladesh.

### Violence, Harassment, and Security

Harassment and violence against women lecturing in public, protecting human rights, or looking for political office are not uncommon in the world,

particularly in conflict-affected or politically unstable states or regions (True et al. 2012). Violence against women and girls, along with the increasing incidence of electoral violence and insecurity, affects women's economic, social, civil, and political rights and discourage women to participate in public life including politics (Chowdhury et al. 1994; True et al. 2012).

Perhaps not surprisingly, none of the participants at the federal level in Australia mentioned political violence as a deterrent to political participation, which would seem to reflect the relatively strong state of security that exists in Australia. However, three participants identified sexism and bullying in Australian politics as an impediment to women's participation in politics. While such behavior is, to some extent, part and parcel of the rough and tumble nature of political life in Australia, it can easily slip into a condescending and misogynist tone (or can readily be interpreted as such) when it takes place between politicians of the opposite sex (O'Flaherty 2005). It could also reflect the fact that more men occupy positions of seniority in politics and hence are in a position to bully female juniors, but this would still be an indirect outcome of gender inequality.

In contrast, violence in elections and politics are ingrained in Bangladesh. In Bangladesh, both "money and muscle" are essential to gain party support for the candidacy. Women are also more vulnerable to violence than men, and hence they are reluctant to involve themselves in – let alone build an entire career on – a career that may attract violent behavior (Ahmed 2008; Chowdhury 2009; Paasilinna 2016).

### The Nature of Politics

The culture of politics refers to the attributes of the political arena that are deemed either attractive or hostile to women. Shvedova (2005) finds that politics often incorporates the hypermasculine ideas of "winner and loser," contest, and conflict.

All the federal participants mentioned the intimidating nature of politics as a serious impediment to the participation of women in politics. Politics is an area of confrontation, and it is an aggressive place. Women generally do not like aggressiveness and avoid it.

Likewise, parliamentary participants in Bangladesh indicated rivalry and dirty competition in politics as a discouraging factor for many women. In reality, politics is full of conflict and confrontation that many women do not like to get involved in. Furthermore, vote-buying is a common practice in the elections. Women, in general, try to avoid such conflicting environment.

### Role of Political Parties

It is difficult to be elected without the patronage of a political party, particularly at a national election. Therefore, women seeking entry into electoral politics generally join political parties (UNDP 2005). This means that party strategies to encourage and support women's involvement and their way of incorporating gender parity issues are vital to political empowerment of women (Shvedova 2005).

All the parliamentary participants in Australia identified the support and selection processes related to political parties as a major determinant to the political participation of women. Participants recognized the pre-selection process as a vital factor, remarking that parties tend to allocate women to marginal seats that are difficult to win. Because of the affirmative action, women in the ALP are now selected in greater number than before. However, most of the time, safe seats are not given to female candidates.

All the parliamentary participants in Bangladesh identified the role of political parties as a deterrent to the political participation of women. The most significant barriers noted are the candidate nomination process, lack of support by the male politicians, and lack of initiatives to ensure increased women participation in the party organizations. However, all the parliamentary participants in Bangladesh supported the quota or seat reservation for women in politics.

### Socio-Cultural Barriers

Culture can be broadly described as the values, norms, traditions, and outlooks common to society in general (Liu et al. 2011). Culture defines women's work and men's work. However, the explanations may differ and change across societies and over time.

Traditional norms and practices globally specify women's key roles as mothers and homemakers and place them in the private arena of home and men in the public sphere. Because women are inextricably associated with the private domain, women need to bargain for their entry into the public sphere depending on the accessible resources in a given culture and society (Bari 2005; Shvedova 2005).

All the Australian parliamentary participants recognized the traditional gender division of labor as a major barrier to women's participation in politics as it keeps women busy at home. For those women who do enter politics, they must continue to contend with these traditional cultural expectations. The attitude of the general community is the key, and there are conservative attitudes from men as well as women that remain in Australia, although these norms have undergone much change in the past few decades. The federal participants in Australia identified the socialization of girls in the family and society as a vital factor that influences the political participation of women. The way girls grow up has a substantial impact on them. A lot of women grow up very shy and do not express their passion or interest to be a politician. Besides, women who are in politics sometimes feel guilty, especially if their children are sick at home.

In Bangladesh, the traditional gender roles, allocation of resources and responsibilities result in an uneven position of men and women in the society (Halder 2004) and keep women isolated from politics. Additionally, due to social expectations and household activities, women usually feel hesitant to join politics.

All the parliamentary participants in Bangladesh mentioned the impact of traditional gender roles in Bangladeshi society as a major deterrent to the political participation of women. The traditional gender role, social system, and parochial mentality create obstacles for women to advance in politics. The interviewees feel that they are judged more critically than men when participating in politics, with the sense that men do not feel that women properly belong in the political sphere. It is also important to note that Bangladesh is a Muslim-majority country, and conservative and/or fundamentalist religious beliefs are seen to reinforce traditional notions that a woman's proper place is within the domestic sphere, not the public place.

### Self-Confidence

Related to the issue of socialization is self-confidence in public. It follows that if women are brought up to feel out of place in public life – even shame in some respects – then this will impact on their self-confidence. Additionally, if men are prone to be condescending and overly critical of women who participate in political life, then this will also impact on their self-confidence. In Australia, many women suffer due to a lack of confidence that acts as a barrier to joining politics. In addition, some women do not think that they have the skills to survive in politics.

Parliamentary participants in Bangladesh did not mention self-confidence as a barrier, but high self-confidence is probably implied in the emphasis that participants placed on overcoming criticism and the aggressive nature of politics in Bangladesh, which involves considerable bravery. The lack of reference to self-confidence might reflect cultural differences between Bangladeshi and Australian women, whereby Bangladeshi women are not as prone to expressing personal traits in individualistic psychological terms as much as their Western counterparts.

### The Role of the Mass Media

Mass media plays a significant role in shaping public attitudes (Shvedova 2005). The way the media portrays women most of the time and female politicians, in particular, has a significant influence on their participation in politics.

In Australia, repeated negative reporting on Julia Gillard, Australia's first (and only) female Prime Minister, is said to have had the impact of trivializing her political career (Sawer 2013; Woodward 2013). Australia's first female attorney-general Nicola Roxon suddenly retired from politics in early February 2013 to be at home for her young girl. She frequently mentioned that questions on how she balanced being a Cabinet minister and a wife and mother annoyed

her a lot as her male colleagues who were husbands and fathers were never asked the same question (Summers 2013).

The federal representatives in Australia mentioned the treatment of women by the media as a negative factor for women in politics. The media is very critical toward women. However, media treatment was not a factor cited by parliamentary participants in Bangladesh, who are, in general, not the subject of attention by the media, which comes from a tendency to ignore women in general.

## Conclusion

It is apparent that women representatives in Australia and Bangladesh face similar barriers that hinder their political participation, despite the starkly different cultural and socioeconomic development that separate women in the two countries. There are of course some key differences (such as violence and security) that are specific to the socio-historical context of the countries and variations in the degree to which certain barriers (such as support from relatives and marital status) present themselves. However, prima facie, it appears as if patriarchy or the traditional culture of male domination is responsible for the similarities of barriers to women in the two countries irrespective of differences in the level of modernization.

The participants identified several barriers to their way of participation in the electoral politics that are commonly associated with patriarchal societies. Domestic and reproductive roles of women; lack of finance; violence, harassment, and insecurity; the aggressive nature of politics; lack of support by the political parties; the process of socialization of girls and boys; and treatment of media toward women are direct or indirect outcomes of the male-dominated social and political system. All the female participants recognized patriarchy as one of the prime factors for the low participation of women in politics.

Additionally, there are contextual differences that exacerbate gender-specific challenges. In Australia, the contextual factors can be broadly categorized as person-centered (e.g., confidence, privacy) and environmental (travel distance) and in the case of Bangladesh as socio-cultural (religion, political instability, social instability). The societal factors affecting women's political participation in Bangladesh are characteristic of societies lagging behind in modernization. Modernization arguably decreases security issues (due to less corruption, separation of religion from the State, and more peaceful civil order) that otherwise indirectly heightens the gender divide but also leads to new barriers as a result of the lack of traditional support networks. In either case, regardless of whether the main issues are basic security or personal anxieties, women seem to suffer disproportionately from these challenges more than men.

Modernization brings a number of opportunities in the lives of women. However, modernization does not appear to completely erase traditional attitudes toward women concerning their duties in the home and occupational gendering (such as the view that politics is a "boys club"). Instead, its effects are directed more toward public acceptance of women as part of public life in general, placing a double set of expectations upon women that are difficult for them to balance and reconcile. This is consistent with a range of studies (Boserup 1970; Nilsson 2004; Scott 1995) that demonstrate that women in modernized societies are increasingly participating in the labor force (as part of public life) but are retaining their responsibilities for home duties and are being selective in their career choices based on persistent gender stereotypes.

Further, by and large, the barriers experienced by women in both countries studied are similar, although it is probably true to say that women in Australia are better placed to overcome them than women in Bangladesh due to greater empowerment (particularly in terms of anti-discrimination legislation and a more egalitarian climate). Modernization cannot be relied upon alone to foster the desired gender parity in society and politics. A combined effort by international agencies, women organizations, and government agencies, may also be necessary to help ensure gender equality in politics.

One limitation of this study needs highlighting, namely, that participants who were interviewed had successfully entered politics. Those who have successfully navigated their way into their political careers obviously had less difficulty overcoming various barriers than those who failed. It might also be the case that those who failed experienced different barriers than those who succeeded. More fine-tuned comparative qualitative research into the nature of barriers facing women in developed and developing countries carried out with women at different stages of their political careers, including those thinking of entering, should help shed further light on these issues and help fill in gaps on the effects of modernization.

# Women in the Middle East

Hmoud S. Al-Olimat and Amal ElGammal
Social Sciences Department, Qatar University, Doha, Qatar

## Synonyms

Preface; Prologue

## Introduction

"The Arab Region comprises 22 states that are members of the Arab League, is defined by complex set of issues including the Arab Israeli conflict and its repercussions, unstable economic conditions and trends, population-resource imbalances and environmental stress" (Al Maaitah et al. 2012). In addition, currently several of the Arab states are witnessing internal wars and conflicts, which is resulting in

mass destructions, deaths, and massive floods of displaced people. According to Al Maaitah et al. (2012), democratization in the Arab region remains a slow process, which faces various setbacks including regional instability and conflicts, economic imbalances, and the lack of freedom to engage in meaningful democratic process. Al Maaitah et al. (2012) added that such setbacks not only hindered the democratization process but have also delayed efforts aimed at promoting women's empowerment and equal participation in decision making.

While most of the Arab countries either signed or ratified various conventions on the rights of women and issued national laws on that effect, however, these efforts did not reach their full fruition in the real world. According to the Arab Organization for Human Rights (2013), the situation of Arab women in all of the Arab world is characterized with various degrees of weak participation in public life, decision-making centers, economic participation, and in the social and family sphere. Women in general, are disproportionally represented in political life. Globally, women occupy only 25% of senior management positions, but this is still much higher than in Arab countries (UNDP 2015).

According to the Arab Development Report (UNDP 2002), the lack of women empowerment is the main factor of the Arab world's backwardness. It stated that "the utilization of Arab Women's capabilities through political and economic participation remain the lowest in the World in quantitative terms, as evident by the very low share of women in parliaments, cabinet, and the workforce, and in the trend toward the feminization of unemployment" (UNDP 2002).

The situation of women in the Arab world and probably in similar situation is influenced by social and cultural norms. The traditional roles of women are more of homemakers and home-carers for all family members. These cultural norms limit the scope of women's socio-economic and political participation. This situation varies from one country to another. In some countries, women made significant progress in the public sphere, while in others they are not. The progress of women in some countries is spearheaded by strong political support of the ruling families, such as the case in Jordan, where women assume most of their high rank positions by royal appointment not by election, although the parliamentary quota had significant impact on women's participation in the Council of Representatives.

On the other hand, the situation of women in specific countries is not so pleasant, for example, women in Libya experience difficult situations, which resulted in weakened participation of women in political, social, economic, and cultural activities of their country (Algmati 2014). The situation in Saudi Arabia is even weaker especially in the decision-making process and public life in general (Abdurrahim 2014). Recently, Saudi Arabia has made significant advances in women's participation in public institutions including the Consultative Council (Majlis Al-Shura) and municipalities.

## Education and Illiteracy

There has been strong regional progress toward gender parity in education, a crucial step to create equal opportunities for women and men. Many more girls now go to primary school in the region (UNDP 2015). Statistics show that the situation of women education is relatively improving in the Arab world with variations among countries and urban-rural societies. For example, in Jordan women illiteracy rate was 24% in 1990 and has dropped to 10% in 2010, and in Bahrain it dropped from 28% in 1990 to 8% in 2010, and in Tunisia it dropped from 48% in 1990 to 28% in 2010. However, some other countries witnessed an increase in women illiteracy rate; these include Sudan from 40% in 1990 to 60% in 2010, and in Mauritanian it increased from 61% to 71% for the same period. While in some other countries, the rate has dropped slightly; however it still is considered very high (e.g., Egypt from 40% to 38%, Yemen from 85% to 60% (Arab Women Organization (AWO) 2010).

## Economic Participation

While women have made significant progress in education, in several of the Arab countries, females outnumber male students in university level especially in arts and social sciences. However, they are disproportionally represented in the labor market. The Arab region has the lowest labor force participation rate among all regions, mainly due to the low participation of women, as men's labor force participation rate is almost identical to the global average of 77%. Although many Arab countries witnessed an increase in women's labor force participation rate in the past two decades, it reached only 26% in 2010, which is the lowest rate among all regions and half the global average of 51%. The region has made progress on educational attainments for both boys and girls, but gains in women's education did not significantly raise their participation in the labor force. Women's employment to population ratio increased slowly, from 16% in 1991 to 19% in 2011. However, it remained the lowest among all regions and much lower than the world average (UNDP 2015).

The low economic participation rate of Arab women is due to several sociocultural and economic factors. The prevailing masculine culture gives priority for males to have jobs. Women's work may be considered as costly because of women having more time off due to marriage, pregnancy, and maternal leaves. Some companies and employers express it bluntly that they hire only singles, and if new female employees get married within a certain period, their contract will be terminated. In addition, the Arab labor market is not creating enough jobs for its youth population, either males or females, and women are those who are affected adversely in this situation. These conditions sharply limit job opportunities for women (see Al-Makhzoumi 2010). Women's work has a positive impact on women's role in family and society, and the economic progress of women and their contribution to the welfare of their families enhance their roles in their families and communities (Olaimat and Al-Louzi 2008; UNFPA 2014).

## Political Participation

Arab women's political participation is below expectations. Despite the progress made in education, health, and relative improvement in their economic participation, the achieved progress is not reflected in their political presence. Arab women's political participation even is lower than their economic participation. If we take some measures, we find that women participation in higher government positions (ministers) in Jordan was 4.7% in 1990 and increased to 9.7% in 2010; in Algeria it was 11% for both periods; in Egypt, it reached 3.9% in 2005. With regard to parliamentary participation, still it is relatively very low compared to the population of women and their improved education. For example, in Jordan the percentage increased from 0% in 1990 to 10.8% in 2010; in Egypt the percentage is low (5.7%) as it was in 2005, increased to 9% in 2012, and decreased to 5% in 2015 (AWO 2015; and The Regional Center for Strategic Studies 2015, see also Olimat 2010). For the Arab world as a whole according to the Inter-Parliamentary Union (2016), as of 1st of August, 2016 women in parliaments worldwide represent) 22.8%), compared to (16.8%) a decade ago (in 2006).

The paradox is that while women have gained constitutional and legal rights, including political rights, however, these gains remain attached to their traditional roles in general. Their political participation despite the promises of the Arab Spring where women were active partners in it is around 10.7% in 2011 (UN Women 2014).

UN Women report (2014) states that only in Arab countries with all the promises, the percentage of women in parliaments did not exceed 30%, and if we compare women participation between 2011 and 2012, we notice a decline. However, the only promising development is that some countries have allocated quota for women's participation such as in Morocco and Jordan. Therefore, women currently constitute around 16.7% of house representatives.

Women's representation in parliaments is rising, but the region is still far behind the rest of the world. Their share of seats rose from 2.6% in 2000 to around 12.7% in 2013 compared to 20% globally and 18% in developing regions (UNDP 2015).

The low level of political representation of Arab women is a result of cultural norms and stereotypes, as well as unstable political situations posing specific security risks. Arab women generally lack experience in leadership and campaigning skills and have a limited presence in political parties. Political systems in Arab countries have long discouraged broad participation for both males and females: many were characterized by either one-party rule or a simple majority electoral system, rather than proportional representation (UNDP 2015). The political participation in general is lacking in most of the Arab countries; this is why in several of these countries, they are prematurely put down by counterrevolutions orchestrated by political regimes in the region. Arab people are striving for freedom and dignity, and they long for democratization. However, the oppressive regimes in general responded to these legitimate aspirations by force and mass killings.

## Arab Spring and Women

Arab women played a major role in Arab Spring in all of its aspects. They were among the first who stand up for freedom and among the first to sacrifice their lives. They spare no efforts in igniting the Arab Spring and providing all the masses needed for the movement. Unfortunately, the peaceful movement toward freedom and dignity has faced a brutal and fierce counterrevolution. The counterrevolution prompted by local and regional players has succeeded in altering at least temporarily the movement of history toward more freedom of the Arab people. These setbacks affected all people and women were affected adversely the most. Aladely (2011) argue that Egyptian women as their aftermath of their participation in the revolution have witnessed more discrimination and their political participation has dropped sharply, and even women activists were excluded from playing their role in major social policies and activities in their traditional fields of childhood and families. Moreover, government policies and actions show more discrimination toward women in employment and fair wages; consequently unemployment among women has increased, and the presence of women in political parties has diminished sharply.

## Recommendations

There are numerous suggestions, proposed to create, an enabling environment for Arab women to have their fair share in socioeconomic development and high profile presence in political and public life. For example, Ben Ezzedeen (2010) calls for the formulation of an inclusive and integrative strategy in legislation to foster women organizations and to create opportunities for women to be an active partner in rights and obligations. Al Maaitah et al. (2012: 24) argue that the integration of women in public and political life requires solid political interventions aiming at empowering women and raising the awareness of men and women in the Arab world about the values of women's role not only in the private but also in the public sphere. That is because the challenges that are facing women in politics are immense, requiring the consolidation of all efforts with great belief in women's capabilities as human beings who are able to lead and shoulder the responsibility in the building and sustaining of their nations (Al Maaitah et al. 2012: 24 and see Al Maaitah et al. 2011).

On the other hand, Khuzam (2011) suggests that several measures should be opted in order to improve the situation of women in society and foster social stability and peace; these include joint efforts by government and civil society organizations, in order to empower women socially, economically, politically, and culturally. Advancing the whole situation of women in society is the crucial step in building a just, advanced, and stable society (see also, Al-Mashhadani 2012).

Specific women populations need a special kind of help. For example, Palestinian women under occupation need more help from international organizations. The needed assistance is in the form of increasing projects and activities aiming at women empowerment, building global women networks, ensuring women's participation in it, and the importance of ensuring financial transparency and honesty in the work of women organizations (Judah 2012).

Abdulmuhsin (2012) argues that women empowerment is not through laws and legislations of women, rather it is through women gaining confidence in themselves and being aware that they are capable of entering the labor market. In addition, he argues that due to state withdrawals from providing basic services and letting market forces shape the scene, without adequate protection, working women suffered the most. In contrary, Shargawi (2009) recommends formulating policies and laws that tackle the issue of discrimination. This is because the essence of social, economic, and political disparities are embedded in laws and policies that are not in the favor of women, although women's confidence in themselves is a decisive factor in their progress in work and public sphere. However, this confidence needs to be grounded in a solid basis of enabling legal, social, and economic environments (see also UNDP 2014; World Bank 2003).

ElGammal (2011, 2013) calls for the implementation of the quota for prolonged election period. This is in order to help in creating a critical mass of women who are used to elections and political participation. In addition, she added to increase training and awareness raising for women, to increase microcredit project for women, and to support women's economic activities in general (see also Olimat 2010; Center for Political and Strategic Studies 2005; Elgammal 2009; Olimat 2009).

## Introduction

Perhaps the most important issue relating to women leaders today is that although they represent half the population, women continue to be dramatically underrepresented within leadership roles around the world. Women's underrepresentation in leadership worsens toward the top of almost any organizational, governmental, or educational power structure. The underrepresentation of women in leadership is of critical importance due to the fundamental roles leaders play in relation to society. Leaders within business, law, government, education, and other arenas determine laws, make decisions about what consumers will see on shelves, and help to define societal norms. As a result, women's continued underrepresentation as leaders presents an important ethical issue. This entry reviews factors related to women's underrepresentation within leadership.

## Background

Within the USA and most other modern societies, the current landscape for women is vastly different than it was in the 1950s and 1960s. Thanks to the passage of legislation such as Title IX in the USA as well as worldwide human rights movements such as feminism, women are expected to receive a formal education and now make up roughly equal proportions of college and professional school students. In addition, with the exception of the science, technology, engineering, and math (STEM) disciplines, women now graduate with advanced degrees at roughly equal rates as do men.

These represent great strides from the position of women in modern society in the middle of the twentieth century, as well as from the current position of women within the developing world. Women within many developing countries still do not have access to basic education at the same rates as do men given that the burden of care and domestic work is expected to fall to them. As a result, access to education continues to be a primary predictor of social mobility for women and their children within the developing world.

With respect to the workforce, women make up approximately half of the entry-level workforce within the USA and many other developed countries. Similarly, women are now relatively well-represented within the lowest levels of leadership in organizations, such as first- and mid-level management. As a result, it is now common within modern society to encounter women as supervisors, professionals, educational leaders, and politicians. However, the proportion of women leaders drops precipitously when considering higher levels within business, government, law, education, or any other professional sphere. For example, within business women currently make up 4% of CEOs of large companies within the USA (Catalyst 2016). This relative proportion does not vary significantly when considering other domains; for example, only four women have been Supreme Court Justices within the USA out of 112, for a proportion of 3.6%. Although some countries have had women as President or Prime Minister (e.g., Germany, Brazil, Britain), for most developed countries, a woman has never served as Head of State (e.g., the United States, Russia). Given the fact that leaders at the very top tend to have a disproportionate influence on decisions that affect many others, the dramatic underrepresentation of women is a key ethical issue as identified by the United Nations (UN 2016) and many other human rights groups.

## Stereotypes and Unconscious Bias

Before women's educational attainment was equivalent to that of men, many speculated that a primary reason for women's lack of advancement to leadership roles was the fact that they were less educated than their male counterparts. However, given the fact that women in the developed world are now equally as educationally prepared as are men, under-preparation is no longer a valid explanation for women's underrepresentation within leadership. The fact of women's equivalent educational attainment has not been met by a change in stereotypes regarding their achievement, however.

It is a popular belief that humans are judicious decision-makers, weighing the available evidence and making decisions accordingly. However, decades of social science research suggests instead that people are subject to numerous decision-making errors that reduce the effectiveness of their decision-making processes and increase their susceptibility to bias (Hoppe 2007). One of these errors is a reliance on mental shortcuts. At any given time people are subject to far more stimulation than can be effectively processed by the brain. As a result, cognitive shortcuts are developed in an effort to conserve cognitive resources. One such shortcut is known as stereotypes. Stereotypes are simplified ways of viewing particular sets of people and are so ubiquitous and efficient that they often operate without the conscious knowledge of the person within whom they are operating.

Stereotypes save time and mental effort because instead of having to evaluate individuals on their own characteristics and merits, stereotypes allow people to make instant judgments about others based on their membership in particular groups. Stereotypes allow for the assumption of a wide variety of traits (preferences, habits, language, and customs) from very little information (race, gender). These assumptions are problematic, however, in that by definition they are incomplete and inaccurate in relation to any one individual.

When they are applied to women, stereotypes around the world are strikingly similar with the exception of those intersectional stereotypes applied to women of different races, which are outside the scope of this entry. For example, stereotypes regarding women almost universally contain content relating to the birth, care, and education of children. Women are generally thought of as being more capable of and interested in these pursuits than men. Further, stereotypes regarding women almost universally contain content relating to nurturance, caring, sweetness, and kindness. Women are generally also thought of as being weaker, quieter, less aggressive, less competitive, and more submissive than men, which generalizes to the workplace where they are expected to make less money. The stereotype is also that women are the more beautiful of the two sexes and are the gatekeepers of love and

sexuality. Few gender differences exist in stereotypes regarding women; that is, both men and women tend to view women similarly. On the other hand, men are stereotypically viewed as being poor caregivers but excellent workers. The stereotypical view of men is that they are expected to be breadwinners, caring for family by earning money through work. Men are stereotypically assumed to be independent, status striving, violent, sexually aggressive, and materialistic.

Ideal prototypes regarding leaders are remarkably similar worldwide and contain little content that overlaps with stereotypes related to women. For example, research from the Global Leadership and Organizational Behavior Effectiveness (GLOBE) program has established that leaders who are honest, inspirational, visionary, performance and team oriented, decisive, and competent are viewed as being effective around the world (Kahneman et al. 2011). Moreover, decades of research within the social sciences has demonstrated a stark contrast between stereotypes of women (which tend to focus on care and communion) and stereotypes of leaders (which tend to focus on agency and task orientation). Indeed, the stereotypes of leaders overlap significantly with stereotypes for men. Researcher Virginia Schein first dubbed this phenomenon "think leader, think male."

The incongruity between stereotypes regarding women and stereotypes regarding leaders has held women back from attaining leadership roles in many ways. First, decision-makers who fail to replace stereotypical information about an individual with content relating to that person specifically are likely to view women as incongruous with leadership roles and to make selection and promotion decisions accordingly.

When stereotypes are elicited automatically, the activation of the stereotypical content can have an impact on decisions made by that person without their knowledge. This is known as unconscious bias. Because it results from stereotypes that are learned from and shared within everyday society, even people who are consciously committed to equality and who work deliberately to behave without bias may still behave with unconscious bias. Even those who are members of a group (e.g., women) possess stereotypes about that group and may make biased decisions as a result, without even knowing it. Unconscious bias can affect areas other than the hiring or selection context as well. For example, supervisors may give fewer challenging assignments to women as compared with men based on the stereotypical assumption that women are overburdened with care and domestic work. Coworkers might also be more formal or polite with women on the assumption that women are more delicate or sensitive. At first blush these actions may seem benevolent; however, they can serve to impede the advancement of women. In the first case, providing fewer challenging assignments to women gives them less developmental opportunities and less experience in the long run. In addition, it may begin or add to a vicious cycle where women are viewed as contributing less to the organization. In the second case, women may either feel as though they are or may in reality be excluded from informal social networks within the workplace if their treatment is different from that of others.

Second, women who do achieve leadership roles face a precarious dilemma. To behave in such a way as to confirm stereotypes regarding women, or to behave in such a way as to be an ideal leader? Research suggests that acting in a manner that is incongruous with stereotypes regarding one's group leads to negative consequences. However, such behavior is ostensibly rewarded within the workplace and is likely the only way to achieve higher leadership positions. Women who therefore act like prototypical leaders experience negative social sanctions, whereas those women who act in accordance with more stereotypical views of women are viewed as having less leadership potential. This tension is often referred to as the *double bind* (Catalyst 2007). The double bind is a powerful barrier for women, because it creates a behavioral impasse wherein no course of action will result in entirely positive, personal, or career consequences. Caught between impossible choices, in order to succeed, women leaders must try to conform to traditional – i.e., masculine – leadership behaviors while also exhibiting just enough

feminine traits to be perceived as likeable. The cognitive load induced by such mental work can be very taxing, and making errors can reduce others' evaluations of women's potential or likeability.

Another example, the gender discount, describes how the behavior of men and women is perceived differently in relation to their social positions and stereotypes regarding their behavior. For example, men who help a colleague with work are perceived as going over and above the duties of the workplace because such behavior violates the role expectations of a man (i.e., helping is not a stereotypical behavior men engage in). By contrast, women who help colleagues with work or spend extra time helping out around the office are not perceived as going above and beyond expectations because such helping behaviors are congruent with the gender role for women. Similarly, if a father leaves the office early because he is coach of his child's sports team, he is applauded for being a good parent. If a woman leaves early for the same reason, research demonstrates that she is not only not commended but is likely to be viewed as not as committed to her career. Taken together, stereotypes regarding women, men, and leaders result in a number of strong but invisible threats to women leaders or those who aspire to lead.

## Mentoring, Sponsoring, and Networking

A great deal of research has established that mentoring and sponsoring are essential to move up within the leadership hierarchy within nearly any sphere. Although selection processes for positions at the bottom of most modern organizations are highly routinized and processes for minimizing bias exist, procedures for hiring or promoting at the top levels of leadership are vastly different and rely greatly on the social networks of those within power. As a result, it is essential for those wishing to obtain leadership positions to cultivate effective networks of mentors, sponsors, and coaches.

Workplace mentoring is a behavior characterized by mutual respect, social support, advice, and counseling. Though typically thought of as occurring between a more senior and a more junior colleague, mentoring can occur between two peers, reciprocally between two individuals of any career stage, or upward from a less advanced to a more advanced individual. Sponsorship is a slightly different behavior that is often related to mentoring and that can occur within the same relationship. In the workplace, a sponsor uses his or her influence to advocate for another person. This often results in the junior person being able to leapfrog his/her career over peers.

Gender differences exist in access to high-quality mentoring and sponsoring, particularly as women move up the leadership hierarchy. Men tend to have more mentors, dramatically more sponsors, and a higher proportion of men mentors and sponsors than do women. It stands to reason that these men sponsors have more power and organizational clout than female sponsors, which begs the question: why is it that men receive more attention from upper-level men than women do? One answer is that men tend to seek out mentorship and sponsorship more frequently than women do. Women are more apt to believe that hard work and diligence are the characteristics that get them promoted rather than networking.

Another answer may lie partly in the fact that most people, unconsciously, tend to favor and be attracted to others who are similar to them. When senior leaders are in search of mentees or people to sponsor, research shows they may look for people who remind them of themselves. This "similar to me" effect thus results in a perpetuation of the racial and gender characteristics currently represented within leadership.

Within the professional sphere, networking involves making connections with others who may be helpful to one's career. Women's networks tend to be smaller and to contain more women than the networks of men, partially as a result of the influences just discussed. However, building a professional network also requires self-promotion, which women tend to be less comfortable doing. Self-promotion tends to be viewed as bragging, self-aggrandizing, or boasting when done by women. In reality, self-promotion is essential for success in the business world. As was discussed above, although it is widely believed that promotion and hiring decisions are

made based on objective information such as one's work experience and education, humans are imperfect decision-makers. Research has shown that reputation and personal brand can have a strong impact on one's career trajectory given that these factors can influence the decisions made about promotions and hires. As a result, the differences in men's and women's networks and self-promotion strategies are also likely to be affecting the proportion of women in leadership.

### Opting Out and the Leaky Pipeline

The terms *opting out* and the *leaky pipeline* both refer to the fact that women are retained and promoted at lower rates than men in virtually every career path. The leaky pipeline term tends to be used more specifically within the STEM disciplines or areas where the differential rates of promotion and retention are more severe. However, both describe the notion that women are increasingly missing from the promotion pipeline as it moves upward. At times, and within this section, the terms will be used specifically to refer to instances where women are perceived to leave of their own volition.

Initially, the term opting out was introduced and described as though professional women were voluntarily leaving the workforce in large numbers to stay home with children. However, additional research showed that many women who had engaged in so-called opting out had actually done so as a result of strong social and personal forces. As a result, the opt-out phenomenon came to be understood as a strongly imposed choice. That is, it is true that many women leave the workforce at least part time for at least some amount of time within their careers, either to raise children or to care for elderly relatives. However, this choice is highly constrained by factors such as societal norms around who should provide care and salary differences between partners in dual-income homes. Specifically, the devaluation of care work within most societies leads to strong pressures for women to leave, and men to stay, within the workforce.

Care work is a specific type of labor that is essential to the future of the human race. It is work that is done in service of others who are either temporarily or permanently not capable of caring for their own personal health and well-being. For example, children, people with disabilities, and the elderly are often the recipients of care work. In addition to the association of women with care and domestic work and the dissociation of leaders with caring and communal characteristics, within many modern societies the work associated with the care of children and other dependents is located not within the formal (paid) economy but instead within the realm of the home.

As a result, this labor is expected to be performed without remuneration. Given the amount of care work that is necessary in order for society to operate (children require care work around the clock for many years and many people with disabilities do as well), this devaluation of care work results in a great deal of unpaid labor being added to the informal economy. Given the association of women with care work and the stereotypes regarding men's inability to perform care work satisfactorily, unpaid work most often falls to women. In combination, these factors contribute both to systematic economic inequality (the gender pay gap) between men and women and to the dearth of women leaders within organizations.

For example, when men and women begin working, they often do not yet have care responsibilities given their age and social position (they are often young and unmarried). As their career progresses, men and women often get married, begin families, and start to care for aging relatives. Given the social pressure for men to remain in the workplace to earn a breadwinning wage (as stereotypes and social roles would prescribe) and the social pressure for women to provide unpaid care for children and others within their social sphere and the lack of social pressure for women to remain in the workplace, research shows that women leave the workforce more often than men before ascending to leadership roles. However, in some countries such as Denmark and Sweden, care work is considered to be a part of the formal economy such that individuals who are caring for children or other dependents are paid for doing so. As a result, there is evidence that the devaluation of care

work is an impermanent or unnecessary feature of society and that the future may hold changes in this realm.

## Conclusion

Overall, women make up roughly half of the human population yet are dramatically underrepresented at the topmost levels of world leadership within business, government, education, and nearly all other areas. In many areas women are absent or nearly absent from leadership within these realms. In the developed world, women's educational preparation is equal to that of men, yet stereotypes and social norms regarding women's roles persist and have a strong influence on women's ability to achieve top leadership positions. In addition, women's access to high-quality mentoring and sponsoring affects their ability to move into leadership roles at the same rates as men. Finally, the devaluation of care work within society results in an overload of necessary labor that falls to women as a result of their societally prescribed roles, leaving a disproportionate amount of men within the promotion and leadership pipeline. These factors combine to create a dramatic underrepresentation of women leaders in the world today.

## Definition

The history of women is a field of historiography created to counteract the classical epistemology of history that attributes to males a character of universality. Its roots can be traced back to 1970 with the spread of feminism and the recognition in historical research methodology of the interplay between anthropology and the history of mindsets, social history, and popular memory research. Above all, its focus on women at the center of research and reflections on women's history, identity, and gender relations, highlight,

above all, issues arising from social and political issues of the past and their impact on the present. Furthermore, its status as an independent field of research and the definition of issues for study have made the subject an integral part of women's claims on political and social grounds. The declared aim of early research on the part of feminist historians was that of filling a void: the absence of women from history (Scott 1991). Between the mid-1970s and mid-1980s, studies prevalently of middle-class white women became the interpretative point of reference. From the mid-1980s onward, the analysis of female diversity became core through categories such as class, race, ethnicity, and religion. In addition to debate on these categories were the impact on identity of regional, local, and national perspectives and the boundaries between the public and the private sphere.

## Introduction

Scientific acknowledgment of women's studies was sanctioned in particular initially, in the United States. In American universities, in fact, between the late 1960s and 1970s, various sections of women's studies were set up. In 1974, the Congress of the American Historical Association officially approved the history of women. The subject found space in feminist and historical journals such as *Feminist Studies* (1972) and *Signs* (1977) and became the emblem of that disciplinary pluralism that characterized the departments of women's studies. From the second half of the 1970s, research also flourished in France, England, and Italy. However, academic recognition was far slower. Notwithstanding, women's experience and relative recourses could not be analyzed independently taking into account their relational nature. The history of women, thus, became linked to the history of gender. The term "gender" refers to the way in which masculinity and femininity are socially-culturally constructed and departs from the biological determinism inherent in the term "sex" or in sexual status (Zemon Davis 1976). The new discovery of gender as a useful category of historical analysis has opened up new possibilities for knowledge on women's past and a significant understanding of multiple identities. Gender and sex were no longer perceived as merely natural phenomena but intended historically as extremely variable dimensions. The combination of gender with that of class and race has finally enabled feminist studies to emerge from both the uni-racial and the biracial approach, which highlighted the differences between women: mistress and slave, immigrant and reformist, and assistant and social worker. A third mode, i.e., the multicultural approach, has thus been created that includes aspects of cultural contact and transformation. Research has expanded its boundaries by overcoming the traditional feminine spheres (family, reproduction, sexuality, and emotions) and has crosscut the areas of politics, work, relationship with the state, and power (Scott 1986). A strong impetus for gender history, for example, has also come from the Annales School. Since 1989, *Gender & History* remains one of the leading international journals for research on the history of femininity and masculinity and gender relations in different epochs and continents.

## Governance in Women's History

In a preliminary phase, feminist criticism in history, strongly marked by ideological intentions, insisted on denouncing the exclusion of women from all spheres of authority and command, depicting them as perennial victims of male overthrow. Subsequent research has, however, highlighted the circuits in which, historically, women have exercised powers and capacity for influence (Alberti 2002). Female presence has, therefore, been identified in different contexts and periods in the management of trades, typical of urban systems of the modern age; in the commitment to founding, from the seventeenth century, charities and charitable structures; and in the ability to weave, between the eighteenth and nineteenth centuries, opinions and destinies, at court and in social circles. In this respect, we should speak in the plural of "female powers."

Such powers, right up to and throughout the modern age, were informal, exercised in daily experience, and excluded from codification. Only by the twentieth century (defined not by chance as the Century of Rights, but also as the Women's Century), women, underpinned by formal legal status, achieved recognition of their abilities up to then only explicated in social practices. Delving into the past has brought forth many "invisible protagonists" who have played important roles in the management of power.

## Background

Within the more general framework of ancient cultures, women lived mainly in a state of subordination to men. Nevertheless, they were endowed with discreet economic and juridical autonomy (dating back to the Sumerians, Babylonians, Minoans, Phoenicians, Etruscans) and enjoyed respect and authority within the family (Chinese and Indian civilization of the origins) or access to a basic culture. In Greece, women, excluded from public life, were legally subject to the authority of their fathers or husbands and were therefore essentially linked to domestic roles and that of educators of children and young people. Between the sixth and fifth century BC, the cultural importance gained by women was remarkable (e.g., the poet Sappho, priestess of Lesotho), marking the opening of modest social, political, and religious spaces to the initiatives of the female aristocracy. The position of Roman (especially aristocratic) women was distinguished by greater autonomy and influence, especially in the private sphere. However, Roman law, not recognizing women's legal personality, prevented them from gaining access to public office. They would later become protagonists by virtue of the spread of Christianity that made no substantial distinctions between the sexes.

Late Roman times and the Early Middle Ages have handed down the memory of queens and regents of the empire or of the Roman-barbaric kingdoms who supported Christianity from a politically influential position.

## Medieval and Modern Age

In the feudal society, women were bound to the private and domestic sphere, confined to the traditional biological tasks of brides, mothers, and educators. The family institute was regulated on male authority (patriarchy) and the monogamous union between man and woman. Distances from the Greek and Roman traditions were established by abolishing the institution of divorce and with a firmer control of sexuality. Such control included the exaltation of early chasteness with the rise of convictions, including criminal ones, against adulterous wives. However, through case studies, it has emerged that the wives of feudal lords were permitted to intervene in the economic management of the feud during the absence of their husbands engaged in war.

In Western culture, female emancipation was a slow and uneven process. From the seventh century, the status of nun was complementary, as opposed to alternative to that of mother-wife. The convent and taking vows represented, in fact, an important tool for the preservation of aristocratic wealth, to the benefit both of family inheritance – an exclusive right of male children – and dowries given to daughters destined for their wedding.

However, the convent was not just a place of segregation. Religious life was also an opportunity, in the first place, for literacy as well as for cultural enrichment, with the consequence that some convent communities exerted considerable economic and political influence on the curia and courts. During the Age of Catholic Reform, following the Council of Trent, the pedagogic initiatives and assistance promoted by female religious orders increased. At the same time, the limited space within which women's initiative could unfold, the family or the convent, was extended and strengthened. Between the late Middle Ages

and the Renaissance period, women succeeded in gaining partial spaces of autonomy. The female presence was significant in shop and court life. They were pilgrims, healers, and even warriors. However, they were not permitted to study. In antithesis to the positive model inspired by the Madonna gradually emerged the negative one of witches. Witch-hunts, a phenomenon characterized by antique social and cultural implications, some of pagan ancestry, reached its pinnacle in Central-Northern Europe (fifteenth to sixteenth century). It particularly affected women living on the edge of village communities and was counterbalanced to the rise of local powers (inquisitors, bishops, administrators) whose purpose was to suppress female behavior considered deviant, i.e., damaging to the constituted social order.

In this overall context, it can be affirmed that over the centuries the conviction, more or less explicitly stated, was consolidated never to assign to women any task of government seeing as it was considered unnatural and constituted a reversal of the proper social and civil order. Yet, even in the *ancient regime*, women attributed themselves such powers, nullifying, de facto, the laws and customs that prohibited them from grasping power. In France, for example, in the centuries preceding the Revolution, various queens had decided their own status. Although dynastic succession was governed by Salic law (containing the principle of exclusion of women and their descendants from succession to the crown), Caterina and Maria de'Medici exercised the institute of regency. Moreover, in England and Sweden, where there was no Salic law, Elizabeth I and Cristina Vasa ascended the throne, reigning in the total absence of a monarchic male figure, and, furthermore, rejected the obligation to marry to guarantee the crown a direct descendant.

Alongside the queens – often at the same time and in antagonism with them – their current lovers, exerting great influence on the internal and external stability of the monarchy, exercised extraordinary, yet discreet, authority.

## From the French Revolution to the Present Time

The first important period of political protagonism for women of the bourgeoisie came during the French Revolution with Olympe de Gouges, author of the *Declaration of the Rights of Woman and Citizen (1791)*, the first document to invoke the legal and juridical equality of women. She was guillotined (1793), for opposing the execution of Louis XVI and, probably, for attacking the Public Health Committee.

During the Napoleonic Age and Restoration, most of the civil rights, conquests of the revolutionary period, were rescinded. Yet, during that same period, the process that brought many women to important positions in the political and cultural battle was starting, in particular, during the nineteenth century and the early twentieth century, linked to the workers' movement. The list of bourgeois women in the United States and Europe involved in party governance claiming the right to citizenship is considerable. Notwithstanding, it was only at the end of the First World War that women gained the right to vote in the United States and Great Britain, the two major economic powers in which, since the late eighteenth century, female labor had contributed significantly to the development of the industrial system and where battles for suffrage had most involved public opinion. During the First World War, women became aware of their new economic, social, and political weight, especially because of the profound upheaval of war that had led them to occupy the most diverse, albeit subordinate, male roles. Straight after the Second World War, all Western countries adopted universal suffrage. In this regard, it is significant to mention the paths pursued for the conquest of civil rights. The first country to recognize citizenship to women was Australia (1902). In Europe, the way was paved by Finland and Norway (1906 and 1907), followed between 1915 and 1922 by 17 other countries in the world, including the United States. In 1931, it was the turn of Portugal and Spain. In France, female suffrage was

introduced in 1944, in Italy in 1945, in Greece in 1952, and in Switzerland in 1971. In the field of education, the process of equality was even slower and more difficult. In France, parity between female and male secondary education was sanctioned in 1924. In England, universities allowed women entry in the mid-nineteenth century, but the faculties of medicine and jurisprudence excluded them for an extremely long period. Even when women gained access to universities, they were not admitted to the professional orders. In Italy, the profession of judge has been accessible to women only since 1963. With universal suffrage, the female status was by law equal to that of males. The social, cultural, economic, and political implications of this process have changed the face of the West itself, from the history of consumption to that of the family. However, the issue of effective gender equality is different. To date, that goal has not been reached, and the status of women lags far behind and involves millions of women, especially in Africa and Asia.

## Conclusion

The evolution of the female state, in its relation to power and governance, has never followed a linear path. It can neither be described as a continuous process of development over time nor configured as a uniform phenomenon in space. A useful point of reference could be the conquest of citizenship rights, understood as the set of civil, political, and social rights that belong to individuals as citizens of a particular country. This conquest is, at present, an irreversible achievement within the most important twentieth-century constitutions. For "emancipation" means the process by which women are no longer subject to the legal treatment reserved to those who are mentally incapable and subject to severe legal and social interdictions. Until the second half of the last century, even in advanced countries like Britain, women, considered on a par with minors or the mentally ill, could not sue in court. Many legal and social interdictions preventing women from gaining access to the professions and lifestyles, a male prerogative, have since fallen by the wayside. In the governance of the major institutions (from legal to economic ones), women now hold increasingly apical roles. The International Monetary Fund and the Federal Reserve are pertinent examples. Yet, it should be understood why women have had and still have less favorable opportunities than men even in democratic systems. As it is undeniable that significant, albeit incomplete, emancipation has been achieved, the factors that have facilitated it and the variables that favor and will continue to favor more equal conditions for men and women should be identified. Finally, in the perspective of completing the process, the main policy strategies for equality, both those already in act and those merely at the proposal or consideration stage, can be determined. The existence of undeniable inequalities has in fact highlighted the inadequacy of the recognition of purely formal equality and has led government institutions to undertake action programs and policies for equal opportunities. The two main strategies which have been called "state feminism," *mainstreaming* and *empowerment*, were defined in the 1995 Beijing UN Conference. The first aims to produce a profound transformation in government culture, incorporating the gender perspective into all relevant issues, such as the quality of development and major social reforms. The second provides for the allocation of greater power to women by removing the obstacles to their active participation in all spheres of public life. The instrument of these strategies, i.e., "positive actions," consists in concrete measures taken to accelerate the establishment of equality. In particular, the persistent marginalizing of women in parliaments and public offices has led to positive actions in favor of equal representation of women and men in all government offices. To this end, reform of electoral mechanisms is required to integrate women in public offices in equal proportions and on the same level as men. In companies, leadership still has the main characters typical of masculinity. In fact, the features that are rewarded consist in those that in our common imagination, based on widespread stereotypes,

distinguish men: assertiveness, strength, and ability to dominate. Organizational language frequently or directly uses warlike idioms (e.g., competitive attack, price war, take-over, action plan, etc.). The scarcity of women managers or women at the top in business is just the tip of the iceberg (Stainback and Kwon 2012). The absence of the "feminine dimension" is found, above all, in the founding values of enterprise, its leadership model, incentive systems, and the creation of "high-potential" profiles and roles that define the characteristics necessary for success (Mora 1992).

Notwithstanding, according to recent surveys, the "macho" paradigm is in crisis, and, in countries where women's thinking has entered governance, the quality of life has improved and GDP is higher (Gerzema and D'Antonio 2013). Masculinity and femininity are seen now not as two opposing elements, but as the extremes of a single entity continuum, "the human being." Diversity is a value not only in terms of numbers but also in the share of voice. It has to be included in the mix of resources for a truly inclusive culture that unites the two elements – male and female – by overcoming the contrasts and seeing the two components as necessary and complementary within a healthy and quality performance environment.

# Women's Representativeness in Government and Politics, Korea

Soojin Kim
Public Policy and Global Affairs Programme, School of Social Sciences, Nanyang Technological University, Singapore, Singapore

## Synonyms

Gender equality in the public sector; Women and politics; Women's representation in government

## Definition

Women's representativeness in government and politics refers to the presence of more women in the civil service and political arena, as well as increasing women's access to leadership positions in the public sector.

## Introduction

Over the past few decades, South Korea has rapidly developed from being an agricultural country toward industrialization and economic modernization alongside Asian countries. In the process, it became the 11th largest trading country in the world by the mid-1990s (Hermanns 2006). Despite dramatic progress in economic development, the representation of more women in the civil service and political arena has not increased correspondingly. In other words, compared to men, women have been relatively disadvantaged

in opportunities to enter areas of governance, including government agencies, legislative bodies, and political parties, as well as in roles of power and authority. This ongoing gender imbalance in Korean society was also reflected in the Global Gender Gap Report 2017. According to this annual report that places greater value on gender equality, measured by the degree of women's economic participation and access to opportunities, their educational attainment, health and survival, as well as political empowerment, South Korea ranked 118th among 144 countries, faring worse than other Asian countries (i.e., China ranked 100th; India ranked 108th; Japan ranked 114th) (World Economic Forum 2017).

A large body of research has responded to this issue, arguing that the different gender roles and expectations embedded in Korean society, especially the subsequent inferior political status of women, may have originated from the country's Confucian legacy (e.g., Hermanns 2006; Kim 2013). Traditionally, Korean men have been relatively well-educated and naturally given better opportunities of access to economic and political activities. On the other hand, Korean women have tended to be raised within the household (or minimally educated) to fulfill the role of being good wives and mothers. In short, women's roles were simply private and domestic (e.g., child-rearing and practices of housework) (Chin 2004; Hoffman 1995; Kim 2013). Such a passive and apolitical image of Korean women could be expressed in the following Korean proverb: "When the hen clucks, the family will be ruined" (Chin 2004, 299). Arguably, this unique conservative ideology (also known as Korea's patriarchy) has long been related to culturally defined categories of male and female (role differentiation) in social systems, which in turn made the empowerment and political participation of Korean women even more difficult (Hoffman 1995; Kim 2013).

However, it should be noted that, since its transition from the military regime to democracy in the late 1980s, Korean society has experienced marked changes in political ideology, societal and cultural expectations in the governance system, as well as policy initiatives and decisions toward greater gender equality (Nam 2000). It is thus undeniable that Korean women's current social status and rights, accompanied with their political participation and leadership roles, have vastly improved from the past. Given this situation, it is worth exploring which factors have largely influenced women's representativeness in the public sector and how these historical trends and features have been shaped by factors within the context of Korean government entities and politics.

## The Road Toward Women's Rise to Power in the Public Sector

It has been argued that enhancing women's participation and representativeness in the public sector is largely attributable to changes in socioeconomic conditions, institutional factors, and political culture (Chin 2004; Kim 2013; True et al. 2014). Focusing on cases of Asia-Pacific countries (i.e., China, Japan, Taiwan, and South Korea), a recent report by True et al. (2014) addresses the following factors as key common enablers as well as obstacles pertaining to women's political engagement: (1) rapid economic and human development, (2) economic opportunities, (3) education, (4) electoral systems (e.g., gender quotas and temporary special measures), and (5) culture and civil society. It should be noted that in practice, such factors are intertwined with one another rather than perform independently. In light of this viewpoint, there is a need to have deeper discussion of the impact of a few critical factors on Korean women's social and political empowerment within the historical context.

First, spurred by the growing number of economically active female human resources and women's increased education levels, a significant proportion of Korean women began not only to enter the public service workforce but also to become equipped to politically represent themselves. Obviously, while Korea's rapid path to economic growth and urbanization owed a great deal to women's labor (Lee and Chin 2007), it also has greatly expanded employment opportunities

for women in the labor market, regardless of sector. This socioeconomic change has positively influenced women's educational attainments. For example, according to Lee and Chin (2007, 1212), average years of schooling were approximately 6 years for males and 4 years for females in the mid-1960s, whereas those increased to approximately 11 years for males and 9 years for females in the 1990s. In addition, with regard to the rates of women attending high school and institutions of higher education, the figures increased from 24% to 85% and 4% to 24%, respectively, over the period 1970–1990. This evidence shows that through education, Korean women and men have been trained more equally, which in turn made women more qualified than before to work outside, including the public sector (Kim 2013).

Meanwhile, the apolitical image of Korean women has gradually faded. Specifically, the issue of gender imbalance at all levels of society, resulting in part from women's awareness of (opposition to) sex discrimination in the workplace (e.g., gender-based recruitment, pay gaps, and promotions), has received much attention, which began in the 1980s (Nam 2000). Citizen demands for equal opportunities and empowerment, regardless of gender, have been growing, and in turn, many women have begun to actively engage with the government and its politics, rather than by simply voting, to better voice their views and preferences pertaining to public policies. Although almost every female candidate was defeated in local elections in the 1980s and 1990s, due to the predominant social prejudice that "women would not be able to do politics" (Kim 2013, 1851), such a belief has been challenged in practice since the 2000s. Notably, in 2004, all the three main political parties began to designate a female speaker, with the main opposition party (the Grand National Party) electing a female party president, Park Geun-hye (Hermanns 2006). In 2006, the first female Prime Minister, Han Myeong-sook, was appointed under the Roh Moo-hyun administration; and on December 19, 2012, South Korea saw a historical moment in having its first female leader, Park Geun-Hye, elected the as 18th President. Given long-standing male-dominated politics, Park's success of winning the presidential election was a symbolic event in Korean history, as well as in other Asian countries. This event did trigger visible changes of the female power in Cabinet positions. Under the Park administration, two female ministers were appointed, and under the subsequent administration, led by Moon Jae-in, the 19th and current President of South Korea since 2017, more than eight female ministers have been appointed, which is deemed the highest figure in Korean history.

Second, it is notable that electoral systems, accompanied by their gender quotas, have affected the extent to which Korean women become political representatives. True and his colleagues (2014, 8–9) argued that it is likely in proportional electoral systems for women's political representation to be higher, compared to majority or plurality systems, because proportional systems directly allow for quotas of the number of female candidates on the party list. They further stated that, "[i]ncreasing the number of women representatives in legislatures and parliaments at all levels will lead, in turn, to the appointment of women to leadership or executive positions such as party leaders or heads of governments" (True et al. 2014, 11). South Korea has not been spared from this rationale of gender quotas in the electoral system. In 1995, to lower women's entry barriers to run for elections as well as increase women's parliamentary representation, Korean government adopted the obligatory quota system for female candidates in proportional representation (PR) (i.e., for female nomination for seats in the legislative elections) (Soh 2011). Under the 2002 amendment to the Political Party Act, 50% of nominations are to be reserved for female candidates running for local constituency seats and 30% of nominations for those running for national constituency seats (in the National Assembly), respectively (Lee and Lee 2013, 48). As a result, the political party-registered PR election system was carried out, starting with the 2004 general election (Suh et al. 2011). Later, under the 2010 amendment to the Election Act for Public Offices, a compulsory legal quota in the candidate selection process of local councils' constituencies was first

introduced, so that more than one female candidate per general constituency can be nominated by each political party (Soh 2011, 100). Indeed, such institutional and legal changes have played a critical role in motivating political parties to nominate female partisan elites to attract young female voters (Hermanns 2006; Kim 2013). On the other hand, this has enabled women to be given more political opportunities to run for legislative seats, thereby leading to an increase in the number of female lawmakers in national and local legislatures (Hermanns 2006; Kim 2008; Suh et al. 2011).

Third, government-led (public) organizations and citizen-led (civil society) organizations, especially nongovernmental organizations (NGOs) supporting gender equality and feminist ideology, have influenced the likelihood of achieving higher levels of women's representativeness in the public sector (Hermanns 2006; Kim 2013). In terms of public organizations, for instance, the Korean government established the Korean Women's Development Institute (KWDI) in 1983, the Presidential Commission on Women's Affairs in 1998, and the Ministry of Gender Equality in 2001 (renamed as the Ministry of Gender Equality and Family in 2005). These organizations have allocated gender-oriented policy budget and implemented the related action plans, such as a rule to prevent one particular gender from exceeding 60% in the membership of a government committee, a plan for the expansion of women's participation to achieve the 40% target in government committees, training and education programs to support for reemployment of career-interrupted women (Article 13 of the Act on Promotion of Economic Activities of Career-Interrupted Women), and family-friendly policies in the workplace (e.g., expansion of maternity and parental leave, flexible working hours, workplace childcare centers).

With respect to NGOs, for example, there exist the Young Women's Christian Association (YWCA), the Center for Korean Women and Politics, the Korean Institute for Women and Politics, and the Korean League of Women Voters (Kim 2013; Lee and Chin 2007; Lee and Lee 2013). According to Lee and Lee (2013, 46), in the early 2000s, more than 3500 women-related organizations have been created to support or push for government policies in promoting improved gender balance in the social context and women's political access, which was a striking change within civil society, having risen from 2000 organizations in 1989, and only 23 in the 1960s. Such organizations have directly and indirectly contributed to institutional and legal changes by the Korean government. As a few representative cases, the Gender Equality Employment Act in 1987 (modified to the Act on Equal Employment and Support for Work-Family Reconciliation in 2007), the Act on Women's Development in 1995, and the Gender Discrimination Prevention and Relief Act in 1999 were enacted (Kim 2008; Lee and Lee 2013). Furthermore, in line with the efforts toward better employment environments and outcomes for women, since 2003, public institutions and universities have started hiring female applicants with a target quota of 30% employment.

## Trends and Features of Women's Representativeness in Government and Politics

### Women in the Civil Service

In response to the improved social and political status of Korean women, the number of female public officials and lawmakers has been gradually growing. As Fig. 1 shows, in the late 1990s, women comprised approximately 20% of all public employees working at local autonomous entities, but since the mid-2010s, women made up more than 35% of them. The governance structure of Korean local autonomous entities generally includes a total of 16 prefectures, including the Seoul special metropolitan city, 6 metropolitan cities (Busan, Daegu, Incheon, Gwangju, Daejeon, and Ulsan), 8 provinces (Gangwon, Kyonggi, Chungbuk, Chungnam, Gyeongbuk, Gyeongnam, Jeonbuk, and Jeonnam), and the Jeju special province. In such a broader array of local governments, this increase is expected to continue.

In addition, in terms of the proportion of women public servants at level 5 and above,

**Women's Representativeness in Government and Politics, Korea, Fig. 1** Female public employees in local autonomous entities. (Source: Statistics Korea (n.d.))

**Women's Representativeness in Government and Politics, Korea, Fig. 2** Female public employees at level 5 and above. (Source: Statistics Korea (n.d.))

there has been quite a notable change. In the Korean civil service system, the open recruitment exams can be classified into three types: level 5, level 7, and level 9. For the ranking or employment grade, level 5 ranks higher than the latter two. Aside from them, high-ranking public officials over level 4 are considered senior (executive-level) civil servants. As Fig. 2 shows, over the past decade, from 2001 to 2014, the percentage of female employees in central and local governments has increased, from 3.6% to approximately 15% and 5.3% to approximately 12%, respectively. It is notable that until the early 2000s, a relatively much smaller portion of high-ranked female employees has tended to work in central government than in local government, but since 2005, the proportion of women who place in higher positions in central government has exceeded that of local government.

## Women in Politics

In history, political suffrage was granted to women in South Korea on July 17, 1948, after the first Presidential election on May 10 in the same year. Since then, Korean men and women have both been legally entitled to vote and participate in national elections (e.g., Presidential election and National Assembly election) as well as local ones. As a result, a few pioneering female politicians (i.e., Yim Yong-sin, Pak Sun-chon, and Pak Hyon-suk) were able to work in the first government of South Korea and the National Assembly in the late 1940s and 1950s. However, most of them were not elected leaders, but instead as political appointees (Park 1999, 433). It should not be surprising that compared to their male counterparts, very few female candidates had been nominated nor popularly supported in the previous Korean cabinet and electoral system.

Since the 1970s, however, in increasing voters' support for female candidates running for the legislative elections, the ratio of female political leaders has considerably grown over time. As Table 1 shows, the proportion of female legislators (lawmakers) in the National Assembly increased steadily, from 0.5% in the 1st National Assembly to 5.9% in the 16th elections. Subsequently, the number of women serving in cabinet positions rose dramatically, comprising 17% out of the total of 300 members in 2016. Likewise, the number of female lawmakers elected directly has increased since the 2000s (see parentheses in Table 1). Since the 16th general election, due to the quota system for women, each political party has nominated female candidates more often than before (Hermanns 2006; Kim 2008). Consequently, there have been 194 female politicians in total between 2000 and 2016, which is two times more than the number (a total of 77 women lawmakers) between 1948 and 1996.

**Women's Representativeness in Government and Politics, Korea, Table 1** Statistics of the National Assembly elections

| Election | Total seats | Number of females | % of females |
|---|---|---|---|
| 1st (Constitutional Assembly, 1948) | 200 | 1 (1) | 0.5 |
| 2nd (1950) | 210 | 2 (2) | 1 |
| 3rd (1954) | 203 | 1 (1) | 0.5 |
| 4th (1958) | 233 | 3 (3) | 1.3 |
| 5th (1960) | 291 | 1 (1) | 0.3 |
| 6th (1963) | 175 | 2 (1) | 1.1 |
| 7th (1967) | 175 | 3 (1) | 1.7 |
| 8th (1971) | 204 | 5 (0) | 2.5 |
| 9th (1973) | 219 | 11 (2) | 5.8 |
| 10th (1979) | 231 | 8 (1) | 3.5 |
| 11th (1981) | 276 | 9 (1) | 3.3 |
| 12th (1985) | 276 | 8 (2) | 2.9 |
| 13th (1988) | 299 | 6 (0) | 2 |
| 14th (1992) | 299 | 8 (1) | 2.7 |
| 15th (1996) | 299 | 9 (3) | 3 |
| 16th (2000) | 273 | 16 (5) | 5.9 |
| 17th (2004) | 299 | 39 (10) | 13 |
| 18th (2008) | 299 | 41 (14) | 13.7 |
| 19th (2012) | 300 | 47 (19) | 15.7 |
| 20th (2016) | 300 | 51 (26) | 17 |

Note: Numbers in parentheses are elected legislators (lawmakers) from electoral districts (proportional representatives were excluded)
Source: National Election Commission, Republic of Korea, Election Statistics (National Assembly) & Kim (2008), Table 6.3: Rate of Females elected in previous elections

**Women's Representativeness in Government and Politics, Korea, Fig. 3** Rate of women elected in local elections (%). (Source: National Election Commission, Republic of Korea (n.d.))

In line with this surge of female elites in the national elections, the results of local elections also coincide with women's increased political participation. Figure 3 shows the proportion of female metropolitan and municipal-level government heads and legislative members historically elected in local-level elections. It was observed that the percentage of female candidates elected has increased at all levels of government. Notably, female members occupying municipal-level district council seats increased from 1.59% in 1995 to 20.7% of the total members in 2018, which is a huge change across the three different types of local elections.

## Conclusion

Despite women's increased social and political empowerment within the historical context, a male-dominated culture, stemming from a patriarchal tradition, still somewhat remains in the current Korean governance system. Until recently, compared with other Asian countries, only a marginal number of Korean women had access to leadership roles in the public sector. Possibly, one of the challenges faced by female public officials and lawmakers might be perceived glass ceiling, especially at the upper levels of government organizations and legislative bodies, not to mention discrimination in pay and promotion. Therefore, there is a continuous need to push for a change in women's underrepresentation in government and politics. The government should make more visible efforts toward gender equality in the public sector. It is critical to not only design various women-friendly institutions and policies that help enhance women's participation in the civil service and political sphere but also to motivate political parties to engage more talented women, beginning with the candidate selection process of national and local elections through continued support in their electoral success.

# Work from Home in the Public Sector Context Post-Covid-19: Challenges and Barriers

Mohamed Mousa[1] and Hala A. Abdelgaffar[2]
[1]WSB University, Dabrowa Gornicza, Poland
[2]Estonian Business School, Tallinn, Estonia

## Synonyms

COVID-19; Flexibility; Work from home

## Crisp Definitions of the Key Title Words

WFH is defined as "an alternative work arrangement in which employees perform tasks elsewhere that are normally done in a primary or central workplace, for at least some portion of their work, using electronic media to accomplish their duties and interact with others inside and outside the organization" (Lee and Sirgy 2019).

WFH is also defined as "a work practice that involves members of an organization substituting a portion of their typical work hours (ranging from a few hours per week to nearly full-time) to work away from a central workplace—typically principally from home—using technology to interact with others as needed to conduct work tasks" (Allen et al. 2015).

Flexibility is defined as "ceding control to workers over the circumstances of their work by enabling them to vary those circumstances to address personal and family needs and uncertainties" (Evans et al. 2004, p. 2).

## Introduction

The on-going repercussions of Covid-19 are altering where, how, and whether people can work. As of mid-April, 2020, to contain the spread of the

pandemic and maintain physical distancing while saving the economy, governments across the globe have encouraged employers to allow work from home particularly for nonessential face-to-face processes. Workplace closure and restrictions on mobility have forced businesses to close or rapidly adopt digitalization and managerial innovations. Resorting to telework to enable workers to perform work assignments during lockdown may not end with the pandemic, but should become part of "the new normal" and be supported with advanced technology, management systems, and well-prepared human resources.

## Work from Home

Work from home (WFH) is not a new concept; it was first introduced after the international oil crisis in the early 1970s by Jack Nilles and his colleagues who used "telework" or "telecommuting" to refer to the use of computing technology combined with telecommunications to enable work to be conducted away from the conventional workplace (Nilles et al. 1976). At the time, telework was perceived to be a solution to the problems of congestion and pollution in major cities. Over time, the concept evolved with the changes in work culture, social responsibility, and environmental protection to serve various ends. Moving from the neoclassical emphasis on efficiency and productivity, to the economic globalization requirements of competitive production and flexible collaborative work processes, to the sustainable development demands of environmental and social well-being and work-life balance, telework served as an innovative solution.

WFH has been used interchangeably with various terminology such as "telework," "telecommuting," "remote work," "flexible work," "distributed work," "virtual team work," "online work," and "e-business" to refer to slightly different but basically similar work done away from the employer's premises in any location in the world. However, there have been inconsistent definitions of WFH ranging from "parttime or fulltime remote work" that accounts for 50% of the week or the equivalent of 2.5 days to "virtual workspace" that allows employees to consecutively and collaboratively work on the same project exclusively in online mode from different countries or regions such as in the case of global virtual software development teams (Pyöriä 2011).

Evolution and widespread use of communication and information technology from the 1990s onward opened diverse venues for WFH. Throughout the past couple of decades, companies have invested in a variety of technological infrastructure (e.g., Internet connections, mobile communication devices, and VPN bandwidth and licenses) and software such as cloud computing software (e.g., Google Cloud, IBM Cloud, Microsoft Azure, and Oracle Cloud), video conferencing and chat platforms (e.g., Zoom or Microsoft teams), cybersecurity tools (e.g., network security, antivirus, firewall, and encryption tools), and project management tools to facilitate remote work. Integral to the structural changes to facilitate remote work are investments in human resource management of digital workforce to prepare skilled virtual professionals capable of transforming business models and organizational practices (Mousa et al. 2017).

With the global outbreak of the Covid-19 pandemic in 2020, millions of workers worldwide shifted to WFH to join others who had been working from home for decades (Mousa 2021). However, the sudden rise in WFH numbers brought urgency to the need to research and understand this work mode and its implications for both workers and organizations, The International Labor Organization defines WFH as "work carried out by a person . . . (i) in his or her home or in other premises of his or her choice, other than the workplace of the employer; (ii) for remuneration; (iii) which results in a product or service as specified by the employer, irrespective of who provides the equipment, materials or other inputs used" (ILO 2021).

ILO further differentiates between three categories of WFH: (a) *industrial home-work* or goods made by artisans for or replacing factory production; (b) *telework* or technology enabled remote work as described in the definition; (c) *digital platform work* or home-based service-sector tasks executed according to employer specifications by "crowdworkers" who do not have the economic independence or autonomy of independent workers. Industrial home-work is mostly prominent in labor intensive domestic supply chains (e.g., electronics, apparel, and houseware) in developing countries, particularly in Asia. Telework is white-collar work to support service industries like banking, tourism, and insurance across the world. Crowdworkers are paid by project or tasks outsourced through digital platforms offering flexible, cost and time efficient advantages to employers. However, these definitions do not capture the idea of lack of time boundaries in the WFH setting, an issue that most teleworkers complain from especially with the restrictions on mobility imposed by the Covid-19 outbreak. WFH offers telecommuters flexibility to use their time and energy more efficiently, adjust priorities, and engage in multiple social roles (Lee and Sirgy 2019).

The world after the pandemic no longer resembles the world before. With the Covid-19 restrictions on mobility and social activities, WFH is defined as flexible work processes that are unbounded by time or geographic location, and aided by technological innovations to partially or fully perform job responsibilities from home or other nonconventional workspaces. This definition conforms with ILO definition of telework and does not include occasionally work from home or work online to complete job-related tasks after employees serve required working hours on-site.

WFH is no longer considered a privilege or matter of flexibility but rather a standard operational mode adopted by enterprises globally to maintain work processes and survive the economic downturn. Before the Covid-19 pandemic, 7.9 % or approximately 260 million workers of the global workforce engaged in WFH on a permanent basis and 56 % (147 million) of these workers were women, while after the outbreak WFH employees jumped to 20–30 % of the labor force depending on the country (ILO 2021). The pandemic outbreak accelerated WFH, which evolved from being a strategic solution to some enterprise, societal, and environmental issues, to a globally practiced mode of work practiced in both public and private sectors.

## Challenges of Remote Work in the Public Sector

While the Covid-19 shock slowed down economic activity worldwide, it has invariably impacted different sectors and work processes. Although WFH was a common practice in the public sector, the pandemic has fast-tracked the implementation of teleworking modalities in public sector organizations around the world (ILO 2020). Basically, transitioning to full or partial WFH in the public sector depends on the professional demands of the job tasks. Jobs that rely on interacting face to face with the public or operating equipment such as healthcare, construction, manufacturing, agriculture, transportation, and tourism are not likely to transition to WFH, whereas service professions like ICT, finance, insurance, public administration, and education are more likely to mobilize the potential benefits of WFH. And even in "white-collar" and knowledge-oriented jobs, the feasibility of switching to remote work necessitates changes in work processes and procedures and can be hindered with the need for physical presence or proximity to the workplace or to clienteles for certain job functions. Given the confidentiality of information and security issues in the public sector, in-person work is most necessary in many job functions. Accordingly, many governments allow civil employees working in "essential" public services, authorities, or bodies to alternate between WFH and flexi-time shifts at their work premises while maintaining mandated social distancing and hygiene procedures. The degree to which formal work activities are impaired by shutdown and social distancing measures mostly depends on the capacity of each organization to

maintain work processes while its employees WFH. It can be reasonably argued that the public sector ability to adapt to and adopt WFH processes is challenged by its ability to comply to institutional arrangements, performance management, and human resource management requirements.

### Institutionalizing Work from Home

Fundamental institutional arrangements required by the public sector to transition to WFH are to (a) equip the workforce with digital devices, software, and online connectivity; (b) secure access to business-critical applications and networks; (c) set WFH guidelines; (d) adapt work processes and use remote communication and collaboration tools; and (e) adjust management practices to remote working and supervision (Milasi et al. 2021). However, these requirements may be especially challenging and costly for organizations which have limited previous adoption of digitalization and innovation, no previous experience with WFH, and greater difficulties in accessing technologies (OECD 2020). Barriers to instituting WFH arrangements in government agencies include management resistance, lack of funding, nature of the work processes, and technological support (Choi 2018). Though public sector organizations are adopting supportive legislative policies to regulate and allow full to partial WFH, concerns about cybersecurity, privacy, confidentiality of information, and legal recognition are plausible obstacles to considering WFH as a fully operative mode in this sector (ILO 2021). Moreover, WFH supportive infrastructure, technological literacy, and employee readiness can pose a challenge for the government in many countries. Civil employees, in developing countries for example, are especially likely to encounter difficulties in accessing essential WFH resources, such as electricity supply, digital technology, or Internet connectivity to work effectively (Schuster et al. 2020).

### Performance Management of Work from Home

WFH arrangements require reconfiguration of bureaucratic structures of control, funding, accountability, and patterns of oversight (Schuster et al. 2020). Although WFH is arguably more effective in flatter organization structure that allow flexibility, deregulated work, and autonomy than in bureaucratic organizations with hierarchical structures, empirical research has shown that WFH can be effectively implemented in government organizations under certain conditions (Taskin and Edwards 2007). For "white-collar" job functions to be effectively adapted to WFH mode, Taskin and Edwards (2007) demonstrated the need for three conditions: (a) professional workers with high levels of autonomy; (b) strategic support from management and effective and transparent communication; and (c) modification of organization policies and regulations. Successful WFH in the public sector requires an effective performance management approach by setting clear and consistent WFH guidelines, policies, and expectations, strategically aligning and securing work processes, and supporting and engaging employees. It also involves measuring productivity of the remote workforce using objective metrics, which may be assumably easier than measuring that of physically present workers or "time in the work premises." However, WFH poses a challenge to the need for predictability, accountability, and management control as it entails functions characterized by being unforeseen and multifaceted, and thus not easily accountable for when compared to control of on-site work functions, which depends on visibility and physical presence of employees. Therefore, Taskin and Edwards (2007) stress that managing WFH processes should not contradict with innovative means of control whether trust-based as employee self-control, social control, or performance oriented as electronic-based tools.

### Human Resources Management of Work from Home

Equally pertinent to effective WFH is human resources management of the quality of employee and organizational life. WFH literature highlights several advantages of flexible work arrangements at the organizational level including productivity, cost-efficiency, talent management, work climate, reduced costs, absenteeism, and turnover, as well

as at the individual level, including autonomy higher productivity, well-being, work-life balance, motivation, satisfaction, and reduced work-family conflict and stress (Allen et al. 2015). Conversely, WFH can have detrimental effects on employee productivity, wellbeing, and sense of belonging when telework hours are too long and opportunities for formal and informal interaction are limited (Pyöriä 2011). Benefits of WFH, in terms of flexibility, higher control over job functions, and reduced turnover intention among public sector teleworkers, can be undermined by negative impact of professional isolation and less organizational commitment, though higher leader–member exchange can alleviate these negative outcomes (De Vries et al. 2019). Other challenges to teleworkers include reduced interpersonal relationships and informal networking, lower visibility to managers to ensure career advancement, and reduced sense of belonging, and these require government agencies to invest in development of technology, resources, managerial skills, support mechanisms and to demonstrate more understanding of employee-family demands and teleworker psychosocial wellbeing (Choi 2018). In addition, contrary to on-site employees, public sector teleworkers may not necessarily have control over the temporal boundaries of their work and are assumably available and reachable at any time, a matter which contradicts with the ILO international standards on working time of 48 regular hours of work per week, with a maximum of 8 h per day. And although technology creates telepresence and facilitates supervisor-subordinate interactions, which may have positive work outcomes, it allows constant accessibility of teleworkers. This is further reinforced by remote surveillance or monitoring applications that screen employee daily activities across applications like calls, mail, documents, and calendar and that is argued to be intrusive, intimidating, and alienating of teleworkers from their homes especially during lockdown.

### Enhancing Online Civic Service

Owing to the life altering changes induced by the Covid-19 crisis, it would be unreasonable for public sector organizations to simply return to "business as usual" as the world and workplace practices are no longer what they were. In the era of digital governance and a knowledge-based society, enhancing WFH or telework coupled with the next-generation technologies is necessary to serve citizens and businesses. Therefore, it is necessary to reassess the drivers, constraints, and opportunities available to strategically plan and develop WFH practices and online civic performance. This entails continuous evaluation and enhancement of the tools and arrangements for institutionalizing, managing, and supporting public sector teleworkers during WFH. Public sector management plays a key role in supporting WFH by providing civil teleworkers with the necessary resources, training, support, social integration, and organizational direction to ensure they work safely and productively. WFH can cause stress and isolation and blur the temporal, physical, and psychological boundaries between work and home, a matter that can be detrimental to employee work-life balance, family obligations, and psychosocial wellbeing. Therefore, in the absence of face-to-face contact, it is practical to replace the "command and control" style of management with a results-based management approach and reasonable timeframe for tasks to ensure productivity while building mutual trust between teleworkers and leadership during WFH. Moreover, exploring the experiences, attitudes, and behaviors of civil servants, as agents in government response during states of emergency and crisis, is crucial to benchmark good practices, identify and resolve WFH challenges, set corrective procedures, support work processes, and secure public sector employees' health and wellbeing.

## Conclusion

Precautionary measures to manage and limit the pandemic spread have caused disruptions in traditional modes of work and enforced the need for WFH. Governments are leading by example and allowing public sector employees to WFH. This chapter touches on the conceptual development of WFH and offers relevant definitions of the term

before highlighting the three key areas that challenge the public sector potential to maintain work processes while its employees WFH. It ends with suggestions to challenges in complying to institutional arrangements, performance management, and human resource management requirements necessary to enable public sector employees to continue to WFH.

# Workers' Mental Health Knowledge

Vincent Ekow Arkorful
Department of Government and International Studies, Hong Kong Baptist University, Kowloon Tong, Hong Kong, China

## Synonyms

Accessing mental health service and health and mental stability; Mental health knowledge; Mental health policy; Work and mental health; Workers mental health

## Definition

Mental health knowledge is conceptualized as the individual consciousness and understanding

of the mental, social, and physical well-being, based on which the individual can realize his/her potentials, cope with the excesses of life, progressively work, and contribute productively.

## Introduction

With approximately one in every four people suffering from mental health, the phenomenon is reportedly one of the leading causes of disability around the globe (WHO 2001). Susceptibility to mental health increases individual's risk to infections and chronic diseases – which collectively accounts for more than 30% of years of life lost globally (Prince et al. 2007). The wide-ranging deleterious ramifications of mental health around the globe, more particularly in low-income developing countries, are enormously inestimable (Siddiqi and Siddiqi 2007; Arkorful et al. 2020). In spite of the widespread reports of mental health incidence around the globe, discourses and research within the Ghanaian context has not received much priority (Adu-Gyamfi 2017). The few seminal studies conducted, including Sipsma et al. (2013), empirically investigate the national prevalence of the phenomenon, and its correlates. In another study, Adu-Gyamfi (2017) conducts a review of mental health studies and further confirms the impoverished state of research regarding the field.

That notwithstanding, as impoverished as the situation stands, it is significant to note that, the Government of Ghana has began demonstrating commitment towards tackling mental health issues. Essentially, through a concerted collaboration with nonstate development actors, the Mental Health Act 846 was implemented by the government of Ghana in the year 2012. This marked a significant step in the light of the pursuit of the binary global goals composed of; the Global action on workers' health (2008–2017), and the Mental Health Action Plan (2013–2020). These set of goals which signaled the phenomenal dawn of a new era, most importantly accentuated in clear terms, benchmarks, and blueprints for pursuing mental health. Among other things, these policy pair directives enjoin governmental and nongovernmental organizations to implement mechanisms targeted at advancing good mental health whiles forging strong coalitions to enhance best practices. Moreover, the need to reduce mental health–related stigmatization and discrimination to the barest minimum level received priority. Part of the measures to promote good mental health consequently led to the prioritization of the need to empower people and reduce negative attitudes towards mental health patients at the same time.

Taken together, these commitments glaringly underscore the relevance of mental health to building a healthy, productive, and prosperous nation. Overall, the well-being of a population and the pursuit of development (i.e., infrastructural and human) are to a greater extent premised on the state of mental health. By extension, so far as work and workers' well-being is concerned, mental wellness remains very essential in corporate settings (Time to Change 2014; Mindful Employer 2016). Situating workers mental health within the spectrum of a progressive results-oriented corporate working space – one that places not only employees under enormous pressure, but further drives them to work tirelessly to meet short-, medium- to long-term goals – highlights the possible precarious situation of workers. In the same vein, the melding of work and corporate obligations, altogether with social and other household demands, sharply projects the effects of pressures on the quality of life of employees and their mental health conditions. The deleterious effects of increasing work on employees are corroborated by Graf (2018) and Collins et al. (2011). In their views, the impact of mental health problems in the workplace has serious consequences for individuals and productivity. Precisely, the state of employee performance, rates of illness, absenteeism, accidents, and staff turnover, all have significant correlations with employees' mental health such that it affects functional and working capacities in numerous ways.

Against the backdrop of the upsurge in mental health incidence, Brundtland (2000) and Wittchen et al. (2011) aver that the urgency to reduce incidence of work-related accident to the

barest minimum level while pursuing sustainable development in its varying dimensions has, like never before, engendered a much-invigorated global commitment to population sensitization. The effects of mental health transcend the individual to affect interpersonal-level relationships. Demonstrating the realities of mental health relative to corporate work, Wedegaertner et al. (2013) reveals in a seminal study that 13% of people with depression prematurely retire. Also, mental challenges precipitate frequent sick leave and absenteeism more than cardiovascular diseases and musculoskeletal disorders (Krankenkasse 2012). Muschalla and Linden (2012), Stansfeld et al. (2012), and Dewa et al. (2014) also observed that the mental health–related sick leave accounted for as twice more than six leave within a space of over 60 days.

In view of these dire consequences of mental health challenges, it is therefore not surprising that employers, insurers, and health-care service providers are equally shifting attention to the phenomenon (Mezerai et al. 2006). Hannon et al. (2012) corroborates the significance of workplace health because of its bearing on employee morale improvement, increased productivity, reduction in absenteeism, and promotion of corporate image. These benefits notwithstanding, there still remains a general dearth of research focus on mental health, particularly of workers (Adu-Gyamfi 2017). It is in view of the benefits of pursuing workplace mental health that the pertinence and urgency to assign some degree of paramountcy to workers and workplace mental health is emphasized. In recent times, Ghana's economy has experienced a nosedive – one that has caused not only investment dips, but also currency depreciation. This situation has elicited various responses. Parts of the efforts to diagnose the potential cause(s) have stirred mixed responses primarily anchored on bad economic policies, bad leadership, and a general instability of the global economy.

Whereas others ascribe the situation to a dearth of workers incentivization, some other group school of thought have laid the argument on the pervasive, yet unappealingly addressed state of mental health, generally impetused by a deficit in workers' mental health knowledge. Considering the relevance of mental health to general social welfare, this study sets out to explore workers' mental health knowledge. As there is not a well-developed body of empirical research critically investigating mental health among workers in Ghana, the study will provide insights into the phenomena of workers' mental health. The findings of this study will highlight priority areas for mental health research in Ghana, and also serve valuable insights to employers, clinicians, researchers, policymakers, and other stakeholders. The remaining part of the paper is organized as follows. Section "Method" covers methodology; section "Presenting Data" presents the results from the data; section "Discussion of Findings" presents discussion of the study; and section "Conclusion and Recommendations" concludes with recommendations and study implications for future studies.

## Method

### Study Site

The study was carried out among some selected workers in the Kumasi Metropolis of the Ashanti Region of Ghana. The Kumasi Metropolis, one of the thirty (30) districts in Ashanti Region is located between latitude 6.35°N and 6.40°S and longitude 1.30°W and 1.35°E. The Metropolis is elevated 250–300 m above sea level and shares boundaries to the north with Kwabre East and Afigya Kwabre districts; Atwima Kwanwoma and Atwima Nwabiagya districts to the west; Asokore Mampong and Ejisu-Juaben municipality to the east; and Bosomtwe district to the south. The metropolis has about 36.2% of the region's populations. Out of the total population of 1,156,647 persons aged 15 years and older in the Metropolis, 769,381 or about two-thirds (66.5%) are economically active (Ghana Statistical Service 2014).

### Study Design and Purpose

The data for this study was drawn from workers – with the help of a human resource outsourcing companies. Pescud et al. (2015) posits that

workers knowledge on mental health is essential in influencing productivity, health, and overall well-being. For this reason, exploring workers' knowledge of mental health in this study is expected to create awareness while helping to fill gaps between scholarship, policy, and practice. In response to the deficit in workers mental health in Ghana, a qualitative study was designed to elicit responses. The study employed the interpretive phenomenology approach to analyze responses. Interpretive phenomenology, unlike descriptive phenomenology, aids in presenting unbiased and objective views of study participants. Interpretive phenomenology converges around the notion that humans are restrained in both thinking and position, for which reason it becomes utterly impossible to illuminate on all experiences and thoughts (Shaw and Anderson 2018). In carrying out the study, prior ideas and experience of the author who had served in human resource (HR) outsourcing entities as an intern helped in data interpretation. This experience actually provided the insight and initial idea of exploring workers' mental health knowledge. In analyzing data, to eschew the tendency of imposing researchers' initial knowledge and interest, codes that were developed in tandem with participants responses were further shared and discussed to confirm their accuracy. This was consistent with the recommendation of Shenton (2004) who underscores the relevance of member checking, thus presenting data to participants for corroboration. The interpretive phenomenology was employed to guide development of interview questions and discussion of findings. This aided the analysis of data within the precincts of literature and assumptions relative to the topic under review.

## Eligibility Criteria

The study bordered on workers' mental health knowledge. Therefore, study participants included full-time workers outsourced by HR entities to corporate agencies registered under the Trade Unions Congress (TUC) of Ghana. Participants had worked within the selected organizations for a minimum of five (5) years. Generally, registered workers, both blue- and white-collar job workers were recruited for the study. Given the inclusion criteria set, part-time workers, and workers with less than 5 years working experience, working in organizations with no working partnership with the selected HR firms were not considered.

## Recruitment

The conduct of the study was preceded with establishing initial contact with the human resource management department of the HR firms in January, 2019 to introduce the study and seek relevant information on procedures to secure ethical approval. From the initial contact and the subsequent explanation of the study, assistance was sought from the department members to recruit participants. After the issuance of institutional approval, some department personnel were asked to serve as gatekeepers because of their relevance in facilitating the introduction of researchers and their study to study participants (Given 2008). In this regard, gatekeepers and the researchers worked together to inform participants about the study, its relevance, the need for them to participate, and how interview sessions were going to be held. Acquaintance with the study and potential participants took 3 weeks during which the gatekeepers went around with the research team to the workplaces of potential participants. During the same time, the gatekeepers used the opportunity to interact, receive participation consent, and finally, recruit study participants. In the end, 120 participants consented to participate in the study.

## Ethical Considerations

The research team sent a formal letter to the heads of department of the HR outsourcing firms to seek approval to conduct the study. In seeking for ethical approval, research instruments were submitted to the departments for vetting. Also, pilot interviews were conducted with some 10 worker participants selected by the departments. This was part of measures to get the departments involved, while enabling them to know how the interview sessions with participants was to be held. In agreement with ethical guidelines on human subjects–based research, formal consent was elicited

from participants who agreed to participate. Participants were served an informed consent form to corroborate their participation. The consent form covered participants' rights and research purpose. In-depth explanation was provided to study participants before obtaining formal consent. Participants were informed of their liberty to withdraw at any stage of the interview. Participants were assured of confidentiality and anonymity. On this account, names of participants were detached from interview transcripts during analysis. Also, data was not shared with the departments of HR bodies. And finally, prior to interviewing, participants were assured that their participation in the study will not impair their working relations with the HR outsourcing firms and their clients as well.

### In-Depth Interviews

The study used a semi-structured in-depth interview guide to elicit data. Interviews lasted for approximately 50 min. Data collection took approximately three (3) months (10th February to 15th May, 2019). The study used a semi-structured interview guide because it aids in exploring various issues and perspectives of research participants (Marvasti 2004). To aid in gathering deeper perspectives from participants, open-ended questionnaires were used. Some of the questions posed included: "What do you know about the mental health?," "How do you understand mental health?," etc. Among some of the probing questions posed to gather much deeper insights to enrich data included: "Can you explain further?," "Can you give some practical instances or examples?," etc. The interviews were held in offices at the working places of participants using the Twi local language, a widely spoken language spoken in the study area. The researcher and the three research assistants were also fluent in the language. Interviews were conducted by the researcher, ably assisted by the research assistants engaged purposely for this study. The study anticipated the difficulty of participants to reflect on issues relating to the subject matter under investigation, so the research team was provided with sufficient training to engage and draw data from participants. Audio-recorded interviews were stored in a password-protected laptop procured for the research project.

### Coding of Interview Data

Audio-recorded interviews were transcribed verbatim using Nvivo 11 Plus software. The transcripts were compared with the audios to validate their precision and exactness. This was followed by coding of the agreed-upon transcripts to identify commonalities in narratives and responses of participants. The coding was manually done in agreement with Saldaña (2012). Initially, the researchers thoroughly read through the data to get acquainted. Common patterns were then pre-coded while the researchers maintained memo records to help reflect on meanings, interpretations, and consequences (Saldaña 2012). The research team again maintained a framework to bring together codes developed by research team members. The framework was partitioned into code names, frequency, and meaning. Further, a consistency check was performed to match and integrate codes with unified meanings within the developed framework (Saldaña 2012). In this process, codes with low frequencies and as such with insignificant bearing on the study were discarded. Comparing and contrasting of code to develop final codes were done, after which final codes were refined and developed. Thereafter, themes and subthemes were drawn for reporting purposes. The recommendations of Braun and Clarke (2019) on reflexive thematic analysis were followed.

## Presenting Data

### Study Participants

The study involved workers (77 males and 43 females) drawn from both formal and informal sectors. Twenty-five and ninety-five participants were formal and informal workers, respectively. On education, while 35 have had primary education, 45 also had secondary education. Another 15 and 25 also had tertiary and no formal education, respectively. On income levels pegged at an exchanged rate of 1 USD – 5 Ghana, 16 earned

<200 ghc, 48 earned between 200 and 500 ghc, 27 earned between 600 and 900 ghc, and 19 earned 1000–1300 ghc. Another 10 participants earned between 1400 and 1500 ghc and 15 also earned 1500 ghc and above, as presented in Table 1. The study developed following themes from the in-depth interviews and focus group discussions with participants: (1) Mental health knowledge; (2) Mental health challenges; (3) Coping mechanisms; and (4) Mental health needs and support systems (Table 2).

## Mental Health Knowledge

In meeting the study objectives, participants were interviewed on their knowledge about mental health. Knowledge as expressed in individual responses and during focus group discussions signified varying dimensions. On the whole, and to a larger extent however, study interaction revealed a general dearth of knowledge among participants. The responses gathered resonated with feedbacks from focus group discussion. Quite interestingly, it was apparent that, even among some highly educated and top brass corporate executives interviewed, mental health knowledge levels were generally low. Participants appeared uninformed on the subject matter. When asked about mental health knowledge, some participants said that

> If you ask me about this, it would be very difficult for me to tell you. I don't know what it is, neither do I know how it feels. This is my first time of hearing this. I am sorry, I have no idea.

> Honestly, with my level of education and top position in this corporate setup, I have no knowledge about mental health. Perhaps it is a much bandied around phenomenon, yet abstract. That is what I think my brother

Others emphasized that

> I feel ashamed to say this. But I won't deceive you. I have no knowledge about the discourse. Don't be surprised

> I sometimes hear my friends talk about mental health. Personally, I know nothing about it. I'm ignorant of this whole thing

**Workers' Mental Health Knowledge, Table 1** Respondents sociodemographic characteristics

| Variable | Category | Frequency (*n*) | Percentage (%) |
|---|---|---|---|
| Age | <30 | 40 | 33 |
| | 31–40 | 35 | 29 |
| | 41–50 | 25 | 21 |
| | 51+ | 20 | 17 |
| Gender | Male | 77 | 64 |
| | Female | 43 | 36 |
| Education level | Primary | 35 | 29 |
| | Secondary | 45 | 38 |
| | Tertiary | 15 | 13 |
| | No formal education | 25 | 20 |
| Marital status | Married | 65 | 54 |
| | Single | 45 | 37 |
| | Divorce | 7 | 6 |
| | Widow | 3 | 3 |
| Affiliate sector | Formal | 25 | 21 |
| | Informal | 95 | 79 |
| Residence | Rural | 5 | 4 |
| | Urban | 40 | 33 |
| | Peri-urban | 75 | 63 |
| Income level (ghc) | <200 | 16 | 13 |
| | 200–500 | 48 | 40 |
| | 600–900 | 27 | 23 |
| | 1000–1300 | 19 | 16 |
| | 1400–1500 | 10 | 8 |
| | 1500+ | 15 | 13 |

## Mental Health Challenges

The study went further to explore workers' mental health challenges. By mental health challenges, the research sought to understand work-induced psychological difficulties encountered. Generally, though it was apparent that mental health knowledge levels among participants appeared low, there however were some few respondents who were aware of mental health. These few

**Workers' Mental Health Knowledge, Table 2** Characteristics of focus group discussants

| Group category | Gender | | Participants (*n*) |
|---|---|---|---|
| | Male (*n*) | Female (*n*) | |
| A | 5 | 5 | 10 |
| B | 4 | 3 | 7 |
| C | 4 | 6 | 10 |

participants admitted having ever faced mental health difficulties in their life. In exploring some of the challenges, some participants indicated workplace stress and pressure, among others. Others also cited their inability to deliver on targets as some of the mental health challenges they contend with. During interaction, some participant had this to say:

> On some occasions, I experience difficulties with work. It normally happens when I am under pressure to deliver my task or when I feel scared with work load and cannot deliver on assigned targets

Another stated that

> I am aware of mental health challenges. There are times I feel like I am undergoing stress and other difficulties. Even though it is too heavy to bear, I rarely pay attention to it because I have no idea about how to handle it

In trying to find out some of the challenges, some mentioned depression, anxiety, among others. Moreover, in the process of trying to further explore some of the possible causes of the challenges, some respondents identified pressure from superiors and supervisors, threats of retrenchment, perceived task inadequacy, unfriendly work space/workplace phobia, and assignment work failure. A respondent recounted that

> The unfriendly working space ignites unfriendliness. When there is much pressure from supervisors and other superiors, because they are expecting much, and I cannot deliver as expected, it becomes difficult for me to bear

It was also identified that workspace policy changes like retrenchment or downsizing essentially affects the mental health of workers. A participant indicated that

> Overtime, whenever there is news of labour force retrenchment, mentally, it affects workers. Out of fear of who would survive the storm, people are left thinking and feeling vulnerable. This affects mental health and work output because it saps the zeal and passion to work better

## Coping Mechanisms

The research also explored how workers coped with challenges of mental health encountered either at the workplace or through work relations. Generally, it was obvious that the level of mental health across the diverse category of participants' sociodemographic background was not impressive. In identifying coping mechanisms, participants outlined a myriad of factors. Whereas other admitted withdrawing from the public space into solitude, other participants also revealed that they try to take rest. A handful of respondents claimed they visited a psychologist at their own cost. Majority of participants admitted resorting to traditional and nonclinical means. As part of study inquisitions, most participants resorted to prayers, consulting counselors, engagement in social activities, and listening to music to assuage the difficulties brought about by mental health challenges. Others also confessed smoking, drinking alcohol, and engaging in sex as a means to ameliorate the effects of mental health challenges. Interaction with participants elicited the following responses:

> When I feel am undergoing stress or any form of mental health difficulty, I pray. From my religious point of view, I think some of these things are more spiritual than clinical. The bible makes me to believe that, we are not fighting against flesh and blood. Explicitly, this attests to the fact that, there is more to issues of mental health beyond the clinical and physical realm

> I don't waste time when I feel mentally unwell. I quickly consult to my church counsellor. He has been of immense help in this regard I think

Others testified that

> Whenever I think I am mentally stressed, sometimes I call my prophet or any of my church pastors or elders to pray for me. Mental issues are more spiritual I think

> I am neither a Christian nor a Moslem. I am a traditionalist. At any point in time in my working life, when I feel psychologically unwell, I pray to my gods to intervene on my behalf. This world is made up of so many things. Evil forces fight against our wellness. So, it's always advisable to consult the gods for protection

Some of the participants also said that they engage in social and other entertainment activities to save themselves from the effects of mental unwellness. Interaction drew the ensuing responses:

> What has been working for me is listening to music. Temporarily, it aids in making me quite better. I think it pulls the magic for me

Another emphasized that

> I go to night club to listen, sing and dance to good tunes. Admittedly, it relieves me of burdensome thoughts and stress for a while. With no long-lasting alternative at hand, I think this is good for me. What do you think?

Quite surprisingly, some participants made stunning revelations about how they coped with mental health challenges. Below are accounts of some participants.

> I feel I am in this alone. When I think my situation is breaking me down, I get some spiritous liquid to drink. When I get tipsy, I get relieved of the challenge and life goes on as normal for me. In all this discomfort life, I must confess it doesn't help me in any way. After some hours, when the alcohol wears off, I get back to my previous state.

Others also disclosed that

> Hmm, it has not been easy. Until the realities of mental health challenges dawns on you, never knew its consequences. Let me tell you the truth. In my difficulties, I do what I despise very much. I smoke. Afterwards, take a shower and relax my body

A couple of participants also confirmed the following:

> Often times, I have sex to reduce the intensity of mental health difficulties. One might think it is very stressful though. In as much as it is, the enjoyment has always been a therapy

### Mental Health Needs and Support Systems

After identifying some of the mental health challenges encountered by workers, the study proceeded to investigate some mental health needs. With regards to this study, participants mental health needs were classified as the necessary things required to enhance workers' mental or psychological wellness to be able to function efficiently and effectively at work. Even though the study recorded a low level of mental health knowledge, the few participants who had knowledge on the phenomenon were able to identify and catalogue needs required to enhance workers' mental wellness. Also, interaction further revealed that, whereas some few employees had been provided with mental health needs and support system at the workplace, majority of the participants have no such benefits. Below are some accounts of participants.

> Employers need to provide employees with clinical psychologist to assist challenged workers

> I think there is the need for management of corporate institutions to put in place measures to periodically sensitize workforce on the realities of mental health and its deadly ramifications

> In my interactions with my colleagues at the workplace, there are times I realize they are experiencing mental health challenges. But unfortunately, because they are not aware of the realities and complexities brought about by such feelings, they consider it as spiritual and as such resort to seeking for spiritual solutions from spiritualist and sometimes from their godfathers and mother. There is the need for education on this I think

## Discussion of Findings

Workers mental health is confirmed as significant to corporate workplace and productivity. Therefore, it is significant to stress that workforce wellness and familiarity with mental health constitutes a sine qua non to ensuring higher productivity levels in corporate settings. Given that low-level mental wellness among workers can induce losses and plummeting in productivity, it is essential that employers attach a high degree of pertinence to workers' mental health. The results from this study provide sufficient pointers and insights to guide and research policy and health promotion practices. As a consequence, it is incumbent on health practitioners, government and labor organizations, policymakers, and other stakeholders alike to exert efforts towards motivating managements, heads of organizations, employees, and other human resource regulatory authorities into taken action on mental health. On the same threshold, it is significant to initiate advocacies meant to devise strategies that will create and enhance improvements in employee health benefits. As much as these research findings are more practical and applicable in the Ghanaian context, given the global applicability, pertinence, and the bourgeoning trends in the

implementation and promotion of workplace health and well-being programs, this study will contribute to making insightful contributions, specifically with regards to exposing the realities and depth of workers knowledge level about mental health. This study revealed interesting results.

To unravel the wide-ranging challenges that workers undergo, the study revealed that due to the responsibilities placed on workers, coupled with the need to meet certain daunting corporate production targets, workers come under enormous pressure. This significantly invokes psychological instability, which further takes a toll on workers' mental health. Among some of these challenges include emotional exhaustion brought about by feelings of perceive failure. This is consistent with the findings of Lu et al. (2013a, b). Oppolzer (2010) confirms that though workers undergo a series of mental health difficulties as a result of the need to meet corporate demands, the larger part of the excessive load of work placed on workers, sometimes beyond their capabilities and capacities, substantially takes a toll on their mental health and wellness. Confirming this assertion, participants were almost unanimous in their response as they indicated that the situation becomes more compounded, more especially when expectations and targets are unmet overtime. Under this situation, participants confirmed the work-related anxieties they have had to go through as a result of ideations of perceived insufficiency and incompetency. From the perspectives of participants, all these expose workers to mistakes and woeful failings at the workplace.

Also, the study further confirmed pressure from superiors and workplace supervisors as one of the mental health challenges workers undergo. Most participants emphasized on corporate controls and sanctions as some of the factors that contribute to heaping pressure on workers. This is in agreement with Panse and Stegmann (2007). Some participants also raised worries about unfriendly working spaces or workplace phobia as a potential source of mental health challenges. Workplace phobia is another form of work-related mental health challenge. The World Health Organization (1992) asserts that individuals have workplace phobia by either "*approaching, being at, or simply imagining the work-place leads to acute physiological arousal that amounts to a panic reaction*." Some expressed the view that overcrowded working spaces come with challenges such as unhealthy rivalry between workers. This is confirmed by Stroebe et al. (2014) and Thomas and Hynes (2007).

Additionally, some workers complained of bullying and discrimination. This is also confirmed by McDonald (2012) and Morgan et al. (2013). Some participants also expressed concern about workplace uncertainties as some challenges they encounter. More specifically workers identified retrenchment and downsizing initiatives as sources of mental health challenges. Forcella et al. (2007) confirm that far-reaching changes like anticipated company closure or merger have challenges to workers mental health (Campbell and Pepper 2007). This may be as a result of the varying impact of work loss which is confirmed by Elst et al. (2014) and Mohr and Otto (2011). The concept of work-related mental health challenges has been developed in psychosomatic rehabilitation, a setting in which people with workplace-related mental health problems are over-represented (Muschalla and Linden 2009).

The study made efforts to explore workers' ways and means of coping with mental health challenges. By coping mechanisms, the study sought to investigate how workers either countervail or contend with challenges brought about by the phenomena. Coping research (Carver and Scheier 2001; Lazarus and Folkman 1984) emphasizes the relevance of cognitive, emotional, and behavioral reactions to work demands. The specific nature of individual coping reactions to stress determines whether those individuals stay healthy or become ill. Transactional stress theory defines coping as "constantly changing cognitive and behavioral efforts to manage specific external and/or internal demands" (Lazarus and Folkman 1984). Krause et al. (2012) identified behavioral strategies used by employees to cope with work-related mental health situations.

Given the challenges workers encounter, the study revealed that some participants have devised coping mechanisms which included praying, consulting counselors, engagement in

social activities, and listening to music. Some of these functional behaviors are consistent with Krause et al. (2012). Others resort to smoking, drinking alcohol, and engaging in sex as a means to reduce the intensity of mental health challenges. This confirms the research findings of Grebner et al. (2010) and Wirtz (2010) who assert the detrimental reactions of workers to mental health–related challenges. This further demonstrates that coping measures ameliorate the effects of work-related mental health challenges on workers' well-being (Lazarus and Folkman 1984). Mental health challenges brought about by work demands like high workload and the ways in which individuals deal with these demands contribute to the genesis of mental and physical illnesses (Lohmann-Haislah 2012).

As a result of the wide-ranging challenges workers endure at the workplace, through interaction, the study identified a myriad of workers' mental health needs and support systems. Key among the needs was institutional priority and leadership. In the views of participants, a leadership that places much premium on advancing workers' mental health needs is cardinal to workers' well-being. A well-developed organization-wide health-focused leadership complemented with good general leadership skills tailored to protect employees' psychological and physical health is equally essential. In this regard, Kelloway and Barling (2010) confirm leadership as a potent intervention in occupational mental health. Cooper and Roden (1985) confirm the negative ramifications of autocratic leadership on workers' health. Laschinger et al. (1999) for instance assert the impact and potency of leadership on workers' wellness.

Some participants also expressed concern about a cooperative, tolerant, and receptive supervisorship as important to promoting workers' mental health. In the views of workers, since supervisors are key architects responsible for designing and organizing workplace schedules and engagement as well as enforcing workplace rules, they are invariably key players in facilitating workplace mental health through their role as rule enforcers. By this, leadership of supervisors set the atmosphere and condition for mental wellness or otherwise. This is consistent with Stadler and Spiess (2003) and Quick et al. (2007) who have demonstrated the degree of influence of supervisors on employee's well-being and health. Actually, an encouraging behavior from supervisors could have a positive impact on employees' well-being by reducing workplace tension, enhance wellness, and increase efficiency and effectiveness.

Among other mental health needs and support systems, the study revealed that social support from colleagues, leadership, and sometimes from immediate supervisors is imperative to workers' well-being. Also, a germane social relationship is a sufficient source of support for challenged workers. On how ensure and promote mental health and knowledge among workers, some participants suggested the inception of health groups, periodically screening workers' health and undertaking regular medical checkups. These are essentially steeped in the concept of social support (Podsiadlowski et al. 2013).

## Limitations of the Study

Though the study has strengths, like others, it also has limitations which need to be highlighted to help guide policy, and the conduct of future research. The study was restricted to a sample of 120, within the Kumasi Metropolis of the Ashanti Region of Ghana. As such, replication of findings in diverse settings among a larger population must be done diligently, altogether with caution. As much as these do not in any way invalidate the study findings, the study strongly recommends the conduct of further studies with much larger sample, to draw further relevant insights into the subject matter under investigation. This study employed the qualitative approach. On this basis, the study urges future research to employ either a quantitative or mixed method approach to further investigate the subject matter under review. Future research taking into cognizance these diversities would help reveal subtleties and variations underlying the study, thereby enriching the discourse and contributing significantly to policy and practice.

## Conclusion and Recommendations

This study reveals the dearth of mental health knowledge among workers. In addition to identifying challenges and various coping mechanisms employed by participants, the study also reports on workers' mental health needs and support systems. Against this backdrop, it is instructive to emphasize that as far as workers' plight is concerned, issues of mental health are important. As such, it is relevant that, as a matter of urgency, corporate organizations make mental health an integral part of corporate priorities and practices. To better achieve the objective of not only entrenching, but also increasing mental health knowledge among workers, the study therefore recommends the following:

Firstly, corporate entities should institute health promotion leadership at the workplace to provide the needed resources to ensure a balance between work and wellness. In this vein, employee-oriented and health-conscious leadership is very essential. As part of a broader short-, medium- to long-term plan, organizations should also promote employee well-being as part of measures to maximize the attainment of long-term goals while fostering high-quality workplace performance.

Secondly, corporate entities must endeavor to design and implement work and organizational processes, as well as favorable working conditions. Not ending there, health promotion management committed to entrenching health as an organizational culture must be promoted. These can help promote cooperative action, health consciousness creation, and the development of a sustainable workplace support system. Anchoring these within organizational visions and guidelines for personnel development will contribute to the overall workforce well-being.

Moreover, organizations must regularly organize medical checkups and screenings, make changes to the workplace, carry out stress management programs, and also institute health-oriented leadership models through leadership seminars, workshops, and control trainings. In this regard, organizations should train leaders in health-focused leadership behaviors. For example, institutions can organize training workshops to sensitize leaders on their responsibility to advance workers' mental wellness and overall well-being.

Besides, organizations should engage professional clinical psychologist at the workplace to offer essential services to psychologically challenged workers. At the same time, these psychologists should regularly hold mental health education sessions for workers. When suitable measures are implemented, good health will lead to higher levels of employee happiness and strong organizational commitment.

Furthermore, organizations and stakeholders alike should invest in work-related mental health research to help identify new developments on the incidence and prevalence of mental health. This would provide a sound basis for mental health policymaking and implementation. At the national front, the Government of Ghana, health sector players, and the regulators of the national health insurance scheme should expand the scope of the insurance scheme to include the provision of clinical psychology service, as part of an overall primary health-care system. Finally, labor-based organizations, (for example, the Trade Unions Congress) should prioritize and advocate for mental health services for their members.

# Working from Home in the Australian Public Sector Before, During, and Post-COVID-19

Neale Slack, Shavneet Sharma, Asheefa Aiyub and Gurmeet Singh
School of Business and Management, The University of the South Pacific (USP), Suva, Fiji

## Synonyms

Telecommuting; Telework; Virtual work; Working remotely

## Definition

| | |
|---|---|
| *Coronavirus disease (COVID-19)* | An infectious disease caused by a newly discovered coronavirus. |
| *Pandemic* | An epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting many people. |
| *Public sector* | Government and all publicly controlled or funded entities that deliver public programs, goods, or services. |
| *Telework/ Teleworking/ Telecommuting ("working from home")* | A flexible work arrangement where employees perform all or a substantial part of their work while physically separated from their employer's location. |

## Introduction

Based on the number of cases of coronavirus (COVID-19) outside China having "increased 13-fold . . . more than 118,000 cases in 114 countries, and 4291 people having lost their lives, and thousands more fighting for their lives," the World Health Organisation (WHO) declared on 11 March 2020 that COVID-19 was a pandemic (WHO 2020). The COVID-19 pandemic continues unabated to wreak havoc across the globe, with the confirmed count of COVID-19 infected cases at 132,046,206 (including 2,867,242 deaths) on 8 April 2021 (WHO 2021). Global interventions adopted to stem the spread of COVID-19 have resulted in international and state border closures, cessation of international and domestic flights and transit, supply chain disruptions, mass closures of businesses and employee layoffs, panic buying, social distancing, enhanced personal hygiene practices, and mandatory and self-isolation. These interventions have individually and collectively dramatically affected the way people typically work and live their lives (Sharma et al. 2020). Governments across the world have also been forced to make timely and what could be perceived as apparently contradictory decisions, policy changes, nationwide broadcast messages, and advice notifications. Understandably, such apparent contradictions have been contingent on the ever-changing, latest available information regarding the increasingly wide-ranging impact of COVID-19, the identification of mutated and more virulent strains of the virus, and the availability and effectiveness of vaccines (Williamson et al. 2020).

When the COVID-19 pandemic was declared, national and state governments, employers, employees, and citizens generally remained optimistic that the impact of COVID-19 on "life as we knew it" would be minimal. Governmental messages such as "to go about . . . regular life and business as much as possible" were issued to the general public and reinforced such optimism (Morrison 2020a). However, in very quick succession, those messages were replaced with governmental requests to remain at home, and if possible, work from home (Morrison 2020b). Across the globe, business sectors, including the public sector, directed their employees on a previously unimaginable scale, and at short notice, to commence working from home, in what has been toted, the "world's largest work-from-home experiment" (Banjo et al. 2020). In 2020, it is suggested that "a veritable revolution happened in global job markets," which has continued into 2021, where it is currently estimated that "55% of businesses globally offer some capacity for remote work," and 18% of the workforce work from home on a full-time basis (Marinova 2021). Notwithstanding, a survey in 2020 of the Australian Public Service agencies, which employed 1.2 million public servants (Burton 2020), identified that "64% of public servants were working from home" (Dingwall 2020).

As a result of the COVID-19 pandemic and the associated "lockdowns" globally, millions of public servants have been working from home. Many of those affected public servants, governments, academics, and news media outlets have questioned and speculated whether widespread working from home could become the post-pandemic "new norm" (FourNet 2020). This chapter investigates the working from home history, perceived benefits and challenges, and the likelihood that widespread working from home could occur in the Australian public sector post-COVID-19. In this chapter, the terms "working from home," "teleworking," and "telecommuting" are used interchangeably.

## History of Working from Home

While teleworking was considered by employers in the 1950s, until the introduction of affordable personal computers and portable modems in the early 1970s, the practical application of teleworking was not feasible (Hill et al. 1998). From the 1970s and into the 1990s, teleworkers that worked from home typically were under an arrangement with their employer to accommodate the integration of work and family care responsibilities (Hill and Fellows 2014). With increased availability, portability, and use of computing and

communications equipment, and a corresponding dramatic reduction in cost, the emergence of teleworkers on a larger scale materialized (Hill et al. 1998). However, despite flexible working practice adoption in the new millennium (Cassidy and Parsons 2017), employers remained disinclined to sanction working from home due to uncertainty as to whether gains would outweigh losses (ABS 2019). Such uncertainty stemmed from contradictory findings regarding performance and productivity improvement (Martin and McDonnell 2012) and perceived challenges associated with employee isolation, communication and supervision, and questionable employee commitment (de Vries et al. 2018). Hence, pre-COVID-19 adoption of teleworking had been restricted in the Australian Public Sector and was atypical, as evidenced by only 10% of public servants in Australia in 2013 teleworking, and by 2019 less than 15% (APSC 2019).

## Perceived Benefits of Working from Home

As with any change in working conditions (such as working from home), motivations, perceived benefits, and drawbacks exist for both employers and employees and need to be balanced in favor of both parties, lest this work arrangement would not survive long. A range of benefits have been purported to interest public sector employers sufficiently to consider allowing employees to practice teleworking. Such benefits have been identified as reduced organizational expenses (rent, telephones, utilities, equipment, etc.), enhanced workforce productivity due to "lack of interruptions, increased concentration, increased motivation, employee satisfaction, a better employee dedication, increased work energy by reducing time and disruptive elements," reduced absenteeism due to "diseases, family events, and adverse weather conditions," and mitigation of the risk of spreading contagious diseases throughout the workforce resulting in productivity loss and business disruption (Lupu 2017, 696).

Research has identified that 86%of employees have expressed a preference to work from home (Stahl 2018). Therefore, it is important to understand what factors have motivated such a high level of employee preference for working from home. One of the most important factors (benefits) mentioned by employees that motivated them to desire to work from home has been the autonomy and opportunity for flexible scheduling of their daily activities and to work according to their personal needs (Lupu 2017, 696). Further, as a result of not being required to commute to/from the office, commuting time was eliminated (time-saving) and commuting stress reduced, resulting in more available time to spend with the family and be productive. Financial benefits have also been identified as accruing to employees who worked from home, such as savings on fuel, other forms of transportation, parking fees, and preschool/child care, etc. It is also important that mothers provide family support while still working (Wienclaw 2019), and employees living great distances from their employer were still able to be employed (Lupu 2017, 695).

## Perceived Challenges of Working from Home

Fear persists among many managers in the public sector regarding telecommuting "despite the mounting evidence that shows telecommuting is beneficial to both employers and employees." Those fears tend to stem from a number of factors. Management perceives that telecommuting is unchartered territory; therefore, it will be unmanageable and daunting. Notwithstanding, informally, telecommuting has already been underway for years in most organizations, with employees using their mobile phone and computer at home to check emails, finish work at home, make and take work-related phone calls to/from work, etc. "The fact is that we're already working remotely because of the integration of technology and mobility in our lives, but we (employers and employees) are just not formally acknowledging it as such." Realistically, "nobody only works at their desk in their on-site office anymore." Management also perceives that telecommuting only benefits employees.

Notwithstanding, studies have clearly identified that both employers and employees benefit from such flexible working arrangements, in spite of setup costs in equipping employees and adequacy of technology to work from home, trust, productivity and performance "issues," and the "growing pains" experienced. Generally, those perceptions have been shown to be unfounded, and costs to be far outweighed by reduced operating costs, increased productivity, reduced absenteeism, and increased staff and organizational flexibility (Sutton 2014).

While public sector managers' fears are noted, it is pertinent to acknowledge that manifold challenges exist for employees when teleworking, none the least being that they are unsure as to what to expect and what to do, as no clear-cut rules typically exist. Further compounding this significant challenge is that employees commonly report that from day 1 of working from home, they are confronted with technology glitches such as unreliable Wi-Fi, reduced Internet speed, frequent disconnections from corporate networks, poor quality video meetings, and printers and scanner that malfunction, all which adversely affect employee productivity and promote immense frustration (Leprince-Ringuet 2020).

Many teleworking employees also strike trouble maintaining a structure in their day and working normal business hours; hence, they find themselves not completing required work during the day and then being forced to work evenings or weekends. Further, no clear division exists between workspace and personal space, with employees often feeling that their home is no longer "a place of relaxation, safety and security" where one can slip out of "work mode" and into "relaxed mode" and "switching off," because there is always the sense of necessity to "finish one last thing" or "check one more email." Working from home, employees also find themselves surrounded by distractions such as TV, household chores, family, and friends, which all prove challenging and can affect their productivity. As well, employee supervision and direction from superiors dramatically reduced with limited guidance provided as to what to do, feedback on progress, reprioritization of goals, and the like. Employees often find themselves craving guidance from the bosses they use to complain about (Davis 2021).

Communication and coordination can also be challenging when working from home. While it is difficult enough undertaking productive face-to-face meetings and coordinating a team of employees' efforts, when employees are working from home, those activities become that much more difficult. Because of the heavy reliance on nonverbal cues in communication, when working from home, those nuances are removed when communicating via email, phone, video conferencing, and the like; hence misinterpretation and conflict can result. When working from home, the whole work dynamic has changed. So, how is an employee's performance to be monitored and measured and against what standard? Because many managers lack answers to this question, they tend to resort to a basic tracking metric of how long the employee has logged onto their computer. The length of time an employee physically sits at a desk does not necessarily equate to output and goal achievement. Employees who work from home require very clear and simple performance indicators to guide and monitor their performance (Davis 2021).

Social isolation when working from home each and every day takes its toll. Because human beings are social by nature, without the opportunity to socialize they can become lonely and starved for communication. Also, when working from home and not surrounded by ambitious colleagues, it is easy "to slip into a rut," feel comfortable, and lose the motivation, drive for and sight of important objectives. In summary, while employee telecommuting comes with a myriad of perceived benefits, "with every benefit comes a challenge" (Davis 2021).

## Working from Home and Returning to the Workplace during the Pandemic

Shortly after the WHO's declaration of the COVID-19 pandemic in March 2020, state governments across Australia required public

servants to work from home. Each state adopted differing approaches to employees working from home. In some instances, states were generous in providing extensive online resources, funding consumables and utilities, and management of employee fatigue, and if the whole job could not be undertaken from home, accrued annual leave was not required to be used. Conversely, other states were less generous and adopted more hardline approaches requiring that if an employee "could not be fully productive, they should take leave," implemented "working from home on a trial basis," and instructed that "employees with young children could not work from home, but could work less than full-time work hours." The disparate responses provided by state governments demonstrate the differing degree of "acceptance or resistance to the practice of working from home" (Williamson et al. 2020). Further, "the timing and messaging of the transition out of the pandemic also indicated resistance" with Australian Government advices appearing to be contradictory (Williamson et al. 2020) – on 8 May 2020, a roadmap was released which encouraged employees to continue to work from home (Australian Government 2020), and the same day, an advisory was issued for employees to plan the transition back to their workplaces (Australian Public Service Commission 2020). In May and June 2020, state governments staged the return of employees back to their regular workplace based on the workplace being deemed COVID-safe, a "hierarchy of need," decisions by agency heads based on whether the employee delivered a critical service, and the employee's preference to continue working from home (Williamson et al. 2020).

## Conclusion

The Australian public sector (as with many public sectors across the globe) has a history of being risk-averse and notoriously slow (resistant) to change, and when change has occurred, it typically has been incremental (and "safe") and not radical ("higher risk"). It is also commonly reported that pre-pandemic considerable resistance was evidenced by Australian public sector management to employees working from home and other flexible working arrangements; while in contrast, employees were generally desirous of working from home. Such resistance by management has been openly espoused to be founded on concerns regarding technical difficulties of working from home, employee productivity and performance, and an absence of a culture of trust (Williamson et al. 2018, 2020). However, with the rapid and wide-ranging impact of the COVID-19 pandemic requiring an immediate, radical response from the government, management resistance to employee's working from home was for necessity and expediency sake somewhat "side-stepped," and working from home for employees was implemented across the Australian public sector. It is suggested that once the immediacy of the pandemic has passed, normalization of public servants working from their workplaces, and restricted pre-COVID-19 levels of employees working from home, will be reinstated. It is further suggested that for any major consideration by the government for employees to work from home, extensive governmental review of managers' and employees' experiences with working from home pre, during, and post-COVID-19 would be required, and necessary policies needed to be developed, therein delaying any possible consideration for operationalization or extension of prior work practices. Finally, because the concept and practice of working from home are such radical diversions from perceived "normalized" public sector work practices, and continue to be resisted by management, it is considered questionable as to whether large numbers of public sector employees would post-COVID be offered the opportunity to work from home. This then begs the question as to how the government expects to "put the genie back in the bottle"? Public sector employees have received the liberating "taste" of working from home, and then under instruction, are simply expected to return to the bureaucratic "norm" of their workplace, as though nothing had happened or changed. It will be interesting to see how this scenario pans out. . .

## Working Style Assessment (WSA): The Gender Difference in Thai Population

Nanta Sooraksa
School of Human Resource Development, National Institute of Development Administration, Bangkok, Thailand

### Synonyms

Career exploration tool; Occupation-oriented assessment; Worker-job oriented assessment

### Definition

The Working Style Assessment (WSA) is a career exploration tool for an individual conducting by means of self-administration, self-score, and self-interpretation. The gender difference refers to variances between male and female which include biological, social and culture attributes.

### Introduction

Work styles are essential to both employees and managers. Work styles also reflect the outcome and quality of training program. In case of the job applicants hold similar qualification, especially functional competency, it is work styles that offer a way to distinguish candidates that are most suitable for the job and organization culture. In addition, work styles assessment can effectively help with promotion decision, as employees with higher levels of work styles tend to be more efficient in their current jobs and work behaviors.

Measuring work styles will allow an organization to keep track of the level of effort being enacted by its employees over time and compare the amount and quality of effort to what is required. In addition, work styles are not static but are influenced by a wide range of variables through policy, structural change, and environmental transformation. It is noted that employee work styles may be constructively adjusted (Bayl-Smith and Griffin 2015).

Work styles can be of practical use to professionals in human resource and organizational development. To characterize a person's work style, the WSA was developed (Messer and Ureksoy 2014). The WSA is an assessment or a career tool for finding a person's personality traits that are involved to effective job performance. The development of the work style taxonomy was based on the review and integration of several well-established personality taxonomies. Essentially, it was established based on the Hogan Personality Inventory (Hogan and Hogan 1992), big five-traits and job performances (Barrick and Mount 1991), and the Occupational Personality Questionnaire (Saville and Holdsworth 1990).

The collection of the work styles taxonomy was based on a number of resources: a review of the relevant personality literature, empirical data informing of the work styles and higher-order factors, as well as constructs that have been displayed to associate with work-related behaviors. The finding was a good number of qualifications that explain the vital personality requirement essential to successful career development.

The WSA was derived from Occupational Information Network (O*NET) work style traits and adding two new scales that are relevant to a variety of occupations. Based on O*NET work style traits, the questionnaire was constructed based on the five global constructs and the 18 individual working styles. The five global constructs were: 1) drive; 2) interpersonal skill; 3) adjustment; 4) responsibility; and 5) problem-solving skill.

The standard version of WSA was administered to the US population. The samples of 739 individuals (49% male and 51% female) ranging in age from 17 to 70 years were selected.

According to demographic characteristics of the WSA standardization sample, percent of race and ethnicity were 62.8, 12.8, 16.1, and 8.3 for Caucasian, African American, Hispanic, and other, respectively (Messer and Ureksoy 2014). Although the reliability and validity of the assessment were highly statistical significance, it was wondered whether the assessment would still be applicable to the cross-cultural groups.

With users from different cultural backgrounds, the use of cross-cultural version of assessment needs to be validated. The purpose of this entry is to provide: (i) a guideline to carry out an existing procedure used for conducting WSA research in another country than the one in which it was originally designed; (ii) issues on gender difference within a single country differ from each other in ethnic or cultural background even using the same assessment procedure.

In this entry, the Thai version of WSA was provided as an example to underline forms of cross-cultural assessment for certain gender issues about the cross-cultural comparability and limitation. The outlines will be as follows. A brief review of original WSA version will firstly be presented, followed by Thai WSA development, participants, translation and cultural adaptation, and context of gender differences. Finally, concluding remark will provide a context of gender differences on comparison with the US original version.

## Original WSA Version

**Development.** The original WSA developed by Messer and Ureksoy (2014) had 5 global constructs and the 18 individual working styles. The five global constructs were: (1) drive; (2) interpersonal skill; (3) adjustment; (4) responsibility; and (5) problem-solving skill. Drives consists of four working styles: achievement, initiative, persistence, and confidence. Interpersonal skill consists of four working styles: leadership, cooperation, concern for others, and social orientation. Adjustment consists of self-control, stress tolerance, and adaptability. Responsibility consists of dependability, attention to detail, integrity, and conscientiousness. And problem-solving skill consists of independence, innovation, and analytical thinking.

**Reliability.** Reliability refers to the degree to which an assessment consistently measures whatever it measures. There are many ways to examine reliability. For the WSA, inter-scorer agreement, internal consistency, and test-retest reliability and were considered. It revealed that high inter-scorer agreement was found.

To calculate the degree to which item in a scale measure the same construct, internal consistency for the working styles was carried out by using Cronbach's alpha (1990) for each of the four age groups (17–25, 26–34, 35–54, and 55–70 years) and by gender. The coefficients were high, ranging from 0.61–0.92 throughout all age groups.

To determine which test scores still stable over time, a pilot group of 102 individuals (male = 36, female = 66) ranging in age from 18 to 70 years was studied by taking the WSA twice over a 5-week period. The results revealed the test-retest reliability ranged from 0.71–0.88 meaning that scores on the assessment exhibit sufficient consistency over time.

**Validity.** Validity refers to the extent to which an assessment measures what it is supposed to measure. Based on expert review, the items on the WSA have acceptable face validity. In addition, the WSA has predictive validity. There was equivalence between print and online version as well (Messer and Ureksoy 2014).

To examine the WSA relationship with other assessments that measure similar constructs, convergence validity was carried out. The pattern of correlations between WSA scores and other related measures revealed evidence for the construct validity related to the Self-Directed Search (SDS) (Holland and Messer 2013) and other standard personality tests (NEO-PI-3; McCrae and Costa 2010; MBTI; Myers et al. 1998).

To examine the internal structure of a measure, the intercorrelations between scales is examined. The intercorrelations ranged from 0.11 to 0.73. The strongest relationships were found between Achievement and Initiative and Conscientiousness and Attention to Detail. Most of the working

styles were significantly correlated with a few exceptions, i.e., independence-social orientation among both males and females, and integrity-leadership among females (Messer and Ureksoy 2014).

**Applications.** Main use of WSA are in career development and in personnel selection. In career development, the WSA assists individuals gathers information on their personal work preferences and gain understanding of how to narrow a list of potential occupation in which an individual may perform well or may be satisfying. In personnel selection, the WSA reveals traits that are related to successful job performance. This helps hiring managers to identify value of their employees from a list of working styles to narrow down a list of application. In addition, the WSA can help a manager and an employee to identify strength of the employee's workstyle area to meet the expectation of the suitable position.

**Gender difference.** What difference does gender make when compare with the original WSA version? On average, males tended to rate themselves significantly higher on Stress Tolerance. Females tended to rate themselves significantly higher on achievement, cooperation, concern for others, dependability, attention to detail, integrity, and conscientiousness (Messer and Ureksoy 2014).

## Thai WSA Version

**Development.** The WSA was translated using a three-stage cross-cultural adaptation process as proposed by Ware et al. (1995). The procedure includes the following:

1. Translation and cultural adaptation of the original scale into the Thai language, and evaluation to ensure it is the conceptual equivalent.
2. Formal psychometric testing of the assumptions underlying item scoring and multi-item scales, to ensure that scoring algorithms can be applied to the population concerned.
3. Validation and invariant analysis studies that provide a basis for interpretation.

**Participants.** The samples were selected, and data collected from people working in Thailand. Demographic information on age, gender, education level, and social strata by occupation were also obtained. 896 questionnaires were collected from Thai participants (388 males and 508 females) who were currently employed in the workforce and aged between 18 and 60 years old.

## Translation and Cultural Adaptation

The Thai translation of the WSA was performed according to the Principles of Good Practice Translation and Cultural Adaptation proposed by Wild et al. (2005). The procedure includes preparation, forward translation, harmonization, cognitive debriefing, and finalization. The objective was to develop a culturally sensitive version of the WSA equivalent to the original in the following aspects: items, semantics, and operational and measurement equivalence.

**Translation.** The WSA was first transferred to an appropriate computer format for translation. Forward translation was performed by two independent translators and the two translations were reconciled into a single form. The reconciled form was back translated into English by two independent translators and combined into one back translation. The back translation was compared with the original version. Differences were highlighted and discussed by a panel comprising two HR professionals, a psychologist and a statistician. Changes were made accordingly to ensure the consistency of concepts between the original and the translations. This yielded the Thai translation of the WSA.

**Cognitive debriefing.** Ten adults knowledgeable in the Thai language were pretested using semistructured interviews to explore whether the questions were relevant and understandable, and to identify potential difficulties in answering.

**Finalization.** An expert panel meeting was organized to evaluate the content and validity of the translated versions, the results of the pretesting, and the equivalence with the original in terms of the conceptual, semantic, and normative

equivalence of each item. Eventually, the Thai version was approved by PAR, Inc.

**Reliability.** The internal consistency test is an internal test of each item of a questionnaire using Cronbach's alpha coefficients. The Cronbach's alpha coefficient represents the average of all possible split-halves and can be used for dichotomous and continuously scored variables. The test-retest reliability of the Thai WSA ranged from 0.433 to 0.773 (mean = 0.663, median = 0.696).

The reliability testing data for each item of the Thai WSA. Cronbach's alpha coefficients revealed the values for each scale from a total of 18 scales. Globally, the findings demonstrated that the average Cronbach's alpha coefficient ranged from 0.583 (Dependability) to 0.877 (Leadership). For males specifically, Cronbach's alpha ranged from 0.575 to (Achievement) to 0.860 (Innovation). For females, reliability ranged from 0.449 (Dependability) to 0.893 (Leadership).

The findings based on gender revealed that the Cronbach's alpha was greater than 0.70 for males which is considered acceptable. However, the Cronbach's alpha which were lower than 0.70 included achievement and dependability. The reliability of dependability was questionable, and achievement was poor.

Most females had a Cronbach's alpha greater than 0.70 which was acceptable. However, those scales with a Cronbach's alpha lower than 0.70 were achievement, initiative, persistence, cooperation, dependability, and independence. The reliability of achievement, initiative, persistence, and cooperation was questionable, while the reliability of independence was poor and that of dependability unacceptable.

**Test-Retest.** The test-retest reliability of Thai Working Styles Scale was carried out. The test-retest reliability of the Thai WSA ranging from 0.433 to 0.773 (mean = 0.663, median = 0.696). There were scales with pretty low reliability which were achievement, cooperation, self-control, and independence (<0.6). In the American population (Messer and Ureksoy 2014), the test-retest reliability was in the range of 0.71 and 0.88 (mean = 0.805, median = 0.798) which is considered as pretty high reliability. In addition, the absolute mean change of the Thai population ranged between 0.01 and 0.51.

**Validity.** The Thai version was validated using a method of confirmatory factor analysis with invariant analysis to assess measurement invariance, to test invariance across gender, and other attributes. The test was conducted to check whether the two groups have the same configuration. To confirm similarity, fit indices are employed to evaluate how the model fit is based upon the evident data. If the two comparison groups have a similar configuration, then the second step will proceed. If not, the test stops.

It revealed that the scale reflects the confirmatory factorial structure, good intercorrelations, and overall psychometric properties. Invariance results across groups reached structural invariance in general. The structural invariance provides a confident invariance measurement for this scale. In general, invariance across gender and sociocultural levels reached metric invariance provided detail in the next.

**Gender difference.** What difference does gender make when compare with the Thai WSA version? The Thai version seems to achieve an adequate level of reliability and validity criteria. According to analysis of the invariance of the WSA model between Thai and US population, the following conclusions can be drawn:

1. For males, in general, workstyles for both Thai and US population had the same model form under the same conditions. Like American, on average, Thai males tended to rate themselves significantly higher on Stress Tolerance. However, on standardization sample, mean total scores for working style for Thai males rated themselves as Average scores (149–224) whereas American males rated themselves as High scores (225–252).

However, in detail, Drive variable has more influence on American male working styles than Thai males. This might be an effect of cultural difference which teaches Thai people to be humble, rather than express an objective driven direction like an American. The remaining variables including interpersonal skill, adjustment,

responsibility, and problem-solving skill changed between the two groups as indicated in terms of distinct competencies by Burrus et al. (2013). Since globalization of the workforce via information and other related technologies might shape a person working in either Thailand or the USA to adapt to an important component in similar manner, under the same company regulations, and require the maintenance and adjustment of people-environmental fit, tracking how employees display their commitment to work overtime in different locations has become important (Bayl-Smith and Griffin 2015).

The disruptive changes in working style around the world due to globalization might also contribute to, and be influenced by, a wide range of variables; through policy, structural change, and environmental transformation; therefore, employee work styles might require constructive adjustment (Bayl-Smith and Griffin 2015). That was why the Thai version was almost compatible and agreed with the original US version.

2. For females, in general, the WSA model for Thai females agreed with the theory of Messer and Ureksoy (2014). Like American female, Thai females tended to rate themselves significantly higher on achievement, cooperation, concern for others, dependability, attention to detail, integrity, and conscientiousness. However, on standardization sample, mean total scores for working style for Thai females rated themselves as Average scores (149–224) whereas American female rated themselves as High scores (225–252). This rated score profile for females was like that of males.

In detail, the WSA model for females was "partially invariant" between the two groups. An explanation of how the internal parameters of the WSA model between Thai and US females were partially different could result from stereotypes at work, which may predict race and gender segregation in the workforce. Asian people are more likely to be represented in occupations characterized by high competence (He et al. 2019). These facts are true for Thai society as well.

## Conclusion

This entry has provided an overview of the WSA in the context of gender difference. A Thai version of the WSA was presented as an example of cross-cultural study. The Thai version seems to achieve an adequate level of reliability and validity criteria. The invariance of the WSA model between Thai and US population led to the following conclusions:

1. Workstyles for both Thai and US males had the same model form under the same conditions.
2. The WSA model for Thai females agreed with the theory of Messer and Ureksoy (2014).
3. On standardization sample, mean total scores for working style for both Thai males and females rated themselves as average scores (149–224) whereas both American males and females rated themselves as high scores (225–252).

The WSA has been established as a tool in the Thai language to appraise how individual workers respond to a variety of work situations. This will benefit the development of the HR field in Thailand. The Thai version of the WSA is compatible with the US one, not only in terms of structure, reliability, and validity when self-administered, but also for functionality when self-scored as a self-interpreted career exploration tool. This entry also pointed out availability of a Thai version of WSA that can be used professionally and academically.

# Work-Life Balance Among Ethnic Minorities: A Case Study of Hong Kong

Lina Vyas
Department of Asian and Policy Studies,
The Education University of Hong Kong,
Tai Po, Hong Kong

## Synonyms

Burnout and satisfaction; Family-friendly policies; Minorities; Minority groups; Work-life interface

## Definition

Work-life balance refers to the optimal equilibrium between the time allocated for work and activities, which increase the life satisfaction; ethnic minorities refers to the nonindigenous people, which constitutes considerably less portion of the whole population.

## Introduction

The globe has been aging at an alarming rate, particularly in the countries with an well-developed economy. As a result, governments are seeking alternatives for the sake of economic integrity and such trend also happens in Hong Kong. Due to the fact that longer average life expectancy and a low fertility rate, the latest population projections show that the Hong Kong population will age faster than expected. The number of Hong Kong people aged 65 or above is projected to reach 2.16 million in 2041, more than double the figure of 980,000 in 2012 (The Steering Committee on Population Policy 2013). This results to a corresponding decrease in the labor participation rate pegged by the Steering Committee on Population Policy (2013) at 58.8% in 2012 down to 49.5% in 2041, the Government is importing ethnic minority workers

as a new source of manpower to "provide a much-needed boost to the labor force" facing a manpower shortage from an aging population (The Steering Committee on Population Policy 2013, p. 7). "Ethnic" refers to those not belonging to the indigenous people (Guirdham 1999). In the 2016 Population By-census by Census & Statistics Department, ethnic minorities living in Hong Kong hit a new high, account for 584,383 or 8% of Hong Kong population – an increase from 451,183 (6% of Hong Kong population) in 2011. In 2016, the five largest non-Chinese ethnic groups were respectively Filipino, Indonesian, White, Indian, and Nepalese, who made up 6.2% of the Hong Kong population (Census and Statistics Department 2016).

## Ethnic Minority Workers in Hong Kong: Difficulties and Dilemma

According to Mak (1997) and Marger (2001), work and family factors as well as participation within ethnic networks such as local ethnic communities are key factors that influence ethnic minority workers' intention of permanent settlement and social incorporation. Despite the increasing population of ethnic minority workers in Hong Kong, they are facing considerable challenges in adapting to an unfamiliar social and cultural framework. Such challenges range from stereotyping tendencies in the community, racial discriminatory barriers and prejudices, lack of education qualifications against standards imposed in destination countries, limited access to the labor market, to insufficient language skills to compete effectively in the job market (Bertrand and Mullainathan 2004; Jargowsky 2009). A 2014 study by the University of Hong Kong Centre for Comparative and Public Law revealed that more than two-thirds of the ethnic minorities in employment were engaged in "elementary occupations" that do not require special skills because of language barriers, for example, catering, construction work, and manual labor jobs (Kapai 2014), while less than 20% of the general Hong Kong population as a whole were engaged in elementary occupations (Kapai 2014). Owing to lack of the linguistic skills and discrimination, nonwhite ethnic minorities have immense difficulties finding employment in the mainstream economy, so they are more likely to resort to such offensive or objectionable jobs, in which employees may have to work long hours and overtime at short notice, and to work "unsocial" or irregular hours such as evenings, nights, and weekends, resulting in reduced satisfaction with work-life balance (McGinnity and Russell 2015). Additionally, practices of differential and unfair treatment are commonplace among the working ethnic minorities in the city, including longer working hours, greater workload compared to their Hong Kong Chinese counterparts, and lack of opportunities for promotion (Kapai 2014). In fact, a growing body of research has highlighted the importance of working conditions on work-life balance outcomes, including employees' control over scheduling, flexibility in working arrangements, and job insecurity (McGinnity and Russell 2015). It has been observed in some economies that apart from resorting to offensive or objectionable jobs, ethnic minority workers may attempt self-employment. All such job choices are known as labor market assimilation (Alund 2003; Logan et al. 2003).

### Government Responsibility on Securing Work-Life Balance of Ethnic Minorities

The Government has been criticized for failing to integrate and support ethnic minorities as well as to improve their working conditions, including ethnic minorities who were born in or have relocated to Hong Kong from abroad (Blundy 2017). Among the growing challenges and pressure from the community regarding the employment situation and working conditions of ethnic minorities, the Government has initiated a number of programs, including engaging staff familiar with ethnic minority languages and cultures to provide personalized employment advisory services for ethnic minority job seekers at designated job centers on a pilot basis. They further engage trainees proficient in ethnic minority languages as ambassadors to provide employment support services at selected job centers, industry-based recruitment centers, and job fairs

(Legislative Council Panel on Manpower 2017). Although the Government claims that ethnic minorities "are very much part of the community," and "have played important roles in shaping Hong Kong's history," (Hong Kong Government 2014) the efforts made by the Government have largely been limited to enhancing their job opportunities in the public and private sectors. They have however not taken into account the needs of working ethnic minorities in terms of their family-friendly benefits, work-life balance, and working conditions in such an ethnically diverse workforce.

## Family-Friendly Policies: A Possible Relief for the Working Ethnic Minorities

In fact, working ethnic minorities can be more prone to stress-related risk factors compared to their indigenous counterparts, considering work environments where they are a minority and the economic necessity that weighs against behaviors towards leaves (Miller and Travers 2005). A number of studies (Contrada et al. 2001; Miller and Travers 2005) have suggested that ethnicity as a demographic variable holds equal if not more importance in determining the amount of stress that an individual experiences at work. For example, some studies have found that ethnic minority workers are concerned about or feel stressed easily when it comes to whether they are able to remit their earnings to their family in their home country regularly (Thongyou and Ayuwat 2006). These issues can lead to marginalization of ethnic minority employees, acculturation difficulties, and stress relating to their ethnicity in the workplace (Miller and Travers 2005). In multiracial Hong Kong, the effect of ethnicity is more compelling in the work environment due to the increasing composition of the ethnic minority population. Likewise, different ethnic groups may differ in terms of their values, beliefs, and attitudes toward family-friendly policies (FFPs). They also vary in terms of experiences in reconciling employment with work and family life; and thus, with influences from their cultural group, they may have different appreciation of the importance and relevance of certain FFPs (Khokher and Beauregard 2014). For that reason, the perceived value of FFPs is a significant predictor of positive reciprocal actions (Khokher and Beauregard 2014). However, no research has been conducted yet examining the interaction between working conditions facing ethnic minority workers and the spillover effects of work on such workers' family life. This study focuses on working ethnic minorities because in the process of acculturation, that group of workers may find themselves particularly exhausted between fulfilling job functions with the highest possible optimal productivity and the social setup highlighting the value of family. Even though some ethnic minority workers may be better educated compared to their local counterparts, they are held back by a culture that puts equal pressure and demand on them to prioritize family. The dilemma is intensified when the traditions, beliefs, and practices of ethnic minorities are different from the prevailing organizational culture. It is therefore of our interest to investigate whether FFPs provided to that group of workers are sufficient to support them, and to what extent FFPs are flexible and inclusive enough to accommodate their needs.

### The Impact of Family-Friendly Programs on the Minorities Well-Being

The provision of family-friendly-programs (FFP) is a crucial public policy for reducing work-family conflict in modern human resource management. Literatures had argued that family-friendly interventions will produce positive impacts for employees. For example, the previous research by our research team on the effects of FFPs on employees' work attitudes and behaviors and the role of family-supportive organizational and supervisory support has found that certain family-friendly policies such as 5-day work weeks and flexible working hours are common in Hong Kong (Vyas et al. 2017). Another study of ours has revealed that well-intentioned family-friendly benefits, organizational culture, and fair supervisory support are essential to achieve the desired results (an ongoing project of FFP funded by Public Policy Research Scheme), so what makes employees reluctant to utilize family-friendly benefits is the absence of family-supportive supervisors (Brewer 2000; McNamara et al. 2012). Work-related outcomes are also

influenced by the availability of informal family support practices including family-supportive supervisors (Allen 2001). In fact, the presence of supportive supervisors is meaningful at both individual and employer levels. Employees can enjoy job and life satisfaction and balanced work-family life, and employers can benefit from employees' enhanced performance, reduced absenteeism, and lower staff turnover. A healthy workforce will also result in increased overall productivity, and reduced health care service utilization and related expenditures. This will also address the negative impacts of stress on the fertility rate. In the context of Hong Kong, the level of supervisor support is far from satisfactory. A study has revealed that only one-third of the supervisors understood the family-responsibilities of their staff, possibly resulting in low utilization of family-friendly policies (Vyas et al. 2017). Utilization of family-friendly policies was only as low as 40% in 2014. Hence, with the city's aging population and a declining birth rate, women are being encouraged to join the labor market by introducing more effective, wide reaching, and coordinated family-friendly measures, along with a favorable environment where people are able to utilize them.

## Conclusion

Due to the rising number of working ethnic minorities in Hong Kong, their contribution to the Hong Kong society has become increasingly important. One should not undermine their well-being because of the racial identity. From the discussed literatures, it is well recognized that ethnic minorities are facing difficulties when balancing between career and life due to their inadaption in a foreign environment. The lack of institutionalized support from the government also helps to escalate the problem in different ways. Family-friendly programs would be an excellent start to develop the basic protection against overwork and stress by creating a more harmonious workplace. Further studies should emphasis how severe government support fails to support minority workers and how effective family-friendly policies can enhance the well-being of ethnic minorities working in Hong Kong

# Work-Life Balance and Its Challenges, Iran

Akbar Hassanpoor and Mahsa Kavei
Faculty of Management, Kharazmi University, Tehran, Iran

## Synonyms

Work-Family Balance; Work-life Balance; Work-Nonwork Balance

## Definition

Work-life balance refers to employees' appraisals of how well they combine paid work (work-life) with nonwork roles (family and personal life).

## Introduction

Research in the field of work and family has expanded over the past five decades. The number of successful searches in the American Psychological Association database with the keywords work-life, work-nonwork, and work-family confirms this fact, which is 68 times during the years 1970–1979, 520 times in the years 1980–1989, 1094 times in the years 1990–1999, 3131 times in the years 2000–2009, and more than 5000 times from 2010 up till now. The changing nature of gender rules, families, jobs, and professions is one reason that increases the researchers' attention to the work and family field in recent years (Powell et al. 2019b).

There are three main perspectives about work and family interface: Conflict perspective, Enrichment perspective, and Balance perspective. The conflict perspective may occur in two directions: work-to-family conflict (WFC) and family-to-work conflict (FWC). Likewise, the enrichment perspective emphasizes two routes: work-to-family enrichment (WFE) and family-to-work enrichment (FWE). Contrary to the enrichment and conflict perspectives, work-family balance does not consider a different path for work and family to influence each other (Liao et al. 2018; Li et al. 2017; Allen et al. 2015.

In 1985, Greenhouse and Butel stated that work-family conflict occurs when work and family demands are incompatible (French et al. 2018). They proposed a model that shows three types of a struggle between work and family: time-based, strain-based, and behavior-based (Hoobler et al. 2010; Greenhaus et al. 1989; Greenhous and Beutell 1985).

According to the perspective of Greenhaus and Powell (2006), work and family enrichment means the extent to which experiences in one

role improve the quality of life in the other function (Greenhaus and Powell 2006). For example, in the research of Carlson et al. (2006), [as cited in Zhang et al., 2018, p. 216] one of the participants states: "My work engagement helps me to understand different ideas and be a better member of the family" (Zhang et al. 2018).

Greenhouse and Allen (2011) [as cited in Casper et al., 2018, p.199] define work-family balance as the overall assessment of the individual's satisfaction and effectiveness in work and family roles in proportion to his/her values and life priorities. A Google search for the phrase work-family balance will show more than 320 million (320,000,000) results, indicating that work-family balance is essential but difficult to achieve (Casper et al. 2018).

Research on work and family has developed over the past five decades, and several theoretical models have been proposed (Powell et al. 2019a). Most of the proposed models emphasize the role of resources and demands in creating a conflict between work and family roles. Some other models show how work and family can enrich one another. The rest of the models illustrate work and family balance. The last perspective has been studied considerably less than conflict and enrichment (Hirschi et al. 2019), so achieving work-family balance remains a significant challenge globally, especially in countries like Iran. In the following, while reviewing the models proposed in the work-family interface, some of Iran's work-family balance challenges will be discussed.

## Work-Family Models

Researches have tried to model and explain how employees feel and behave concerning their family and work (Byrne and Canato 2017). The following sections will refer to some work and family models based on three perspectives: Conflict, Enrichment, and Balance.

### Work-Family Conflict Model

The work-family conflict focused on the harmful effects of work and family on each other (Greenhaus and Powell 2003; Kopelman et al. 1983). In 1985, Greenhaus and Beutell proposed a model and suggested three types of work-family conflict caused by time, strain, and behavior.

Figure 1 presents a model of the work-family conflict sources, which is a two-direction model. It means the cause of struggle (time, strain, and behavior) in both areas (work and family) affect the conflict between work and family.

As Fig. 1 illustrates, the first source of work-family conflict is time. Long working hours, inflexible working schedules, and shiftwork are the work-related sources of time, and family-related sources of time are having young children, spouse employment, and large families. The second source of work-family conflict is the strain. On the one hand, work pressures, role ambiguity, role conflict, low levels of leader support in the workplace, etc., cause work-family conflict. On the other hand, family conflict and Low spouse support, etc., cause family-work conflict. Finally, the third source of work-family conflict is behavior. Some expected behaviors in the workplace, such as self-reliance, emotional stability, aggressiveness, and objectivity, may conflict with expected behaviors at home, such as warmth and emotionality. If an individual cannot match two roles' anticipated actions, they will experience a conflict between work and family (Greenhous and Beutell 1985).

Various models have been proposed for the consequences of conflict too. In 2000, Allen et al. divided the consequences of work-family conflict into three categories: work-related, nonwork-related, and stress-related outcomes. As Fig. 2 shows, work-related outcomes include job satisfaction, organizational commitment, turnover, absenteeism, job performance, career satisfaction, and career success. Nonwork-related variables include life satisfaction, relationship or marital satisfaction, family satisfaction, family performance, and leisure satisfaction. Finally, according to the proposed model, stress-related consequences include general psychological health, physical symptoms or somatic complaints, depression, burnout, alcohol, and substance abuse (Allen et al. 2000).

**Work-Life Balance and Its Challenges, Iran, Fig. 1** Work-family conflict model (Greenhous and Beutell 1985)

**Work-Life Balance and Its Challenges, Iran, Fig. 2** The work-family conflict consequences Model (Allen et al. 2000)

## Work-Family Enrichment Model

In addition to the opposing perspective, there is a positive view of the work-family relationship called Work-Family Enrichment. Some researchers have used some concepts like enrichment, positive outcomes, reinforcement, and facilitation in their studies. These concepts show the work-family relationship is not just a simple negative one, but some aspects of work and family can reinforce each other (Zhang et al. 2018; Byrne and Canato 2017; Greenhaus and Powell 2006).

In 2006, Greenhaus and Powell presented a theoretical framework and model for work-family enrichment (Zhang et al. 2018). Figure 3 illustrates how experiences in role A (work or family) can improve the quality of life in Role B (family or work).

As per the Work-Family Enrichment Model, role experiences include five resources (skills, psychological and physical resources, social capital resources, material resources, and flexibility). These resources directly (instrumental path) or indirectly (affective path) improve another role's performance. The experiences gained at home can also create positive affect (such as enthusiasm, alertness, and higher energy) toward family rules. This positive effect on family rules can positively affect work rules (Greenhaus and Powell 2006).

### Work-Family Balance Model

Based on the work-family balance literature, two positive and negative conditions play an essential role in the work-life balance model, including four approaches of balanced role commitment, positive spillover, role conflict, and social alienation (Sirgy and Lee 2016). In 2016, Sirgy and Lee provided an integrated model of work-life balance, including the above four approaches. As per this integrated model shown in Fig. 4, the work-family balance is achieved by reinforcing the two favorable conditions and reducing the two unfavorable conditions' effects.

The proposed integrated model introduces four groups of people who experience work-family balance and life satisfaction differently. These people experience different role commitment levels and positive spillover (the favorable conditions), role conflict, and social alienation (the unfavorable conditions). They categorize individuals as per different work-life balance to fully

**Work-Life Balance and Its Challenges, Iran, Fig. 3** Work-Family Enrichment Model (Greenhaus and Powell 2006)

**Work-Life Balance and Its Challenges, Iran, Fig. 4** Work-Family Balance Model (Sirgy and Lee 2016)

engaged, partially engaged, engaged but conflicted, and disengaged (Sirgy and Lee 2016).

## Work-Family Balance Challenges in Iran

Work-family balance is an essential issue for human resource management as considered by Iranian policymakers also For example, the ninth clause of the administrative system's general policies (2010) refers to achieving work and family balance, emphasizing family stability. There is no doubt about the importance of work-family balance, but the main challenge is how to achieve it.

Unfortunately, the qualitative and exploratory research conducted in Iran in work and family is minimal. Findings from a systematic study by Shockley et al. (2017) show that little research has been done in South Asia, the Middle East, and sub-Saharan Africa. These countries are very different from the countries that have been regularly studied in various studies (European and American countries) in cultural, economic, political, and social indicators. The research findings in other countries cannot be used in Iran without considering these kinds of differences. Therefore, despite the understanding of the importance of work-family balance in Iran by individuals, organizations, and policymakers, there are still many challenges to achieve it. In the following, some of these challenges will be discussed.

### Model Designing and Conceptualization Challenges

Researchers have tried to provide a model for achieving work-family balance (Byrne and Canato 2017). Compared to developed countries, fewer researches have been done in developing countries like the Islamic Republic of Iran (Bonsu 2016).

Casper et al. (2018) believe that the concept of work-life balance is strongly influenced by culture. They studied 290 articles and found 233 different definitions of balance, indicating no agreement on this concept yet (Shockley et al. 2017). According to the interpretive view, an

abstract concept can have different meanings in different cultures and societies. The concepts of work-family balance should be studied in a specific cultural context of Iran. We cannot use the questionnaire of work-family balance, which is derived from qualitative research in other countries and cultures, and it is necessary to examine these concepts considering the different cultural and religious context of Iran.

This issue should be considered about antecedents and consequences of work-life balance too. For example, as discussed in subsection 4.3, life satisfaction is one of the consequences of work-family balance, but when somebody talks about satisfaction, what kind of satisfaction does he/she mean? There are two different approaches to satisfaction: materialist and spiritualist. Islam's view is spiritualist and utterly different from Western cultures and materialistic societies. Also, the family's stability and strength are essential in Islamic societies like Iran. It is necessary to pay attention to the Iranian-Islamic model's characteristics and features in designing the work-family balance model in Iran.

In recent years, major demographic trends in Iran have changed. It is necessary to pay special attention to the change of demographic trends as one of the consequences of work-family balance in Iran. According to the National Organization for Civil Registration report, Iran's fertility rate has decreased rapidly in recent years. Iran's fertility rate is ranked 25th among 26 countries in the region, and it is estimated that in 2045, the population growth of Iran will reach zero. Low fertility may be associated with overwork (Duxbury and Higgins 2001). In recent years, 35% of couples have only one child or no children, indicating a slowdown in population growth. Many Iranian women delay their marriage or childbearing to achieve high employment and career advancement (Registration 2018). We do not know how much the work-family balance has affected demographic trends such as reducing fertility rates and increasing marriage age in Iran, especially in large cities such as Tehran? Therefore, cultural, social, political, and economic differences of Iran with other countries, especially developed countries, should be considered in all aspects of the work-family balance model, including the concept of balance, antecedents, and consequences of balance.

### Cultural Challenges

As discussed, sufficient studies in work and family have not been done in countries like Iran, considering gender equality, cultural values, and norms (Shockley et al. 2017). Iran is in a period of change from traditional to modern society, and it seems necessary to consider cultural backgrounds in this field (Beigi et al. 2016). Of course, in recent years, some researchers have tried to study this issue in developing countries in East Asia and the Persian Gulf (Shah and Barker 2020; Cho et al. 2019; Thakur et al. 2018). However, there is still a need for further study in different cultures and societies, including Iran. Islam has a profound role in all aspects of Iranian life. It is needed to consider the differences between Iran's Islamic culture and western or individualistic cultures regarding family and employment. As mentioned before, the family's stability and strength are essential in Islamic societies like Iran. The Islamic Republic of Iran is always trying to provide a suitable position for women in economic and social activities while maintaining women's dignity and the family's strength according to Islamic principles. Islam agrees with a woman working, but this work should not conflict with women's dignity and their more important roles like wife and mother in the family.

Also, Iran is a multi-ethnic country with different cultures that have different views on women. Therefore, the religious and cultural differences with other countries, even the differences between Iran's ethnicities, should be considered.

### Economic Challenges

Considering economic indicators, Iran is completely different from developed countries, even from many developing countries in the Middle East. In recent years, Iran's economy is impacted by many internal and external challenges.

Also, some worldwide issues like the COVID-19 crisis have impacted the economy and the businesses' nature. These days, with the outbreak

of COVID-19 disease and its aftermath, employees face new challenges in balancing work and family. One of these challenges is working from home during the quarantine period. Employees are often expected to perform work tasks at home, such as answering emails or video conferencing, limiting communication with family. The challenges like COVID-19 and US sanctions have increased unemployment, inflation, and falling Iran's currency, which affect all aspects of Iranian life. Therefore, Iran's economic differences with other countries, especially developed countries, cannot be ignored in designing a work-family balance model.

### Work-Family Balance Policies and Regulations

Governments can help individuals balance their work and life by providing laws and controlling the implementation of regulations. In Iran, there are some general policies and rules in the field of work and family. Some of these policies and regulations are mentioned below.

### Iran's General Policies on Family

All economic and social policies affect families, but the term general family policies usually refer to social programs, policies, and guidelines used to strengthen the family unit and balance work and family. Ayatollah Khamenei, the Supreme Leader of Iran's Islamic Revolution, has announced general family policies (2016). The following are some of the articles on these policies:

- Establishing a family-based society and upgrading and strengthening family and its primary functions based on the Islamic family model as the center for growth and Islamic training of children and a tranquilizing place (Article 1).
- Giving a pivotal standing to family in rules and regulations, plans, executive policies, and all educational, cultural, social, and economic regimes, particularly housing and urban development (Article 2).
- Presenting and sketching out an Islamic model for family and upgrading and spreading the Islamic-Iranian lifestyle (Article 6).
- Improving families' livelihood and economic conditions by empowering them to reduce their future anxieties regarding employment, marriage, and housing (Article 9).
- Supporting the honor and dignity of women's role as spouses, mothers, and housewives and men's role as fathers and breadwinners, educative and spiritual responsibility of men and women, and the empowerment of family members in assuming responsibility, family interactions, and fulfillment of its obligations and tasks (Article 12).

A review of general family policies in Iran shows the importance of family in the planning and public policies of the Islamic Republic of Iran. As mentioned before, the family's stability is essential in Islamic societies like Iran. It is necessary to present an Islamic work-family balance model, considering the Islamic-Iranian lifestyle and family strength. The general family policies (Article 2) clearly state the family should have a special place in the laws and regulations, programs, administrative policies, and all educational, cultural, social, and economic systems of Iran.

General family policies also emphasize improving families' livelihood and economic conditions to reduce their concerns about employment, marriage, and housing (Article 9). As discussed before, many challenges like the US sanctions have increased unemployment, inflation, and falling Iran's currency, which affect all aspects of Iranian life. So the improvement of the family economic situation in current condition requires more detailed and practical laws and programs.

It is also important to mention that in the general policies of the family (Article 12), maintaining the dignity of women and the role of women as wives, mothers, and homemakers in the family have been emphasized. The family and social norms regarding women's role in the family have put too much pressure on working women. It is necessary to examine the situation of employed women in Iran by considering social and cultural norms.

## Women's Rights and Policies

Women's rights have always been discussed in social, economic, and political issues. In the following, the situation of women's rights in Iran, according to some charters and general policies of the Islamic Republic of Iran, will be discussed.

### Women's Rights in Iran Charter of Citizens' Rights

One of the topics of civil rights declared by the President of the Islamic Republic of Iran is women's rights. As the charter's name suggests, the focus is on citizenship rights, but there are also rights specifically for women. This charter includes 120 articles, and approximately 7 articles deal with women's rights. The following are some of the articles related to women's rights in society and the family (Charter on Citizens' Rights 2016):

- Women have the right to have active and effective participation in policymaking, legislation, management, implementation, and supervision, and shall be provided equal social opportunities under Islamic norms (Article 11).
- Women have the right to appropriate job opportunities and pay equal to men for similar work (Article 83).
- Women shall have the right to enjoy healthy nutrition during pregnancy, healthy childbirth, postpartum health care; maternity leave; and medical treatment for common women's diseases (Article 90).

### Charter of Women's Rights and Responsibilities in the Islamic Republic of Iran

The Charter of Women's Rights and Responsibilities in the Islamic Republic of Iran (2004) has been prepared by the Supreme Council of the Cultural Revolution. This charter is based on Islam and Iran's Constitution's principles and explains women's rights and responsibilities in individual, family, and social fields. Some women's rights related to family and work are mentioned below:

- The right to participate in the process of policymaking, lawmaking, management, executive affairs (Article 49).
- The right and responsibility to be informed of and acquire the necessary skills related to home and family management, child-rearing, and effective confrontation against cultural and social ills (Article 71).
- The right to enjoy higher education up to the highest scientific level (Article 77).
- The right to get wages from the husband for doing household chores upon her request and to protection as a result of her effects on the family economy and national revenue (Article 89).
- The right to benefit from wages and equal privileges with men and other women under equal work conditions (Article 104).
- The right to enjoy facilities, rules, and laws consistent with family responsibilities considers that she is a spouse and mother during recruiting, employment, promotions, and retirement (Article 107).
- The right to participate in economic policymaking and the establishment and management of financial institutions and membership in them (Article 109).

There are many general rules and policies considering women's rights like the country's constitution, the Charter of Citizen's Rights, the Charter of Women's Rights and Responsibilities in the Islamic Republic of Iran, and the Law on the Protection of Women's Rights and Responsibilities in Domestic and International Areas. The review of these policies shows that women's rights are always considered in Iran's general guidelines, but there are still some challenges regarding these policies and charters.

One of the most critical challenges is ensuring the implementation of these policies and programs. Applicable rules and facilities do not guarantee existing available systems. Also, most general guidelines are family-related, and there are no specific public policies on work-family balance. Of course, Iran's Labor and Social Security Law provides some family-friendly laws and facilities for individuals, especially working women. For example, the women shall have maternity leave, and all workers shall be entitled to days of vacation with wages in the cases of

Permanent marriage or death of spouse, father, mother, or children. The new ruling was also incorporated in Article 118 of the sixth economic development plan (Head of the Islamic Parliament 2016–2021). Two-week paternity leave for fathers or increasing paid maternity leave from 6 to 9 months for working women. Although general policies include many women's rights, the statistics of gender equality and women's participation in economic, political, and social activities show an unfavorable situation for women in Iran (World Economic Forum 2020).

It is necessary to investigate the contradiction between these policies and the Iranian women's situation compared to other countries. Despite such policies and facilities, women's social and economic participation in Iran is still a great challenge, and there are many gender inequalities in society and organizations. The legal support of the parliament and other government agencies in funding and monitoring the implementation of laws can help enforce these policies and programs.

Also, the role of social norms and cultural stereotypes in the responsibilities expected of women, such as housekeeping and childcare, cannot be ignored. The global reports show that Iranian women's participation in the workforce or parliament is the lowest globally. One of the reasons could be balancing work and family and the pressure of cultural and social norms such as patriarchal culture and traditional gender rules to perform household chores despite being employed. The research findings show that work-family balance challenges have forced many women to give up their job opportunities (Heath 2012).

### Women's Participation Challenges

Global reports show that women's participation in economic activities and managerial jobs is much higher in developed countries as they are more successful in achieving work-life balance. In some states, including Iran, work-life balance challenges have forced many women to quit their jobs (Heath 2012; Toston 2014).

According to the World Economic Organization report in 2020, Iran is one of the six countries with the highest gender gap (World Economic Forum 2020, p.9). The same report shows the rank 140 in 2017 and level 142 in 2018, which indicate that Iran's situation has become worse in recent years (World Economic Forum 2017, p. 11 2018 p. 11). According to the United Nations Development Program report (2018), only 16.8 % of Iranian women participate in economic activities. In comparison, Iranian men's participation is 71.4 %; women's involvement in many developed countries is more than 50 %. For example, in Norway, 60.8 % of women and 67.6 % of men; in Switzerland, 62.9 % and 59.2 % of women participate in Australia's economic activities.

Balancing work and family is one of the most critical challenges women face in their careers and achieving high management positions. These kinds of challenges cause many of them to give up their job opportunities, because work-family conflict is negatively associated with job satisfaction and achieving high job levels (Heath 2012, Hoobler et al. 2010).

Women traditionally experience more challenges balancing work and family because they have more roles to play (Belwal et al. 2020). The findings show that men and women have different work and family experiences (Chen and Powell 2012).

In Iran, women's success or failure in managing work-family balance has always been discussed and considered by policymakers. Still, women-friendly programs and policies are more limited in developing countries like Iran than in developed countries. Indeed, the developed countries' cultural, political, economic, social, and religious conditions are entirely different from Iran. Therefore, it seems necessary to conduct qualitative research considering the specific requirements of Iran.

## Conclusion

As discussed, Researches have tried to model the work-family relationship based on three main perspectives of Conflict, Enrichment, and Balance but still, achieving work-family balance remains a significant challenge in the world, especially in countries like Iran. The developed countries have

increased women's presence in the labor market by providing many work-family programs and facilities. The cultural, political, economic, social, and religious conditions of the developed countries are entirely different from Iran. So the other countries' programs cannot be used in Iran without considering these differences. The programs and models need to adapt to Iranian culture and the situation entirely. Therefore more qualitative and exploratory researches should be conducted in Iran in the work and family field. It is necessary to redefine the concepts, antecedents, and consequences of work-life balance considering Iran's different cultural, political, economic, social, and religious contexts.

There are many challenges in achieving work-family balance in Iran. We have little information about how policies and regulations and the particular political or economic conditions in Iran, like sanctions, can affect an individual's work-family balance.

Cultural and social challenges are the most challenging issues. Demographic trends indicate increasing the age of marriage and reducing the number of children in families. Attention to new topics such as changing the nature of gender roles and the families' structure in the work-family balance seems necessary. It is needed to consider the differences between Iran's diverse ethnicities and religions and the religious and cultural differences of Iran with other countries regarding family, employment, and views on women. In Islamic countries, the family is prioritized in the general beliefs and general policies. Also, maintaining the dignity of women and the role of wives, mothers, and homemakers in the family have been emphasized. The characteristics and features of the Iranian-Islamic model in designing the work-family balance model in Iran should be considered.

A review of most of the regulations and policies shows that women's rights are always considered in Iran's general guidelines. Still, there are some challenges regarding these policies and charters. The most critical challenge is ensuring the implementation of these policies. Also, there are some contradictions between the policies and the situation of women in Iran. Despite such policies, women's participation in Iran is still a great challenge, and there are many gender inequalities in society and organizations. The legal support in funding and monitoring the implementation of laws can help enforce these policies.

Also, the role of social norms and cultural stereotypes in the responsibilities expected of women, such as housekeeping and childcare, cannot be ignored. One of the reasons for women's low participation in Iran could be balancing work and family and the pressure of cultural and social norms such as patriarchal culture and traditional gender rules to perform household chores despite being employed. The general policies of the family and social norms regarding the role of women in the family have put too much pressure on working women. It is necessary to examine the situation of employed women in Iran by considering social and cultural norms.

As mentioned, it is tough to achieve a work-family balance. Also, the challenges and factors affecting balance can vary in different societies and cultures. It was impossible to explain all the challenges in this entry, and more profound exploratory research is needed to discover all aspects. Therefore, the direction of work and family research considering Iran's social and cultural contexts is essential.

# Work-Life Balance and Preferences for Government Employment

Michael C. Moltz
Department of Political Science, Shippensburg University of Pennsylvania,
Shippensburg, PA, USA

## Synonyms

Extrinsic motives; Intrinsic motives; Person-environment fit; Person-organization fit; Public service motivation; Work-family conflict

## Definition

The time devoted to private life and work (professional) demands is a factor influencing the decision of individuals to pursue careers in government, alongside intrinsic and extrinsic motives; employment decisions are also influenced by nation-level characteristics.

## Introduction

Of growing concern among public management practitioners and scholars alike is the ability of governments to attract, select, and retain the most qualified professionals for public service. Mounting evidence indicates that government employment is not an attractive option for younger workers, e.g., millennials. Younger workers tend to value job mobility and are increasingly embracing the "gig" economy, in which their careers are like that of a freelancer or independent contractor. Given that government employment is often more traditional, career based, with the same employer, and not likely to offer significant job mobility, younger generations are apt to seek careers in the private and nonprofit sectors to satisfy their career needs. Combine this generational trend with the warnings from the public management community about decreasing morale among the public sector workforce and increasingly negative public perceptions of government, and it is evident why scholars and practitioners are interested in the employment preferences of those who are currently employed *and* desire employment in the public sector. In short, why are those individuals attracted to public sector employment versus private sector employment?

Existing explanations of government employment preferences include: the perceived fit between the employee and his/her employer, work motives, and various demographic characteristics. Emerging research also indicates the role with which work-life balance may play in attracting individuals to government employment. Moreover, it is likely that country-level characteristics may explain preferences for government employment as well. Each of these explanations is considered in more detail below.

## Public Versus Private Sector Employment

Before addressing various explanations of government employment preferences, it is important to consider the differences between public and private sector employment, for if no differences were to exist, then the preferences for one sector over another are effectively moot. Among the myriad differences between employment in the public and private sector are: (1) job security, (2) hiring and promotion practices, (3) wage and benefits, and, in many circumstances, (4) the nature of the jobs to be performed. Generally speaking, job security is observed to be more prevalent within the public sector than the private sector. Public sector employees benefit from the stability of public employment and tend to have more effective tenure protections than private sector employees (Buurman et al. 2012).

Additionally, the hiring and promotion practices within the public sector appear to be more "career based" than those found within the private sector. Public sector employees can often expect a merit-based civil service system, in which hiring and promotion decisions are made with long-term career relationships in mind. Moreover, the wage and benefits associated with government employment often differ from those found in the private sector. Within the US context, the experience among many state and local government employees suggests that while wages may be less than their private sector counterparts, benefits (e.g., health and welfare) may be more generous. (Bender and Haywood 2010). However, public-private wage differentials (the difference be wages for public and private sector employees) in some European nations may be positively skewed toward the advantage for public sector employees (Bender 1998). Finally, the very nature of many government jobs distinguishes them from the private sector. While jobs in a career field such as information technology clearly exist in both the private and public sectors, there are several jobs that are more or less unique to the public sector, e.g., emergency first responders, social workers (with increasing exceptions being made for the nonprofit sector), or foreign diplomats to name just a few (Bender and Haywood 2010). Given these and other differences, scholars and practitioners appear justified in determining the preferences for government employment versus private sector employment.

## Person-Environment Fit

There are several answers to why an individual may prefer government employment over that in the private sector; many of which have received considerable attention from scholars. Most explanations can be viewed within the person-environment fit framework. Person-environment fit posits that the "fit" between an employee and his/her employment environment is driven by the organization's capacity to meet or satisfy his/her motivations and the degree to which the organization's values are congruent with his/her values. In other words, "can the employer meet the needs of the employee" and "do the employer's values reflect those of the employee?" (Kristof 1996). Within the public management literature, the fit between an employee and his/her employer is often examined through the lens of public service motivation. Public service motivation is the theory that those who work for government do so out of a predisposition to respond to motives that are uniquely grounded within the public sector (Perry and Wise 1990).

Public service motivation is often synonymous with a form of intrinsic motivation. Unlike extrinsic motivation, in which someone undertakes an action in response to external pressures (e.g., the employee performs his/her job in exchange for a promised salary from his/her employer), intrinsic motivation can take one of two primary forms: enjoyment-based intrinsic motivation and obligation-based intrinsic motivation. Enjoyment-based intrinsic motivation is that in which the individual performs a task simply because they enjoy doing so, e.g., a personal hobby. Obligation-based intrinsic motivation is that in which the individual performs a task out of a sense of duty to others. Obligation-based intrinsic motivation most closely describes public service motivation (Frey and Osterloh 2002). Numerous studies indicate that individuals who are said to be public service motivated are driven by a sense of obligation to their communities, to pursue a career which advances the public interest, or out of a general sense of altruism.

However, those who prefer employment with the public sector also respond to extrinsic motives. Notable among the extrinsic motives driving public sector employees is job security. Public sector employees are often more risk averse than private sector employees. They value stability in their employment and a reasonable assurance that they will keep their job. The tenure protections of many civil service systems (as well as the labor protections afforded by many public sector unions) equates to greater job security in the public sector than the private sector. Naturally, risk-averse individuals will prefer the employment

sector offering greater job security, i.e., the public sector (Houston 2000).

Yet, whereas public sector employees value job security, they tend to place a lower value on other extrinsic motives, such as high income. Compared to private sector employees, those who currently work and desire to work in government are generally less driven by high income (Wittmer 1991). This is not to say government employees do not value high income, but that they place less value on high income than their private sector counterparts.

## Demographic Characteristics

Not only do work motives help explain public sector employment preferences, several key demographic characteristics are correlated with a preference for public sector employment. First, it is widely observed that women are more attracted to the public sector than men. The progressive nature of many civil service systems, the leading role that government often plays in advancing gender equality, and the family-friendly policies afforded to public sector employees makes government the employer of choice for women more so than men (Blank 1985).

Similarly, age is arguably correlated with preferences for public sector employment. As indicated earlier, younger generations are decreasingly interested in government employment, due to many possible factors, not least of which may be their preference for job mobility. Older individuals appear to prefer government employment (Lewis and Frank 2002). For example, the job security associated with public sector employment may be more important for older individuals than younger workers.

Equally important is the role that education may have in determining public sector employment preferences. The more years of education an individual has attained, the less likely he/she may be to prefer public sector employment. One possible explanation may be the increased marketability associated with higher education levels or the expected higher earning potential of attaining more years of education (Steijn 2008).

## Work-Life Balance

In the same fashion as work motives and demographic characteristics, work-life balance is likely to explain preferences for government employment. There are numerous definitions of work-life balance, but common among most is the - balance of time devoted to private life activities and work (professional) activities. Work-life balance involves a myriad of different considerations beyond just time commitments to private life and work, including work-family conflict, satisfaction with family life, and, in some circumstances, sleeping hours. Corresponding to this is the theme of stress resulting from work and/or family commitments. The overall conclusion of the work-life balance literature implies that the employee is constantly seeking to balance and rebalance his/her family commitments with his/her demands from work (Warhurst et al. 2008).

When work-life balance is examined within the public sector context, it appears that public sector employees enjoy greater work-life balance than private sector employees. With limited research to date, preliminary conclusions suggest public employees experience less work-family conflict, are able to devote more time to private-life activities, and even experience greater satisfaction with their family lives. Moreover, public sector employees report fewer working hours than their private sector counterparts, perhaps partly contributing to the greater balance between work-family commitments found among public sector employees (Buelens and Van den Broeck 2007).

Other recent findings indicate those who prefer government employment are less likely to value spending time in private life activities, such as with friends or in leisure activities. While this may seem contradictory to the overall implication that public employees value and enjoy greater work-life balance than their private sector counterparts, the findings may speak more to the self-sacrifice dimension often attributed to public sector employment (as mentioned within the public service motivation research stream) (Moltz 2019). Overall, the conclusion drawn

about work-life balance and public sector employment indicates that the public sector likely affords employees greater balance between work and family commitments, resulting from such factors as fewer working hours and more family-friendly policies.

## Country-Level Considerations

The above explanations of public sector employment preferences address individual-level characteristics, that is to say, these are factors associated with the individual employees themselves. However, there is growing interest within the public administration scholarly community about cross-national analysis or comparative public administration, and the role in which country-level attributes may explain important trends in the practice of public management.

There is an attempt by scholars to explain the differences in public sector employment preferences across countries. The general conclusion is that some country-level characteristics may indeed explain public sector employment preferences. First, scholars distinguish between two types of internal labor market conditions: position-based and career-based labor markets. Position-based labor markets are those in which an organization's external recruitment of candidates is very common, among most career levels within the organization. For example, external applicants are given equal consideration with internal applicants for a management position. Conversely, career-based labor markets are characterized by a long-term career relationship, in which career decisions are largely decided by the organization and entry into the organization is mostly limited to entry-level positions, i.e., the candidate enters the organization early in his/her career and remains with the organization for the duration. Within the career-based system, there is little opportunity for outside applicants to compete for jobs beyond entry-level positions. Career-based systems are also characterized by greater job security for existing employees (Van de Walle et al. 2015).

Comparative analysis indicates public sector employment is more attractive in nations with career-based systems as opposed to nations with position-based labor market. This finding corresponds with the existing narrative suggesting that public sector employees value job security and its associated benefits more so than private sector employees. Additionally, external labor market conditions also help explain public sector employment preferences. External labor markets can be measured in terms of Gross Domestic Product (GDP), unemployment rates, and inflation, to name a few indicators. Limited, but growing, evidence suggests external labor market conditions may help explain public sector employment preferences across countries, in particular GDP and unemployment rates. However, the scholarly results are too disparate to draw any solid generalizable conclusions regarding the significance and direction of these relationships from one country to the next.

## Conclusion

Why would an individual choose to work in the public sector versus the private sector? The answer is a complicated mixture of personal characteristics and country-level factors. Those who are attracted to government employment appear to respond to a combination of intrinsic and extrinsic motives. They are driven by a desire for job security and the associated benefits that are afforded by such labor market protections. At the same time, they want to work for an organization in which they can satisfy their public-service-related motives. They have a desire to serve the public interest and respond to a general sense of altruism. To further complicate the hiring process for public managers is the general conclusion that public employees are less apt to respond to higher pay than their private sector counterparts.

Furthermore, there is growing evidence to suggest that work-life balance plays a significant role in the preference for public sector employment among current and potential public servants. Public sector careers are characterized as having greater balance between work and family

commitments. At the same time, those who desire greater work-life balance are less likely to prefer employment with the public sector. This latter finding suggests the self-sacrifice dimension of public service may outweigh the desire for work-life balance among prospective public servants.

Moreover, employment preferences are driven by a need and desire on behalf of the employee to "fit" with his/her employment environment. The employee seeks both a job and an organization, which are congruent with his/her values and motives. Public management reforms touting higher pay and more competitive hiring practices are not likely to result in attracting those employees who fit best with public service, given the complicated mixture of intrinsic and extrinsic motives driving many public sector employees.

Additionally, increasing evidence suggests that country-level characteristics influence employment decisions and help explain differences in employment preferences across countries. It is likely that a country's civil service system explains attraction to public sector employment. Government is likely to be the employer of choice in countries with career-based civil service systems. It may also be likely that national economic conditions provide additional explanations for employment sector preferences.

In order to attract, select, and retain the most qualified professionals for public service, public managers need to identify and satisfy the needs of those individuals attracted to public employment. At the same time, public managers should remain cognizant of societal trends and country-level attributes and the effect these may have on human resource practices.

# Work-Life Communication in Nonprofit Organizations

Erika L. Kirby
Creighton University, Omaha, NE, USA

## Synonyms

Work-life balance

## Definition

**Work-Life Communication**: Creating shared meaning(s) about working life and personal life – as well as programs and policies to create "work-life balance" – in the workspace, homespace, and beyond.

A 2021 Google scholar search of "'work-life communication' and 'nonprofit'" yielded only 23 results. Yet multiple scholarly and popular press sources *allude* to ways that communicating about working and personal life may be different in nonprofit organizations (See Kirby 2015; Kirby and Buzzanell 2014; Kirby and Krone 2002, Kirby et al. 2013). Work-life discourses exist at the macrosocietal, organizational, relational, and intraindividual levels and are studied by scholars across multiple disciplines. These levels are used as an organizing framework, highlighting areas where the nonprofit context might have special influence. Many of these examples emerge from the United States context, where the access to governmental support for work-life balance is minimal; in nation-states with a more communal orientation and different governmental policies related to leave, etc., these outcomes may play out differently.

## Macrosocietal Discourses

Macrosocietal discourses about working and personal life emerge from economic systems, political landscapes, gender ideologies, cultural values and attitudes, history, and governmental support and legislation to influence enablements and constraints surrounding work-life balance. As one example, capitalism contributes to these discourses: my daughter was told if she was going to work in the nonprofit sector to "marry rich or you'll have to change your standards of living."

Political landscapes also shape the possibilities for work-life: globally, parental leave policies can be generous like in Finland, where starting in 2021, both parents are entitled to parental leave of 164 days each, and 26 of these weeks are paid out at 70 % of the employee's salary. In contrast, the USA is the only country classified by the World Bank as high income that does not have paid maternity leave; the only standardized work-life policy is the Family Medical Leave Act (FMLA) of 1993 which guarantees leave for "eligible" employees but not all US employees as it is based on size of the organization (50 employees within a 75-mile radius), length of time with employer (at least 12 months), and hours worked in the past year (at least 1250).

Another macrosocietal discourse impacting work-life communication emerges from gendered norms and ideologies that reify expectations of men in public life (the occupational sphere) as breadwinners and women in private life (the family-domestic sphere) as caregivers. Although social norms are evolving, COVID-19 illustrated women are still primarily responsible for domestic labor and childcare, as well as and low-paid care for others in need, based on motherhood norms. Gendered discourses socialize women (and men) into "appropriate" forms of careers, and women are often socialized into "caring" nonprofit work: the nonprofit sector has a large percentage of female workers (Park and Word 2012).

Thinking about Western cultural values and attitudes, one trajectory of work-life communication scholarship examines how "ideal workers" are reproduced through norms rewarding long hours and always saying "yes" to additional work responsibilities. These norms become even more precarious when coupled with the notion that nonprofit work is "inherently meaningful" and that people are "called" to work for social causes. Discourses in popular culture about choosing nonprofit work often celebrate a

"troubling account" of work-life balance (see Dempsey and Sanders 2010). Their analysis of autobiographies of nonprofit founders illustrates how portrayals of meaningful work hinge upon extreme self-sacrifice: their devotion to their work (including spending endless hours at work) comes at the expense of their physical and emotional well-being and their family life. The utilization of "calling" as a grounding discourse can help naturalize and justify a reliance on unpaid volunteer labor and the payment of survival wages within the nonprofit sector.

Employees in the nonprofit sector are often attracted to the job through their identification with an organization's social and humane mission (see Wang 2021). Indeed, Commongood Careers found that 84 % of nonprofit jobseekers saw work as part of their identities, not just a way to make a living. Many nonprofit theorists posit that prosocial behaviors and wanting to work "for the common good" in respected organizations play a role in motivation of nonprofit employees – who are less motivated by extrinsic rewards – which has been used to explain long-standing pay gaps that persist in the sector (see Park and Word 2012). Research cited in Wang (2021) shows that nonprofit employees tend to be overworked yet underpaid and that the nonprofit sector had a high turnover rate and lower employee satisfaction than other sectors – perhaps because of this expectation of overwork for a cause.

## Organizational Discourses

Work-life communication exists at the organizational level in considering how organizational policies and culture suggest that employees – or in the case of nonprofits, also volunteers – should enact their working and personal lives. Thinking about organizational work-life *culture*, individuals considering entering the nonprofit world are encouraged during anticipatory socialization to seek out work that is personally meaningful which prioritizes the importance of work and creates perceptions that sacrifice is worthwhile as a part of the job (Riforgiate and Kramer 2021). When available, organizational work-life *policies* typically include (a) wellness programs, (b) leave policies (that may be more generous than governmental policies), (c) flexible or alternative work arrangements, and/or (d) "family friendly" benefits to assist with caregiving responsibilities and adoption assistance. Organizations can also offer training programs and workshops to help employees with stress and other workplace and work-life issues (Riforgiate and Kramer 2021). Yet since organizations offer work-life benefits on a voluntary basis unless mandated by governments, access and availability is uneven.

Work-life communication scholars have also noted the difference between policies being available and policies being usable, as work-life benefits are sometimes "added on" rather treated as mainstream, usable policies. Policies are interpreted and implemented by supervisors, and policy use is influenced by coworkers and the "culture" related to work-life. Facets of work-life culture include: organizational time demands, perceived career consequences for using work-life initiatives, formal and informal managerial support regarding work-life, the degree of social support, whether the work climate allows for sharing "personal" concerns, whether the work climate encourages employees to make personal-life related sacrifices to support work, the degree to which workplace norms support the integration or segmentation of work and personal life, and the degree to which an organization values roles outside of paid work.

Nonprofit managers are much more motivated by benefits to help them achieve work-life balance (Park and Word 2012). The limited salary budgets of nonprofits may "force" them to more widely adopt work-life initiatives to attract and retain talented workers. And at the organizational level, nonprofit organizations have an additional "layer" of complexity of work-life concerns as they not only employ staff, but often also rely on volunteers for organizational success (see intraindividual section).

## Relational Discourses

Talking with partners, family members, and friends about work and career – and talking with

coworkers and supervisors about personal life – impacts both the working and personal life domains, leading to greater work satisfaction, higher work functioning, higher satisfaction with home and family activities, and more functional families. In nonprofits, where the nature of the work can lead to conditions to higher stress and burnout, the relational level takes on additional significance as support and guidance from others in the nonprofit emphasizing self-care can especially help newer employees acclimate (Riforgiate and Kramer 2021).

In the workplace, supportive relationships are critical social resources: when supervisors or coworkers are not supportive of an individual's efforts at work-life balance, work-life conflict is increased. Supervisors influence how well their employees are able to balance work and life roles (and whether they can utilize policy), and supervisory-employee relationships also operate within the influences of macrodiscourses of ideal worker norms and gendered expectations. Workers with "life" supportive supervisors have greater use of flexible hours and family leave, enhanced job performance, increased job satisfaction, decreased work-life conflict, and increased career and overall life satisfaction.

Coworker relationships can also be a source of social support in negotiating working and personal life – talking with coworkers about family and personal life leads to greater work satisfaction and higher work functioning as well as higher satisfaction with family activities. Coworkers can provide emotional support to peers seeking affirmation and assurance through listening, empathizing, and giving advice; they can also provide instrumental support by covering for a coworker who leaves early due to family issues. Research shows coworkers' emotional support impacts overall emotional exhaustion, as "venting" among peers is seen as a catharsis. This is especially the case in nonprofit work, where client confidentiality, etc., may make it impossible to discuss stressful matters outside of the bubble of coworkers. Yet even as coworkers can positively impact work-life, they can also pressure peers *not* to take advantage of available policies by communicating negatively about those who used benefits.

In the "lifespace," family and friends outside of work provide individuals with coping resources, and their social support can have positive effects on a range of physical and psychological outcomes. Family climate – the extent to which the family unit is sympathetic to members' work-life balance choices and needs – decreases work-life conflict. Partner support influences stress prevention and overall well-being – it impacts marital quality, relationship satisfaction, and family satisfaction, and a key finding is that partner social support is more effective in *preventing* work-life conflict than alleviating it once it occurs (see Friedman and Greenhaus 2000). Thinking about how the nonprofit context might mitigate any of these relational situations, the notion of "calling" again emerges as a discursive resource in nonprofit work. For example, supervisors and coworkers might pressure an employee to reduce their requested family leave because "we need you here to do the good work" . . . and that same employee may in turn use that discourse with their family as to why they are indeed reducing their family leave.

## Intraindividual Discourses

Issues of work-life exist at the intraindividual level in terms of whether individuals feel "balanced"; this level may be particularly important in nonprofits given that the work can often be more stressful and prone to burnout. Work-life communication research has examined how individuals strive for balance on an ongoing basis by constructing "boundaries" (or not) between their working and personal lives, which may also include the role of volunteer in third spaces. Popular discourse surrounding nonprofits and work-life balance often implies how nonprofit employees have very blurry lines between their personal lives and work. Individuals create diverse boundaries – that can be physical, psychological, or emotional – between work and personal life that vary along a continuum from segmented to integrated. Segmentation occurs

when individuals erect mental boundaries around their identities or realms of experience to "bound" the context; integration occurs when individuals do not differentiate between roles, but behave similarly regardless of work or personal life context (see Cruz and Meisenbach 2018).

This in turn impacts "boundary work" – the ongoing process through which individuals create, manage, transform, and transcend boundaries between work and life (see Trefalt 2013). Communication scholars have called attention to the fundamentally discursive nature of boundary construction. Recent work related to "boundaries" and nonprofits examines how individuals who volunteer communicatively manage their role interfaces (Cruz and Meisenbach 2018). They found the most common frame and means of managing the volunteer role was to segment and view it as separate from working and personal life roles. While they also saw participant discourse describing integration, looking at volunteer as a role separate from working or personal life gave glimpses of what they called "boundary collapsing" where the individual removes the boundaries between roles both physically and in their talk, enacting both roles at once. This may lead to "role fusion collapsing" where individuals use more than one role to pursue their social justice values – they could advocate in both the volunteer role and work organization.

Another strand of this research related to how individuals strive for balance on an ongoing basis looks at routines and practical actions. Individuals utilize multiple strategies to try to achieve work-life balance (see Higgins et al. 2010). *Active* coping techniques cognitively reduce sources of work-life conflict through prioritizing, scheduling, organizing, planning, and delegating commitments. Individuals who utilize *avoidance* coping techniques try to forget about the stress or conflict by finding another activity to take their mind off stressors. *Reactive* coping techniques focus on alleviating the symptoms of stress rather than the source of stress itself, often through using drugs or alcohol. A final strategy is to seek *social support* by talking to or seeking help from colleagues, family, and (or) friends (see relational section). Most popular press sources of discourse about work-life and nonprofits land at this level, prescribing how individuals in nonprofit jobs should work to "balance" working and personal life to avoid the burnout that can be typical in nonprofit work, such as keeping time logs, setting boundaries, learning to say no, etc.

Finally, since nonprofit employees see their identity as entwined with work, scholars have studied how this operates. Self-identities regarding paid work emerge out of the interplay of identity work, which are individuals' efforts to portray a positive and distinctive identity, and identity regulation, the ways that organizational and social practices shape the process of identity construction (Wieland 2010). Identity construction as a normative activity through which socially acceptable ideals of who one should be as an "ideal nonprofit worker" are woven into an individual's understanding of who they are (see Macro-societal section).

## Conclusion

Employees in nonprofits receive multiple messages concerning work-life balance that may be contradictory. Even if other organizational members encourage them to maintain work-life balance to take care of themselves, the structure, nature, and communication of "the work" can create obstacles to maintaining work-life balance for those serving clients (Riforgiate and Kramer 2021). Macrosocietal discourses of "calling" and mission in nonprofits may create expectations of overwork for a cause. Consequently, at the organizational level, employees in nonprofits are much more motivated by benefits to help achieve work-life balance. The increased potential for burnout in nonprofits intensifies the importance of relational discourses. At the intraindividual level, setting boundaries has increased significance, especially for those in volunteer roles, and the notion that nonprofit employees see their identities as entwined with work "circles back" to the macro-level discourse of calling. As illustrated, work-life communication across levels has unique implications when applying the context of nonprofit organizing and its implicit ties to the common good.

# Work-Life Programs

Charlene M. L. Roach
Department of Political Science, Faculty of Social Sciences, The University of the West Indies, St. Augustine Campus, St. Augustine, Trinidad and Tobago

## Synonyms

Family friendly programs; Reconciling employment with family life; Work and family benefits; Work-life balance; Work-life benefits; Work-life compatible benefits

## Brief Definition or Concept Description of Work-Life Programs

Work-life programs is a concept that has evolved to include the challenges men and women encounter in harmonizing paid work with other components of their lives. The term work-life programs is linked with more humane approaches in contemporary societies to engage all categories of employees as a result of the challenges they experience to synchronize paid work activities and those that fall outside of paid work (Berg et al. 2014).

## Introduction

This chapter focuses on the range of work-life programs that are designed to address the multifaceted needs of employees to balance their work and personal lives. It highlights the significance of these programs in light of the historical changes in the landscape of work. It examines their impacts on many levels and discusses some strategies for successful implementation. There are lessons to learn as organizations and employers forge ahead into the future.

## Looking Back and Surveying the Past

Twenty-first century employees' profiles project shifts and diversions of traditional employees of earlier centuries. These include a wide range of conditions from friendly, family-oriented worksites to hostile, brutal masters ruling over slaves, serfs, and indentured servants.

Even more so, work-life programs were inconceivable for the period of industrialization. Factories were the work environment where efficiency and increased output preoccupied the workers' task masters. Metaphorically, employees were treated like machines and cogs in a wheel. Therefore, humanizing the work environment with programs such as family-oriented, flexible work schedules and other benefits to help alleviate the drudgery of the intensive factories were ludicrous.

Work-life programs are creatures of our contemporary era. More employers are realizing that work-life programs need to be created to address the complex needs of their workforce. By so doing, employees will be able to pursue their personal lives with critical and legitimate concerns, while at the same time contributing to their professional and work lives which are demanding.

Work-life programs or work-life balance is a more fitting description of a term that has evolved to be inclusive of the challenges men and women encounter in harmonizing paid work with other components of their lives. Initially, terms such as family friendly or work family benefits were used, but these were narrow and excluded individuals in the workforce such as those who are single, childless, have no care-giving roles/responsibilities, and/or performed unpaid work in many informal settings (Chandra 2012; Gambles et al. 2006).

Although work life or work-life balance programs are broader and inclusive, there is still debate how this phenomenon should be conceptualized. Some scholars perceive it as an oxymoron. According to them, work-life balance or work-life programs seem to infer that work is not part of life. Balance also implies a compromise yet work and life are equally important and are not diametrically opposed. According to these authors it may be misleading since it overlooks the differences between paid and unpaid work, and both are important and serve valuable roles.

Therefore, these contemporary terms signal fundamental shifts to earlier terminologies and applications which were limited, narrow, and misleading. A change to newer terminologies came as a result of conscientious attempts to provide a richer description of what this phenomenon measures. It captures not just the issues married men and women experience but those who may be single, childless, and having other caring responsibilities or roles or no caring roles or commitments. Therefore, the term work-life programs or work-life benefits or balance is associated with more humane approaches in contemporary societies to engage all categories of employees as a result of the challenges they experience to synchronize paid work activities and those that fall outside of paid work (Berg et al. 2014).

### Significance and Benefits of Work-Life Programs

This topic is significant as it brings to the fore critical needs of contemporary workers, organizations, and societies. There seems in today's world for people to have such "busyness" and perceptions of inadequate time for leisure, rest, personal relationships, and other personal pursuits. So many employees experience burn out, stress, and fatigue due to overwork and intensely pressured workloads on their jobs. Their activities, demands, pressures, commitments, roles, and whatever else comes with being on the job are part of their lives, and combining other parts of

their lives' activities with work are major challenges of our modern day experiences.

Initially, organizations saw work-life programs as a critical response to more females in the workforce which helped to boost employee satisfaction (Carell 2007). Statistics from the Bureau of Labor Statistics indicated that women and, more so, mothers showed an overall increase since the early 2000s, with three quarters of them being among those listed to include more women who are married with children than singles with the same (U.S. Bureau of Labor Statistics 2002).

Later, these programs became more relevant to the growing need for cafeteria style benefits for a multigenerational workforce. The younger generation is more interested in family and lifestyle issues. One study reinforced this variation by generations, highlighting 50% of Generation Y and 52% of Generation X versus 41% of Baby Boomers had this interest. Hence, this shows a deviation from previous generations and periods of times (Family and Work Institute 2005).

Diversity in the workforce also reflects these variations in preferences about work and life interests. These are then translated to reflect employees' concerns about their benefits. Hence, public organizations should aim to attract prospective employees who would be retained, and in order to do this, they must offer a variety of benefits to accommodate for their changing needs and other pursuits in their lives.

Subsequently, work-life programs have the capacity to provide benefits to employees, employers, societies, and communities. Essentially, these programs seek to provide, as discussed already, balance between employees' professional and personal activities by managing the changing stressors they face on both sides. Empirical research has indicated that a positive correlation exists between work-life programs and job satisfaction, and programs can be used as predictors for job satisfaction (Giancola 2013).

Additional benefits on macro and micro levels relate to employers observing positive organizational impacts as there is greater productivity, and employees also demonstrate on individual and group levels positive behavioral changes. In short, employees are able to perceive through these programs that organizations support their need for balance in their personal and professional lives, thereby reducing stressors from these challenges. Research also supports positive effects on employee retention and motivation. These can be counted as organizational benefits, hence a symbiotic effect for organizations and employees. They reflect other positive behaviors as greater commitment and loyalty to their organizations.

Managers also gain as they become more caring, compassionate, and empathetic to their employees' needs. On the flip side, employees go above and beyond their prescribed behaviors in terms of performing their duties and responsibilities. They also avoid or minimize proscribed behaviors such as absenteeism and tardiness. Managers in turn also impact their own personal lives at home: they become more effective leaders; develop a repertoire of skills and competencies for work; and overall improvements in their attitudes, demeanors, and performance.

## Analysis of Work-Life Benefits Programs

One cannot deny the numerous benefits that can be gleaned from work-life programs across the board and from multiple levels of analysis. This section attempts to examine and analyze the dimensions of work-life programs that exist. They are not exhaustive but attempt to identify the major ones discussed in the literature. They include as follows: flexible work schedules or work-life flexibility practices, dependent care programs, wellness programs, employee assistance programs, domestic partner programs, career development programs, and any other programs that may not fall under those listed earlier.

**Flexible working schedules or work-life flexibility practices** are not recent innovations and share a history where organizations have used them for particular occupations (e.g., police officers and firefighters), careers, and persons. They can be described as policies and practices that are designed to facilitate adjustments to employees' preferences to change their work schedules or arrangements whenever, wherever, and however needed in order to balance their paid work and

nonwork commitments. There are many reasons for their flexibility from personal prerogatives, cost efficiency concerns, environmental, traffic, and others.

Contemporary organizations have expanded the use of flexible work-life practices due to the increase of more women in the workforce, dual-career couples, and individuals with care giving roles and single parent families. Other flexibility needs arise as a result of industry needs such as for professionals (e.g., managers, technical, and sales). There are individuals who have personal flexibility needs, pursuits, or responsibilities. Examples are those engaged in volunteerism, charity work, seasonal employment, and personal or family concerns. For the latter, flexibility concerns may arise unexpectedly such as a terminal illness of a significant other or a short-term issue as a personal emergency or crisis.

Characteristics of flexibility work practices allow employees scope for selection and management of their schedules. Employees are able to select their start and end times for work, day-to-day flexibility schedules, compressed workweeks or schedules, and or part-time (e.g., job sharing) or shorter/reduced time schedules. Job sharing occurs frequently with part time work and entails two or more individuals who are sharing one position, with different schedules, hours, and times in order to complete a work period and days scheduled. Seasonal workers such as those employed in agriculture, landscaping, life guards, and the like are employed for a short season or period of time as work is needed for these jobs at specific times. Telework is also a flexible work practice where employees work from home or another location outside of their workplace. Telework assists employees to meet their personal needs by reducing times spent traveling to and from work; allows for convenience and flexibility in their schedules. Employers also gain as employees tend to be more motivated, empowered, and productive, thereby enhancing organizational goals and objectives while exercising boundary management techniques. Some studies report at least 10% to as much as 30% productivity increases. Therefore, for varied reasons flexibility work practices are very attractive to employers and employees alike since each of their needs may be fulfilled. At the organizational level the literature details the benefits that adoption of work flexibility programs provide for organizations and impacts on their determinants such as economic efficiencies and effectiveness (Cayer and Roach 2008). However, there are challenges within flexible work schedules and these will be covered under Challenges to Adoption, Access, and Usage.

**Dependent Care Programs** are categories of work-life programs that cater for employees who have children and or elderly care responsibilities and desire to maintain balance to their roles at work and in their personal lives. An absence of this kind of support can create negative impacts on employees in terms of their outputs, efforts, motivation, ability to focus at work, and overall increased stress due to these perennial parental and childcare responsibilities outside of work. Employers can also be badly affected by employees' absences, sick leave, distractions from work, attrition rates, stress, fatigue, and other related conditions or behaviors.

Therefore, with the adoption of dependent care in many organizations, existing employers may get more from their employees as they perceive such programs positively, as proactive strategies to recruit and retain talented employees. As seen with flexible work practices, both parties benefit and also persons in the employees' immediate households. In fact, a federal government survey forecasted that 54% of employees had dependent care needs and that about 19% would expect this need to be fulfilled in the near future (U.S. Government Accountability Office 2007). An emerging issue to consider is HIV/AIDS. In some countries where the rates of those infected are growing (e.g., South Africa) dependent care programs should address employees' needs who give care to significant others and those who are infected with the disease.

These dependent care programs can take the form of low cost or no cost and direct costs to the employers. One study in 2002 alleged that approximately one third to a half of employers offered the no costs or low cost programs, with 45% of the same actually providing them.

Employees may also gain in receiving tax exemptions as much as $5000 for childcare expenses. Fewer provided (7%) direct cost childcare within the workplace or nearby. In the same study, one third of the employers provided resources and referrals for childcare. Similarly, those who had teens in the same study, only 7% of employers with 50 or more employees, provided such programs to them. When it came to elder care, the same study reported more supervisors (79%) as representatives of employers had offered employees time off with no adverse effects on salaries (Bond et al. 2005).

Additionally, employers made resources available or referrals for eldercare. Examples include adding a family member to the healthcare insurance plan and geriatric care and management in coordinating these services. Others provided group rates for long-term insurance care insurance coverage and day care for the elderly. Conversely, countries in Europe are way ahead of the USA in terms of their practices. They tend to have more proactive approaches such as educational and sensitivity programs to enlighten persons of the diverse options available to them – wellness, promotion of best practices, and care facilities. A good example is Sweden where the government promotes educational awareness of the impact of fathers in childrearing and their benefits. Similarly, they are very supportive of parents taking more active roles in their children's lives. Leave is given to parents with sick children between 12 and 16 years. Men and women also enjoy 120 benefit days per year and 7 days for a child annually. Overall, these programs help to support strong family units although they can be expensive in the long run. Hence, in the USA it is not uncommon to see states create consortia to provide child and elder care and set up fee systems where services can be accessed at a nominal fee. These are ways to enable costs to be managed effectively. Bureaucracies and organizations take more advantage of consortia such as Internal Revenue Services and IBM and Citigroup (Todd 2004).

**Wellness Programs** strive to project well-balanced and healthy lifestyles for all employees. One possible rationale is that a healthy employee will be a productive employee. There will be compelling benefits for organizations in terms of less claims on health care or medicals; preventative strategies in terms of an increase in attendance and regularity; and a decrease in absenteeism, sick leave, and other leave that may have medical implications such as stress, fatigue, or depression.

Additionally, empirical studies reinforce other positive outcomes like high returns on their employees' investments. An example cited is Citibank which claimed about nine million savings in healthcare benefits by instituting a wellness program which was estimated to cost approximately two million (Ozminkowsi et al. 1999). It is also preventative. Programs institute exercise and on-site and off-site gym activities, nutritionist programs, consultations, and informational sessions. Many US universities such as Arizona State University have created student recreational centers, Olympic size swimming pools, weight training rooms, indoor basketball and track for jogging, tennis courts, massage therapy, yoga, pilates, and meditational approaches and other elaborate wellness programs, activities, and classes for students, faculty, and administrative and support staff (Arizona State University 2016).

The philosophy behind wellness programs is to cater for the entire person's wellbeing – i.e., body, mind, and soul – which is holistic in order to cultivate a healthy lifestyle. They orient preventative stress management programs that incorporate a tier system of prevention. Primary prevention identifies the stressors or health risk factors. Secondary prevention is geared towards directing strategies to manage them effectively. Tertiary prevention is where efforts are focused on healing persons from the effects of distress and strain. Some organizations make it like a cafeteria style where persons can select accordingly based on their physical and health needs. Other places like in Florida, Sarasota, employees' fitness targets are built around leave incentive programs where they can earn as much as six leave days per annum.

Wellness programs also include health screenings, medical testing, and other forms of preventative strategies. In fact, studies have shown that 25% of healthcare sunk costs are directly related

to at least 10 risk health factors that can be managed or minimized via wellness programs, such as hypertension, diabetes, and smoking and its ill impacts and obesity (Cayer and Roach 2008).

**Employee Assistance Programs (EAPs)** just as the title suggests provide assistance to employees with personal issues when they conflict with their work roles and demands. The content of EAPs may appear eclectic since they reflect difficulties that employees encounter in balancing their lives and work. Some major ones from the literature are drug abuse management approaches, testing; counseling for areas of family, spousal and children issues; and managing personal relationships. They provide financial and legal advice. Terrorism being a contemporary problem in our societies, EAPs are prepared to treat employees who experience traumatic situations such as 9/11 terrorist attacks, violence in the workplace and harassment, and a whole range of other coping and interventionist strategies and activities that a twenty-first century employee would need to survive in their workforces and societies. A corollary to wellness programs, EAPs can address stress management and prevention. By so doing, these help to mitigate health threats and manage risky behaviors that may be harmful to employees to the extent of causing them physical, emotional, and psychological damage or injury.

**Domestic Partner Programs** are now being incorporated into work-life balance programs. They create debate and intrigue especially since they represent a contemporary issue in the work place of sexual orientation. The idea behind these programs is to allow for inclusiveness of groups that may not have been defined traditionally such as gays, lesbians, and transgender groups. They aim to provide similar or comparable benefits to heterosexual monogamous relationships between a man and a woman with these latter orientations. The rationale is to provide equity to those parties who would not be eligible for these benefits under previous Human Resource Management policies.

State laws and organizations including private and public are divided over this issue of domestic partner benefits. There is a lack of consensus on the precise description or definition of a domestic partner. One thing remains salient is that in contemporary settings there is an increasing development of couples (same sex and opposite sex) who are choosing to cohabitate versus marry. Other trends today are same sex marriages, alternative family structures versus the nuclear or extended families of earlier centuries. These shifts and diversions make these programs relevant in order to meet the needs of a changing society.

Statistics across states highlight the growing pattern for coverage although it is still not in a majority. According to the Human Rights Campaign Fund, in 2007, about 9375 employers of which 8657 were from the private sector, provided domestic partner health benefits. This is noteworthy since among benefits health is the most common for all employees (2007). Yet, the federal government does not offer such benefits.

Similarly, 145 city and county governments, 13 states, and 303 universities and colleges provided such benefits to their employees. Parallel to this among cities in California, government contractors are mandated to provide similar benefits afforded to heterosexual married couples to homosexual couples. Cost is a major concern; studies have shown costs do not increase substantially with this added benefit (less than 1% between 0% and 5%). Just as other work-life programs help in contemporary settings, the existence of these program and the benefits that employees can gain from them such as satisfaction at work and equity demonstrates an effort to address issues of marginalization of groups who contribute to the national economy (Cayer and Roach 2008).

**Career Development Programs** can be seen as an extension of activities of training and development and performance management which are critical human resource management functions. Everyone gains especially when activities are effectively streamlined to match the strategic plans of organizations through good Human Resource Management (HRM) planning. Employees are able with the assistance of their organizations (supervisors in particular) to develop goals to channel their energies in achieving their professional and personal goals and organizations' strategic priorities.

Training focuses on improving employees' immediate needs in performing their jobs such as gaps in their knowledge, skills, abilities, attitudes, and other characteristics. Development hones in on employees' preparation for their careers. This ensures that succession planning occurs smoothly. For instance, when vacancies occur, employees would have had adequate preparation in the past to perform them through advancement and growth opportunities, enabling them to be equipped for promotion to challenging roles in the future.

Other components of career development include mentoring, learning, coaching, cross training, educational preparation, buddy systems, college and university training centers, external consultants, nonprofit organizations, government agencies, shadowing of role models, special assignments, acting, job rotation programs, and on-the-job training. Flexible work schedule practices may be incorporated and this can improve employees' opportunities at various stages of their career development to balance with personal life circumstances to secure these opportunities for their future promotions and advancement. For instance, research universities such as Arizona State University (ASU) have created adjustable tenure track programs to allow women of child-bearing age the flexibility to give birth and resume their careers without hindering their retention. Hence, these programs are integrated into ASU's HRM functions to ensure that candidates who are recruited and selected are retained; programs are designed to assist their performance; compensation and benefits are restructured to accommodate for work-life balance practices (Arizona State University 2016).

Finally, retirement and voluntary separation are aspects of career development programs. Organizations need to prepare employees for that final phase in their careers. This is where work-life programs can assist in making flexible working schedules available: job sharing, shorter work weeks, phased retirement, and part time work arrangements as possible options. These programs assist other employees who may have to learn their roles and perform similar responsibilities. They may also help in succession planning. There will be effective transitioning of employees into their new roles of preretirement employees. Overall, employees at retirement age will be prepared for permanent retirement where they see that there is quality life beyond the world of work through counseling, consultations, and financial and legal advice.

**Other Work-Life Programs** include activities that may not fall under those previously discussed. Employers today may use, as stated earlier, a cafeteria style approach to access and implement these benefits. Some that are noted are group life insurance, medical, and health coverages. In terms of group life coverages, employers may cover a fixed rate of agreement and then employees could pay their fixed premiums or increase to more if desired. Universities in Arizona provide benefits such as life insurance policies which are comparable to their employees' yearly salaries with the latter having the discretion to increase to more if they prefer. Other programs cover vehicular and home insurances. These may be given at attractive rates that are affordable to employees given the group coverage rates. These agreements are made with the respective insurance companies and employers on behalf of their employees on reduced rates.

Recognition and reward are contemporary strategies used to enhance employees' motivation, performance, and productivity. Like other work-life programs this can be mutually beneficial to employers and employees; the latter's high morale, job satisfaction, and motivation can impact their engagement and commitment to their organizations (i.e., employers) among other positive impacts.

Breast feeding programs again are contemporary programs that reflect the concerns of many stakeholders who see children's health a critical factor in child rearing practices. Hence, organizations have created lactation and breast feeding areas for mothers, providing them with breaks to allow for breast feeding and pumping. Minnesota and other states have passed legislation to protect mothers' rights to breast feed. The literature also underscores that programs of this nature positively impact both employers and employees. Organizational impacts can be felt in reduced claims, high quality of life experiences, and

employee morale (Cayer and Roach 2008). The important thing is that work-life programs have expanded to reflect some of the complex needs of employees in this era. There are still many yet to cover, but they have evolved into covering broad areas for employees' needs and concerns about their personal and professional lives.

## Challenges to Adoption, Access, and Usage

Studies have shown that although work-life policies are adopted, many employees may not be able to access and use them effectively. In a US Census Bureau report only 53% of employees were able to access their flexibility benefits, while 63% could work away from work and only 22% reported they could do so. Yet, a 2012 National Study of Employers' survey of 1000 HR directors asserted that 77% of employers permitted their employees to adjust their schedules (Giancola 2013).

Overall, complex factors at multiple levels are cited as among challenges for work flexibility practices and generally for work-life programs. From 2005 to 2012 Families and Work Institute surveys documented an acute decline in organizational support of work-life initiatives. One report showed only 25% of organizations continually informed employees of their available work-life resources. One will observe that these problems are at the macro (e.g., organization and system) and micro (e.g., individual) levels of analysis. Some are listed here such as individual characteristics in negotiations, supervisors'/managers' discretion, industry demands, occupational dictates, work-life supportive organizational perceptions, work-life supportive supervisory/leadership behaviors, supervisor/top leadership support, work-life cultures, employee performance, affective organizational commitment, and job self-efficacy (Mills et al. 2014).

Another issue where research should address is the role that unions play in managing problems of access and usage especially in unionized environments. One study identified several areas for concern. These are listed but not discussed in detail. First premise is the role of "collective voice" is lacking in the literature. Secondly, employers and unions need to clarify in their formal agreements and collective bargaining the areas open for flexibility and justifications for variations among classification of employees by nature of tasks, industry, and professions. Thirdly, framing issues at the union level for collective bargaining mobilizes bias using diverse stakeholders in the work-life debate which shifts the focus away from a micro level issue of individual-employer (Berg et al. 2014).

Additionally, governments especially in the USA need to play a major role in the framing of work-life programs. In 1993 the Family Medical Leave Act (FMLA) helped to streamline organizational policies as it related to leave for reasons such as care giving roles and child rearing circumstances. However, this law gives the right to take time out of the labor market only for some employees (e.g., care givers) and there are employers who under this law may be exempt. With increased legislation, it may signal to employers and employees that this issue is of major importance at a macro level warranting societal attention. Greater attention, responsibility, visibility, and intervention will certainly help in the framing of policies and in making more organizations responsible for critical areas of work-life programs.

The USA lags behind other governments in Europe and Canada who have given more attention and adopted policies to ensure that employees' lives are holistic and that organizations are able to meet their strategic priorities while addressing the needs of their current workforce. During the USA presidential campaign for 2016 Donald Trump as the Republican representative and Hilary Clinton as the Democratic representative during convention speeches alluded to their commitment to giving attention to a critical area of work-life programs which may affect institutional change. Trumps' daughter Ivanka announced a childcare policy proposal for affordability and accessibility (Baltimore Sun 2016). Senator Kirsten Gillibrand recommends Hilary Clinton as the presidential candidate to give paid family leave and equal pay for women (MSN

News Online 2016). Perhaps, if either becomes president, it may usher in a new era of government reforms for the USA to change laws that can signal the importance of childcare programs, paid family leave, and equal pay for women who constitute a greater percentage of the workforce and many who remain childless as a result of the challenges in balancing their dual roles in the twenty-first century workforce climate.

Examples of other emerging issues for national policies to address in the USA are paid leave arrangements for parents during early years of parenting and when children may get sick and maternity leave to include extended parental leave such as countries like Canada and in Europe. The USA is one of the few countries globally that does not have a universal entitlement to paid maternity leave.

Japan has mandated for a National Commission in the Falling Birth Rate in order to examine how as a nation it can better support men and women in balancing paid work and their personal and or family responsibilities. Internationally, some countries have instituted conciergie services and on-site recreational and social activities for their employees. In the USA, more private and large corporations provide such benefits, but this is something that can be implemented across the board to as many organizations for their employees within reason of their resources. Other global challenges to adoption, access, and usage are countries where HIV/AIDS rates for affected persons are on the increase such as South Africa and many African nations. A challenge is presented here in rethinking work-life programs for affected employees. Studies have shown that women bare more of the caregiving roles in families and perhaps organizations may need to consider those affected with the disease and those who have significant others who need assistance during crisis times and closer to their passing. Recommendations include extending work flexibility arrangements for those with HIV/AIDS and in instances during their treatments to allow some telework or closer to their deaths provide shorter work week or compressed work schedules to such employees (Gambles et al. 2006).

A final area for discussion about challenges is the impact that recessions have on public organizations such as cost containment initiatives. Within this context, a growing trend to note is the declining support from organizational leaders and their cultures toward work-life programs and benefits. This may be explained due to the lack of skills to supply solid business proposals for using them. There is an absence of strong corporate cultures to support work-life principles and practices (Giancola 2013).

In spite of this, many organizations are still supportive of work-life programs, perhaps since because of their low cost and positive impacts to HRM processes and functions, such as compensation where work-life benefits may provide added value to benefit packages for employees. Work-life professional have also helped to keep the phenomenon visible and significant.

On a micro level, recessionary times have created some mixed reactions from employees, which have dampened their support and skewed their perceptions of work-life programs. These programs have become low priority for employees. According to Giancola, employees perceive that having a job and reasonable compensations are more relevant. Thus, work-life programs will play a pivotal role in their lives; but given recessions and cut back management policies, employees have put them on hold (2013). If these perceptions are accurate then work-life programs may revive to earlier prominence when economic conditions improve and labor shortage arises. In the meantime, organizations have been able to create some compromise in their modest attempts to provide some balance in combining paid work with employees' personal lives.

## Strategies for Successful Implementation

At the beginning of the chapter, it was proposed that work-life programs seek to blend paid work with other segments of employees' lives and as a result, can offer significant benefits to numerous stakeholders at the macro and micro levels. These include employees, public (and the third sector-

NGOs) and private organizations, societies, countries, governments, communities and families. This phenomenon is so complex that it should be addressed at many levels of analysis. Having multiple lenses will also facilitate all-encompassing approaches, with multiplicity of perspectives.

Macro analyses will allow for the problem to be conceptualized at the organizational, governance, system, global and structural levels. It was already noted the need for stronger roles by governments, top and line managers' roles, and organizational support. Organizational cultures also need to be re-aligned to support and promote work-life programs. Inconsistencies in cultural practices need to be addressed and confronted through open communications in order to ensure that there is total support for these programs from top management, line supervisors, managers and employees. For instance, work-life cultural practices may be effectively communicated through HRM policies and how they are implemented. These include but not limited to training and development initiatives, effective HR planning using needs assessments, costs/benefits analyses and other forecasting methods; recruitment and selection strategies that appeal for diverse employees; compensation and benefits policies and practices that incorporate cafeteria style work-life benefits plans for employees; job classification systems and work designs for job analyses should be restructured to facilitate flexibility in work arrangements and practices.

Positive attitudes and behaviors need to be demonstrated from organizational leadership at all levels such as directors, HRM professionals, and supervisors in support of work-life programs. Similarly, negative attitudes and behaviors need to be corrected. Organizational communications and discussions in meetings, policies, practices and other forms should reflect a supportive work-life culture (Chalofsky 2008). Hence, changes at the macro level can be institutionalized, formalized and sustained to usher in transformations to allow for the enhancement of societies' wellbeing and employees' quality of work-life experiences.

Micro analyses will hone on issues that impact employees at the personal, individual, and group levels and their ultimate impacts on their organizations especially in their ability to achieve their end results such as performance, productivity, motivation, service, and the like. Employees as colleagues should reflect and communicate supportive perceptions and conversations about individuals accessing and using these programs. For example, this can be expressed through group and individual levels family supportive perceptions and strong work-life balance values. Awards can be given from different levels for employees who reflect affective job self-efficacy and proper usage of work-life programs which lead to their effective performance on the job and positive impacts on organizations' strategic priorities. In the same vein, managers and supervisors who are able to marshal organizational resources to support work-life balance programs and develop initiatives that contribute to employees' harmonization of work-life programs given their needs should be rewarded in symbolic and tangible ways (Mills et al. 2014).

## Mapping Future Projections and Lessons

In mapping future projections and reflecting on lessons, competing realities that may persist in this twenty-first century workforce are paradoxical cultures within work place practices and policies. This competing reality shows a bitter-sweet existence for employees who continue to grapple with these competing challenges. On the one hand, there is an increasing awareness and desire to redefine work and how people can maintain balance to their family lives and personal lives. Yet, at the same time, there are mounting pressures within the work place driven by external forces such as globalization, technology, competitiveness, and other influences to push employees into more intensive work demands, having less time for family and personal life activities and commitments. Moreover, many of the responses for change in developed countries such as the USA are more at the micro levels, where individual responses have been noted by organizations, NGOS, and researchers, and options are also being articulated as micro issues. Conversely, these issues should be macro concerns, societal problems, and organizational cultural challenges.

As the twenty-first century forges ahead here are some likely projections that may be forecasted for employees' work profiles as follows. The landscapes of work where individuals are employed are filled with over worked persons. Their work cultures are filled with contradictions of intensely timeworn and stressed employees as well as those who are managing to create high quality of life experiences and greater work-life balances. There are inequities between employees who are highly skilled and work full time and may enjoy work-life programs and those who have low skills who may work full and or part time and may not enjoy the full benefits of work-life programs. There are inequities between rich countries who can afford to support work-life balance policies and programs versus poor countries where employees are being pushed beyond the hilt of their capacities to cope with work pressures and diminishing family and personal life activities. Those who are struggling are the ones who possess fewer resources – personal, family and organizational. They are struggling to cope with competing realities of increasing blurriness between work-life programs and policies and boundary management strategies in their desires for work-life balance and high quality of life experiences.

Another cultural paradox is that while there is this increasing awareness and acceptance at many levels for greater work-life programs, policies, and practices, the realities in the world of work are demands such as this subtle ideal that "jobs take priority" in light of recessions and cut back management initiatives, and access to work-life programs should be used for "productivity gains" or "practical purposes" versus for individuals' needs and supports or "altruistic reasons" (Giancola 2013). Those who are perceived as using these benefits for their needs are perceived as "not very committed" and as such may not be inclined to access them for fear of job security, downsizing, and less advancement in their careers. Hence, they are still being stigmatized and systematically marginalized even when such programs exist and can be accessed. This illustrates that societies and organizations are in crises as these problems need to be comprehensively addressed and confronted.

Therefore, twenty-first century employees are not ideal by any means. Some are confused of the expectations of their roles as employees and the extent to which they should exercise good boundary management between work and their personal lives. Others are pressured and afraid to access the work-life benefits that are afforded to them in their organizations. Yet, there are those who are enjoying what these programs can offer to employees in combining two demanding and important parts of their lives.

There is also perennial debate to conceptually reframe the jargon used to describe this phenomenon as issues broaden and emerge in the twenty-first century. Some scholars in Europe have described it as earlier as "reconciling employment with family life" but the latter connotes persons with families. This revisits old issues of excluding persons who have no children, spouses, or serve as care givers. Perhaps, some possible suggestions in mapping the future to enhance clarity and inclusiveness of terminologies coined are to consider capturing the real issues behind these programs for the workforce. For instance, possible terms may read as employees' harmonizing programs, employees' synchronizing programs, employees' holistic programs, or programs for harmonizing employees' wellbeing. Another option is to expand the old term of Employee Assistance Programs (EAP) as it is known today, to a broader classification to conceptually frame such programs. By so doing, it will replace work-life balance as a term and cause EAP to be redefined to include more inclusive programs, strategies, and initiatives to reflect these issues and themes within contemporary workplace settings. These themes or terms suggested put emphasis on the strategies to harmonize, synchronize, or to make employees holistic individuals. There is no need to mention work and life since it is implied as they are employees, and the focus is making them sound and more humane as all these programs should strive for inclusiveness and to restore their total wellbeing as employees who are first human beings.

Therefore, this topic requires a reality check for all stakeholders at the macro and micro levels. Big questions need to be brought to the global,

national, and local settings for debate, consultations, bench marking best practices, and for policy making. There are still areas societies need to reflect and introspect in forging ahead with proactive rather than reactive responses.

## Conclusion

Work-life programs are not quick fixes. They present complexities of our workforce that require a multiplicity of perspectives, innovative strategies at multiple levels, perennial stakeholders' discussions, global and national forums, and reforms and societal initiatives that shape positive work-life practices, programs, and quality of life experiences for all. These changes observed should reflect and keep abreast with the work-life programs created, adopted, and implemented. The reality check lessons for this contemporary era are strive for harmonization and integration of employees as holistic persons who work and have personal lives that matter.

# Workplace Adversity

Margaret H. Vickers
School of Business, Western Sydney University, Sydney, NSW, Australia

W

## Synonyms

Adverse working conditions; Adversity at work; Averse work conditions; Aversive workplaces; Managing workplace adversity; Psychosocial

adversity; Psychosocial workplace adversity; Social adversity

## Definition

Any negative phenomenon or event experienced at work, or related to work, that makes it difficult for workers to perform and retain their jobs and to feel comfortable, satisfied, and happy in their place of work.

## Introduction

Workplace adversity, adversity at work, adverse workplace conditions, adverse psychosocial working conditions, or aversive workplace conditions are all terms used, often interchangeably, to represent the large, and growing, number of industrial and organizational challenges continuing to face workers around the world: from being exposed to bullying, violence, and corruption, to expectations of longer working hours, to widespread structural changes to the timing and way people work and the increasing use of part-time workers and casual workers, through to the routinized nature of restructures, redundancies, and layoffs. Workplace adversity is something all workers are likely to face at one time or another during their working lives, and its deleterious impacts and possible remedies remain as widely debated this century as they were the last.

## Workplace Adversity

The term "Workplace Adversity" has had the greatest prominence in the nursing workplace literature (see, e.g., Grafton et al. 2010; Hunter and Warren 2014; Jackson et al. 2007), but its sources, challenges, and impacts have been of keen interest to scholars in business, organization and administration, nursing and midwifery, sociology, psychology, health, education, and law. Unfortunately, workplace adversity is something most working individuals can expect to face at some point and, while recognized sources of workplace adversity may change according to shifting economic conditions, events of social misbehavior, and varying stakeholder priorities, it remains widely acknowledged as having serious negative consequences for individuals, groups, and organizations.

For decades, scholars have lamented that workplace institutions have a wide, multi-sourced, and increasing array of challenges that can cause workers stress and anxiety, undermine health and well-being, and create physical, psychological, and emotional discomfort. While the literature is also clear on the multitude of positive identity, social, financial, personal, psychosocial, psychological, health and well-being, and emotional outcomes that have been directly attributed to work and working, workplaces have also long been characterized as potentially dark and dangerous places, capable of great harm, even devastation, for workers exposed to their traumatizing social transactions, cultures, practices and processes, and modes of operation. Scholars have variously described workplaces as toxic, hostile, violent, abusive, dark, alienating, stigmatizing, traumatizing, machine-like, emotionally anorexic, dehumanizing, discriminating, unrelenting, demanding emotional labor, evil, soulless, unsatisfying, unrewarding, unsupportive, corrupt, sources of humiliation and degradation, and crucibles of anger, embarrassment, humiliation, jealousy, anger, frustration, hate, resentment, shame, grief, and loss (e.g., Blauner 1964; Braverman 1994; Fineman 1993; Fromm 1963/1994; Frost 1999; Goffman 1963; Hochschild 1983; LaBier 1986; Stein 1998; Weber 1948). Workplaces have even been described as "evil," home to malicious psychopaths, sociopaths, bullies, and thugs that routinely traverse their corridors and who often reach positions of considerable power (Boddy 2006), although some have warned that such research has been dominated by popularist coverage rather than systematic scientific attention (Smith and Lilienfeld 2013).

It would be fair to say that many workers feel under siege in their places of work given the range of problems they routinely face while engaging with work. Sources of workplace adversity that can emanate directly from the workplace have

included (but are not limited to) unskilled and abusive management; poor job design; expectations of longer working hours; efficiency-based, bottom-line, managerialist norms and assumptions; negative and unsustainable workplace cultures; an increasingly casualized and part-time workforce; unsustainable environmental workplace practices; crime and corruption; bullying, harassment, stalking, abuse, and violence; organizational change, downsizing, and restructuring; redundancies and layoffs; and increasing levels of unemployment and underemployment.

In addition to what workers face at work, workplace adversity can also emanate from the numerous sources of personal trauma that can emerge in a worker's life and cross the border into their working lives. Examples discussed in the literature include (but are also not limited to) the changing nature of work and employment; increased career responsibilities for aged and infirm friends and family, or chronically ill or disabled children, or grandchildren; diagnosis of, and coping with, serious chronic illness or disability; hospital treatment for disability and chronic disease; a partner or family member's suicide; the serious illness or death of a loved one; mental health issues, such as depression, anxiety, and panic disorders, for self or a family member; drug and alcohol addiction or overuse; financial challenges stemming from unemployment, underemployment, impending retirement, or increased casual work; facing non-voluntary redundancy or early retirement for self, partner, or family member; outcomes of natural physical disasters such as storms, fires, and floods; car accidents for self, partner, or friends and family; being subjected to stalking, abuse, or violence beyond the workplace; and the multitude of other significant stressors and personal losses that may be experienced by workers that are then expected to keep working.

Given the aging population in many developed and developing nations, there have also been particular concerns about the high levels of workplace adversity faced by older workers as a result of ageism and discrimination; increased casualization of work; increased redundancies and layoffs; an increasing and ongoing need for (older) workers to reskill to maintain their employability; the increased likelihood of chronic illness and disability associated with increased age; higher levels of unemployment and underemployment for ageing workers; financial concerns for those approaching retirement; and, the erosion of older workers' sense of purpose and fulfillment.

In such situations, the workplace adversity stems from a lack of recognition of, and compassion for, the emotional and physical outcomes of the personal grief, stress, strain, anxiety, turmoil, and loss that can accompany significant personal challenges faced by individuals (Vickers 2009). Workplaces that have been termed emotionally anorexic (see Fineman 1993) expect workers to leave their problems at the door during times of distress, to carry on working and performing, and to not allow personal circumstances to impact their productivity during the working day. However, this lack of acknowledgement of personal turmoil at work can make matters worse. For example, grief has been characterized as an intense emotional distress that typically follows traumatic events and which may last for years; it is not something that can be easily worked with or through.

The literature confirms that organizations can sometimes respond to workers' significant personal losses with small allocations of personal leave – perhaps a few days to grieve the death of a close family member – but only if such leave is available and if said worker is eligible. Workers experiencing personal traumas are, for the most part, required to carry on doing their jobs, without any diminishment to productivity, or to take paid or unpaid leave – if that is available to them and is approved by their employer. Research focused on challenging personal circumstances brought to workplaces is less evident in the literature, but such studies do exist, and show workers experiencing significant negative health and well-being outcomes as a result of their personal adversity combining with the challenging rules of work and working (see, e.g., Hunter and Warren 2014; Kemeny et al. 2004; Vickers 2011).

Adversity at work can also be sourced from, and magnified by, the type of work being performed. Some roles have been noted in the

literature as being especially demanding on individuals, bringing with them considerable, even excessive, levels of stress, anxiety, pain, fear, and grief. Examples include (but are also not limited to) health-care workers, including doctors, nurses, and midwives, perhaps doing oncology or palliative nursing; social and community workers, including case workers in child protection agencies; drug rehabilitation workers; and police, ambulance, fire, and other security and emergency workers. All are routinely exposed to high levels of uncertainty, danger, and emotionally charged situations while working. Professions such as these require workers to continue their duties in often volatile, uncertain, and emotionally intense situations that require high levels of emotion work skills, skills that have been claimed to have been unrecognized, overused, and undervalued (Hunter and Warren 2014). Such work has also been recorded as negatively affecting the emotional well-being of workers, and concerns have been raised about long-term negative effects on worker morale; increased levels of stress and strain, especially in workplaces where a perceived lack of trust and support between management and staff exists; a lack of workplace autonomy for professionals charged with such work; and any generalized insufficiency of workplace support.

Workplaces are often not good for our health and well-being. The association between workplace-related stress, especially chronic stress, and its deleterious impacts on physical, emotional, and psychological health has been well established. There is a vast, and growing, amount of evidence that confirms this. The field of psychoneuroimmunology provides evidence of a significant biological link between the state of mind and emotions of an individual and the health and well-being of that individual. The negative impacts on workers facing adversity noted in the literature are considerable: increased stress and strain; onset and exacerbation of chronic and acute illness (e.g., asthma, heart disease, multiple sclerosis, and cancer); worsening levels of disability; loss of employment; reduction of employment; loss of status; negative impacts on home, family, and close partner relationships; loss of trust; financial loss; career loss; post-traumatic stress disorder (PTSD); severe psychological trauma; lowered self-esteem; sexual health difficulties; heightened emotional responses, such as angry outbursts; reduced coping skills and self-efficacy; sleeplessness; alcohol and drug addiction, overuse, and abuse; social isolation and withdrawal; onset and exacerbation of mental health issues such as depression, anxiety, panic, and self-harm; an eventual inability to work; and the ultimate workplace injury and suicide. Suicide rates are claimed to be increasing, with most suicide victims having been found to have experienced at least one or more such adverse life events within the year of their death, with such events having been found to have been concentrated in the few months before their death (Olie 2014).

Finally, the literature also confirms that the negative impacts of workplace adversity are not just felt by the workers experiencing adversity. The ripple effect flowing to third parties has also been investigated: Friends, family members, intimate partners, children, and colleagues have also been noted as having been impacted by witnessing the workplace adversity experienced by others. Unemployment, layoffs, restructures and redundancies, inherent stresses of some work being performed, bullying, and other forms of organizational violence have all been found to have detrimental outcomes, not just on those workers experiencing them but on those connected to them (see, e.g., Duffy and Sperry 2007; Hockley 2003; Skarlicki and Kulik 2005). For example, colleagues of workers terminated during redundancies, restructures, and layoffs report feeling guilty and traumatized; family members, close personal friends, and partners have been found to experience stress, confusion, and guilt as a result of not knowing how best to support those close to them being bullied, harassed, or exposed to other workplace violations; counselors have reported feeling overwhelmed and uncertain as to how to respond to clients traumatized by chronic bullying; and colleagues of people experiencing workplace misbehaviors such as violence, corruption, and bullying have been found to leave their workplaces as a result of what they have witnessed.

The key indicators of a healthy work environment are also well known: work engagement, work identity, person-job fit, and job satisfaction (see Hackman and Oldham 1976). Workplaces have also been found to be able to promote effectiveness and flourishing in people, both on and off the job (Kossek et al. 2012). However, and unfortunately, workers faced with precarious ongoing employment offering little or no job security; underemployment and inflexible, unpredictable, or nonstandard work schedules; and pay systems that transfer risk to the payee have been found to feel increasingly insecure, stressed, and anxious – all outcomes likely to negatively impact that worker's health, well-being, and productivity. For workplaces, the outcomes of allowing adversity to flourish have been well documented as being very costly. Workplace bullying, for example, has been found to cost workplaces billions in lost productivity and lost opportunity costs. Negative impacts on workplaces have been found to include an inability to retain a talented workforce; heightened negative media attention; the emergence of organizational whistleblowers; a negative, even toxic, workplace culture; loss of organizational reputation and consequential loss of shareholder confidence; staff loss of innovation and creativity; lowered morale; decreased productivity and loyalty; increased absenteeism, sick leave, and "presenteeism" (where workers are present at work but not fully engaged); increased staff turnover; an increased intention to leave; reduced organizational learning and knowledge translation; reduced profits and shareholder wealth; and direct financial and political threats to the organization which, in turn, can further threaten that organization's sustainability over the short and long term.

## Traditional Organizational Responses to Workplace Adversity

Traditional organizational responses to workplace adversity have tended to be made in response to complaints made by workers against the organization and have tended to include improved job design, the development of relevant policies and procedures (e.g., anti-bullying policies), the implementation of employee assistance programs (EAPs), the use of alternative dispute resolution procedures, and offering of training and educative initiatives. Unfortunately, such approaches have often been found to be of limited value, ineffectual, and sometimes having a deleterious outcome for workers and the organization. Scholarly scrutiny in recent years has revealed some flaws, misconceptions, and (perhaps) unintended consequences of some of those responses.

Improving job design by enhancing autonomy over tasks was one of the earliest attempts to respond to worker stress and strain, while also being aimed at enhancing their productivity. Autonomy is defined as the need to experience one's behavior and actions as freely chosen and fully endorsed, rather than being imposed by external forces. Autonomy at work allows for significant freedom, independence, and discretion over daily work decisions, such as work scheduling, and how to go about tasks (Hackman and Oldham 1976). When needs for autonomy are met, individuals have been found to experience high levels of well-being. Autonomy has been noted as a core psychological need that must be satisfied if individuals are to function at optimal levels. Reorganizing work tasks to increase people's job control and autonomy has been found to improve mental health and well-being, increase work performance, improve physical health, enhance motivation, increase job satisfaction, and reduce absenteeism. However, if needs for self-determination and autonomy are not met, or obstructed or neglected – as they are likely to be if a person is also facing workplace adversity – well-being may be adversely impacted. Notably, workplace adversity has been found to be experienced by workers whose autonomy is threatened, undermined, or reduced, through threats to job security and unhelpful changes to job roles and design.

Another response by workplaces has been to develop putative supportive workplace policies. However, researchers have found that, sometimes, such policies can be little more than "empty shells," policies and procedures that exist to supposedly support workers but can have paradoxical, even negative, effects on workers who invoke them (see, e.g., Hoque and Noon 2004).

Workplace policies, for example, that advocate zero tolerance for bullying, or corruption, might encourage reporting of these workplace misbehaviors without having appropriate procedures in place to respond to complainants in a supportive way after the complaint is made. Further, such policies – often in place to protect the organization, not workers – may not be enforced or acted upon by the organization. If the organization does respond, the skills and resources available to investigators of complaints from within that workplace may not be sufficient for the task. Middle managers or human resource professionals asked to conduct such investigations may not have been specifically trained in investigation skills and will be operating to protect their employer. Such investigations have been reportedly conducted as part of already onerous workloads, making the outcomes for complainants at best, unpredictable, and, at worst, causing more harm.

Support policies also usually require the target of workplace adversity to be the one to instigate action. That person – already stressed – must take their time, energy and resources, risk alienation, career disruption, unemployment, increased stress and strain, substance abuse, potential damage to close personal relationships, and negative health outcomes to initiate action against the adversity. Targets have then been reported as finding themselves ostracized at work, unsupported by HR practitioners, and finding their complaints ignored. Such organizational responses have been claimed to seriously erode trust and may result in further trauma to an already highly stressed worker. Some researchers have argued that such policies are only in place to underpin that organization's public relations agenda and protect the organization in the case of unwanted litigation by complainants.

Litigation is another possible response for those exposed to adversity. Various forms of protective legislation exist in developed nations around the world and are, again, ostensibly in place to protect and support workers against various forms of adversity. They include legislation on anti-bullying, anticorruption, anti-discrimination, wrongful dismissal, and occupational health and safety. For workers in developing nations, the existence and enforcement of such legislation is less reliable, and, in both instances, the onus remains on the injured person to use their time, energy, and resources to make a complaint and, if a litigious path is followed, the likelihood of an alleged perpetrator (s) reforming is low. Decisions to pursue legal grievances tend to be made by workers based on their subjective expectations around the utility of making their complaint, versus a decision to suffer in silence, or leave. Hirschman's (1970) seminal model of Exit, Voice, and Loyalty still has relevance for those so faced; the perceived utility and net benefits of filing a grievance, combined with the perceived probability that any perceived net benefits will actually be realized, have been found to be at the front of the minds of injured workers.

Injured workers tend to litigate, usually, for three reasons: (1) for compensation or monetary gain; (2) for vindication, that is, to have the wrongdoing acknowledged; and (3) to achieve workplace reform. However, and unfortunately, the literature confirms that litigation rarely achieves any of these goals. Cases can take months, or years, to find their way to court, and bring considerable stress to individuals involved, and further reduce their well-being. The stress effects of litigating have been widely reported as being long lasting and, potentially, very damaging. Further, the costs of litigation can be prohibitive and generally far beyond any likely award of damages (if the damages can be proven). The complainant may also lose their job during, or as a result of, the instigated legal proceedings. Evidence confirms that litigation process is a long, stressful journey, infrequently successful for complainants of workplace adversity, and the likelihood of any benefit being realized having been found to be very low.

As a result of increasing recognition of the high personal and financial costs of litigation, alternative dispute resolution (ADR) approaches have emerged. Mediation and facilitated negotiations have become popular alternatives to litigation, especially within workplaces seeking to "resolve" allegations of workplace adversity. Workplace violence, abuse, bullying, discrimination, harassment, and interpersonal conflict are frequently

referred to mediation, or some other forms of ADR, in an attempt to resolve the "dispute," keep the "problem" in-house, and avoid legal proceedings. However, the literature has cited numerous problems with the use of ADRs: unhelpful influence of negative stereotypes attributed to those involved in bargaining processes (e.g., members of diversity groups, such as women, people of differing race/religion/sexual orientation, or people with disability); the inappropriate use of ADRs between parties with an existing power imbalance; outcomes of such proceedings being not legally enforceable, leaving perpetrators to return to their misbehaviors with impunity, perhaps making things worse for targets; and, finally, that participation in most forms of mediation and conflict negotiations require *all parties* to implicitly accept equal responsibility for the "problem" in order to participate in the mediation of a possible resolution. Such a response has been found to be completely inappropriate, especially where the misbehaviors being alleged involve violence, bullying, or discrimination.

The provision of counseling, and EAPs, has also been provided by many organizations to support staff facing workplace adversity, usually at no cost to the worker, and would appear to be a very supportive workplace response. However, the literature also reflects numerous concerns being raised by about EAP use: that there is little evidence that EAP use actually works to ameliorate the ill effects of workplace adversity and that EAP use may offer an endorsed means of organizational surveillance and social control for "troubled" workers, with reports to management from EAP providers having been noted by researchers in past years, especially for high users. Still other researchers have claimed that EAPs have been instigated to protect the organization in a number of ways: as part of a positive, public relations campaign, confirming to internal and external stakeholders that the organization "cares" about their staff; as a defense against litigation by an injured worker to reduce associated insurance premiums; and as a means for senior management wishing to absolve themselves of their responsibility for allowing toxic and harmful workplace cultures and practices to continue. Researchers have also noted that counselors working for EAP services have had difficulties, with some reporting feeling powerless to respond, and other reports showing counselors' misunderstandings of the complexities of the workplace phenomena being described to them by clients (e.g., bullying or violence) and of them unhelpfully sending traumatized individuals back to their workplaces for support.

Finally, training of staff about aspects of workplace adversity, including the surrounding issues, processes, and behaviors involved to enhance worker understanding, has also been investigated. Training workers as to their rights and responsibilities, and how to implement workplace codes of conduct, has been noted by some scholars as productive. However, once again, a number of weaknesses with the use of education and training as an organizational response to workplace adversity have been reported. First, sending both complainant and alleged perpetrator to training, especially in cases where bullying, violence, or corruption are alleged, presupposes that the worker reporting adversity is in equal need of remedial response. Situations of adversity that involve physical, psychological, or emotional violence, such as harassment and bullying, are often incorrectly diagnosed as interpersonal conflict. With this comes a flawed expectation that training in interpersonal communication skills, violence prevention, or codes of conduct will remedy the problem. Unfortunately, there has been little evidence to suggest that such responses assist, while the opposite outcome has been reported: violence prevention programs have been shown to not produce long-term changes in violent behavior or decrease the subsequent risk of victimization of complainants.

## Alternative Organizational Responses to Workplace Adversity

Given the noted failure of many of the usual organizational responses to workplace adversity, scholars have increasingly been turning their attention to more positive, productive, and appreciative approaches. It is widely acknowledged that workers feeling violated, overloaded, and insecure and who are being bullied or harassed, or

who have low control over work tasks and how and when they might perform them, are likely to experience significant, adverse impacts on their psychological and physical well-being. In response, scholars have shifted attention toward finding ways for organizations and individuals to enhance the resilience, positivity, and mental and physical health and well-being of workers facing adversity. Finding ways to enhance the perceptions of individuals with regard to their capacity to respond successfully, cope, and survive have also been investigated. The study of individual psychological traits, such as self-concept and self-efficacy, have been found to be powerful components of enhanced resilience, improved well-being and positive self-concept, and fundamental to successful coping with adversity (Marsh and Craven 2006). Understanding and enhancing self-esteem, self-concept, self-perception, and self-efficacy have been found to be useful ways to support the physical and mental health of workers experiencing workplace adversity.

This new paradigm of positivity has spawned numerous new approaches to management, management training, research, and consultancy. Rather than focusing on problems, problem-solving, and negatives in organizational life, researchers have increasingly been searching for ways to stimulate new images, ideas, and positive actions through the appreciation and recognition of both the light and dark in organizational life. Finding ways to develop positive responses in individuals and organizations faced with adversity has emerged from recognition that workers damaged by workplace adversity need a means of articulating the devastation that has befallen them, a means to transform their lived experience into positive outcomes, and a means of getting past their fear, humiliation, shame, and pain. Finding ways to explore the hurt, anger, injustice, and despair, and in ways that can benefit both the injured individual and the organization, has been strongly advocated (see Bushe 2007). It is a paradigm shift intended to mobilize informed, positive action and has arguably contributed to the development of more effective organizational responses to workplace adversity.

A key development has been the emergence of positive psychology. Positive psychology is a growing body of research intended to enable the flourishing of human potential. It was first introduced as a science of positive subjective experience, positive individual traits, and positive institutions and promised to improve quality of life and prevent the pathologies of a barren, meaningless one (Müceldili et al. 2015; Seligman and Csikszentmihalyi 2000). The focus of positive psychology on enhanced coping and well-being through the generation of ideas, hope, wisdom, creativity, future mindedness, courage, spirituality, responsibility, and perseverance has become clear research directions, for organizations, individuals, and groups wanting to improve the quality of their work life (see, e.g., Tejeda 2015).

Within the organizational context, positive psychology has focused on strengthening and building the best and repairing the worst problems of workplaces. It aims to achieve this through building positive qualities in individuals and encouraging the flourishing and prospering of individuals, groups, organizations, and communities. Two specific fields of positive psychology in organizations have included (1) positive organizational behavior (POB), which has focused on microlevels of analyses (individuals), and (2) positive organizational scholarship (POS), which has focused on macro levels of analyses of organizations and groups (organizations). POB has been concerned with studying positively oriented human resource strengths and psychological capacities to improve individual performance in workplaces. POS is a study of the conditions and processes that contribute to the flourishing or optimal functioning of people, groups, and institutions (Müceldili et al. 2015). These approaches have offered a positive lens for seeing, analyzing, and better understanding organizational life. Positive psychology in organizations has been of particular interest, with its emphasis on exploring and better understanding of the role of resilience, authenticity, empowerment, appreciation, energy, meaningfulness, and gratitude in workplaces and within individuals (see, e.g., Müceldili et al. 2015).

Indeed, the literature has confirmed that some workers, despite much workplace adversity, have still been able to sustain themselves physically, mentally, and emotionally. Not only have they reported surviving but some have been confirmed to have thrived while sustaining long, successful, and satisfying careers (McDonald et al. 2012). It has been claimed that resilience is a beneficial, even essential, trait for those able to sustain themselves and thrive, physically, mentally, and emotionally. Importantly for workplace adversity researchers, resilience has been described as being able to be developed or enhanced through cognitive transformational processes, education, and environmental or workplace support (Grafton et al. 2010).

The role of resilience in protecting workers and workplaces has been increasingly recognized, and investigated, especially with regard to various forms of workplace adversity. Resilience describes an individual's ability to resist adversity and cope with it and to recover and grow as a result of it (Grafton et al. 2010). The presence of individual resilience has been said to confirm a person's capacity to function optimally under stress and duress, to find opportunities in tragedy, to bounce back from setbacks, and to be able to turn adversity to their advantage. The study of resilience can be found in physics, medicine, theology, philosophy, psychology, and spirituality, though the conceptual roots stemmed from the childhood development, psychology, and stress literatures. Most definitions of resilience highlight outcomes of positive adaptation to adversity, without significant residual psychological or physiological disruption. Resilience research began with attempts to identify resilience traits or characteristics that were believed to be common to resilient individuals. Investigations then shifted toward learning how such characteristics might be acquired. More recently, resilience has been described as a form of accessible inner strength that can be enhanced or supported by external resources (Grafton et al. 2010).

One small area of controversy around resilience has been a challenge to the expectation that a resilient person will always "bounce back" from their adversity, unchanged. Many studies on resilience have been underpinned by the assumptions that (1) resilient individuals can and do bounce back from traumatic events in their life, relatively unchanged; (2) individuals can learn to be more resilient, through learning enhanced interpersonal capacities and by drawing on the collective resources available to them; and (3) the supply of appropriate organizational resources intended to foster and develop individual- and group-based resilience can assist in this process. However, some have suggested that, while resilient workers may cope and survive even significant, chronic workplace adversity, those workers may still be permanently injured, or at least changed, as a result of their negative experiences. It has been argued that their capacity to resume their lives, cope, survive, and even flourish does not necessarily confirm a lack of long-term negative impact for that individual (see Vickers and Kouzmin 2001).

Alongside the increased interest in positivity and resilience has been a growing recognition of the need for health and well-being in workers and organizations. Well-being has been defined by the World Health Organization as a state in which every individual can realize his or her own potential, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community (WHO 2013). The subjective well-being of individuals has been found to consist of three things: positive mood, an absence of negative mood, and life satisfaction. Unfortunately, there is abundant evidence that workplace adversity damages positive mood, emotions, and well-being; increases the presence of negative emotions and affect; and can have a profoundly negative impact on worker's health, happiness, and well-being. Some scholars have investigated the well-being of individuals, while others have focused at a more macro level, on organizational wellness. For still others, employee and organizational well-being have been claimed to be a "dual agenda" where the interests of workers and the organization employing them are regarded as complimentary (Kossek et al. 2012). Concern for an organization's health and well-being has been motivated by associated concerns with an

organization's ongoing success. Claims have been made that individual worker's health and well-being is intimately connected with the well-being of the organization and its culture.

Similarly, the presence of positive emotions, such as happiness, has been found to enhance cognitive ability, memory, innovation, and creativity, thus confirming their value in workplaces, especially in response to the presence of adversity. It has been repeatedly confirmed that workers who are happy and healthy do a better job. Happiness has also been found to be not just as a positive outcome in people's lives but resulting in many beneficial outcomes for workplaces. Individuals with high levels of happiness have been found to be more productive at work, earn higher incomes, and facilitate more democratic governance in organizations. Happiness and contentment (see Diener and Seligman 2004) have been recognized as forming important components of wellness and well-being, but happiness also requires positive emotion, engagement with life and work, feeling connected with others, and a sense of meaning and accomplishment in one's life. Workers experiencing adversity are unlikely to be happy at work, at great cost to both those individuals and their places of work.

Increasing recognition of the need for happiness, positivity, and resilience in workers and the continuing need to find ways to respond to workplace adversity have led to a growing interest in, and recognition of, the value of compassion in organizational life (see Kanov et al. 2004). Compassion and compassion organizing have been increasingly seen as virtuous individual and collective responses to adversity that contribute to both personal and social good, with compassion having been recognized as being at the core of what it means to be human. Discussions about compassion are not new, dating back over 2,000 years, and spanning the disciplines of religion, philosophy, and sociology. However, in recent times, compassion has been reclaimed as an essential, but frequently overlooked, element of productive and successful workplaces, especially those needing to respond to workers facing adversity. Jane Dutton, Peter Frost, and colleagues (Dutton 2003; Dutton et al. 2006; Frost 1999) have been at the forefront of recognizing that while organizations are often sites of pain and suffering, they can also be places of healing and somewhere where caring can be both given and received. The presence of compassion has been claimed to help people feel seen, known, and less alone and has been associated with a wide range of positive emotions, attitudes, behaviors, and feelings. Within the workplace, compassion has been recognized as a means where individuals might assist in healing one another, singly or collectively, by noticing another's suffering, experiencing an emotional reaction to that person's pain, and acting to ease or alleviate it. Acting compassionately has been increasingly argued as another way organizations can respond positively and proactively to the adversity they spawn.

## Alternative Ways to Learn About Workplace Adversity

As part of the quest to find new ways to respond to workplace adversity, researchers and managers have increasingly noted that the investigation and resolution of challenging, complex, and ambiguous phenomena – such as workplace adversity – require nuanced perspectives, different analyses, and explication of both the positives and negatives of organizational life. Enhanced understanding of, and response to, challenging phenomena and their associated negative experiences, social interactions, and critical incidents have been increasingly recognized as requiring various representational options, including more appreciative, positive, and creative forms of exploration and presentation. Workplaces have been urged to find alternative, more humane and sustainable ways of doing things and learning about themselves; holistic, new, innovative practices, including emancipatory and innovative action learning approaches, appreciative inquiry, critical reflections, reflexive thinking, and double loop learning have increasingly been advocated (see, e.g., Bushe 2007; Schein 1992).

The seminal article on appreciative inquiry by Cooperrider and Srivastva (1987) was considered by many to be revolutionary and has been a precursor to many positive developments in

researching organizations. Tools for organizational change have been increasingly used that offer constructive reimaginings and positive and appreciative foci and that are intended to improve structures, competitiveness, profitability, and sustainability. These appreciative orientations are said to have been based on the "heliotropic principle" (where plants grow toward the light (see Michael 2005: 222)). In similar form, it is claimed that people and organizations also move toward their light, by imagining positive futures and creating affirming, appreciative responses to past and present events, such as workplace adversity. It is a research orientation that is intended to enable pathways to new ways of thinking about troublesome workplace phenomena and in ways that lead to more positive and constructive options for action (Bushe 2007).

Appreciative and positive approaches allow researchers, and managers, to depict examples of success and embrace the goodness that may be present in organizations, even when success is overshadowed by dark, dysfunctional, or otherwise precarious organizational systems. Such approaches have not been intended to ignore the negatives or deny the unpleasant. Rather, they proceed with analyses based on hope and that use imagination to explore how workplaces might function in a better world. An increased use of action and engaged research approaches, where researchers work with organizational members to brainstorm, create, and develop responses to negative workplace situations, are being seen. Workplaces, and workers, have been claimed to benefit from involvement with positive processes that seek workers' views and learn from workers' capacities for innovative thinking. Appreciative inquiry, creative writing, portraiture, action research, and engaged research all seek positive responses and solutions via workers' ideas about how they would like the world to be.

Similarly, the use of stories remains a positive means of exploring difficult workplace phenomena. Recent decades have confirmed the value, increasing use, and acknowledgement of stories as a credible and significant means of acquiring knowledge about workplaces (e.g., Boje 2014; Hummel 1991). The use of stories, combined with a focus on the positive in organizational life, has seen a burgeoning of creative, qualitative research methods that have gained increasing traction as a means of grappling with nuanced and complex issues, such as workplace adversity, that are traditionally difficult to effectively interrogate, and respond to, using more traditional research approaches. Creative research approaches founded on appreciative, compassionate, and generative responses to workplace adversity have been numerous. Narratives; short stories; re-storying of the self; portraiture; critical, reflective, and reflexive diaries and journals; fiction, semi-fiction, and creative nonfiction; poetry; and interpretation and interrogation of existing fiction all have been used to illuminate some of the many sensitive, painful, and fraught aspects of social and organizational life. Creative writing has been used by scholars dealing with challenging social and institutional phenomena, for decades (e.g., Cope et al. 2015; Gutkind 2009; Harold 2003; Ketelle 2004; Phillips 1995; Rolfe 2002; Vickers 2011), but now forms part of a crucial paradigm shift being made around responses to adversity in organizational life.

Finally, the literature has also been bathed in discussions of sustainability of the planet, the problem of global warming, the need for clean air and conservation of water resources, and the growing numbers of endangered flora and fauna. However, sustainability of workplaces has also been an area of concern, and the damage created by workplace adversity is something scholars have become increasingly concerned about. Multidimensional, critical, human resource management that is socially conscious and contributes to building just, compassionate, democratic and sustainable workplaces has been called for in tandem with a shift toward positive change in workplaces.

## Conclusion

Contemporary workplaces are increasingly being admonished to embrace the societal and organizational transformations necessary to shape, and improve, worker experiences and perceptions,

especially in relation to preserving worker humanity, diversity, equality, justice, and trust. Approaches that encourage and develop workplace and worker sustainability – which support positivity, compassion, well-being, and appreciation and ameliorate the often devastating consequences of workplace adversity – are increasingly being sought, and used, by managers, workers, and scholars to respond to the harm caused by workplace adversity.

# Workplace Relevance of Professional Standards to Practitioners

Paul Higgins
Department of Public Policy, City University of Hong Kong, Hong Kong, China

## Synonyms

Certification; Competency; Expert; Licensure; Practiced; Quality assurance; Specialist; Trained

## Definition

A professional standard is an explicit, predetermined expectation set by a competent authority that describes an individual's acceptable performance level (Rooney and Van Ostenberg 1999). Ultimately, a professional standard

contributes to the broader processes of licensure and certification, making explicit the learned occupational components of an entire profession. Whereas licensure ensures that an organization or an individual meets minimum standards to protect public health and safety, certifications are voluntarily designed to provide a signal to employers concerning the qualities of established practitioners. Contemporaneously, licensure and certification are the two main ways for an individual to demonstrate the mastery of a body of knowledge that only professions command and are able to perform.

On an individual level, the workplace relevance of professional standards to empirical practice can be garnered by practitioners continually reflecting on their professional socialization and workplace experience. Referred to as continuing professional development, qualified members are expected to maintain, improve, and broaden their subject knowledge and skills giving confidence to the public. In return, professional practitioners expect autonomy at work which means being allowed to perform tasks without the necessity for externalized control over the application of their skills. Whether newly emerging corporate professions share the same values (or traits) as their more established (i.e., traditional) counterparts is an important question in the contemporary debate on professionalization with related implications for practice.

## Introduction

Not only do we expect professionals to command expertise in the subject knowledge of their chosen occupation, but we also expect them to perform work with due process and integrity. In both cases, one is referring to a set of standards that professionals are expected to uphold and which are prevalent in any occupation attaining the privileges of closure, such as accountancy, engineering, and medicine. When the professional standards are sanctioned by law, a license to practice is necessary; otherwise, some form of certification is required. Whereas licensure is sanctioned by government entities and carries the force of law, certification has no legal underpinnings.

Unlike licensure, an individual does not need to be certified to engage in an unlicensed occupation. However, employers sometimes use certification as a job requirement. This occurs, for example, when the certification is required in job descriptions, career-laddering systems, or project specifications. If an entire occupation demands certification, then it becomes a de facto mandatory entry requirement. To become licensed or certified, one usually has to meet eligibility requirements (such as years of work experience) and pass an assessment (usually a test). The licensure/certification assessment typically covers a broad area of knowledge and skills at the entry level (Marberry et al. 2011). In addition, licensure and certification both tend to have ongoing requirements (such as training or retesting and renewal fees) for professionals to continue practicing (ibid.).

Although professional associations do not grant professional licensure, they often play a role in licensure and certification activities. For instance, professional associations can help practitioners prepare for licensure exams and theorize continuing professional development scenarios. Professional associations can also oversee certification to evaluate and recognize that an individual has met predetermined requirements or criteria. While licensure might be the single-best descriptor of a "true" profession, certifications can be just as tough in terms of qualifying criteria and just as powerful institutionally. Normatively, stringent certification and licensure procedures produce an interchangeable group of experts, socialized in the same kind of education and background social class, which forms an identity in the institutional field (DiMaggio and Powell 1983).

## Professional Standards of Practice

Professional standards of practice and ethics for a particular field are typically agreed upon and maintained through widely recognized professional associations (also called professional bodies, professional organizations, or professional

societies). A professional standard is defined as an explicit, predetermined expectation set by a competent authority that describes an organization/individual's acceptable performance level (Rooney and Van Ostenberg 1999). Ultimately, the performance level is designed to reflect licensure or certification requirements providing a degree of quality assurance to workplace practice. For instance, in accountancy there are Generally Accepted Auditing Standards, which require adequate technical training and proficiency, independence in mental attitude, and due professional care (Chorafas 2008). The General Standards establish clear expectations of effective practice in the accountancy occupation and enable practitioners to identify areas for their own professional development.

One of the key advantages of an occupation establishing a Professional Standards Scheme is that it distinguishes the association and its members as a recognized profession. In a competitive market, such distinction is critical – because it is increasingly difficult for consumers, governments, and even aspiring professionals to be able to tell the genuinely professional from the growing field of people claiming to be professional (Professional Standards Council 2016). In particular, professional standards are designed to make consumers confident of professional practice providing a form of quality assurance. Quality assurance is achieved through the service provider (i.e., professional practitioner) attaining a formal professional standard maintained through continuing professional development. Membership of a community of professionals encourages each service provider to maintain the standard of the group, regulated either by license or by certification.

## Workplace Relevance of Professional Standards

One way to establish the workplace relevance of professional standards to practitioners is to examine the amount of time they spend on regulated activities (Higgins et al. 2016). Another way is to ask practitioners to state the importance of certified activities to actual work, and a third way is to identify aspects of their job that only qualified can do (i.e., the occupation's exclusive knowledge base) (ibid.). In addition to specific occupational skills, there are generic skills that define the scope of a professional's workplace activity. For instance, the profession must demonstrate judgment in decision-making to determine the best course of action for any particular circumstance. Judgment can be exercised in two main ways. First, the profession can exercise *substantive* judgment to diagnose a problem, to decide a course of action, and to strategize or make policy. Second, the profession can exercise *instrumental* judgment using established procedures to deliver a course of action, to implement policy, and to administer tasks. In either case, the qualified practitioner is expected to continuously reflect on their work experience while positively shaping their professional identity.

Known as continuing professional development, members of professional associations are expected to maintain, improve, and broaden their subject knowledge and skills while developing the personal qualities required in their professional lives (Law Society of Northwest Territories 2016). Continuing professional development encompasses all types of facilitated learning opportunities including academic degrees, formal coursework, conferences, and informal learning opportunities situated in practice. However, in order to contribute to the professional practitioner's recertification or licensing claim, the continuing professional development outcomes need to be properly documented, self-directed, reflective (i.e., learning from experience), and prospective (i.e., set development goals). Along with licensure and certification, continuing professional development gives the general population, and professionals themselves, confidence that they are being supported by qualified, capable, and competent practitioners.

Traditionally, professional practitioners are expected to uphold and attain certain professional values which include an altruistic norm of service and a code of ethics that implies responsibility to performance. At the same time, a socially responsible professional (Brint 1994) has recognition in

society and is expected to share the outcomes of their wisdom (if not the exact knowledge) for the public good. In return, because of their specialized knowledge and skills, professionals expect autonomy at work, which means being allowed to perform tasks without the necessity for externalized control over the application of professional skills. It reflects the solidarity in the guild training system where the skill of the expert remains a mystery to laypersons (Krause 1996).

As Greenwood (1966) maintains, whereas a customer in a market determines what services and/or commodities s/he wants and shops around until s/he finds them in a professional relationship, the professional dictates what is good for the client who has no choice but to accede to professional judgment. The associated premise is that because the client lacks the requisite theoretical background, she/he cannot diagnose her/his own needs or discriminate among the range of possibilities for meeting them. Accordingly, professionals traditionally believe that their performance can be best judged by other professionals and not by supervisors who do not possess the same knowledge. The expert-layperson relationship has implications for reward structures in that professionals may struggle to accept hierarchical authority as legitimate.

Whether newly emerging corporate professions, distinct from traditional professions, share the same values (or traits) as their more established counterparts have become a pertinent question in the contemporary debate on professionalization. Traditionally, professional standards provide a national reference point that organizations can use to support the development of their staff. Contemporaneously, just as traditional professions, such as medicine and law, are highly dependent upon the nation state in terms of accreditation and enforcing jurisdictions, so too are the nation states dependent upon professions in constructing stabilizing institutions of justice and health (Suddaby and Muzio 2015). Originally, the relationship between professions and government was referred to as a "regulative bargain," where the state devolves power to the profession provided that it acts in the public interest. If the power is abused, the state may alter or avoid the contract.

However, with the emergence of often large global organizations that employ or buy the services of expert labor for the financial benefit of individual companies and investors, the regulative bargain could be waning. Particularly noticeable is the observation that while professions have historically had a distinct national focus, newer forms of corporate professions (e.g., personnel, marketing, and consultancy) increasingly display a distinct international dimension and vocation (Muzio et al. 2011). At its simplest level, the international presence is realized through membership of a global umbrella body, which coordinates such initiatives as the development of international qualifications, codes of practice, and competence frameworks (ibid.). However, as professional service firms increasingly become the dominant actors in the structuring of modern expert occupations, rather than professional bodies or the state itself, traditional professionalization processes may no longer be relevant. Consequently, as newly emerging corporate professions rely less on barriers to entry and monopolies of practice and more on a market-based entrepreneurial approach to professional practice (Butler et al. 2012), the workplace relevance of professional standards will need to be adjusted accordingly.

## Conclusion

In addition to locating this brief entry on professional standards within the institutional context of licensure and certification, it has also considered ways that practitioners might assess the workplace relevance of professional standards. The entry has also detailed the contribution a continuing professional development can make to professional identity. Inevitably, to gain a full understanding of the workplace relevance of professional standards to practitioners, each profession needs to be considered on a case-by-case basis. This entry has only provided general details of professional practices as a whole. Professions come in all shapes and sizes, and it is difficult to

produce a definitive list of traits to define each and every one.

Although licensure provides a potentially important distinguishing factor in professions, newly emerging corporate professions with certifications could become just as equally powerful institutionally. Alternatively, without coercive institutional power, corporate occupations are not professionals in the true sense of the word and can be ultimately challenged as such provided that the political will is there. The values upholding the profession must, then, be accessible to public scrutiny just as the accompanying professional standards should remain relevant to the occupation, while continually being reflected upon. By fusing standards and development, the profession avoids unnecessarily reinventing itself but instead remains susceptible to incremental change in the light of contextual transformation.

# Workplace Spirituality

Carole L. Jurkiewicz
McCormack College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Authentic leadership; Organizational strategy; Transcendent work experience; Value transformation

## Definition

*Aspects of the workplace, either in the individual, the group, or the organization, which promote individual feelings of satisfaction through transcendence.*

## Introduction

Interest in issues of spirituality, particularly as related to the workplace, has grown rapidly over the past two decades and has moved from theoretical conceptions to definitions to measurements. Workplace spirituality is generally understood as either a set of static qualities that organizations may or may not possess to varying degrees or traits that change little if at all over time, such as benevolence, generativity, and gratitude (Giacalone and Jurkiewicz 2010b). The

other approach views workplace spirituality as a dynamic set of skills or capacities that can change in conjunction with the external environment. The forces driving this growing level of inquiry are (1) a recognition that younger and subsequent generations place emphasis on inner life satisfaction as much or more so than materialism and promotion and (2) evidence that workplace spirituality has a positive impact on motivation, productivity, efficiencies, and financial outcomes. The field is very much a developing paradigm and often researchers need to educate readers about the topic as they report their findings.

## Overview

Initial research into workplace spirituality by scholars, practitioners, and the general public prompted researchers to search for the causal factors. Some reported it was merely an expression of a global value change initiated by younger generations. Others suggested it was resultant of an expanded interest in Eastern philosophies that promote the integration of self with the environment (Giacalone and Jurkiewicz 2006). The predominant then and now the foundational belief is that the interest in workplace spirituality is a reactive response by organizations to developments that heightened social anomie and increased a sense of further alienation from their employers. Surveys indicated that while employees were dependent upon their workplaces for the human contact and social interaction (Jurkiewicz 2012), they simultaneously felt anxious and insecure at work. As individuals are distanced from the traditional social supports of nearby family, places of worship, and neighborhood affiliations, the workplace became increasingly more important in satisfying their social needs, and individuals looked to their experiences there to enhance their self-esteem, recognition, and respect.

An organization's culture has a profound impact on its performance, as has been well documented in the literature, and a spirituality-based culture has been shown to have the greatest impact on productivity, employee loyalty, ethics, leader effectiveness, and financial prosperity, among many positive variables (Jurkiewicz and Giacalone 2016). Spirituality, as defined here, has no connection to religion; religion in the workplace tends to be divisive and discriminatory and leads to lower productivity (Giacalone and Jurkiewicz 2010a). Workplace spirituality is expressed through the values that define an organization's culture. Adopting this set of ten values is viewed as a strategic advantage and a key element in an organization's strategy to achieve its goals (Kolodinsky et al. 2008).

## Values Framework of Workplace Spirituality

### Benevolence

Demonstrating kindness toward others, coupled with the impetus to foster the happiness and prosperity of employees and other stakeholders, is benevolence. Such behaviors generate positive emotions in employees and increase their positive attitudes about work. Research has shown that employees who have shown organizations demonstrating benevolence have higher motivation toward task accomplishment and are 86% more productive than those in organizations where benevolence is absent. Organizations which promote happiness have employees who are better able to moderate stressors.

### Equality

An organization operating with the value of equality treats all employees as inherently worthy and equivalent in all matters, regardless of lifestyle orientation, demographic, or hierarchical position. Employees feel respected and value and feel as if their voice in organizational matters is important. Organizations demonstrating equality have fewer unhealthy conflicts, reduced political activity, less gossip, and higher levels of collaboration and mutual support.

### Generativity

Generativity in organizations is express through policies, practices, and programs that demonstrate a concern for the future and the individuals not yet born who may be affected by activities undertaken in the current time period. Organizations high in generativity are proactive in leaving something

behind for those who follow. Behaviors that evince generative concerns, such as sustainability practices and awareness of environmental impact, demonstrated concern over an employee's lifespan and mentoring, and the organization's reputation show that these orientations are positively correlated with career outcomes, role clarity, job satisfaction, loyalty, sector dominance, and productivity.

### Humanism

Humanism is expressed through practices and policies that assert the essential dignity and worth of each employee and provide opportunities for personal growth as a function of achieving organizational goals. The positive effects of humanism on organizational culture are increased hopefulness, self-esteem, and job satisfaction. Employees are less distracted and are able to focus more clearly on the tasks required. Employees who view their workplace as a place to advance spiritually are inclined to exert greater work effort than those who view their organizations as merely a means to a paycheck. Humanistic values increase employee identification with the organization, making them more protective of its reputation.

### Integrity

Integrity is demonstrating uncompromising adherence to a code of conduct; sincerity, honesty, and candor simply because these are recognized as inherently worthy. In the absence of integrity, a multiplicity of values often conflicts between personal and organizational life, leading to feelings of disconnect and disparity and reduced connection with the organization (Jurkiewicz and Thompson 1999). Further, it has been shown that organizations and employees function best when their values are aligned, increasing productivity and employee commitment.

### Interdependence

All employees are interconnected and mutually dependent as a community; each contributes to the process of goal achievement. Interdependence is a workplace value that emanates from the importance of working together for a greater overall good, both for goal achievement and for feelings of social connection. Combining these outcomes enhances intrinsic motivation and facilitates the social contract, thereby enhancing feelings of identity with the organization and loyalty to it.

### Justice

Employees who expect to be treated fairly are happier and more productive, and their organizations see higher financial outcomes if those expectations are evinced in practice. Employees' sense of job satisfaction is directly connected to the perceived justice of employers' decision-making, policies, practices, and decision-implementation procedures. Even during periods of downsizing or cutting costs, organizational leaders who are subject to the same sacrifices as their employees and speak with them directly and transparently about the cuts, the reasoning behind them, the expected outcome, and the timeline can still retain high levels of loyalty and productivity and reduce the theft and other negative impacts that usually occur in such circumstances.

### Mutuality

The interconnection and interdependence of employees provide a benefit to the organization. Core feelings of belonging to a community and engaging in meaningful work lead to increased organizational commitment, job satisfaction, and self-esteem. This balancing of needs and contributions encompasses both employees and stakeholders who essentially share the same goals of working toward the common good. Valuing mutuality leads to organizational success and career optimism. Cohesive groups given some control over their work in conjunction with others are also less likely to experience burnout, unhealthy conflict, hopelessness, and feelings of alienation that lead them to seek employment elsewhere.

### Receptivity

Research has shown that threatening organizational cultures lead to rigid and simplistic decision-making that is invariably faulty and shortsighted. Those cultures inclusive of receptivity create supportive and open relationships with employees, foster productivity and creativity at all organizational levels, and make leaders feel more

comfortable with risk and change, leading to better quality decision-making. These creative organizations are more fiscally healthy and therefore are better able to adapt and grow with changing internal and external conditions. These cultures also are better able to function during crises and use crises to advance the organization in general.

### Respect

Organizations benefit from a culture that values mutual respect and demonstrates consideration and concern for others. These organizations are characterized by employees who are less likely to suffer from burnout, are less stressed, are more productive, are more satisfied with their employer, and are less likely to seek career opportunities elsewhere. Further, research has shown that respect for employees increases their job satisfaction, reduces absenteeism, weakens efforts to unionize, and increases the average length of tenure with the organization. Respect also generates higher levels of organizational spirituality, an orientation toward giving, and an acceptance of diversity. Along with these benefits, respectful cultures increase employee enthusiasm for their jobs, collaboration, creativity, and performance.

### Responsibility

When employees who have demonstrated capability and skill are allowed to follow through independently on aspects of goal attainment, both employee and organizational productivity increase. Such self-directed employees, when encouraged by the organizational culture, are more conscientious, collaborative, and overcome obstacles more creatively and efficiently than other organizational cultures. Empowered employees are more intrinsically motivated and productive; with the greatest productivity gains seen at the lower levels of the hierarchy, such autonomy is rare.

### Trust

Research has clearly demonstrated that trust between employees and between employees and their employer is essential to productive work relationships and that those organizations which create trust are more productive than those that do not. Employees who can confidently depend on the organization and know the organization trusts them have a greater sense of employment and personal security, reduced political behaviors, and greater employee commitment. As the Pygmalion effect has shown, employees live up to the beliefs employers have in them, and if they believe they are trusted, they are more likely to behave in a trustworthy manner.

While spirituality-related work policies and practices such as gainsharing, job security, narrower wage and status differentials, outlets for worker input into the organization's decision-making processes, and legal guarantees on individual workers' rights have been widely correlated with growth in labor productivity, it is the organizational culture that is the determining factor in the extent to which these and other similar practices are likely to be adopted, or if adopted, in whole or part. Many, if not most, organizational cultures are resistant to such changes even when presented with the empirical data supporting their efficacy. As with all changes, there are considerable short-term costs in instituting new long-term policies and procedures which can be perceived as deterrents, especially given most organizations focus on short-term results. However, a large body of data suggests that the costs connected to the conversion to a spirituality-based work culture are more than offset by measurable productivity and financial gains.

On an individual level, demonstrated benefits of a spiritual culture include enhanced physical and mental health of organizational members across the hierarchy, fulfillment of personal growth needs through contributing to something larger than oneself, and a sense of self-worth. The literature associating workplace spirituality with performance can be grouped into three key areas: motivation, commitment, and adaptability.

### Motivation

Organizational cultures defined by workplace spirituality have a positive impact on employee motivation. In such an environment, employees believe that their efforts make a substantive difference in organizational outcomes and are motivated to achieve them. They exhibit greater

determination in overcoming impediments in reaching these goals and are more inventive in crafting solutions to resolve problems causing goal interference. By satisfying personal growth needs through the attainment of organizational goals, they are subsequently intrinsically motivated to excel. This motivation to achieve occurs at both the individual and team levels.

### Commitment

An employee-employer job fit characterized by value alignment has been reported as resulting in increased productivity and success in recruiting talented employees, reduced turnover, and increased employee commitment as a function of workplace spirituality. Employees find personal fulfillment through their work as well as the satisfaction of a job well done, enhancing feelings of identification with and commitment to the organization.

### Adaptability

Employees in organizations with greater levels of spirituality display increased acceptance toward organizational changes. They are better equipped to direct the change process, are more open to new ideas, and experience less anxiety than employees in organizations without spiritual cultures. These employees are also more adaptable to organizational needs for action, feeling they are serving a greater purpose rather than simply doing a job. Finally, such cultures promote employee creativity and individuation, with positive financial impacts.

## Conclusion

The majority of our waking hours are spent at work. The work we do and the culture in which we do it are essential to our self-concept, which affects the quality of our lives beyond work as well. We seek growth and satisfaction through our efforts both in terms of the contributions we make and the fashion in which we make them. To accelerate this sense of satisfaction is to motivate individual effort and, in doing so, maximize organizational performance.

The intrinsic drive for personal growth through skill development and self-actualization has been established across a range of interdisciplinary research (Giacalone and Jurkiewicz 2010a). Generally, individuals seek opportunities to grow and advance themselves, to feel respected and valued for the contributions they are making, thereby experiencing a needed sense of connection to others. Such experiences transcend both the tasks themselves and the mundane aspects of the workplace and align us with a sense of the meaningful which we feel but can only rarely articulate. We can work longer and harder under these circumstances yet leave refreshed and energized, rather than drained and depleted. This sense of meaningfulness extends to our personal lives as well. Described by some as "a peak experience," "in the zone," "flow," or "when things just clicked," it is the time when we are compelled toward our best efforts and are able to overlook insignificant distractions.

We also know well when that sense of connection between spirit and work is missing. We are too aware of the resultant feelings of disconnect and disassociation. Many have come to accept this lack of fulfillment as normal and the lowered expectations of work as only a necessary step toward monetary reward. While we might yearn for the spirit/work connection, many have come to believe that it is magical, a chupacabra, that the confluence appears out of nowhere and disconnects without warning or reason. As discussed here, advancing research has shown workplace spirituality is set of tools than can be implemented to maximize both organizational and individual benefits.

## Introduction

Globalization has created both opportunities and challenges. The international trading system, embodied in the World Trade Organization (WTO), is rightly celebrated as one of the great successes exploring these opportunities and a medium to tackle these challenges (Sutherland et al. 2004). As the governments, after the Second World War, were looking for a trade institution, the General Agreement on Tariffs and Trade (GATT) as a de facto organization before the creation of WTO and now the WTO has success stories not only in trade liberalization but also in global trade governance. To secure a better governance, WTO sets some ambitious objectives which are to raise the standard of living and ensure full employment with growth in real income and trade while providing for the optimal use of the world's trade resources (Agreement Establishing the World Trade Organization). Another important feature of the WTO is to focus on the trade development issues as well as concentrate on many issues such as human rights and environmental protection which are not normally considered before to be in the domain of traditional trade policy (WTO Analytical Index: Guide to WTO Law and Practice). Question relating to the applicability and accomplishment of the WTO rules relating to the dividing line between WTO rules, national sovereignty, and the other international organizations might elevate when someone attempts to discuss the WTO's role in global governance. Pascal Lamy, former Director General, once correctly figured out this problem and remarks that, in both public and academic discourse, analysis of the WTO generally results in either extreme criticism or excessive praise, with the result that discussions are dominated by two opposite positions. On the one hand, some globalization critics assert that the WTO holds a hegemonic grip on global issues, while others denounce the WTO's isolation as an international rule setter and compliance enforcer. Proponents of a rule-based view of international relations, on the other hand, promote the WTO as a model for global governance (Sampson 2001). With this type of reaction in mind, the first two paragraphs after the introductory remarks of this contribution talked about the key definitions for better understanding and reformation of GATT to WTO and their role of trade governance for the past few decades. Then it tried to examine the contributions of WTO in specific trade-related issues and give some focus on non-trade-related issues. The WTO profile has also changed because of the greatly strengthened dispute settlement mechanism. So in the next paragraph, it attempted to examine

how the dispute settlement mechanism makes it the only international organization with an effective judicial tool to ensure compliance with its rules. Two-thirds of WTO members are now developing countries. Having undertaken new and demanding obligations, their legitimate expectation for the next chapter flourished on whether WTO will provide a forum in which their views can be effectively expressed and their concerns adequately dealt with. In the concluding remarks, some of the fundamental aspects of the world trading system that are important to its future directions are recommended.

## Definition

**Reciprocity:** Reciprocity refers to the practice that occurs in negotiating rounds and maintaining a smooth trading relationship whereby one country offers to reduce a barrier to trade and a second country "reciprocates" by offering to reduce one of its own trade barriers (Hoekman et al. 2002).

**Most-Favoured-Nation Treatment:** Most-Favoured-Nation (MFN) treatment creates an obligation for member states to prohibit discrimination between other members. It thus requires members to accord the most favorable tariff and regulatory treatment given to the products and services of any one member at the time of import and export of "like products" to all other members. The first article of the General Agreement on Tariffs and Trade (GATT), the second article of the General Agreement on Trade in Services (GATS), and the fourth article of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) are giving priority to this treatment over other articles considering its significance in the WTO trading system (van den Bossche and Zdouc 2013; Understanding the WTO: basics-principles of the trading system).

**National Treatment:** Under the national treatment rule, members must not accord discriminatory treatment between imports and "like" domestic products (with the exception of the imposition of tariffs, which is a border measure). This principle is also found in all the three main WTO agreements (Article 3 of GATT, Article 17 of GATS, and Article 3 of TRIPS), although once again the principle is handled slightly differently in each of these (Understanding the WTO: basics-principles of the trading system).

**Safeguard Measures:** Safeguard measures are defined as "emergency" actions with respect to increased imports of particular products, where such imports have caused or threaten to cause serious injury to the importing member's domestic industry (Article 2, the Agreement on Safeguards) (WTO Analytical Index: Guide to WTO Law and Practice).

**Subsidies:** Subsidies include various forms of government support, including financial grants, subsidized loans, loan guarantees, tax exemptions or reductions, and research and development supports. The government can also support an industry by building production facilities and infrastructure for them (Lee 2006).

## GATT to WTO: The Changing Role of Trade Governance

The world has witnessed a dramatic increase in both the value and volume of world trade after the Second World War. To govern the tremendous pressure of trade, WTO/GATT rules play a significant role in trading governance since the world trade has grown more rapidly than the world production in almost every year. After the Second World War, the world had faced a serious economic crisis. Since then the governments had initiated on a variety of efforts to reduce or to eliminate import restrictions and export subsidies (Global Problems, Global solutions: Towards Better Global Governance 2010). The motivation behind the trade liberalization was to increase the volume of trade, to promote economic growth, and to improve living standard worldwide. After the end of War, a number of international negotiations were set in motion in order of creating institutional structures for the conduct of international relations in the postwar period. The original intention was to create a third institution (International Trade Organization) to handle the trade side of international economic cooperation, joining the two "Bretton Woods" institutions, the

World Bank and the International Monetary Fund (Understanding the WTO: basics). After the success of Bretton Woods, one of the most important negotiation processes at the time was the United Nations Conference on Trade and Employment, held in Havana, Cuba, in 1947. At the end of the conference, the Havana Charter for the International Trade Organization (ITO) was adopted, though the ITO charter was considered very ambitious as it covered not only the basic trade issues but also thought about the importance of employment, commodity agreements, economic development, and restrictive business practice. As part of the negotiations on the Havana Charter, a group of countries engaged in tariff negotiations and in 1947 agreed to substantial tariff reductions. Due to the pending status of the Havana Charter to entry into force, a mechanism was needed to implement and protect the tariff concession negotiated in 1947. For doing so, it was decided to take the Chapter on Commercial policy of the Havana Charted and convert it, with certain obligations, into the General Agreement on Tariffs and Trade (GATT). To bring the GATT into force quickly, a "Protocol of Provisional Application" was developed on June 30, 1948. However, for various reasons including the failure of the United States to ratify it, the Havana Charter never entered into force (Croome 1998). From 1948 to 1994, the General Agreement on Tariffs and Trade (GATT) thus provided the rules for much of world trade and presided over periods that saw some of the highest growth rates in international commerce. It seemed well established, but throughout those 47 years, it was only a provisional agreement and organization until the WTO was established in 1995 (VanGrasstek 2013). Since then, the World Trade Organization (WTO) has operated as the institutional framework for the world trade governance (Lee 2012). The means available to the WTO to achieve its goals are trade liberalization and the conduct of trade according to multilaterally agreed rules. The success of WTO as a dynamic institution that has fostered dramatic increases in worldwide trade lies in its founding principles of reciprocity and nondiscrimination (Hoekman et al. 2002). The importance of eliminating discrimination is highlighted in the Preamble to the WTO Agreement, where the "elimination of discriminatory treatment in international trade relations" is identified as one of the two main means by which the objectives of the WTO may be attained (van den Bossche and Zdouc 2013). In addition to guaranteeing these principles, WTO is also trying to lower trade barriers among its member countries, ensuring predictability and transparency; discouraging unfair practices, such as export subsidies and dumping products at below cost to gain market share; giving the developing countries a greater flexible and special privilege; and permitting members to take measures to protect not only the environment but also public health, animal health, and plant life for making a secure place for trade governance (Understanding the WTO: basics). All these principles, the idea of moving toward more, rather than less, seem very much consistent with the global trade governance. It is believed by the policymakers that the strong multilateral rule-based trade regime, attained through the WTO, is essential to developing a system of governance of the global market (Sampson 2001).

## Trade Governance Within WTO

The WTO and its predecessor the GATT comprise the international system of rules governing trade. WTO rules are not only covering and applying strictly to the one-fifth of the world trade production but also issues related to goods and services that may never enter into a trade. The WTO provides the institutional framework for a unique system of rights and obligations for trade in goods and services and for certain aspects of intellectual property underpinned by rules and procedures for the settlement of disputes (Agreement Establishing the World Trade Organization). These rules extend vast areas of trade-related measures and reach deep into domestic regulatory measures. Domestic regulations relating to support measure for agriculture, subsidies, safeguard, countervailing measures, anti-dumping, patent, and protection of intellectual rights are all subject to WTO discipline. Some WTO agreements also raised a question about the patenting of life forms,

the role of precaution in the absence of scientific evidence, compulsory licensing to provide access to essential medicines, and the rewarding of indigenous peoples for pharmaceutical discoveries (Jones 2015; Steger 2009). Though WTO rules do not actually discuss governance, the WTO Secretariat and other observers have believed that improved governance is a spillover of its efforts to promote open trade. WTO helps its members and upcoming members to cope with the challenges of global trade governance by improving the norms of good governance (accountability, responsive, equitable and inclusive, effective and efficient, follow the rule of law, participatory and consensus oriented (10 benefits of the WTO trading system; Hoekman and Kostecki 2009; Weiss and Steiner 2006). Members of the WTO use the system to improve governance among nations, such as a country who wants to join this rule-based system. Working parties comprised of other WTO member states closely monitor potential members and make sure these nations meet their commitments. Once these acceding nations become members, they are monitored through trade policy reviews and can be challenged in a trade dispute. In short, the WTO has a feedback system to hold members to account for their trade practices and governance commitments (Aaronson and Abouharb 2013). It is tough for a nonmember to get the status of a member of the WTO. New members must reduce trade-distorting rules and regulations and make a significant reformation to their governance process and strategies. Countries with better governance may find an easy way to access than countries with weak governance policies that must make major institutional and policy changes. So membership in the WTO can yield governance improvements. Though the new acceding members are bound to change the law with conformity with the multilateral trading system, it takes time for such changes to improve governance. Upon accession, a new member should follow the fundamental guidelines already followed by the others. The members are obliged to follow some specific WTO obligations, as good governance norms that influence the behavior of the member states and market actors. The multilateral trading system is an attempt by governments to make the business environment stable and predictable.

Governments also must accord due process of rights to market actors. GATT Article X:3-(b) requires each party to maintain judicial, arbitral, or administrative tribunals or procedures for the purpose . . . of the prompt review and correction of administrative action relating to customs matters. These tribunals must be independent of administering agencies and allow importers to lodge appeals. Moreover, individuals with interests in investigations have a right to receive notice, to present written evidence, to review the public docket, to challenge decisions, and to seek judicial review (WTO Analytical Index: Guide to WTO Law and Practice). WTO takes and implements the decision in a very democratic and transparent way. Within the WTO, process and decision-making procedures have always been important elements of governance and often difficult to separate from the substance of the negotiation. Compared to the Bretton Woods Institutions (IMF and World Bank), WTO ensures a more balanced democratic process for its members. Membership in the IMF and World Bank is represented by a board, with each member giving voting rights proportionate to its contribution to the institutional budget. As a result, rich industrial countries hold the de jure driving seat in these institutions. On the other hand, the WTO Agreement stresses that all members have a right to representation in all of the WTO's governing bodies, ranging from the Ministerial Conference on the General Council, as well as all other councils and committees. All decisions are taken by consensus on the basis of a "one government, one vote" principle (Agreement Establishing the World Trade Organization). The legitimacy of the multilateral trading system depends both on internal legitimacy (full participation of all members) and external transparency (engagement of civil society in the member states). Indeed, if the rules are to legally bind all parties in a single undertaking, without the possibility of opting out of individual agreements, full participation and transparency become essential to enhance the sense of ownership of the substantive outcomes. So WTO, after establishment, proved itself as an

effective multilateral organization which maintains good governance norms such as non-discrimination, transparency, and due process. Members have got a chance to learn how to improve governance and adopt those norms to improve governance as they participate in the day-to-day working of the trading system. However, this learning process is gradual and uneven. Sometimes countries make significant progress in some areas, and the same countries may make less progress in others.

Due to the dramatic failure of the WTO's 1999 Ministerial Conference in Seattle, WTO trade governance turned into a new chapter. Massive demonstration and dissatisfaction of certain groups with the state of globalization at the time of Seattle Conference influenced WTO to step forward to revisit the issues relating to non-trade areas. Protesters succeeded in drawing attention to their concerns about labor, environmental, and human rights issues. At the Doha Ministerial Conference in the fall of 2001, the WTO laid out an agenda for the "Doha Development Round," which opens the door to a discussion of at least some of these non-trade issues, including environment, competition policy, and investment (About the WTO: The Doha Round Texts and Related Documents 2009). The non-trade concerns at issue – sometimes referred to as "fair trade" issues – include regional economic integration; environment, investment, and competition policy; transparency in government procurement; trade facilitation; electronic commerce; and labor rights. The non-trade interests in these areas, however, are powerful and important enough that they must be given a voice if relevant trade rules are to be sustained. A refusal to grant such a voice will give strength to the already powerful forces aligned against the WTO and globalization (Guzman, August 2002). These developments have placed the WTO and the international economic community at a crossroad. The WTO must either move forward by incorporating more regulatory issues within its mandate or move backward and retreat to a narrower focus on trade, leaving controversial topics such as environmental and human rights issues outside of its influence.

## Dispute Settlement and Governance

An effective consensus-based decision-making process could be achieved by increasing the transparency with which decisions are taken. Dispute settlement is the central pillar of the multilateral trading system to secure this transparency and make WTO an effective democratic organization for global economy and trade governance (van den Bossche and Zdouc 2013). The GATT rules relating to the settlement of a dispute were less elaborate and detailed compared to those under the World Trade Organization (WTO). The WTO dispute settlement procedure is premised on the assumption that all members are equal in their legal capacity to present their position in dispute settlement. The purpose of the WTO's Understanding on Rules and Procedure Governing the Settlement of Disputes (DSU) is to provide for an efficient, dependable, and rule-oriented system to resolve disputes (a dispute arises when one country adopts a trade policy measure or takes some action that one or more fellow WTO members consider to be breaking the WTO agreements or to be a failure to live up to obligations. The third group of countries can declare that they have an interest in the case and enjoy some rights application of the Marrakesh Agreement Establishing the World Trade Organization (Hoekman and Mavroidis 2007). The dispute settlement body is equipped with a two-stage procedure, panel, and Appellate Body. The main functions of the panels are to find and analyze the facts and also determine the consistency of the measures in question with the rules of WTO Agreements. If the parties are dissatisfied with the findings of panels, they might appeal to the Appellate Body for a review of the panel reports. Appeals have to be based on points of law such as legal interpretation and they cannot reexamine existing evidence or examine new issues. An effective consensus-based decision-making process could be achieved by increasing the transparency and accountability with which the decision is taken. It is often said that consensus principle is at the heart of the WTO decision-making process and is a fundamental democratic guarantee that is not negotiable. For this reasons, each member undertakes to accord

sympathetic consideration to and afford adequate opportunity for consultation regarding any representation made by another member concerning measures affecting the operation of any WTO agreement. Consultations have a number of functions. They allow parties to clarify the facts of the matter, thus dispelling misunderstandings as to the actual nature of the measure at issue. They may allow parties to find a mutually satisfactory solution and, if no solution is found at that stage, permit them to take stock of the issues which were not solved through consultations. Article 5 of the DSU provides for good offices, conciliation, and mediation to be undertaken voluntarily if the parties to the dispute agree. Good offices, conciliation, and mediation may begin at any time and be terminated at any time. If the parties so agree, these procedures may continue while the panel process proceeds. Panel and Appellate Body reports have to, where applicable, contain the recommendation that a measure which was found inconsistent with the WTO agreement be brought into conformity with that agreement (Understanding on Rules and Procedures Governing the Settlement of Disputes). But in recent years, WTO dispute settlement process encounters criticism for the secretiveness of the decision-making. As a result, most developing countries are reluctant to get relief from the WTO dispute settlement. To remove these types of deadlock situation, few steps should necessarily be implemented. In short, what is required is a system by which the state of play of any ongoing negotiation in any group is immediately communicated to all member countries for information sharing and ultimate decision-making. Better and improved trade governance is based on not only on the external transparency but also to the internal transparency of an organization. Today, the public from developed and developing countries would like to see the WTO to be more open and more accountable. In this regard, the WTO should consider limiting its restriction on its documents and most information should be accessed by the members. All of these efforts will make the public better informed about the WTO dispute settlement, WTO negotiations, and operations.

## WTO, Trade Governance, and Development

The facilitation of economic development agenda because developing countries now account *numerically* for the larger part of the WTO membership. Though the preamble of the WTO Agreement (Agreement Establishing the World Trade Organization) includes the facilitation of development among its major objectives, the development issues were not getting the same spotlight while the WTO legal regime had started. Herein the parties to the Agreement refer to objectives relating to economic growth, expansion of the production of and trade in goods and services, and sustainable development; recognize the need for positive efforts to ensure that developing countries, especially least developed countries (LDCs); secure a share in the growth in international trade commensurates with their economic development needs; indicate their desire to contribute to these objectives by entering into trade liberalization agreements; and resolve "therefore to develop an integrated, more viable, and durable multilateral trading system." Article XVIII of the GATT, "Government Assistant to Economic Development" is one of the primary provisions facilitating development in the GATT regime. Another set of the GATT provisions attempting to assist economic development is Part IV of the GATT (Article XXXVI–XXXVIII) entitled to trade and development. In 1964, the United Nations Conference on Trade and Development (UNCTAD) was established and rapidly became the main voice of the less-developing countries calling for reforms to the international trading and financial system. As part of its manifesto for New International Economic Order, UNCTAD called for the introduction by the developed countries of nonreciprocal tariff preferences for products exported by less-developing countries. In 1968, an agreement was reached on a scheme, the General System of Preferences (GSP), for granting such preferences. For decades, WTO tries to innovate such multilateral trade agreements which can meet the benchmark of equity, recognizing the differences that exist between WTO members – rich or poor,

large or small. WTO also recognizes the need for more flexible options in favor of less-developing economies. However, it is reluctant to allow more time to open markets which would have been beneficial for less-developing economies. Nonreciprocal mechanisms have long been included in trade agreements embodied in the concept of "special and differential treatment." A set of policy statements was made in the form of the GATT discipline on November 28, 1979 in favor of development and developing country members. This statement stated that "the developed countries do not expect reciprocity for commitments made by them in trade negotiation to reduce or remove tariff and other barriers to the trade of developing countries." But the inadequacy of the development-oriented provisions in WTO disciples urges the policymaker to do more. So Special and Differential (S&D) treatment is given in Uruguay agreements to participate in international trade more easily. But the S&D treatments, as currently provided, are not sufficient to meet the economic development. Though the DOHA round took initiatives to diminish the gap by declaring the round as "development round" and declared S&D treatments for developing countries shall be an integral part of all elements of negotiations, the relaxation of current requirements in favor of developing countries could not server their needs. The protections are giving the impression to be "insufficient." Many developing countries still have limited technical and human resources to comply with and to participate meaningfully in the many and often parallel negotiating circuits. So empowering these countries to have an effective voice in the work of the Organization remains part and parcel of governance. There are numerous ways in which WTO provides assistance to build trade capacity in developing countries. Among them, one of the main organizational efforts is to instruct developing countries' delegates on how their countries can gain through the trading system. The main objects of these training are facilitated to them to understand the WTO process as they can implement WTO agreements in ways which will bolster their trading regimes and negotiate more effectively with their trading partners. In addition to technical assistance, WTO further gives assistance to improve developing countries' infrastructure, i.e., efficient port and road network, providing customs official with automated equipment to cope with and to take advantage of the business opportunity in the global marketplace. WTO runs programs, particularly those involving infrastructure, in coordination with the international organizations and national government, because WTO's functions are to achieve greater coherence in global economic policy-making and to cooperate, as appropriate, with the IMF and World Bank (WTO: building trade capacity). In the framework of the WTO, the developed members have also committed themselves to accord high priority to the reduction and elimination of barriers to products currently or potentially of particular export interest to developing countries, including customs duties and other restrictions which differentiate unreasonably between such products in their primary and in their processed forms. On the other hand, the only target of developing countries is not only applying the trade restrictions to protect their domestic markets but also being able to exploit the export opportunities that open up for them and also to defend their acquired rights and interests and to formulate development-oriented trade policies. There is a problem relating to the systematic absence of many developing countries (particularly those that are small) from both informal and formal meetings in the WTO. Most small delegations from developing countries do not have the appropriate resources either in Geneva (Secretariat at WTO) or at home to service the increasingly frequent, complex, and resource-intensive negotiation process at the WTO. Full participation can come about only with a strengthening of their human and institutional capacities. As many of them do not have the resources or expertise to build this capacity themselves, they have to turn to technical assistance programs offered by others. There is a pressing need for a considerable increase in the inadequate resources currently available to them through the regular WTO channels (Sampson 2001).

## Conclusion

The multilateral trading system, with the World Trade Organization (WTO) at its center, is the most important tool of global economic management and development. The WTO has extended its reach far beyond that of GATT, the rules and applications are advanced more than before, and its importance in international economic and political affairs has increased dramatically. It is believed that the global trade governance could be partially and effectively filled by none but the WTO by taking on more initiatives and responsibilities. Besides considering only the trade-related issues, WTO should take more responsibility to build a strong multilateral rule-based system based on effective reciprocity, corrective equity, transparency, and accountability. The trading system cannot act in isolation when there exists a wide variety of issues including to preserve and protect the environment, access to essential medicine, and respect of core labor standards and human rights that belong on the international agenda and that are directly affected by trade itself or the rules that govern it. So WTO should remake or revisit its rules essential to develop a system of governance in the global market. WTO also gives potential concentration on implementing the development goals and social issues, i.e., a substantial increase in development assistance, including the strengthening of trading capacities and acceptance of the need for special and differential treatment to allow developing countries increased flexibility, including taking tariff-freezing, tariff-raising, or import-limiting measures when necessary, fully in future trade-liberalizing negotiations. Changes also require WTO decision-making procedures which not only address developing country grievances but enhance the organization's ability to conduct business efficiency. Another initiative that should be taken by its member states to strengthening the WTO in global governance is to increase its own institutional capacity by increasing its budgets and the size of the staffs. Moreover, weak or the lack of other international organizations responsibility for global trade governance, overlapping and ill-defined mandates, inadequate organizational cooperation, and the absence of a mechanism for deciding who does what are the global governance problems that are burdening the WTO and undermining the effectiveness as an important multilateral institution and policy initiative. If all these challenges that face the organization are to be understood and fully addressed, the WTO's place in the larger system of global economic governance will have to be considered.

## Youth Unemployment in Egypt

Ghada Barsoum
Public Policy and Administration Department, The American University, Cairo, Egypt

Youth unemployment in Egypt is a central policy issue. Egypt has witnessed heightened political mobilization of young people in 2011, as part of what has been described in the media as the "Arab Spring." Youth employment issues are key in this context. Particularly as young people constitute the majority of the unemployed in Egypt. There is also a high prevalence of unemployment among youth, particularly the young women and the educated.

In order to understand the issue of youth unemployment in Egypt, it is good to start with how unemployment is generally defined. The International Labor Organization (ILO 2013: 56) defines unemployment as referring to persons of working age (defined as starting age 15 in Egypt) who are "not in employment," actively "seek employment," and is "available" for work. Employment statistics are drawn from household labor surveys from nationally representative samples. In Egypt, the labor force survey is conducted four times a year by the Central Agency for Public Mobilization and Statistics (CAPMAS).

The youth unemployment rate in Egypt is 15.7% according to a recent ILO report that builds on data from CAPMAS (Barsoum et al. 2014). This statistic refers to the proportion of unemployed youth aged 15–29 to those in the workforce (both employed and unemployed) from the same age group. While youth as an age group is commonly identified as those between the ages 15–24, youth labor statistics usually take into account the fact that education could extend beyond the age of 24 and hence extend the analysis to include those aged 29 in order to capture post-education employment experiences. Another important statistic is the percentage of the unemployed to the general population. The unemployment-to-population rate for those aged 15–29 in Egypt stands at 8.5% (ibid.). This figure shows that roughly one in twelve young people in Egypt is unemployed. Similarly, the rate of those not in employment, education, or training, dubbed by the ILO as NEET group, is a large group in Egypt and reaches almost one third of youth in Egypt (29%) (ibid.).

There are a number of key characteristics of unemployed youth in Egypt. First, unemployed youth are primarily from the educated. The above-cited ILO report shows that 44% of unemployed youth had a tertiary education degree. Young people with vocational secondary education completion degree also constitute 38.4% of the unemployed (ibid.). These two groups of educated youth, therefore, constitute more than 82% of the unemployed. This explains the political importance of the youth unemployment issue, for touching on the welfare on the politically volatile group of the young and educated. Second, young

https://doi.org/10.1007/978-3-030-66252-3

women constitute a very large proportion of the unemployed. The unemployment rate among young women is at a high of 38.1%, to be compared to 6.8% among young men (ibid.). Similarly, the unemployment-to-population ratio is 11.9% among young women, to be compared to 5.2% among young men (ibid.).

There are many reasons for the high youth unemployment rate in Egypt. First and foremost, the level of economic growth in the country did not match the demographic pressures of having an increasing number of new entrants to the labor market from the youth every year. Population pressures, not matched by adequate economic growth, remain a key factor to youth unemployment in the country. However, the youth unemployment problem in Egypt and in the Arab region in general is often described as a structural problem. This analysis, best postulated by Assaad (2008, 2014), relates youth unemployment to the duality of the economy in Arab countries, where there is a formal economy predominantly represented by the public service and state-owned enterprises and a large informal economy populated by small- and microscale enterprises. The job characteristics and level of benefits widely vary between the formal and informal economies, making it highly desirable among young entrants to seek jobs in the public service and state-owned enterprises (Barsoum 2016a). Jobs within the informal economy are commonly characterized by lack of benefits such as access to written work contracts, social pension schemes, health insurance, or work and income stability. Research has also shown a wage gap between the formal and informal economies in favor of the former (Said 2015). This disparity induces many young people to queuing for the fewer number of jobs in the formal economy.

The desirability for jobs in the public service and state-owned enterprises among the youth is a reflection of an historical legacy that dates back to the socialist policies of the 1960s in Egypt. In 1962, higher education was promulgated as a free right in Egypt similar to the pre-university stages. In the same year, a guaranteed employment scheme for graduates of secondary education and above. These policies widened access to post-secondary education. However, the guaranteed employment scheme was an unsustainable economic policy, leading to the bloating of the public service sector and a prolonged wait period for jobs among graduates. The scheme had to be eventually stopped with the implementation of economic reforms and structural adjustment policies in the early nineties. Assaad (2008) relates the high youth unemployment in Egypt to the high expectations for public employment engendered by the government's employment guarantee policy. However, public sector hiring continues after the scheme has been relinquished, following a new modality of hiring competition. The disparity between work characteristics in the private sector and the public sector leads to a situation where applicants to public sector jobs far exceed demand, opening way for nepotism and cronyism in hiring.

Gender is a key determinant of unemployment status in Egypt. As the above-stated statistics show, unemployment is much more prevalent among young women than among young men. In absolute numbers, the number of unemployed young women is more than double that of unemployed young men (1.3 million young women as opposed to 0.6 million young men) (Barsoum et al. 2014). Among the NEET category, 49.5% of young women belong to this category to be compared to 9.3% of young men (ibid.). The face of unemployment in Egypt is, therefore, that of young women. While gender is a key determinant of youth unemployment in Egypt, it is also important to remember that Egypt has one of the lowest rates of female labor force participation in the world, hovering around 26% according to Egypt's central statistical bureau, CAPMAS. One of the key arguments about gender disparity in Egypt and the Arab region in general is that while women have made significant strides in access to education, this did not translate in greater labor market participation. A number of studies have looked at the challenges facing women in joining the labor market. While some arguments have highlighted the specifity of cultural constraints to women's employment, others have taken a deeper look into issues related to the structure of the economy and available

opportunities. Moghadam (2001) postulated the impact of oil remittances, which has been reflected in Egypt through remittances from migrant labor, on reinforcing a vision of women as homemakers. Similarly, a report by the World Bank (2013) argued that the presence of large public sectors in the Arab region, including in Egypt, heavily distorted the labor, capital, and product markets. Among young women, the public service remains a preferred employer for its relatively generous package of maternity leaves, availability of leaves without pay, work stability, and shorter working hours compared to the private sector. Given the high competition for public service jobs as discussed earlier, this largely contributes to the high unemployment rate among young women.

There are a number of commonly identified challenges facing male and female youth in entering the labor market and contributing to increasing the unemployment rate. These challenges can be categorized as (1) pertaining to the limited skill base of these new entrants to the labor market, (2) job matching and labor market information deficiencies, (3) limited access to finance for entrepreneurial support, or (4) the lack of employment opportunities. First, the limited skill base of unemployed youth can be related to problems in the education systems and its inability to prepare its graduates with the relevant skills needed in the labor market or early school dropout. Access to soft and portable skills, such as the ability to communicate effectively, has been identified as a key challenge to these new entrants to the labor market. Second, the limited access to labor market information about employment opportunities, particularly for youth in poor and remote areas, is also another key challenge. Young educated youth in remote rural areas face this access to information problem and are hence unable to apply to available vacancies elsewhere. Third, the limited access to finance for entrepreneurial support is also a key challenge and inhibits the entrepreneurship potentials for young people. In fact, research shows that young entrepreneurs in Egypt have to rely on family resources due to limited financing opportunities. Fourth, the lack of employment opportunities challenge is also more prevalent in remote and poor areas, particularly for educated rural youth. This group is faced with contracting employment opportunities in agriculture and the mismatch of their education to their rural settings.

Many state and civil society initiatives have taken place in Egypt to address youth unemployment. The Youth Employment Inventory (youth-employment-inventory.org) includes more than 180 interventions implemented in Egypt for youth employment (Barsoum 2016b). These initiatives are implemented by a large number of state and non-state actors with support from international donor organization along with the private sector and local civil society organizations. The inventory groups the interventions into those addressing the skill gaps, those addressing job matching problems and information asymmetry, and those addressing lack of employment opportunities and access to finance. The first group of initiatives is aimed at skill building through second-chance programs for youth who did not complete their education or at providing soft and technical skill training to young people. Modalities of implementation include classroom settings, internships, or on-the-job training. The latter approach is known for being more effective. The second group of initiatives seeks to promote entrepreneurship, not only through access to finance but also through mentorship, entrepreneurship training, or business grants. The third group of initiatives seeks to provide employment services in order to address the information asymmetry among unemployed youth. Programs in this category provide job search assistance and counseling, job placement services, and even financial assistance to search for jobs. The fourth category includes services in the context of subsidized employment such as public work projects, wage subsidy programs, or employment in public service. This last category is mainly provided by the state.

The movement of labor, particularly youth international migration, is a global challenge that has its roots in the high unemployment prevalence among this group in countries in the South. In fact, Barsoum et al. (2014) show that more than half of employed youth expressed their dissatisfaction about their jobs and their willingness to seek employment in other countries. A survey of

youth in Egypt, the Survey of Young People in Egypt, which was conducted by the Population Council (2010), shows that one in three young men in Egypt expressed willingness to migrate. Employment opportunities are the key reasons for these young people to seek migration.

The issue of youth unemployment in Egypt, while significant, needs to be contextualized and understood in relation to other employment data. As the above discussion of the informal economy and work expectations shows, employment characteristics matter in increasing unemployment rates, job dissatisfaction, and willingness to migrate. Interventions to support youth labor market insertion must be multifaceted, combining different models. Interventions to support youth employment require concerted efforts and government engagement of the private sector and civil society organizations. Youth should be active partners in the design and implementation of these programs.
